TO THE
RIGHT HONOURABLE
WILLIAM Lord *COWPER*,
Baron of *WINGHAM*,
AND
Lord High-Chancellor
OF
GREAT BRITAIN.

My LORD,

THE great Honour and Advantage which the former Volume of this Work receiv'd from the Patronage of His Royal Highness, the late Prince George of Denmark, encourages me to Dedicate This to Your Lordship; as I am also oblig'd in Duty and Gratitude to do, for the many Favours I have receiv'd from You; and especially for the great Honour and Happiness of having been so long known, and so near to You: For this, my Lord, will save me from
Vol. II. A 2 the

DEDICATION.

the Fate of those Dedicators, who attempt Characters above Panegyrick: The Publick Part of Your Lordship's all the World knows and admires; and tho' I see every Day That which renders Your Lordship the Instruction, as well as the Delight of all that have the Honour of Your Conversation, yet I can no more describe it, than I dare attempt it: I shall therefore, my Lord, entirely forbear; fearing as much doing Violence to Your Modesty, as Injustice to Your Merit.

I am,

My LORD,

Your Lordship's

Most Dutiful, and

Most Humble Servant,

JOHN HARRIS.

T H E

INTRODUCTION.

THE Design of an INTRODUCTION to a Book, being to lead the Reader into it, and to acquaint him what it contains; I shall observe that Method here.

He is therefore to understand, that when I first began this Work, I foresaw the *Design* could not be accomplish'd in One Volume; but however, I thought it more proper to Publish one Volume first, than to defer Printing *any thing* at all of it till the Whole was finished: For as it is easy to see, that new Matter will continually occur in a Design of this Nature, and, consequently, that there can be no such thing as a *Perfect Book* of this Kind; so I thought it better to send out an *Imperfect one* than none, and to afford *some* Help to Mens Improvement in Philosophy and Mathematical Studies, rather than leave them to stay four or five Years for a *more Compleat* one. And the unprejudic'd Part of the Learned World have been so kind, as to take my Endeavours as I meant them; and by taking off almost Two Impressions of the former Volume, and numerously subscribing to this, make me hope, the Pains I have taken, and the Time I have employed this Way, may be of some Use and Benefit to Mankind, and to the Improvement of Solid and Substantial Philosophy.

In this Second Volume, as I promised both in the *Preface* to the First, and also in the *Proposals* for This, the Matter is entirely *New*, and without any Repetition, that I know of, of any thing in the *Former*; and that shall be my Method, if ever I Publish any thing further in this Way.

The Reader will find here many Parts of Natural Philosophy and Anatomy largely treated of, which were either but just nam'd, as it were, or entirely omitted in the former: As in particular, the Affair of *Animal Secretion*; into which Dr. Keil's Book on that Subject, publish'd since my Account was printed, will let you yet further; Discourses on Thunder, a Vacuum, Vapours, Water; with a large Account of Sound, Echoes; the Transmutation of Bodies into one another; the Nature of Light and Colours, the Rays of Light, the Double Refraction found in the Island *Chyrstal*; Elasticity, Electricity, the Cohesion of the Parts of Bodies, &c.

And

INTRODUCTION.

And in Natural History, I have here given Schemes of Birds, Fishes, Insects, Quadrupeds, Roots of Plants, &c. by which they are ranged and distributed into their proper Orders.

Here are also inserted pretty large Accounts of the Ear, Stomach, Spleen, Skin, *Vena Porta*, Lungs, Gall, and Respiration, and of the New Theory of Generation ; with Descriptions of the Lymphæducts and Glands, and two very fine and large Copper Plates of the Veins and Arteries of a Human Body, which were drawn from the Original Tables, presented by that great Promoter of Useful Learning, *John Evelyn* of *Deptford*, Esq; to the *Royal Society* of *London*.

You have here also a further Account of that most amazing Property, the *Attraction* of the Particles of Matter one towards another, first discover'd by that Incomparable Mathematician and Philosopher *Sir Isaac Newton* ; who by the wonderful Discoveries he hath made about the Nature of *Light* and *Colours*, hath open'd a New World in Natural Philosophy, as by his Method of Fluxions, &c. he had before done in Mathematicks, Mechanicks and Astronomy ; and hath sufficiently shewn, that what he said in his *Preface* to his *Principia Philos. Math.* in these Words : *Multa me movent ut non nihil suspicer cætera Naturæ Phænomena, ex viribus quibusdam pendere posse, quibus Corporum particule, per Causas nondum cognitæ, vel in se mutuo impelluntur, & secundum Figuras regulares coherant, vel ab invicem fugantur & recedunt*, was what he very well knew then, tho' express'd with that Caution and Modesty, as is so peculiar to that Excellent Man.

This was printed in the Year 1687. and the *Queries* at the End of his *Opticks*, and especially as since enlarged by him in the *Latin* Translation of it, do sufficiently shew his Thoughts to have been long ago employ'd on this most useful Subject ; and from whence those Propositions took their Rise, which those Ingenious and Industrious Brothers the *Keils*, have publish'd about this Affair of Attraction : But however, to do the Illustrious Author yet further Justice, I have, with his Leave, at the End of this *Introduction*, printed a *Latin* Paper of his *De Acido*, with a Translation of my own ; and which, tho' never publish'd before, was given by him to a Friend, as long since as the Year 1692, and which I wish had come to my Hands sooner, to have been inserted in this *Lexicon* under the proper Head, *Acids*.

And give me Leave here further to inform the Reader, That there is now printing a *Latin* Mathematical Treatise or two of *Sir Isaac Newton's*, which were written many Years ago, and which by their Date will sufficiently determine, whether the *New Methods of Fluxions* were known first to him, or *Mr. G. Leibnitz*. But to go on : In this Second Part, I have been very full and particular in Astronomy ; having not only from *Mr. Hayes's* Excellent Book of Fluxions given
a short

INTRODUCTION.

a short System of the New Astronomy, but have also from the Ingenious and Learned Mr. *Halley*, *Savilian* Professor of Geometry in the University of *Oxford*, inserted a *Synopsis* of the Doctrine of Comets; and from the Prelections of Mr. *Whiston*, Mathematick Professor of the University of *Cambridge*, such Astronomical Tables as are necessary for Calculation, illustrating largely the Uses of them, with proper Examples, in the most useful Astronomical Problems, and in the Calculation of Solar and Lunar Eclipses, and in those of the Satellites of *Jupiter*, &c.

And because I would have these Two Volumes to serve as a Kind of small Mathematical Library, and prevent in some measure the Necessity and Charge of buying many Books on these Subjects; I have also, as I design'd at first, given you in this Volume very good Tables of Logarithms, Sines, Tangents and Secants, with a full Account of the Nature, Use and Application of them; so that nothing will be wanting here to compleat Trigonometry, both Plain and Spherical, and the Practice of it in Navigation, Dialling and Astronomy, &c.

I have here also given a full and clear Account of the Nature, Construction and Uses of all the Lines which are usually drawn on any Mathematical Instruments, Rules, Scales, &c. and how to use those Instruments, on which they are drawn, in the several Parts of Practical Mathematicks for which they were design'd.

And I have here and there inserted such useful Tables for the Calculation of Interest, Annuities, Purchases, Reversions, &c. as I found most easily and readily subservient to those Uses. And because of the very many and excellent Uses of the Table of Incomposite Numbers, and its being printed no where but in *Brancker's* Algebra, an obscure Book, and out of Print; I have here given it you entire, and, I believe, correct; being desirous to prevent so useful a Table from being lost, or buried in Obscurity.

Here is also an Account of the Method of *Levelling*, in order to drain Marshes, Fens or Morasses, or to convey Water from one Place to another.

An Account of the Rise, Invention and Progress of the Art of Printing; with a Description of the Tools and Instruments subservient thereunto.

I have added also a farther Account of the Phænomena of Prisms and the Rainbow; with a short System of Opticks from Sir *Isaac Newton*; and many Improvements in Microscopes and Telescopes; the Art of Perspective, and the Methods of Projective, Reflective and Refractive Dialling.

In Mechanicks, besides the Account of the Five Powers and Demonstrations of the Nature and Principles of that Science, here
are

INTRODUCTION.

are many things added about Centres of Gravity and Oscillation, the Resistance of Mediums, with the Description and Uses of all such Mechanical Instruments, Tools and Engines, as are used in Architecture, Fortification, Gunnery, or any Mathematical Arts and Sciences.

In Geometry, here are great additional Improvements; as two Treatises of the *Order* and *Quadrature* of Curves, written by the Incomparable Sir *Isaac Newton*; a Treatise of Conick Sections, translated from the Posthumous Book of the Marquis *de L'Hospitall*, with many other Things relating to the Properties of Curves, scatter'd up and down under particular Words; such as *Cycloid*, *Helicoid*, *Retrogression of Curves*, *Transcendental Quantities*, &c. Here are also added many new Things in Arithmetick and Algebra, and in the Doctrine of Fluxions; as about *Alternations*, *Combinations*, the *Laws of Chance* in Play, *Infinite Series*, and *Political Arithmetick*; and about the *Roots of Equations*, *Renewing of Leases*, *Reversions*, &c.

I have also here given a large Account of the Ways of Finding, Dressing, Melting, &c. of all the several Ores from whence our Metals are taken; describing also the Works, Engines, Tools and Terms of Art used by Miners; as also the Ways of making Salt, Allum, Coperas, Vitriol, and such like Mineral Productions.

In Musick, here is given an Account of the Nature and Grounds of Harmony from Dr. *Holder*, and a new short System of Musick by the Ingenious Mr. *Perk*.

In Navigation I have added many things; as the Way of finding and allowing for the setting of Currents; an Account of the Power of the Winds on the Sails of Ships, and of the Signals used at Sea, both by Day and Night, in Sailing, and in an Engagement; together with a new Traverse Table, and its Use and Application: And at the End, you will find two very accurate Cuts of the *Inside* and of the *Rigging* of a First Rate Man of War; with the several Parts describ'd, and referr'd to by proper Letters and Numbers.

I have also inserted Tables of the Sun's Place, Right Ascension, and Declination; together with a Catalogue of the Right Ascension, Declination, Longitude and Latitude of about fifty of the principal Stars, which Mr. *Hodgson* supplied me with; as also a Table of the Longitude and Latitude of the most eminent Places on the Globe; all which will be very useful in Astronomy, Navigation and Dialling.

I have added also a Copper Plate, describing a new *Hydrostatical Balance*, which is very ready and expeditious to find the Specifick Gravity of Bodies, as is there shewn.

I have

INTRODUCTION.

I have here, under the Word *Microscope*, given the Reader the Figure, Nature, Use and Advantages of Mr. *Wilson's* Glasses of that Kind, which I could only just mention in the *Introduction* to my former Volume, and which I think my self oblig'd again to say, are the most ready, commodious, and universally useful, of any Microscopes, I ever saw.

And that I might do further Justice to our Excellent Mathematical Instrument-Maker Mr. *John Rowley*, in *Johnson's-Court* in *Fleet-street*, I have given the Reader a Plate of a New Sextant lately made by his most accurate Hand, for the Observatory now building in *Trinity-College* in *Cambridge*; and which for its universal Use, far exceeds any Astronomical Instrument ever yet made; as you will easily perceive by the Description of it, which I have added to the Figure.

I have only one thing more to acquaint the Reader, and that is, That the ingenious and Accurate Mr. *Derham*, Rector of *Upminster* in *Kent*, and Fellow of the Royal Society, hath lately obtain'd from *Florence* an Account of the Measures and Weights used there: And we find by Mensuration and Tryal, that the *Florentine Semibroccio*, or Half-Brace, is in Length 11.475 of our *Inches*, or in *Foot-Measure* .956 of our *Foot*: And the *Florentine Ounce* is 17 *Peny-weight*, 12 *Grains*, and three Fourths of a *Grain Troy-weight*.

The following Paper of Sir *Isaac Newton's* is excellently well worth the Philosophical Reader's most serious and repeated Perusal; for it contains in it the Reason of the Ways and Manner of all Chymical Operations, and indeed of almost all the Physicall Qualities, by which Natural Bodies, by their small Particles, act one upon another.

INTRODUCTION.

DE

NATURA ACIDORUM.

I S. NEWTON. 1692.

Acidorum particulae sunt Aqueis Crassiores, & propterea minus Volatiles, at Terrestribus multo subtiliores & propterea multo minus fixae. Vi magna attractivâ pollent, & in hac vi consistit earum Activitas, quâ & corpora dissolvunt & Organa sensuum agitant & pungunt. Mediae sunt Naturae inter Aquam & Corpora, & Utraque attrahunt. Per vim suam attractivam congregantur circum particulas corporum seu Lapideas seu Metallicas usq; undiq; adherent arctissime, ut ab iisdem deinceps per Distillationem vel sublimationem vix possint separari. Attracta vero & undique congregata, elevant, disjungunt & discutiunt particulas corporum ab invicem, id est corpora dissolvunt; & per vim Attractionis quaruunt in particulas commovent fluidum & sic calorem excitant, particulasq; nonnullas adeo discutiunt ut in Aerem convertant & sic Bullas generant. Et haec est Ratio Dissolutionis & Fermentationis; Acidum verò attrahendo Aquam aequè ac Terram efficit ut particulae dissolutae prompte misceantur cum aquâ eique innatent admodum salium. Et quem admodum Globus terrae per vim Gravitationis attrahendo aquam fortius quam Corpora leviora, efficit ut leviora ascendant in Aquâ, & fugiant de Terrâ. Sic particulae Salium attrahendo Aquam fugant se mutuo & ab invicem quam maxime recedendo, per Aquam totam expanduntur.

Particule Salis Alkali ex Terreis & Acidis similiter Unitis constant; sed haec Acida vi maxima Attractivâ pollent ut per ignem non separentur à Sale; utq; Metalla dissoluta praecipitant attrahendo ab ipsis particulas Acidas quibus dissolvebantur.

Si particulae Acidae in minori proportionem cum Terrestribus jungantur, haec tam arcte retinentur à Terrestribus, ut ab iis supprimi ac occultari videantur. Neq; enim sensum jam pungunt neq; attrahunt aquam, sed corpora dulcia & quae cum aquâ agre misceantur, hoc est pingua, componunt; ut fit in Mercurio dulci, Sulphure communi, Luna Cornea & Cupro quod Mercurius Sublimatus corrodit. Ab Acidi vero sic suppressi vi attractivâ fit ut pingua Corporibus prope Universis adhereant & flammam facile concipiant, si modo Acidum calefactum inveniat alia Corpora infumo accensorum quae fortius attrahat quam propria. Sed & Acidum in Sulphureis suppressum fortius attrahendo particulas aliorum corporum (scilicet Terreas) quam proprias, Fermentationem lentam & Naturalem ciet & fovet usq; ad Putrefactionem Compositi.

Quae Putrefactio sita est in eo quod Acida Fermentationem diu foventes tandem in interstitia minima & primae Compositionis partes interjacentia sese insinuant, intimèq; iis partibus Unitæ mixtionem Novam efficiunt non amovendam nec cum priore commutandam.

Cogitationes Variæ ejusdem.

Flamma est Fumus Candens; differtque à Fumo ut Ferrum rubens ab ignito sed non rubente. Calor est Agitatio Partium quaquaversum.

Nihil est absolutè quiescens secundum partes suas & ideo frigidum, præter atomos, vacui scilicet expertes.

Terra augetur, Aquâ in eam conversâ, & omnia in aquam (vi ignis) reduci possunt.

Nitrum ab ita distillatione magnam partem in Spiritum Acidum, relictâ terrâ, quia Acidum Nitri attrahit Phlegma; & idcirco simul ascendunt constituuntq; Spiritum: at nitrum Carbone accensum magnum partem ab ita in Sal Tartari, quia ignis eo modo applicatus partes Acidi & Terre in sese impingit fortiusq; unit.

Spiritus ardentes sunt Olea cum Phlegmate per Fermentationem Unitæ.

Tinctura Cochinellæ cum Spiritu Vini facta in aquæ magnam molem immissa, parva licet dosi, totam aquam inficit: Sc. quia particulae Cochinellæ magis attrahuntur ab aquâ quam à se mutuo.

Aqua non habet magnum vim dissolvendi quia paucò Acido gaudet. Acidum enim dicimus quod multum attrahit & attrahitur, videmus nempe ea quae in aquâ solvuntur lente & sine Effervescentiâ solvi, at ubi est attractio fortis & particulae menstrui undiq; attrahuntur à particula Metallī, vel potius particula metalli undiq; attrahitur à particulis menstrui, hæc illam abripiunt & circumfistunt, hoc est metallum corrodunt: Hæ eadem particulae sensorio applicatae ejus partes eodem modo divellunt doloremq; inferunt; à quo Acida appellantur, relictâ scilicet terrâ Subtili cui adherebant ob majorem attractionem ad liquidum linguae, &c.

INTRODUCTION.

In omni Solutione per Menstruum particulae solvendae magis attrahuntur a partibus Menstrui quam à se mutuo.

In omni Fermentatione est Acidum suppressum quod coagulat precipitando.

Oleum cum nimis magna mole phlegmatis intime mixtum, fit Salinum quiddam & sic Acetum constituit, hic etiam Tartari seu Terrae admixtae habenda est ratio.

Mercurius attrahitur id est corroditur ab Acidis & sicut pondere Obstructiones tollit ita vi attractrice Acida infringit.

Mercurius est Volatilis & facile elevatur calore quia ejus particulae ultimae Compositionis sunt parvae & facile separantur separataeque sese fugant; ut fit in particulis Vaporis, fluidorumque rarefactorum.

Aqua cum primi non potest quia ejus particulae jamjam se tangunt. Et si se tangerent particulae Aeris (nam Aer comprimi potest, quia ipsius particulae nondum se tangunt) Aer evaderet in Marmor. Seq. ex Prop. 23. Lib. 2. Princ. Philosoph.

Aurum particulas habet se mutuo trahentes; minimarum summae vocentur primae Compositionis, harum summarum summae secundae Compositionis, &c.

Potest Mercurius, potest Aqua Regia poros pervadere, qui particulas ultimae Compositionis interjacent at non alios.

Si posset menstruum alios illos pervadere vel si auri partes primae & secundae Compositionis possent separari fieret Aurum, vel Fluidum, vel saltem magis malleabile. Si Aurum fermentescere posset in aliud quodvis corpus posset transformari.

Visciditas est vel solum defectus fluiditatis, quae sita est in partium parvitate & separabilitate (intellige partes ultimae Compositionis) vel defectus lubricitatis seu levioris partes unius supra alias labi impediens. Hujus visciditatis Acidum saepe causa est; saepe Spiritus alius lubricus terrae junctus, ut oleum Terebinthinae capiti suo Mortuo redditum sit tenax.

Ratio cur Charta Oleo inuncta Transiitum Oleo non Aquae concedat est quia Aqua Oleo non miscetur sed fugatur ab eo.

Cum Acida partes, minores scilicet, aliquid dissolvunt, id faciunt, quia partem rei solvendae includunt undique; utpote Majorem quolibet Acidi partium.

Some Thoughts about the NATURE of ACIDS;

By Sir ISAAC NEWTON.

TH E Particles of Acids are of a Size grosser than those of Water, and therefore less volatile; but much smaller than those of Earth, and therefore much less fix'd than they. They are endued with a great Attractive Force; in which Force their Activity consists; and thereby also they affect and stimulate the Organ of Taste, and dissolve such Bodies as they can come at. They are of a middle Nature, between Water and Terrestrial Bodies, and attract the Particles of both.

By this attractive Force they get about the Particles of Bodies, whether they be of a metallick or stony Nature, and adhere to them most closely on all sides; so that they can scarce be separated from them by Distillation or Sublimation. When they are attracted and gather'd together about the Particles of Bodies, they raise, disjoin and shake them one from another; that is, they dissolve those Bodies.

By their attractive Force also, by which they rush towards the Particles of Bodies, they move the Fluid, and excite Heat; and they shake asunder some Particles, so much as to turn them into Air, and generate Bubbles: And this is the Reason of Dissolution, and all violent Fermentation; and in all Fermentation there is an Acid latent or suppress'd, which coagulates in Precipitation.

Acids also, by attracting Water as much as they do the Particles of Bodies, occasion that the dissolved Particles do readily mingle with Water, or swim or float in it, after the manner of Salts.

And as this Globe of Earth, by the Force of Gravity, attracting Water more strongly than it doth lighter Bodies, causes those lighter Bodies to ascend in the Water, and to go upwards from the Earth: So the Particles of Salts, by attracting the Water, do mutually avoid and recede from one another as far as they can, and so are diffused throughout the whole Water.

The Particles of *Sal Alkali*, do consist of *Earthy* and *Acid* united together, after the same manner: But these Acids have so great an Attractive Force, that they can't be separated from the Salt by Fire; they do also precipitate the Particles of Metals dissolv'd in *Menstrua*, by attracting from them the Acid Particles, which before had dissolved them, and kept them suspended in the *Menstruum*.

INTRODUCTION.

If these Acid Particles be join'd with Earthy ones, in but a small Quantity, they are so closely retain'd by them, as to be quite suppress'd and hidden as it were by them; so that they neither stimulate the Organ of Sense, nor attract Water, but compose Bodies which are not Acid, *i. e.* Fat and Fusible Bodies, such as are *Mercurius dulcis*, *Common Brimstone*, *Luna Cornea*, and *Copper* corroded by *Mercury Sublimate*.

From the Attractive Force in these Acid Particles thus suppress'd, arises that universal Property of almost all fat Bodies, that they adhere or stick to others, and are easily inflammable, if the heated Acid Particles meet with other Particles of Bodies in Fume, which the Acid attracts more strongly than it doth the Particles to which it is united. And thus the Acid that lies suppress'd in sulphureous Bodies, by more strongly attracting the Particles of other Bodies (Earthy ones for Instance) than its own, promotes a gentle Fermentation, produces and cherishes Natural Heat, and carries it on so far sometimes, as to the Putrefaction of the Compound: Which Putrefaction arises hence, That the Acid Particles which have a long while kept up the Fermentation, do at long run insinuate themselves into the least Interstices that lie between the Particles of the *first Composition*, and so intimately uniting with those very Particles, do produce a new Mixture or Compound, which cannot fall back again into the same Form.

Note, *The Paper hitherto describ'd, seems to have been a continued Discourse; but what follows are short Minutes of Thoughts relating to the same Subject.*

Nitre, in Distillation, leaving its Earthy Part behind, turns most of it into an Acid Spirit; because the Acid of the Nitre attracts the Phlegm, and therefore they ascend together, and constitute a Spirit. But Nitre, kindled with a Coal, turns chiefly into a Salt of Tartar; because the Fire applied this Way, drives the Acid and Earthy Parts towards, and makes them impinge on, and more strongly unite one with another.

The Reason why Water hath no great dissolving Force, is, because there is but a small Quantity of Acid in it: For whatever doth strongly attract, and is strongly attracted, may be called an Acid: And such things as are dissolved in Water, we see, become so, *easily*, without any Effervescence: but where the Attraction is strong, and the Particles of the Menstruum are every where attracted by those of the Metal, or rather, where the Particles of the Metal are every way attracted by those of the Menstruum; then the Particles of the Menstruum environ those of the Metal, tear them to pieces, and dissolve it.

So when these Acid Particles are applied to the Tongue, or to any excoriated Part of the Body, leaving the subtil Earth in which they were before, they rush into the Liquid of the Sensory, tear and disjoint its Parts, and cause a painful Sensation.

Mercury is attracted, and therefore corroded by Acids; and as it opens Obstructions by its great Weight, so it breaks and obtunds the Power of Acids (in the Body) by its attractive Force.

All Bodies have Particles which do mutually attract one another: the Sums of the least of which may be called Particles of the *first Composition*; and the Collections or Aggregates arising from the Primary Sums, or the Sums of these Sums, may be called Particles of the *second Composition*, &c.

Mercury and *Aqua Regis* can pervade those Pores of Gold or Tin, which lye between the Particles of its *last Composition*; but they can't get any further into it; for if any Menstruum could do that, or if the Particles of the first, or perhaps of the second Composition of Gold could be separated; that Metal might be made to become a Fluid, or at least more soft. And if Gold could be brought once to ferment and putrify, it might be turn'd into any other Body whatsoever.

And so of Tin, or any other Bodies; as common Nourishment is turn'd into the Bodies of Animals and Vegetables.

N. B. *The small Difference which there is between this Translation and the Latin above, was its being taken from another Copy a little different from this Latin Paper. And having been supervised and approved by the Illustrious Author, I have not alter'd it since.*

LEXICON TECHNICUM:

OR, AN

UNIVERSAL ENGLISH DICTIONARY

OF

Arts and Sciences.

VOL. II.

A B A

ABACUS. Besides the former Account of the *Abacus*, I find that *Mauclerc*, in the Ionick Order, designs what the Workmen call an O. G. with a Fillet over it for the *Abacus*: Which Fillet is half the Breadth of the O. G. and he calls it the *Fillet of the Abacus*. In the *Corinthian* Order, he describes the *Abacus* as a seventh Part of the whole Capital. *Palladio* calls the *Plinth* about the *Boutin* (or *Eckinus*) the *Abacus*: Which from its Form, saith he, is commonly called *Dado*, or the Dye; and this is $\frac{1}{7}$ of the whole height of the Capital.

Scamozzi calls a certain Hollow or Casement, which is the Capital of the Pedestal of the *Tuscan* Order, by this Name *Abacus*.

ABASE, in the Sea Language, is to *Lower* or *Take in*. To *Abase the Flag*, is to take in the Flag.

ABBACY, is the Government of a Religious House, with the Revenues and Persons subject to an *Abbat*.

ABBAT, is a Spiritual Lord, having the Rule of Religious Houses according to our Common Law. Some *Abbats* in *England* were called *Mitred Abbats*; and such were exempted from the Jurisdiction of the Diocesan, having Episcopal Authority themselves within their Limits, and were also Lords of Parliament. These were sometimes call'd *Abbats Sovereign*, and *Abbats General*. The other *Abbats* were subject to the Diocesan in all Spiritual Government. There were also *Lords Priors*, which had exempt Jurisdiction, and were Lords of Parliament. Of these *Lords Abbats* and *Priors*, *Sir Edw. Coke* saith there were 29 that sat in Par-

liament, 27 *Abbats* and 2 *Priors*. But sometimes their Number was varied, there being but 25 *Abbats* and 2 *Priors* in a Parliament held in the 20 *Rich. 2*.

ABREUVOIRS, are the Intervals or Spaces between the Stones, or the Joints where the Mortar lies in any Pillar, Wall, or Building.

ACCORD, according to the Modern (*French*) Account of Musick, is the Production, Mixture and Relation of two Sounds; of which the one is *Grave*, and the other *Acute*. They make two Kinds of *Accord*; those which are pleasant and agreeable, and which they call *Consonances*; and such as are harsh and unpleasant, which are call'd *Dissonances*. Which see in Vol. I.

ACERIDES, is a Plaister made without Wax, such as that call'd *Emplastrum Norimbergense*.

ACTION *Civil*, is that which tends only to the Recovery of what is due to any one by Contract, &c. as if a Man seek by Action to recover a Sum of Money formerly lent.

ACTION *Penal*, is that which aims at some Penalty or Punishment in the Party sued, whether Corporal or Pecuniary; as in the *Action Legis Acquilie* in the Civil Law, and in the Common Law in Case of Appeals for Murder.

ACTION *Prejudicial* or *Preparatory*, is that which grows from some Doubt in the *Principal*; as suppose a Man sue a younger Brother for Land descended from his Father, and 'tis objected that he is a Bastard, the Bastard must be first tried; that is call'd *Actio Prejudicialis*, because it must be first judg'd or determin'd.

ACTION

ACTION *Amceftrel*, is in opposition to Personal, being that which a Man hath by some Right descending from his Ancestors: This is either *Droit-turel* or *Poffeffory*: See *Co. 2 Inftit. f. 291.*

ACTOR, is sometimes used for a Proctor or Advocate in Civil Courts or Causes. *Actor dominicus* was also the Term formerly for the Lord's Bailey or Attorney. *Actor Ecclesia* was sometimes the Foreign Term for the Advocate or Pleading Patron of a Church. *Actor Villa* was the Steward or Head Bailey of a Town or Village.

ADDICTIO in Diem, in the Civil Law, is an Agreement between Buyer and Seller, that the Seller may Contract with any other Person who will offer a better Price, before a certain Day.

ADDITION, is the Term in our Common Law for the Title which is given to any Person besides his Christian and Surname, in order to distinguish him by his Degree, Estate, Mystery, Trade, Place of Abode, &c.

And 'tis particularly prov'd by the *Stat. 1 H. 5. c. 5.* that in Suit of Action where Process of Ut-lars lies, such Additions shall be given to the Name of the Defendant; and that *Writs* not having such Additions shall *Abate*, if the Defendant take Exceptions thereunto.

ADVANCE Fosse, is a Ditch of Water round the *Esplanade* or *Glacis* of a Place, to prevent its being surpris'd by the Besiegers: But of late this Work hath been disus'd, because as soon as the Enemy could drain it, it was a Trench ready made for the Advantage of the Besiegers.

ADVOCATIONE Decimarum, is a Writ that lies for the Claim of a fourth Part, or upward, of the Tithes belonging to any Church.

ADVOWEE or **AVOWEE**, in *Latin Advocatus*, was formerly us'd for him that had Right of Presentation to a Benefice; and the *Avowee Paramount* was the highest Patron, or the King. By the Statute of Provisors, 25 E. 3.

ADVOWSON of a Religious House; as the Builders and Endowers of a Church were the Patrons of it, so those that Founded any Religious House, had the *Advowson* or *Patronage* of it. Sometimes the Patron had the sole Nomination of the *Prelate*, *Abbot* or *Prior*, either by Investiture (or Delivery of a Pastoral Staff) or by direct Presentation to the Diocesan. And if a free Election was left to the Religious, yet a *Conge d'eslire*, or License of Election, was first to be obtain'd of the Patron; and the Person Elected was confirm'd by him. If the Founder's Family was extinct, the Patronage of the Convent went to the Lord of the Mannor.

ADZ, is an Instrument whose Blade is made thin and something bending, and hath not its Edge parallel to its Handle, as the Axe and Hatchet hath, but placed athwart to it. It is ground to a Basil on the Inside to its outer Edge. Its general Use is to take off thin Chips of Timber or Boards, and such Irregularities as the Axe can't come at, and where a Plane, tho' *rank Set*, will not make rid-dance enough. 'Tis much us'd in taking off the Irregularities of Floors when they are pinned and framed together; and sometimes on Posts framed upright, and ranged in with other Work framed to them, where the Edge of the Axe can't come.

ESTUARY, is an Arm of the Sea running up a good way into the Land, like the *Bristol Channel*, &c.

AGE, in the Common Law, is that particular Time which enables a Person to do that, which

before he could not do for want of Age: Thus at 14 Years a Man is said to be at the *Age of Discretion*; and at 21, at full Age. At 12 Years of Age a Man may take the Oath of Allegiance at a Leet; at 14 he may consent to marry, and in *Socage* chuse his Guardian; at 15 he is of Age for the Lord to have *Aid pur fuir fitz Chivalier*, and may be sworn to keep the King's Peace; at 12 he is bound to Appearance before the Sheriffs and Coroner for Enquiry after Robberies.

A Woman might heretofore at 7 Years of Age, her Father being the Lord, distrain his Tenants for *Aid pur fill Marier*, and at those Years consent to marry, saith *Bracton*. At 9 Years she is dowable; for then, or within half a Year after (*Fleta, lin. 5. c. 22. Lit. Lib. 1. c. 5.*) she is able *promereri dotem & virum sustinere*: But this *Bracton* limits to 2 Years. At 12 she is able to ratify and confirm a former Consent given to Matrimony; at 14 she is able to receive her Lands into her own Hands, and shall be out of Ward, if she be at that Age at her Ancestor's Death; at 16 she shall be out of Ward, tho' she was under 14 at the Death of her Ancestor; at 21 she is able to alienate her Lands and Tenements.

AGOGICE, is the Art of making Images or Figures in Metals, when Wax is us'd to effect or further the Design.

AIDE, in the Law, hath several Significations; sometimes 'tis the same with *Subsidy*; sometimes a Protestation due from Tenants to their Lords. This Word is also us'd in matter of Pleading for a Petition made in Court, for the calling in of the Help from another that hath an Interest in the Cause in Question. Thus a Tenant for Term of Life, by Courtesy, Tenant in Tail after Possibility of Issue extinct, for Term of Years, at Will, by Elegit or by Statute Merchant, being impleaded touching her Estate, may pray in *Aid* of him in the Reversion; that is, desire the Court that he may be called in by Writ, to alledge what he thinks good for the Maintenance both of her Right and his own; but this Course hath been disus'd. If a King's Tenant holding in Chief be demanded a Rent of a common Person, he may pray in *Aid of the King*; and so may a City or Burgh, having a Fee-Farm of the Crown, when any thing is demanded against them belonging thereunto.

AIR, the admirable Sir *Isaac Newton*, in the Observations mention'd in the 2d Book of his *Opticks*, by considering the Colour'd Rings made by Compressing two Prisms, or two Object Glasses of large Telescopes together, comes to a Calculation of the Thickness of the Air contain'd between the Prisms and Object Glasses in such a State of Compression; and at last he seems (he saith) to gather this Rule, That the Thickness of the Air is proportionable to the *Secant* of an Angle, whose *Sine* is a certain mean Proportional between the Sines of Incidence and Refraction. And that mean Proportional, so far as by the Measure he took could be determin'd, he found was the first of 106 Arithmetical Mean Proportionals between those Sines accounted from the greater of the Sines (*i. e.*) from the Sine of Refraction, when the Refraction is made out of the Glass into the Plate of Air; or from the Sine of Incidence, when the Refraction is made out of the Plate of Air into Glass. And in Observation 14. Page 18. He saith that the *Thickness* of the Air between the Glasses there, where the Rings are successively made by the Limits of the 7 Colours, Red, Orange, Yellow, Green, Blue, Indico and Violet, in order; are to one another as the Cube Roots of

the Squares of the eight Lengths of a Musical Chord which Sound the Notes in an Eighth, *Sol, la, fa, Sol, la, mi, fa, Sol*: That is as the Cube Roots of the Squares of the Numbers $1, \frac{8}{27}, \frac{5}{27}, \frac{3}{27}, \frac{2}{27}, \frac{1}{27}, \frac{2}{27}, \frac{1}{27}$.

And according to his most accurate Observations, the Thickness of the thinned Air, which between two Glasses exhibited the most Luminous Parts of the first six Rings of Colours, were $\frac{1}{178000}, \frac{1}{178000}, \frac{1}{178000}, \frac{1}{178000}, \frac{1}{178000}, \frac{1}{178000}$ Parts of an Inch.

'Tis highly probable that True and Permanent Air is made by Fermentation, (saith the same Author) and Rarefaction of Bodies that are of a very fix'd Nature: Those Particles flying and avoiding one another with the greatest Force at a Distance, which when very near, attract and adhere to one another with the greatest Violence.

The Particles therefore of true and permanent Air, being Extracted from the Densest and most fix'd Bodies, will be Denser and Crasser than those of Vapour; and from hence it is likely, may be Heavier also than those, and that the Parts of a Humid Atmosphere may be Lighter than those of a dry one, as in Fact it appears to be; by the rising of the Mercury in dry Weather, and by Clouds and Vapours rising into and floating in our Atmospheric Air. And he very justly thinks that the Rarefaction and Condensation of the Air cannot be accounted for from the Spring or Elastic Forms of the Particles, without a Supposition that they are endued with some Centrifugal Force or Power, by which they Fly and avoid one another, and the Dense Bodies from whence they are Extracted. See Attraction.

And that this Repelling Force, which is the Cause of Filtration and of the Ascent of Water in small Capillary Tubes to much greater Heights than the Surface of the Water in the open Vessel, in which they are placed. The Air within the Tubes being much rarer than in more open Spaces, and by that means not pressing so much on the Surface of the Water within the Tubes as without. And this Account Dr. Hook had hinted at long ago. Sir Is. did in his admirable *Prin. Philo. Mathem. Prop. 23. P. 301.* long ago demonstrate, That Particles endeavouring to recede from or avoid one another with Forces reciprocally proportional to the Distance between their Centers, will compose an Elastic Fluid whose Density shall be proportionable to its Compression, and from such a Property all the Appearances of our Air may be very well accounted for. And I think much better than from the Supposition of its Particles being Spikes contorted into Spheres, through whose Interstices the Rays of Light may freely pass, &c. tho' this be very ingenious: But I think can never solve the prodigious Rarefaction of this most useful Fluid.

AIRS Resistance: See Resistance.

AIRS Weight, in Proportion to the same Bulk of Water, seems pretty nicely determin'd by an Experiment lately made before the Royal Society by the ingenious Mr. Hauksbee (See *Phil Trans. N. 305.*) to be nearly 885 to 1.

ALARM Post, is the Ground appointed to each Regiment by the Quarter-Master-General, for them to march to in Case of an Alarm; in a Garrison 'tis the Place where every Regiment is order'd to draw up in on all Occasions.

ALBULA. This Word is used sometimes for a Spot in the Eye, and then seems to be the same with *Albugo*: But in the Plural *Albula*, signifies

such very astringent Mineral Waters as have a great deal of Allum in them, and are chiefly used externally for Cleansing and Healing of Wounds and Ulcers.

ALCOLA, is sometimes used for *Aptba*, and sometimes signifies a Tartarous Sediment in Urine, and from hence Urine is sometimes call'd *Alcolita*.

ALGEBRA, besides the Authors mention'd in the Account of this Science under this Word in Vol. I. those that please to have a thorough insight into this wonderful and useful Art, may consult the following Authors,

ALGEBRAIC-Curve, in Geometry, is of such a Nature, that its *Abscissa* or intercepted *Diameters* bear always the same Proportion to their Respective *Ordinates*. Thus if the Product of any *Abscissa* multiplied into one and the same determinate Quantity be always equal to the Square of its corresponding Ordinate; then if that determinate Quantity be call'd *p*, the *Abscissa* *x* and the Ordinate *y*; the Expression of the Nature of the Curve by way of Equation will be $px = yy$, where *p* is the *Parameter* or *Latus Rectum* of the Figure; and the Curve is the common Apollonian Parabola; and because the two indeterminate or flowing Quantities *x* and *y*, do here denote *strait Lines*; therefore the Curve is call'd an *Algebraick* or *Geometrick Curve*. And 'tis plain that the Number of such Curves must be infinite; because there may be an Infinity of Proportions or Relations between the *Ordinates* and the *Abscissa*.

But when the Nature of any *Curve* is expressed by an Equation, wherein one of the indeterminate or flowing Quantities represents a *Curve Line*; then that Curve is call'd a *Transcendental Curve*, and if the Curve which enters the Equation be *Geometrical*, or a Curve, as they call it, of the first *Kind* or *Degree*; then the transcendent Curve is call'd a *Curve of the second Kind or Degree*: And when the Curve which enters the Equation represents a Curve of the second Kind or Degree; then the *Transcendental Curve* is call'd one of the *Third Kind*; and so on infinitely.

ALLUM-Works, *Allum* is made of a Stone of Sea-weed and Urine. The Stone is found in most of the Hills between *Scarborough* and the River of *Tees* in the County of *York*, and also near *Preston* in *Lancashire*; 'tis of a blueish Colour, and will cleave like *Cornish Slate*. The Mine which lies deep in the Earth and is pretty well moistned with Springs is the best. The dry Mine is not good, and too much Moisture cankers and corrupts the Stone, making it nitrous. In this Mine are found several Veins of Stone call'd *Doggers*, of the same Colour but not so good. Here are found those also which are commonly call'd *Snake-Stones*. For the more convenient working of the Mine which sometimes lies 20 Yards under the Surface or Cap of the Earth (which must be taken off and barrow'd away) they begin their Work on the Declivity of a Hill, where they may be also well furnish'd with Water. They dig down the Mine by Stages, to save Carriage, and so throw it down near the Places where they calcine it. The Mine before it is calcin'd, being expos'd to the Air will moulder into Pieces, and yield a Liquor whereof *Copperas* may be made: But being calcin'd it's fit for *Allum*; as long as it continues in the Earth, or in Water, it remains an hard Stone. Sometimes a Liquor will issue out of the Side of the Mine, which by the Sun's Heat is turn'd into natural *Allum*. The Mine is calcin'd with Cinders of *New-Castle Coal*, Woods and Furzes; the Fire made about two Foot and $\frac{1}{2}$ thick, two Yards broad, and ten Yards long. Betwixt every Fire are Stops made with wet rubbish; so that any one or more of them may be kindled, without Prejudice to the rest. After, there are 8 or 10 Yards Thickness of broken Mine laid on this Fuel, and 5 or 6 of them so covered; then they begin to kindle the Fires, and as the Fires rise towards the Top, they still lay on fresh Mine: So that to what Height you can raise the Heap, which is oftentimes about 20 Yards, the Fire without any farther Help of Fuel, will burn to the Top stronger than at the first kindling, so long as any Sulphur remains in the Stones.

In calcining these Stones, the Wind many times does hurt, by forcing the Fire too quickly through the Mine, leaving it black and half burnt; and in others, burning the Mine too much, leaving it red. But where the Fire passes softly and of its own Accord, it leaves the Mine whole, which yields the best and greatest Quantity of Liquor.

The Mine thus calcin'd is put into Pits of Water supported with Frames of Wood, and ramm'd on all Sides with Clay; They are about ten Yards long, 5 broad, and 5 deep, and set with a Current that turneth the Liquor into a Receptory, from whence 'tis pumpt into another Pit or Mine. So that every Pit of Liquor, before it comes to boiling, is pumpt into four several Pits of Mine; and every Pit of Mine is steeped in four several

Liquors before it be thrown away, and the last Pit being always of the fresh Mine.

This Mine thus steeped in each of the several Liquors 24 Hours, or thereabouts, is of course four Days in passing the four several Pits from whence the Liquors pass to the boiling-House.

The Water, or Virgin Liquor often gains in the first Pit, two Pounds Weight; in the second it increaseth to five Pounds, in the third to eight Pounds, and in the last Pit which is always fresh Mine to twelve Pounds; and so in Proportion according to the Goodness of the Mine, and its being well calcin'd. For sometimes the Liquors passing the four several Pits, will not be increas'd to above six or seven Pounds Weight, and at other times above twelve Pounds; seldom holding a constant Weight one Week together: Yet many times Liquor of seven or eight Pounds Weight produces more *Allum* than that of ten or twelve Pounds Weight, either through the Badness of the Mine, or its being ill calcin'd, which is the usual Reason.

And if by passing the weak Liquor thro' another Pit of fresh Mine, you bring it to be ten or twelve Pounds Weight, yet you shall make less *Allum* with it, than when it was but eight Pounds Weight. For what it gains from the last Pit of Mine will be most *Nitre* and *Slam*, which poisons the good Liquors, and disorders the whole House, till the *Slam* be wrought off.

That which they call *Slam*, is first perceived by the Redness of the Liquor when it comes from the Pit, occasion'd either by the Badness of the Mine, or more usually its being over or under calcin'd, which in the *Settler* sinks to the Bottom, and there becomes a muddy Substance, and of a dark Colour. That Liquor which comes whitest from the Pits is the best.

When a Work is first begun, they make *Allum* of the Liquor only that comes from the Pits of Mine, without any other Ingredients. and so might continue, but that it would spend so much Liquor as not to quit Cost.

Kelp is made of a Sea-weed call'd *Tangle*, such as comes to *London* in Oyster Barrels. It grows on Rocks by the Sea-side, between high and low Water Mark. Being dry'd it will burn and run like Pitch; when cold and hard, 'tis beaten to Ashes, steeped in Water, and the Lees drawn off to two Pound Weight or thereabouts.

Because the Country People who furnish the Work with Urine, do sometimes mingle it with Sea-Water, which cannot be discover'd by Weight, they try it, by putting some of it to the boiling Liquor; For then if the Urine be Genuine it will work like Yeast put to Beer or Ale; but if mingled, it will stir no more than so much Water.

They observe that the best Urine for that Purpose, is such as comes from poor labouring People who drink but little strong Drink.

The boiling Pans are made of Lead, nine Feet long, five broad, and two $\frac{1}{2}$ deep, set upon Iron Plates about two Inches thick; which Pans are commonly new Cast, and the Plates repair'd five times in two Years.

When the Work is begun, and *Allum* once made, then they save the Liquor which comes from the *Allum*, or wherein it shoots, which they call the *Mothers*, with this they fill $\frac{2}{3}$ of the Boilers, and put in $\frac{1}{3}$ of the fresh Liquor which comes from the Pits. Being thus fill'd up with cold Liquor, the Fires having been never drawn out, it will boil again

again in less than two Hours time. And in every two Hours time the Liquor will waste four Inches, and the Boilers are fill'd up again with Green Liquor.

The Liquor if good, in the boiling, will be greasy, as it were, at the Top: If Nitrous, it will be thick, muddy and red. In boiling 24 Hours it will be 36 Pound Weight. Then is put into the Boiler about an Hoghead of the Lees of *Kelp*, of about two Penny Weight, which will reduce the whole Boiler to about 27 Pound Weight.

If the Liquor be good, as soon as the *Kelp Lees* are put into the Boiler, they will work like Yeast put to Beer. But if it be Nitrous, the *Kelp Lees* will stir it but very little; and in that Case the Workmen must put in more and stronger Lees.

Presently after the *Kelp Lees* are put into the Boiler, all the Liquor together is drawn into a *Settler*, as big as the Boiler and made of Lead, in which it stands about two Hours, and in that time most of the Nitre and *Slam* sink to the bottom.

This Separation is made by the help of the *Kelp Lees*, for when the whole Boiler consists of Green Liquor drawn from the Pits, it is of power strong enough to cast off the *Slam* and the Nitre; but when the *Mothers* are us'd, the *Kelp Lees* are needful to make the said Separation.

Next the said Liquor is scooped out of the *Settler* into a *Cooler*, made of Deal Boards, and ramm'd with Clay. Into this is put 20 Gallons, or more of the Urine, according to the Goodness or Badness of the Liquor, for when the Liquor is Red and Nitrous, the more Urine is requir'd.

In the Cooler, the Liquor in temperate Weather stands four Days; the second Day the *Allum* begins to strike, gather and harden about the Sides, and at the bottom of the Cooler.

If the Liquor should stand above four Days, then it would turn to Copperas.

The Use of the Urine is as well to cast off the *Slam*, as to keep the *Kelp Lees* from hardning the *Allum* too much.

In hot Weather the Liquor will be a Day longer in cooling, and the *Allum* in gathering, than in temperate Weather. But in Frost, the *Allum* shoots or strikes too soon, not giving time for the Nitre and *Slam* to sink to the bottom, whereby they are mingl'd with the *Allum*. This produces double the Quantity, but being foul 'tis consumed in washing.

When the Liquor hath stood four Day in the Cooler, than that call'd *Mother*, is scooped into a Cistern, the *Allum* remaining on the Sides and Bottom; and from thence the *Mothers* are Pumpt back into the Boilers again: So that every five Days the Liquor is boild again, until it evaporate or turn into *Allum* or *Slam*.

The *Allum* taken from the Sides and Bottom of the Cooler, is put into a Cistern and washed with Water, that they use for the same Purpose; being about 12 Pound Weight, after which it is *Roached* as follows.

Being washed, it is put into another Pan with a Quantity of Water, where it Melts and Boils a little; then 'tis scooped into a great Cask, where it commonly stays 10 Days, and is then fit to take down for the Market.

The Liquors are weigh'd by Troy Weight; so that half a Pint of Liquor must weigh more than so much Water, by so many Penny Weight. *From Phil. Transf. N. 142.*

Vol. II.

ALMAN *Furnace* or *Almond*, as some write it is a Furnace us'd by *Refiners*, and by them call'd the *Sweep*: By it all sorts of Metals are separated from Cinders, parts of melting Pots, Tests, Bricks and all other harder Bodies; which must first be beaten to Powder, before they are put into the Furnace.

This Furnace is about six Foot High, four Wide and two Thick, made of Brick, having a hole in the midst at the top, eight Inches over, and growing narrow towards the Bottom, whereon the forepart ends in a small hole environed with a Semicircle of Iron, to keep the melted Metal; about the middle of the Back there is another hole to receive the Nose of a great pair of Bellows.

When the Furnace is *Annealed* with Charcoal and hot, they throw two or three Shovels of Coal to one of the forementjon'd powder'd Stuff, and so proceed during the whole Work, which continues without Intermission three Days and Nights.

After eight or ten Hours the Metal begins to run; and when the Receiver below is pretty full, they lade it out with an Iron Ladle, and cast it into *Sows*, in Hollows, or *Forms* made with *Asbes*.

ALMONER, is an Officer in a King's or Prince's House, whose Business is to distribute Alms to the Poor; he hath Forfeiture of all *Deodands* and the Goods of *Felons de se*, which he is to dispose of to the Poor. *Terms de Lay* 39.

ALNAGER, *Aulnager*; properly one that measureth Cloth by the Ell, the doing of which is *Alnage*. He is a publick sworn Officer of the King, who either by himself or his Deputy, looks to the Assize of Woollen Cloth throughout the Kingdom, and to the Seals for that purpose ordain'd. Now there are three Officers belonging to this Affair, the *Searcher*, the *Measurer*, and the *Alnager*; which last is now become the Collector of the Subsidy granted to the Crown by several Statutes.

ALOOF, is a Sea Term, signifying as much as *keep your Luff*; being a Word of Command from him that *Comms*, to the Man at the Helm to keep the Ship near the Wind, when she Sails upon a Quarter Wind.

ALOPEX, is by some Writers, a Term us'd for the Muscle *Psoas*.

ALTITUDE of the Eye in Perspective; See Height. *Vol. II.*

ALTITUDE

C

ALTITUDE of the Sun. *To find it readily at any time without a Quadrant or such like Instrument.*

On any plain Place erect a Pin or Wire perpendicularly as in the point C: From which point, you had before with 60 of a Line of Chords, described the Quadrantal Arch *AF*, make *CE* equal to the Height of the Pin or Wire, and through *E*

draw *ED* parallel to *CA*, and make it equal to *CG* the Length of the Shadow. Then will a Ruler laid from *C* to *D*, intersect the Quadrant in *B*, and *BA* is the Arch of the Sun's Altitude, when measur'd on the Line of Chords.

ALVUS, is the lower Belly; but in a medical Sense is sometimes us'd rather for the State and Condition of the Intestines and their Contents. If the Patient be too *Laxative*, they call it *Alvus Liquida* or *Fluida*; if he be too *Costive*, *Alvus dura*; and when he is so in a very great Degree, *Alvus adstricta*.

AMABYR, or *Amvabyr*, was the old Custom of the *Pretium virginitatis Domino Solvendum*. *Henry Fasted Arundel*, by Deed dated 31 Aug. 3, 4. of *Phil.* and *Mar.* releas'd this Custom to his Tenants by the Name of the Custom of *Amabyr* and *Cherage*.

AMAASA, are such Pieces of Glass as are us'd in Enammelling, and are sometimes call'd *Encausta*; by some *Smalta* and *Terre Saracenicæ*. *Bruno*.

AMARACINON, is a very precious Ointment prepared with rich Oyls and highly Aromatick Spices.

AMBIGENAL Hyperbola, is an Hyperbola which hath one of its infinite Legs inscrib'd in it, and the other circumscrib'd about it.

AMERCEMENT. *Dr Kennet*, in the Glossary at the End of his *Parochial Antiquities*, shews that *Amerciamētum* is a pecuniary Punishment impos'd upon Offenders *a la mercie*, at the Mercy of the Court; and therefore in our Law is frequently call'd *Miseri cordia*, and there is this stated Difference between *Fines* and *Amercementes*; *Fines* are Punishments certain and determin'd by some Statute; but *Amercements* are Arbitrary Impositions proportion'd to the Fault, at the Discretion of the Court.

AMETHYSTA, are such Medicines as will preserve Men from being soon inebriated with Wine or strong Liquor. *Bruno*.

AMMONION, is by some Writers us'd for *Collyrium*. Which see.

AMPHORA, was anciently a Measure of Capacity, sometimes call'd *αμβαμωρ*, and was of 2 Sorts; the *Italian Amphora*, which *Galen* saith, held 72 Pound of Water: The *Attick Amphora*, which was larger, and was call'd *μωρεῖον*. See *Weights and Measures*.

ANALEMMA, when all the whole Furniture of this kind of Projection is drawn on a large Plate of Brass or Wood; with an *Horizon* and *Cursor* fitted to it; then that Instrument is call'd an *Analemma*; and is indeed a very useful one. For by it may readily and universally be found, such things as these:

I. *Having the Pole's Height and Day of the Month; to find the time of the Sun's Rising and Setting, and consequently the Length of Day and Night anywhere.*

Count the Latitude from the polar Point where all the Elliptical Meridians meet either *N* or *S*, as suppose 49 deg. and bring the Fiducial Edge of the Horizon to that degree of Latitude in the Limb, and mark where the Horizon cuts the Parallel for that Day; as suppose *April 20.* or when the Sun enters into $\varnothing$. Observe also which of the Hour Circles that point of Intersection is nearest to; and that will give you the Time of the Sun's Rising, in this Case about five or a little after; and therefore it will Set as much before 7. The time of its Setting being doubled gives the Length of the Day; and that of its Rising doubled, gives the Length of the Night.

II. *To find the Length of the longest Day in any Latitude.*

Bring the moveable Horizon to the Pole's Height in the Limb as before; and then mark the Point where it cuts the Parallels of $\varnothing$ or ϖ ; (according as your Latitude is *North* or *South*) and then observe which of the Hour Circles is nearest to that Point of Intersection as before.

III. *Having the Latitude, Sun's Place, and Altitude, to find the Hour of the Day.*

Bring the Horizon to the Latitude, suppose as before 49 deg. *N.* and the Sun's Place being $\varnothing$ of $\varnothing$ and his Altitude observ'd by a Quadrant or otherwise 18 deg. Then since the Degrees of the Cursor denote the several Parallels of Altitude, move the Cursor till 18 deg. on it, will just cut the Parallel of $\varnothing$ of $\varnothing$ or *April 20.* for then that Hour Circle, which (as before) is next the Point of Intersection, will shew the time of the Day, which in this Instance will be either seven in the Morning or five in the Afternoon. And this will give the Hour very well, except between 11 and 12, and 12 and 1, where the Hour Circles run a little too close to shew it exactly.

How to find the Sun's *Declination*, *Right Ascension*, *Altitude*, *Azimuth* and *Hour*, &c. by a ready and easy Projection of part of the *Analemma*; you will find under these Words.

ANALYSIS of Infinites. See *Fluxions* and *Geometry*.

ANCESTOR. The Law distinguishes between *Ancestor* and *Predecessor*, the former being applied to a Natural Person; as *AB* and his *Ancestor*; the

the latter to a Body Politick or Corporate; as a Bishop and his Predecessors.

Tho' the Word *Antecessor*, whence *Ancestor* is deriv'd, is not applied to the *Ancestor* of a Family, but to the Predecessor of an Estate, or a Predecessor in Office. *Ancestrel* Homage, is such Homage as hath been perform'd by our *Ancestors*.

ANCHORS, in *Architecture*, is a certain Kind of Carving, in the Form of an Anchor or Arrow Head, which is placed by way of Ornament to the *Boultins* of Capitals of the *Tuscan*, *Dorick* and *Ionick Orders*; and also to the *Boultins* of Bed Mouldings, of the *Dorick*, *Ionick* and *Corinthian* Cornishes. The Anchors and Eggs being placed alternately.

ANCIENT *Demesne* or *Demayn*, is a certain Tenure whereby all Manors belonging to the Crown in *St. Edward's* or *William the Conqueror's* Time were held. The Numbers and Names, &c. of such Manors were entred by the *Conqueror*, in a Book call'd *Doomsday Book*, and now remaining in the *Exchequer*; so that such Lands as by that Book appear'd to have belong'd to the Crown at that Time, are call'd *Ancient Demesne*. The Tenants in *Ancient Demesne* are of two Sorts; one that hold their Lands frankly by Charter, the other by Copy of Court-Roll, or by the Verge at the Will of the Lord, according to the Custom of the Manor. The Advantages of this Tenure are, 1. That Tenants holding by Charter cannot be rightfully impleaded out of their Manor; and when they are, they may *abate* the Writ by pleading the Tenure. 2. They are free from Toll for all things relating to their Livelihood and Husbandry: Nor can they be impannell'd upon any Inquest.

ANCONY, is the Term in the Iron Works for a *Bloom*, wrought into the Figure of a flat Iron Bar of about three Foot long, with two square rough Knobs, one at each End, which are afterwards to be wrought at the *Chafery*. See *Iron*.

ANGARIA, was formerly the Word for any troublesome or vexatious Duty or Service paid by the Tenant to the Lord.

ANGEL, the Name of a Gold Coin in *England*, which seems to be so call'd from the Figure of an Angel impress'd upon it: Its Value in 1 *H.* 6. was 6 *s.* 8 *d.* in 1 *H.* 8. 7 *s.* 6 *d.* in 34 *H.* 8. 8 *s.* in 6 *Ed.* 6. 10 *s.* and the half Angel, or as it was sometimes call'd the *Angelet*, was the Moiety of this. *Chron. Precios.*

ANGLE of *Inclination* of the Plane of a Planet's or Comet's Orbit to that of the *Ecliptick*, is the Angle made by the Interfection of the Planes of those two Orbits. For the Orbits of the Planets are by no means all in the same Plane, but diversely inclined to one another and to the Orbit of the Earth; which is taken for the Standard, and is call'd the Plane of the *Ecliptick*, in the *N. Astronomy*. And to this Plane the Planes of the Primary Planets Orbits are thus inclin'd. The Angle of *Saturn's* Orbit with the Earth's Orbit is 2°. 30'. that of *Jupiter* is 1°. 20'. that of *Mars* a little less than 2 Degrees; that of *Venus* a little more than 3°. 20'. and that of *Mercury* almost 7°. 00'.

ANGUINEAL *Hyperbola*, is one of an Eel-like Figure, which cuts its *Asymptote* with contrary Flexions, and is produced both ways with contrary Legs. See *Curves*.

ANGULAR *Motion*, in *Astronomy*, is the Increase of the Distance between any two Planets, &c. revolving round any Body as the Centre of

their Motion; and is express'd by two Right Lines drawn from the said Centre to the Revolving Bodies, which will open wider, and consequently grow greater, as the Revolving Bodies part farther and farther from one another.

ANIMAL *Secretion*, is that Action in an Animal Body, whereby, by means of the Glands, all proper Separations of Particles proper to be discerned or separated from the Blood are made, throughout its whole Course of Circulation. How these *Secretions* are every where made in the Body, 'tis of very great Use to understand; and some of our Modern Physicians, who have apply'd themselves to consider the wonderful Machine of a Human Body Geometrically and Mechanically, have made great Advances this way; such as *Borelli*, *Bellini*, *Baglivi*, *Pitcairne*, *Cheyne*, *Wainwright*, &c. from whom you have the following Account of this important Affair.

The Nature of *Secretions* in general depends upon these three Things. (1.) *The different Diameter of the Orifice of the Secretory Duct*; for thereby all Particles, whose Diameters are greater than those of the Ducts, must be excluded; and it may be concluded, that any Peccant or Morbifick Matter may be evacuated therefore by any of the Glands, provided that their Orifices be but sufficiently enlarg'd, together with the Diameters of the Secretory Ducts.

(2.) *The different Angle which the Secretory Duct makes with the Trunk of the Artery*. For all Fluids press the Sides of the containing Vessels in a Direction perpendicular to its Sides; and this is evident in the Pulsation of the Arteries, since 'tis to that *Pressure* that this Pulsation is owing. It is likewise evident, that the Blood is urg'd forward by the Force of the Heart; so that this *Motion of Secretion* must be compounded of both these Motions. Now this *Lateral Pressure* is greater when the Velocity of the *Longitudinal Motion* is so too; but yet 'tis not in the Proportion of this Velocity. For the *Lateral Pressure* is considerable, even when the Fluid is at rest; being then in Proportion to the Specifick Gravity of the Fluid. And in a Fluid, like the Blood in the Arteries, which is urg'd by a Longitudinal Direction, this *Lateral Pressure* is in a Compound Proportion of both: From whence it will follow, that if two Particles of equal Diameters, but of unequal Specifick Gravity do arrive, with the same Velocity, at an Orifice capable of admitting them, yet they will not both enter it and pass, because their *Motion of Direction* is different. So that this *Diversity in the Angles*, which these Ducts make with the Trunk of the Artery, seems altogether necessary to account for the possible Diversities of *Secerned* Fluids, even supposing their Diameters and Figures to be the same: For no doubt the Blood is a *Heterogeneous* Fluid, and contains Parts of very different Specifick Gravities, Cohæsions and Densities; whereas the separated Fluid must be *Homogeneous*, in order to perform the uniform Functions of Life.

(3.) *The different Velocities with which the Blood arrives at the Orifices of these Secretory Ducts*. For since the Secretions are made in Form of a *Fluid*, no possible Reason can be assign'd, why since Animals have a soft loose Texture and Union of the Solid Parts, and why one Part of the Body is of a tender, loose, easily separable Texture, and others of an harder, firmer, and more close Cohæsion; but this different *Velocity* of the Blood, at the Orifices of the *Secretory Ducts*. And tho' the

Diversity of the Diameters of these Ducts, is certainly that which is of the greatest Moment in this Affair of *Secretion*; yet 'tis impossible to account for the Similarity of the Secerned Fluids from one so *Heterogeneous*, as the Blood is from *this alone*: Since all Particles of never so different Kinds and Natures will be indifferently separated there, if their Diameters are less than those of the *Secretory Ducts*, and their *Direction* right.

Again, more particularly from what the above-mention'd Authors have deliver'd, such Propositions as these may be establish'd.

I. *That of an Heterogeneous Fluid at rest in the Body, and equally press'd, the most Liquid Part must be forc'd out first.* II. That of such an Heterogeneous Fluid as the Blood, when it *stagnates*, its heavy Parts will precipitate, and its light be elevated; and all will take place according to their Specifick Gravities. And when it doth not *stagnate*, the Separation of the heavy Parts from the light, will be in Proportion to the Slowness of the Motion of the Fluid. III. The red Fibrous Part of the Blood on its Stagnation retires to its Centre, and forces the *Serum* to the Sides of the Vessel which contains them; and from these two Propositions it will follow, that the *slower* the Blood's Motion is, the more *Serum* will be separated from it, *ceteris paribus*. IV. The most viscid Parts of the *Serum* are the highest, *viz.* such as are separated in the Glands of the Nose, Mouth, Palate, Windpipe, Stomach, Guts, &c. because these *swim* in Water, which is lighter than *Serum*. V. Fluids resist the Motion of such Bodies most, whose Surfaces are greater in Proportion to their Solidities, or whose Specifick Gravities are the least. Wherefore the most viscid Part of the *Serum* must be the *least Susceptible of Motion*, or must be moved with the greatest Difficulty through the Arteries. VI. A Fluid forc'd thro' a Concave Cylinder (and much more so thro' a Concave Cone) moves with greater Celerity at the *Axis* than at the Sides. This *Baglivi* saith, he hath observ'd in the Arteries of Frogs. Wherefore the lightest Parts being least susceptible of Motion, will be forc'd to the Sides of the Arteries where there is the least Motion: So that where there is the least Motion, there will the lightest or most viscid Part of the *Serum* be separated: and from hence it will follow also, *That the Viscidity of the separated Fluid will be reciprocally as the Celerity of the Blood at the Orifice of the separating Canal.* Again, Since *Bellini* hath prov'd that the Velocity of the Blood, at the Orifice of the Secretory Duct, is as the Number of Plications, Folds or Turns in the complicated Artery (*Prop. 40. de Motu Cordis,*) therefore the *Viscidity of the Secerned Matter, will be also as the Number of Plications in the complicated Artery.* VII. When the Motion of the Blood is too slow, the most *Serous* Part is thrown on those Arteries which are the smallest, most complicated, or at the greatest Distance from the Heart. VIII. The *Intestines* in an Animal are a *Gland*, and the *Lacteals* are the *Secretory Vessels*. IX. The Orifices of the Excretory Vessels of any Gland are *Circular*, because all the Vessels of the Body, in which the Blood or other Fluids move, are either hollow Cylinders or Cones: for the Pressure of a Fluid being always Normal to the Sides of the containing Vessel, and being at equal Distances from the Centre, the Sides must be every where equally distracted, *viz.* a Section perpendicular to the Axis of the

Vessel must be a Circle, and therefore the Vessel must be either of a *Cylindrick* or *Conical* Figure. Now from hence it will follow, that the Orifices of Secretory Ducts of different Glands, differing not in Figure but only in Magnitude; *The Fluids separated in different Glands, will differ only in Degrees of Cohesion and Fluidity.* X. *The Relaxed Coat of any Gland increases the Viscidity of the Secerned Matter,* vice versa. The Reason of which is, that the Matter will grow much more Viscid by staying longer in the Gland, the thin Parts being evaporated by the Heat of the Body. XI. *Such Glands, whose Compounding Arteries are most complicated, secrete the most Viscid Matter from the Blood;* for in these Arteries, the Resistance being greater than in *strait* ones, the Motion of the Blood must be slower in Proportion to the Number of their *Plications*; and where the Blood runs slowest, its *Viscidity* will be greatest, &c. XII. *The Quantity of Fluid Matter separated in any Gland, is in Compound Proportion of the Quantity of the Blood; its Celerity at the Orifices of the Excretory Vessels, and the Wideness of those Orifices directly, and the Viscidity of the Blood reciprocally.* XIII. *An increas'd Quantity of Blood increases the Fluid Secretions, in a Proportion greater than the Viscid; and a decreas'd Quantity will lessen the Fluid Secretions more than the Viscid.* XIV. *An increas'd Celerity of the Blood's Motion increases the Fluid Secretion more than the Viscid, & vice versa.* XV. *An Universal Enlargement of the Orifices of all the Glands increases the Fluid Secretions, &c. & vice versa.* XVI. *An increas'd Viscidity of the Blood decreaseth the Fluid Secretions more than the Viscid; & vice versa, an increas'd Fluidity increaseth the Fluid Secretion more than the Viscid ones.* See Dr. *Moreland's* Letter to Dr. *Mead* about the Secretions in an Animal Body, *Philos. Trans.* N. 283. See also an Account of the Nature of Animal Secretion, by *Franciscus Spolatus*, in the *Leipsick Acts* of Nov. 1687.

ANNIVERSARY, was called by our Forefathers, a *Year-Day* and a *Mind-Day*, i. e. a *Memorial-Day*; and is properly the yearly Return of the Day of the Death of any Person: And this Day the Religious registred in their Obitual or Martyrology, and annually observed in Gratitude to their Founders and Benefactors.

ANNUALIA. The Learned Author of the *Chron. Preciosum* saith, that these were such Oblations as were made by the Relations of deceas'd Persons on the Day of their Deaths every Year: Which Day our Forefathers called the *Year's-Day*, or *Year's-Mind*; and on it Mass was celebrated with very great Solemnity.

ANNUITY: For the Recovery of an Annuity no Action lies, but only a *Writ of Annuity* against the Grantor, his Heir, or Successors.

ANNULETS in Architecture, this signifies a narrow flat Moulding, which is common to other Parts of a Column, the Bases, &c. as well as the Capital. And 'tis the same Member which sometimes is called a *Fillet*, a *Listelle*, a *Coinsture*, a *Supercitium*, *Liste*, *Tince*, *Square*, and *Rabit*.

ANTÆ, the same with *Antes*.

ANTIÆGMENTS, in Architecture, are the Ornaments or Garnishings in Carved Work which are set on Architraves, whether of Wood or Stone.

ANTIPATHY, is properly an Affection of a contrary Nature to another; and therefore what we do in a very high Degree dislike, or have an

Aversion against, we say we have an *Antipathy* to. 'Tis easy to see that this may have place in the Affections and Passions of Mankind; but whether there be any such thing in the Properties of Natural Bodies, has been questioned; and I think, as Dr. Hook hath long since observed, the Effects which some have thought owing to some secret Antipathies in the Natures of Things, ought rather to be ascribed to an *Incongruity*: See *Congruity*.

ANTIQUE, is a Word much used by Architects, Sculptors, and Painters; and by it they mean all the ancient Pieces of Architecture, Sculpture, and Painting, from the Time of *Alexander the Great*, to the Irruption of the *Goths*; as also *Intaglias* within that Time: All which they call *Antique*; and whatever is done in Imitation of the great Masters of that Age, they say is after the *Antique Manner*.

APERCTIONS, in Architecture, are the Openings in any Buildings; such as Doors, Windows, Stair-cases, Chimneys, Outlets or Inlets for Light, Smoak, &c.

APHRODITARIUM, is a dry Medicine made of an equal Weight of Frankincense, Pomegranate, Ceruss, Meal, and Scales of Brass; and *Galen* calls a kind of *Collyrium* by this Name.

APHROGEDA, is Milk beat into an entire Froth, and was a Medicine used by *Galen*.

APRON, is a piece of Lead which laps over or covers the *Vent* or *Touch-hole* of a great Gun.

APPETITUS *Caninus*, is an Inordinate extravagant Hunger, to the Degree of a Disease, so that Men come to devour every thing like Dogs, 'Tis attended with a *Lienteria* usually, or some such *Coeliacal Flux*, by which it is distinguish'd from *βελιμία*: 'Tis called sometimes *Phagedæna*.

APPROPRIATION, is the granting a Parochial Church, or the great Tithes and better Profits, *ad Proprios usus*, to the proper Use of some religious House, to enjoy for ever: Whence it was call'd *Perpetuum Beneficium*.

ARCHES, are part of the inward Support of any Superstructure, and they are either Circular, Elliptical or Streight. Of the Circular Arches some are exactly Semi-circular, as the Arches of Bridges, &c. some are such as the Workmen call *Skeen* or *Scheme*, which are flatter Arches, less than a Semi-circle. Some Circular Arches are such as those in our *Gothick* Buildings, *di Tarzo* & *di quarto acuto*, as the *Italians* call them, or as we say of the third and fourth Point. Because they consist of two Arches of a Circle (meeting in an Angle at the Top) and drawn from the Division of a Chord into three or four, or more Parts at pleasure. *Elliptical Arches* were formerly much us'd instead of *Mantle-Trees* in Chimneys: They had a *Key-stone*, and *Chaptrels* or *Imposts*, and consisted of two *Hanfes* and a *Scheme*. *Strait Arches* are us'd over Windows and Doors, &c. having plain strait Edges both upper and under; these Edges are parallel, but both the Ends and Joints do all point towards a certain Centre. They are now usually about a Brick and a half thick, which when rubbed is about 12 Inches. The Workmen call the levelling End of this Arch the *Skew-back*; and the level Joints between the Courses of Bricks in the Arch, they call the *Sommering*.

ARCHES, the Judge of the Court of the Arches is call'd the *Dean of the Arches*, or the *Official of the Arches Court*, &c. with this Officialty is commonly joined a peculiar Jurisdiction of 13 Parishes in *London*, term'd a *Deanery*, and exempt from

the Authority of the Bishop of *London*, and belonging to the Archbishop of *Canterbury*: Of which the Parish of *Bow* is one, and the Principal, because the Court is kept there. Others think he was first call'd the *Dean of the Arches*, because the *Official* to the Archbishop being many times employ'd abroad in Embassies for the King and Realm, the *Dean of the Arches* was his Substitute in this Court, and by that means the Names became confounded. The Jurisdiction of this Judge is ordinary and extendeth it self through the whole Province of *Canterbury*, so that on any Appeal made, he forthwith, and without any farther Examination of the Cause, sends out his Citation to the Appellee, and his Inhibition to the Judge from whom the Appeal was made. *Vid. Histor. de Antiq. Eccles. Britan.* and 4. part of *Instit. Folio 337. &c.*

ARCH-DEACON, being only a Person chose out of those Deacons which were originally the Attendants on, and Servants to the Bishop in Spiritual Affairs, at first was a Person employ'd by the Bishop in more servile Uses, and he always was in Sub-servience to the *Urbans* or *Rural Deans* of Christianity; to whom Arch Deacons were as much inferior, as their Order of Deacon was to that of Priest. Till by the Advantages of a Personal Attendance on the Bishop, and a Delegation to examine and report some Causes, and a Commission to visit some remoter Parts of a Diocese, their Power and Dignity was advanc'd above the *Arch-Presbyter* or *Dean*. Dr. *Kennet's Glossary*. 'Tis now allow'd, that Arch-Deacons have a Power, not only to Visit, but to Suspend, Excommunicate, and in many places to prove Wills, and in some to Institute to Benefices. 'Tis one part of the Arch-Deacon's Office to Induct all Clerks into their Benefices within his Jurisdiction, and by the Act of Uniformity he is now obliged to be in Priest's Orders.

ARCHITECTURE. Some Writers on this Subject.

Vitruvius in *Latin* at *Amsterdam*, 1649. Fol.

In *English* by Mr. *Christopher Wase*.

In *French* by Mr. *Claude Perrault*. *Paris*, 1673. Fol.

Course d'Architecture Enseigni dans l'Academie Royal d'Architecture. Par Mr. *Fran. Blondell*, a *Paris*, 1675. Fol.

Mr. *Evelyn's Parallel of Architecture*, last Edit. 1706. *Lond.* Fol.

Adami Boetleri Architectura curiosa nova cum multis Figuris. *Norimberg*.

Albert Dureri, Architectura & Geometria. *Paris*, 1535.

Potsi's Architecture in 2 Vol. Fol. in *Latin* and *Italian*, and lately done into *English*.

L'Architecture par Jacques Androuet du Cerceau *Paris*, 1615.

L'Architettura d'Andria Palladio. *Venet.* 1642. con Fig. This is translated into *English*.

Vitruvius and *Vignolia*, abridged by Mr. *Perrault*. *Palladio's Architecture*.

Scamozzi's } *Architecture*.

Wotton's }

ARCHIVES, are the *Rolls*, *Chancery*, *Exchequer Office*, or any Places where ancient Records, Charters and Evidences are kept.

ARCH-PRESBYTER, the same with *Rural Deans*.

ARCUALIA *Ossa*, are the Bones of the *Sinciput*; and according to *Barthol.* were the *Ossa Temporum*. And the *Coronal Suture*, is by some Writers call'd also *Arcualis*.

AREOMETER, besides that mention'd in *Vol. I.* Mr. *Homburg* of *Paris* hath invented a new Instrument of this Kind, which is describ'd in *Phil. Trans. N. 262.* Thus, *A* is a Glass-Bottle or Matrafs with so slender a Neck, that a Drop of Water takes up in it about five or six Lines, or $\frac{6}{11}$ of an Inch. Near that Neck is a small Capillary Tube *D*, about six Inches long, and Parallel to the Neck.

When the Vessel is filled, the Liquor is poured in at the Mouth *B* (which is widen'd to receive a Tunnel) till it run out at *D*; that is, till it rise in the Neck to the Mark *C*, by which means you have always the same Bulk or Quantity of Liquor; and consequently, can easily tell when different Liquors fill it, which weighs most, or is most intensively heavy. But some Regard is to be had to the Season of the Year and Degree of Heat and Cold in the Weather: For some Liquors will rarify with Heat, and condense with cold; and accordingly take up more or less Room, See the Memoirs of the *French Academy of Sciences* for the Year 1699.

ARIETUM *Lenatio*, an Old Sportive Exercise, frequently forbidden in our Episcopal Synods and Constitutions, and seems to have been the same with the Quintane or Quintal, as Dr. *Kennet* thinks. See his *Paroc. Antiquities*.

ARITHMETICK, Authors on this Subject are, *Wingate's Arithmetick*, the last Edition.

Tacquet's Arithmetick in Latin or English.

Willisford's Arithmetick Natural and Artificial, Lond. 1656. a good old Book.

Diophanti Alexandrini Arithmeticonum Lib. 6, & de Numeris Multangu'is lib. unus cum Commentariis G. Bocheti, & Observationibus P. P. de Fermat. cui accessit Doctrina Analytica inventum Novum. Tolose 1670. Folio.

Moor's Arithmetick.

Parson's and Wastall's Arithmetick and Algebra.

Feak's Arithmetick in Folio.

Well's Arithmetick in Latin. Oxon.

Sir Isaac Newton's Arithmetica Universalis. Cambridge. 1607.

Ward's Arithmetick, in his young Mathematician's Guide.

ARMINGS, in a Ship, are the same with *Waft-cloaths*, which are Red-cloaths hung about the out-sides of the Ship's upper Works fore and aft, and before the *Cubbridge Heads*; and there

are some also hung round the Tops, and these are call'd *Top Armings*.

ARQUEBUSS *a Croc*, is a Sort of small Fort Arms, carries a Ball of about $3\frac{1}{2}$ Ounces, and is now us'd only in Old *Castile*, and in some Garrisons of the *French*.

ARTERIA *Bronchialis*, is a small Artery (described by Mr. *Ruysh*) which in the Lungs creeps along upon the Branches of the *Trachea*, or the *Bronchia*.

ARTERIES and VEINS.

A Description of the Veins and Arteries of a Human Body in the two Plates annexed, as presented to the Royal Society in London, by that Generous Promoter of all useful Learning, John Evelyn, late of Say's Court in Deptford, Esq; and explained and illustrated by that accurate Anatomist and Surgeon, Mr. William Cowper.

* *Fig. 1st, 6th, and 8th.*

THESE * Figures are closely drawn after the Original Schemes, and

I am apt to flatter myself they will be acceptable to the inquisitive. It is some Satisfaction, that I find the *Arteries* here so agreeable to a Figure which I drew and published not long since, from the *Arteries* of a *Fetus* injected with Wax. But this Figure of the *Veins* differs so much from any extant, as would incline one to suspect all of the Subject hitherto published are fictitious, not excepting even those of *Vesalius*. But first of the *Arteries*.

That the *Arteries* are the Vessels which convey Blood from the *Heart* to all Parts of the Body, is well known; and we see by *Fig. the 1st*, that the common Practice of Nature in distributing these Vessels, to supply the Parts with Blood, is from the next adjacent Trunk, till their ascending and descending Trunks become Conical, as well as their collateral Branches: Not that all the Trunks and Ramifications of *Arteries* are uniform, and become Conical in the same manner; nor do all of them pass directly to the Parts to which they convey Blood; nor do all Parts receive *Arteries* from the neighbouring Trunks.

The Trunks of the *Carotid*, *Vertebral* and *Splenic Arteries* are not only contorted in their Progress, in the *Adult*; but the *Diameters* of their Bores are variously dilated in divers Parts of them, especially where they are contorted; but as these Dilatations of their Trunks are caus'd by the Resistance the Blood meets with at those *Angles of Inflection*; so those *Enlargements* of them afterwards contribute to retard the Protrusion of the Blood to the Extremities of those *Arteries*: Hence it is, That as the *Arteries* of the *Fetus* are not contorted in such Acute Angles as in full grown Bodies, so their Trunks are more Conical, and not here and there dilated in divers Parts of them, as in the *Adult*.

The

The Trunk of the *Splenick Artery* has a straight Progress in the *Fetus* and in *Infants*; but in the *Adult* I have hitherto constantly found it very much *contorted*, as is express'd in Fig. 1, 2, 3.

The peculiar Contrivances of the *Spermatick Arteries* of *Quadrupeds* as well as *Men*, shew a constant Design in Nature of taking off that Velocity with which the Blood would otherwise pass thro' the *Glands* of the *Testes*: It seems to be for this End that the *Testes* of most Animals (especially *Men* and *Quadrupeds*) hang out of the Cavities of their *Abdomens*, that the Canals of their Blood Vessels may be lengthened: For the *Spermatick Arteries* (contrary to all others) arise from their Great Trunk, at a far greater Distance from the *Testes* than the *Arteries* of any other Part of the Body. Nor would the *Testes* (which are such necessary Organs) have been thus exposed to external Injuries, if the End of Nature in lengthening their Blood Vessels had not been very considerable. Besides this lengthening of the *Spermatick Arteries*, we find Nature still contriving other Impediments to check the Current of the Blood in those Parts; it seems for this End that the *Spermatick Arteries* are lessen'd at their Original from the Trunk of the *Arteria Magna* in *Men*, and that the *Spermatick Arteries* of *Quadrupeds* are so much *contorted* before they reach their *Trifles*.

The principal Inducement of Nature in making use of these different Contrivances in the *Spermatick Arteries* of *Men* and *Quadrupeds* seems to be,

That if the *Human Spermatick Arteries* were contorted, as in *Quadrupeds*, before they reach their *Testes*, the Apertures in the *Abdominal Muscles* of *Man* must be much larger than they now are, and would frequently let the *Intestines* descend into the *Scrotum*; which we know nevertheless often happens: Such *Ruptures* (as they are call'd) are not so incident to *Quadrupeds*, tho' the Passages for their *Spermatick Vessels* (through their *Abdominal Muscles*) are much wider than in *Men*, because the Position of the Trunks of their Bodies is *Horizontal*, and their *Intestines* therefore cannot press on the Processes of the *Peritonæum*, as in *Men*, who are *erect*.

Besides these *Artifices* in disposing the Trunks of *Arteries*, I doubt not much more will be detected by the inquisitive: In the mean time, I shall, at present, pursue the Thread, and describe the Extremities of the *Arteries*, with their *Communications* with the *Veins*, and afterwards produce some Instances of the Art of Nature in conveying the reflux Blood to the Heart.

After the *Circulation of the Blood* through the Heart, Lungs, and large Blood Vessels, was demonstrated by Dr. *Harvey*, it was only guess'd how the Extremities of the *Arteries* transmitted the Blood to the *Veins*, till Mr. *Lewenboeck's Microscopes* had discovered the Continuation of the Extremities of those Vessels in *Fish*, *Frogs*, &c. which is now commonly shewn by *Microscopes* made by other *Hands*: Yet there are not wanting those, who doubt of the like Continuations of the Extremities of *Arteries* and *Veins* in *human Bodies* and *Quadrupeds*; since those *Animals* it has hitherto been seen in (to any Satisfaction, as Mr. *Lewenboeck* confesses) have been either such *Fish*, or of the *Amphibious Kind*, that have but one *Ventricle* in their Hearts, and their Blood actually cold, ex-

cept in *Bats*, in which it appears very obscurely: Add to this, that the Blood in those Creatures does not circulate with such Rapidity as in *Animals* whose Hearts have *Two Ventricles*. For all Animals that have *Biventrinous Hearts*, the Vessels of the rest of the Body return their Blood to the Heart in equal Time and Quantity with those of the Lungs, notwithstanding the Inequality of their Course.

This Difference in the principal Organs of the *Circulation of the Blood* in those Creatures (on which only these *Experiments* have been hitherto made) mov'd me to make some, on *Animals* whose Organs differ only from the *Human* in their gross Figure, and not in their intimate Structure: For this End I took a young *Cat*, about ten or twelve Days old, and fastned it to a Board as in *Vivisection*; and making an Incision thro' the *Linea Alba*, the *Omentum* and *Intestines* were extruded, then causing the Creature to be so held (on the Board) under a large *double Microscope*, where a flat Glass for receiving of Objects was placed Horizontally, on which I expanded the *Omentum* or *Caul*, (a Light being placed underneath) I saw the Globules of the Blood move very swiftly in the small Vessels, which are only to be seen in the most transparent Parts of the *Membranes* of its *Omentum*; but the Motion of the Blood soon abated, and its Globules were withdrawn from the Extremities of its Blood Vessels; and in a little time became stagnant in their larger Branches.

This Appearance of the Continuation of the Extremities of the *Arteries* with the *Veins*, while the Blood was moving in them, in the *Omentum* or *Caul*, is express'd by Fig. 4. A A shews the Trunks of the *Arteries*, B B the *Veins*, which were distinguishable by contrary Currents of the Globules of the Blood in each Vessel. C C C shews the branching of the Extremities of the *Arteries* and *Veins*, that no longer associate with each other, but are united, as here express'd. After I had seen this, I attempted to shew the like to several *Friends*, but did not always succeed so well as when Mr. *Chambers* and Mr. *Buckeridge* favoured me with their Presence, at a time when I happened to have a young lean Dog, that was not large; in whose *Omentum* we saw it very well; but by the Assistance of an Instrument I had prepared to expand the *Mesentery*, we all saw it there much better, that Part having not only larger and clearer Spaces than the *Omentum*, but its Blood Vessels are distributed more regular, as appears by Fig. the 5th, where the same Letters of Reference serve as above.

Those who will entertain themselves in viewing the transparent Parts of living Creatures with *Microscopes*, will find that the Extremities of their *Arteries* and *Veins* are not all equally lessen'd, tho' united. In the Tail of the *Lacerta Aquatica*, *Tadpols*, and in most *Fish* (I have examin'd) I have frequently observ'd several *Communications* between the *Arteries* and *Veins*; in which more than two Globules of Blood have pass'd abreast: And in the same *Area* I have seen some of those *Communications* so small, as that but one Globule could pass, and that very slowly before the other. In young *Fish*, particularly in Grigs, I have frequently observ'd a *Communicant Branch*, so very small as that one Globule of Blood only has pass'd it in two or three Seconds of a Minute: At other times I have found considerable Intervals in passing

sing of one Globule in such a Communicant Branch, even half a Minute, a whole Minute, and once in two or three Minutes I have seen one Globule of Blood only pass in a particular Tract.

The prompt passing of Liquors injected by the *Splenick Arteries*, to the *Veins*, shews the Communications between those Vessels are more open than the *Arteries* and *Veins* of other Parts, of which I have elsewhere spoken.

Liquors also injected into the *Pulmonick Arteries* pass to their *Veins*, tho' not altogether so freely as in the *Spleen*.

On viewing the Extremities of the *Pulmonick* Blood-Vessels in a living Frog with my *Microscope*, I found their *Communications* much larger than those that I had before seen in the Membrane between the Toes and in the Feet of the same Creature. Nor can we reasonably doubt of the like patent Communications of the *Arteries* and *Veins* of *Human Lungs* and those of *Quadrupeds*, when we consider the *Blood* of their Lungs must return to the Heart in equal *Time* and *Quantity*, with that of all the Parts of the Body besides, as before noted. Hence it appears, the Bronchial Blood Vessels (first taken Notice of by the accurate *Ruyfch*) are absolutely necessary, else the Parts of the Lungs could not receive Nourishment; nor could the Glands of the *Bronchia* separate their Liquor, if they were supplied with *Blood* from the *Pulmonick* Blood Vessels which is so quickly dispatched thro' the Lungs.

On viewing the Membrane that is between the Toes of one of the hinder Feet of a living Frog, after I had frequently taken hold of the same Leg of that Creature, to apply it to the *Microscope*, I found that Membrane very transparent, and without any Motion of the Globules of the Blood in it, as if the Part had been dead; but while I was looking on it, it was, I confess, not a little entertaining to see the Globules creep into it by Degrees, and at length the Blood move in all the Branches of its *Veins* and *Arteries* as before when no Violence had been offered to the Part: while the Blood is thus leisurely creeping through the Vessels, you may plainly see its Globules compress'd into Oval Figures, which are made more or less oblong, by the Resistance those Globules meet with, by the Contraction of the Sides of the Vessels they pass through; and this I have more than once observed in the Tails of the Water *Newts* or *Lizzards*: But on examining the Blood of these Creatures with a *Microscope*, and comparing it with the Human Blood, I found the Globules of the *Lizzard's* Blood more incline to an oval Figure, and were as big again as the Globules of Human Blood, and that of a small Fish; which I in like Manner viewed at the same Time. It is not unlikely a sudden Retrocession of Blood, from the Extremities of its Vessels often happens, and its *Circulation* in the same Vessels is afterwards carried on without any Impediment; as on some Passions of the Mind, Deliquiums by the Effusion of Blood, or otherwise. But if the Blood is once become stagnant in its Vessels, (especially the *Arteries*) the Part is in no small Danger of a Mortification, unless its neighbouring Vessels, which enjoy the Motion of the Blood, drive on the stagnant Blood, and it escape by the Sides of the Vessels that retain'd it. Experience assures us, that in Bruises when the Blood is extravasated, it goes off either by *Transcolation*, or

else causes an *Abscess*; for there's little Reason (in my Opinion) to suspect any of the stagnant Globules of the Blood will be fit to re-unite with the *Circulating* Mass. But that the Blood after Stagnation in its Vessels will sometimes pass their Sides, appear'd to me from the following Experiment.

On viewing the *Mesentery* of a Dog when living, in which I had before seen the Blood passing the Extremities of the *Arteries* and *Veins*, I consider'd how to preserve the Blood in its Vessels that I might afterwards at any Time see it in their Extremities when stagnant: For this End I caus'd several Parts of the *Mesentery* to be tied on as many Pieces of small round *Pill-Boxes*, cut transversely like little Hoops; on which, Portions of the *Mesentery* were extended like the Head of a *Drum*; and on viewing them afterwards with my *Microscope*, I found the Extremities and Branches of the Blood Vessels charged with Blood, which before appeared in Motion; some of which Parts of the *Mesentery* I still keep by me. On laying one of these Parts of the *Mesentery* (thus expanded) in Water, the stagnant Blood in its Vessels disappear'd; but on just immersing another of those Pieces in Water, I could with my naked Eye see the stagnant Blood diffused in the Interstices of the Blood Vessels, and between the Membranes of the *Mesentery*: Hence it's evident, the Blood may pass the Sides of its *Vessels* after Stagnation in 'em; but whether its Globules are broken, or what Figure renders them fit to pass those Pores that are in the Sides of the Vessels, I leave to the inquisitive; but we must return to our *Tables*, and first of that of the *System* of the *Vena Cava*.

As the *Arteries* are known to export the Blood, so the *Veins* carry it back again to the Heart; but having already described their Extremities, we come next to the large Trunks of the *Veins*; and here, as in the *Arteries*, we find the common Practice of Nature, in disposing the Branches of *Veins* to discharge the reflux Blood into the next adjacent Trunk, and so on to the Heart. As the *Arteries* afford Abundance of Instances of Checks given to the Velocity of the Current of the *Blood* through several Parts, so the *Veins* supply us with as many *Artifices* to assist its regular Return to the Heart, as well as to favour those Contrivances in the *Arteries*.

The Trunks of the *Carotid*, *Vertebral* and *Splenick Arteries* are not only variously contorted, but are also here and there dilated. The Beginnings of the internal *Jugulars* have a *Bulbous* Cavity (Fig. 7. H, H,) which are *Diverticuli* to the reflux Blood in the *Sinus's* of the *Dura Mater*, lest it should descend too fast into the *Jugulars*. The like has been also taken notice of by Dr. Lower in the *Vertebral Sinus's*. The *Splenick Vein* has divers Cells opening into it near its Extremities in human Bodies, but in *Quadrupeds* the Cells open into the Trunks of their *Splenick Veins*.

The *Spermatick* Veins do more than equal the Length of the *Arteries* of the *Testes* in Men; their various Divisions and several *Inosculations*, and their Valves, are admirably contriv'd to suspend the Weight of the Blood, in order to discharge it into the larger Trunks of the *Veins*; and were it not that the reflux Blood from the *Testes* is a *Pondus* to the influent Blood from the *Arteries*, and still lessens its current in the *Testes*, these *Spermatick* Veins, like those of other Parts, might have discharged their Blood into the next adjacent Trunk.

Who

Who can avoid Surprize at the Art of Nature, in contriving the *Veins* that bring Part of the Re-fluent Blood from the lower Parts of the Body? when they consider the Necessity of placing the Human Heart, as well as that of most Quadrupeds, so far from the Centre of the Body towards its upper Part? It is for that End necessary the large Trunks of the *Veins* and *Arteries* should not associate each other; for if all the Blood sent to the lower Parts, by the descending Trunk of the *Aorta*, should return to the Heart again by one single Trunk (as it is sent out from thence) the Weight of so much Blood in the ascending Trunk of the *Vena Cava*, (Fig. 6. C, C, A) (for so its lower Trunk is call'd) would oppose the Force the Heart could give it from the *Arteries*, and hinder its Ascent; For this Reason the *Vena Azygos* (Fig. 6, b.) or *sine pari*, is contriv'd to convey the Blood sent to the Muscles of the Back and *Thorax* into the descending Trunk of the *Vena Cava*, (ib. B. A.) above the Heart: Hence 'tis evident, more Blood comes into the Heart by the descending, or upper Trunk of the *Vena Cava*, (Fig. ib. B, A.) than passes out by the ascending Trunks of the *Aorta*. Nor does this Quantity of Blood convey'd to the Heart by the superior Trunk of the *Cava*, seem without some other Design in Nature, besides transporting it thither to free the inferior Trunk from its Weight: But perhaps it was necessary so much Blood should be ready there to joyn with the Chyle, (Fig. 6. †) for its better Mixture, before it reaches the right Auricle of the Heart.

I might here add the Description of a peculiar Valve, I lately discovered in the lower Trunk of the *Vena Cava*, near the right Auricle of the Heart; but the annex'd Figures have taken up too much Room in those Copper Plates to insert it: For the same Reason, the Figures of some Contrivances in the *Arteries* here mention'd, particularly the *Spermaticks*, are omitted: This being what occur'd to my Thoughts at present on this Subject, which is not to be found (at least not commonly) in the Books of *Anatomy*: The greatest Part of which have been added to these Papers, on their lying by me since the Graver began the Figures.

The Explications of the Figures.

FIG. 1.

Represents the Trunks and large Branches of the *Arteries*, dissected from an *Adult Human Body*, when displayed and dried; as they are now to be seen in the Repository of the Royal Society.

1. The Trunk of the *Aorta* cut from the Basis of the Heart.

2. That Part of it, whence the Coronary Artery of the Heart does arise.

3. That Part of the *Arteria magna*, where the *Canalis Arteriosus* of the *Fetus* terminates; which in an *Adult* becomes a Ligament. Vid. Fig. 2, 3.

Vol. II.

4 That Part of the *Axillary-Arteries*, by some called the *Subclavian Arteries*.

5. The left *Carotid Artery* (in this Subject it seems) arising from a common Trunk with the right *Carotid* and *Axillary Arteries*, as in some Quadrupeds.

6. The left *Cervical Artery*, in this Subject arising from the Trunk of the *Arteria Magna*, as express'd in a Figure given by *Bergerus* in the *Acta Eruditorum An.* 1698. pag. 295. But in all the human Bodies in which I have hitherto examined these *Arteries*, I have constantly found them as express'd Fig. 2. 6. 6.

7. The *Arteries* that carry Blood to the lower Parts of the Face, Tongue, adjacent Muscles and Glands.

8. The Trunk of the *Temporal Artery*, springing from the *Carotid*, and parting with Branches to the *Parotid Gland* 9, and Temples 10, and Parts adjacent.

11. The *Occipital Arteries*.

12. The *Arteries* that convey Blood to the *Fauces*, *Gargareon*, and adjacent Muscles.

13. The Trunk of the *Carotid Artery* cut off, before it is Contorted in passing the Skull.

14. The Trunk of the *Artery* of the Arm parting with Branches to the adjacent Muscles and Parts.

* That Part of this *Artery* which is sometimes prick'd in letting Blood, and makes an *Aneurisma*, in which Case this Trunk of the *Artery* must be bared and firmly tyed above the *Aneurisma*; and if it afterwards happens (as it has been frequently known) that the Flux of Blood to the *Aneurisma* in the *Artery* is not very much abated, tho' the *Artery* has been tyed above; the Operator in that Case must make another Ligature on the Trunk of the *Artery* below its *Aneurisma*: These Collateral Communications of the Trunk of the *Artery* at the bending of the Cubit, preserve the Circulation of the Blood in the Cubit and Hand, tho' the Trunk is totally compress'd both above and below; and the same Trunk afterwards divided between those Ligatures. Hence it is, if one Ligature made above the Wound in the *Artery* is not sufficient, but the Blood still pours out from below, the Patient will sooner recover the Action and Strength of the Muscles of the Cubit, than those in whom the upper Ligature proves sufficient; the Reason of which is obvious to any who consider that the *Communicant Branches* must be larger where the lower Ligature is required, than when the superior Ligature only is sufficient: These *communicant Branches* (as I have seen them in some Subjects) are here mark'd out in prick'd Lines, vid. the Figure.

While these Papers were lying by me, the two following Instances happen'd, in which the Communications of the large Trunks of the *Arteries* of the Cubit and Arm were remarkable. The first was

A Boy of thirteen Years, who, about three Weeks before I saw him, receiv'd a Wound near the middle of the Cubit in which the Trunk of the *Artery* (mark'd in the Fig. †) was divided. The Surgeon who was first call'd, had frequently bound up the Wound, and put a Stop to the several discharges of Blood (which they told me did not amount to less than 6 or 7 Quarts at Times) but not without a Compress on the Trunk of the *Artery* above the Wound. On another impetuous

Flux was I call'd; but seeing no small Quantity of Blood discharged, I was contented to let the Wound be bound up, in the same Manner as it had been done before; omitting the Compress on the Trunk of the *Artery* above, and adding a Piece of Deal-board, on which the Hand and Cubit were fastened, to prevent any Motions of those Parts, as well as the Fingers; Three Days after, the Applications were taken off, and little or no Blood appear'd; but two or three Hours were scarce elapsed ere I was alarm'd with Notice of a fresh Flux. The *By-standers* being instructed in that Case, to compress the *Trunk* of the *Artery* above the *Cubit*, they had thereby prevented no small Effusion of Blood, which must otherwise have happen'd; his *Surgeon* being out of the Way, I laid the Trunk of the *Artery* bare above the Wound as expeditiously as I could, being forced more than once to let loose the Compress above to discover its Orifice by the Flux of Blood. I passed a Needle with strong waxed Thread under the *Artery*, and made a Ligature on its Trunk, which lay concealed in the Interstice of the *Musculus Flexor Digitorum*, and the *Musculus Ulnaris Flexor Carpi*; but notwithstanding this Ligature on the Trunk of the *Artery* above the Wound, the Blood still flow'd from the lower Trunk of the *Divided Artery*; yet the Velocity of its Current was so much abated, that it seem'd like Blood flowing from a Vein. I left the Wound with a Digestive, and the Part without hard Bandage; it being now five Weeks since, I hear the Wound is almost *cicatrized*. The Learned Dr. Harris was present at the other Operation, by which the Communications of the large Trunks of the *Arteries* of the Arm were very evident.

A Boy about eight Years of Age, who came to Town with an *Aneurisma* of the left Arm, upon bleeding six Weeks before. The *Tumour* was indeed very large in Proportion to so small an Arm. After laying the *Aneurisma* or *Tumour* bare, and making a Ligature on the Superior Trunk of the *Artery* (in the annex'd Fig. *....) I found, on loosening the Compress on the superior Trunk of the *Artery*, very little Abatement of the *Pulsation* of the *Aneurisma*; I then passed a Ligature in like manner on the Trunk of the *Artery* below the *Tumour*; but notwithstanding, the *Pulsation* continued, tho' much abated. I then discovered another Trunk of the *Artery*, arising from the lower Part of the *Tumour*, on which also I made another Ligature, and the *Pulsation* was then taken off. However, on cutting off the Surface of the *Cystis* or dilated *Artery*, and clearing it of the coagulated Blood, which was soon stopped with a common Astringent, I left the Part without any other Ligature or hard Bandage. It is now eight Days since the Operation, the Ligatures on the *Arteries* are all come off, and the *Pulsation* of the *Artery* of the *Wrist* begins to be very manifest, nor does any Symptom appear that threatens Success.

15. The Division of the Trunk of the *Artery* of the Arm below the Flexure at the *Cubit*.

16. The external *Artery* of the *Cubit*, which makes the *Pulse*, that is commonly felt near the *Carpus*.

17. The *Arteries* of the Hand and Fingers.

18. The *Mammary Artery*.

19. 19. The descending Trunk of the *Arteria magna*.

20. 20. The *Intercostal Arteries*.
21. The *Arteria Celiaca*.
22. The *Arteria Hepatica*.
23. The Trunk of the *Arteria Splenica*.
24. The *Arteria Epiploica Sinistra*.
25. A Branch of an *Artery* which passes to the Bottom of the *Stomach*.
26. The superior *Coronary Branch* of the *Stomach*.
27. 27. The superior *Mesenterick Artery*.
28. 28. The *emulgent Arteries*.
29. The inferior *Mesenterick Artery*.
30. 30. The *Lumbal Arteries*.
31. 31. The two *Spermatick Arteries*, which in this Subject, seem to arise at a greater Distance from each other than commonly.
32. The *Iliack Artery*.
33. The *Arteria Sarca*.
34. The internal *Iliack Branch*.
35. The external ———
36. The *Epigastrick Artery*.
37. Branches of the external *Iliack Artery*, passing to the oblique *Muscles* of the *Abdomen*.
38. 38. The *Arteries* that pass to the *Muscles* of the *Thigh* and *Tibia*.
39. The *Crural Artery*.
40. The *Umbilical Artery*, with those of the *Penis*.
41. That Part of the *Crural Trunk* that passes the *Ham*.
42. The three Trunks of the *Arteries* of the *Leg*.
43. The *Arteries* of the *Foot* and *Toes*.

FIG. 2.

THE Trunks and some of the Ramifications of the *Arteries* of an adult human Body fill'd with Wax, to shew the Variety in Nature, and supply the Defects of the former Figure.

1. The *Aorta* cut off at the *Basis* of the *Heart*.

A. The three *semilunary Valves* as they appear when the *Heart* is in *Diastole*, and hinder the Blood coming back from the *Arteries* into the left *Ventricle* of the *Heart*.

B. A Portion of the Trunk of the *Arteria Pulmonalis*. b, b. its Division before it passes to the right and left Lobes of the Lungs.

C. The descending Trunk of the *Arteria Magna*.

D. D. The internal *Mammary Arteries*.

2. The Trunk of the *Coronary*, cut off.

3. The *Ligamentum Arteriosum*. Which in the *Fetus* is the *Canalis Arteriosus*, and conveys Blood from the *Pulmonick Artery* to the great *Artery*.

4 The Trunk of the *subclavian Artery*.

5. 5. The *Carotids*.

6. 6. The *Vertebrales*.

7. 7. The *Arteries* which pass to the lower Parts

Parts of the Face, Tongue, adjacent Muscles and Glands.

8. 8. The Trunks of the Temporal Arteries arising from the Carotids, giving Branches to Parotid Glands (9. 9.) and the Temples (10. 10.) &c.

11. 11. The Occipital Arteries.

12. The Arteries of the Fauces, Gargareon, &c.

13. 13. The Contortions of the Carotid Arteries, as they pass the Basis of the Skull: These Trunks of the Carotid Arteries in Dogs (like those I guess of most Quadrupeds) are very much contorted before they reach the Basis of the Skull: On filling these Vessels of that Animal with Wax, I found those Branches of them which pass to the Brain, first clipping the hinder Parts of the lower Jaw, immediately under its condiloide Processes; where those Arteries are received in two Sinus's of that Bone, which Sinus's may also be seen in the Jaw-bones of other Quadrupeds, but not in human Bodies.

14. 14. Those Parts of their Trunks that pass by each Side of the Sella Turcica, whence divers small Branches arise, and help to compose the Rete Mirabile; which is more conspicuous in Quadrupeds than in human Bodies.

15. 15. The Contortions of the Vertebral Arteries, where we find their Trunks considerably dilated.

16. The vertebral Arteries, as they ascend on the Medulla Oblongata towards the Annular Protuberance or Pons Varoli.

17. 17. The communicant Branches of the Vertebral and Carotid Arteries.

18. 18. The Arteries of the Brain displayed.

FIG. 3.

I Chuse to place this Figure on the Copper Plates of one of the Trunks of the Arteries of the Tibia (dissected from the Leg after Amputation) rather than the following Distich, which I find written on the Original Table of this Scheme of the Arteries.

*Pulsificus Sanguis de Cordis Ventre sinistro.
Funditur ut Corpus nutriat hisce viis.*

Before I explain the Letters of Reference of this third Figure, it will be necessary to let you know that Mr. Stringer was in his sixty seventh Year when this Artery was taken from him, and near twenty Years before lost the Use of both his Legs; and in that time he had been so persecuted with Convulsions in them, that neither Leg was free a quarter of an Hour together, whether sleeping or waking. At length one of his little Toes mortified, which was taken off by Mr. Coldwyer, an expert Surgeon of Salisbury; not long after more Toes of the same Foot followed the like Fate: The Convulsions following that Leg stronger and quicker: That Part of the Foot next the Toes became tumid and inflam'd, the Tumour extending it self above the Maleoli: a sinuous Ulcer passed by the Side of one of the Metatarsal

Vol. II.

Bones; the Extremity of which Bone (whence the Toe was taken off) lying bare. In this Condition I found the left Foot and Leg of this Gentleman, when I had the Honour to wait on him, by Command of the Right Honourable the present Earl of Shaftsbury, he living in the Neighbourhood of that Noble Peer in Wiltshire; where I met with Mr. Goldwyer above-mention'd; and finding the Leg very chilly, the Necessity of parting with it was too evident; which Mr. Stringer suffer'd with extraordinary Fortitude, He not so much as expressing the least Outcry during the Operation, tho' the Part did not want the most exquisite Sense of feeling: On the Abcission (which was about five or six Inches below the Knee) it was unexpected by me, I must confess, to see so little Blood spouting from the Arteries. The Stump being bound up, and committed to the Hands of two or three Servants, a less Number not being sufficient to hold it, by Reason such strong convulsive Motions pursued the Part on the Operation. I was very desirous to examine the Arteries of the amputated Leg, having before discovered the Cause of a Mortification of the Arm of a young Gentlewoman, who dy'd not long after an Amputation of the Part, tho' the Gangreen did not appear to reach near the Place where the Abcission was made: (i. e. below the ending of the Musculus Deltoides.) In which Case, I found the Sides of the Trunk of the Artery of the Arm so thicken'd, that the Diameter of its Bore was contracted to less than a third Part, and would scarce admit a common Probe to pass it, vid. Fig. G. H. I. When I had found the Ends of the Arteries in the Leg above-mention'd, I endeavour'd to pass my Probe into one of them, but meeting with some Opposition, I suspected I had mistaken the Vein for the Artery, and that the Valves opposed the passing of the Probe that Way: but on further Dissection I clear'd the Trunks of both those Blood Vessels, and found the Veins in their natural State; but the Sides of the Arteries were grown Bony or Stony; having clear'd two of their Trunks, I left one of them at Salisbury, the other I brought to Town, and is here figur'd.

A. The upper Part of the Artery cut off in the Amputation of the Leg; from A to

B. The Trunk of the Artery distended and dry'd to shew its Canal.

C. That Part of the Trunk of the Artery which was so contracted by the Putrefaction or Ossification, that a Probe would not pass its Canal; from C to

D. The Trunk of the Artery opened and expanded.

E, E. The Putrefactions or Ossifications in the Sides of the Artery.

F, F. Their Specks in the lower Part of the Artery, not so large as in the upper Part, and placed at greater Distances.

a, a, &c. The Branches arising from the Trunk of the Artery.

G. A Proportion of the Trunk of the Artery of the Arm above-mention'd.

H. The Sides of the Artery very much thickned, whereby the Diameter of its Canalis was so much diminished that the Probe

I. Would not pass it.

The Ossifications in the Coats of Arteries have been frequently observ'd, especially in their large Trunks within the Cavities of the Thorax and Abdomen; but I don't remember the like has been taken

ken notice of in the Limbs; or that such Impediments in their Canals have been found the Cause of Mortifications of particular Parts, as in the Instance above-mentioned; tho' I doubt not, but the like has often happen'd in aged People, especially where we find the Progress of the Gangreen not very swift, and its Beginning from no external Cause; the Consequences of which are commonly found fatal. When the Arteries of one Leg (or of any other Limb) are so affected, we may well suspect the like in *those* of other Parts; which probably happened in the Instance I now mention'd; for tho' no Gangreen came on the Stump, yet the other Foot and Toes began to mortify about six Weeks after the Amputation, as did the Parts about the Hips, which were compress'd in lying or sitting before he expired.

F I G. 4.

Represents the Extremities of the Blood Vessels, as they appear while the Blood is passing them in the *Omentum* of a live Dog, view'd with a *Microscope*.

A, A, The Branches of Arteries, and B. B. the Veins which associate, C C their lesser Branches where they pass from each other, and are united at their Extremities.

F I G. 5.

THE like appearing in the *Mesentery* of a Dog when living.

D, D, The *Arææ* that are here viewed with the Microscope, as they appear to the naked Eye.

F I G. 6.

THE Trunks of the *Vena Cava*, with their Branches dissected from an adult human Body, done from the original Scheme in the *Repository* of the *Royal Society*.

A, A, The Orifice of the *Vena Cava*, as it appears when cut from the right Auricle of the Heart.

a, The Orifice of the coronary Vein of the Heart.

B, A, The *superior*, or *descending Trunk* of the *Vena Cava*.

C, C, A, The *inferior* or *ascending Trunk*: so distinguished from the Motion of the Blood in their Trunks, which is contrary to their Position:

D, D, The Subclavian Veins.

† That Part of the left Subclavian Vein, where the *Thoracick Duct* enters it, and discharges it self of its *Chyle* and *Lympha*.

b, The *Vena Azygos* with its Branches going to the Ribs, e, e.

c, The superior Intercoastal Veins.

d, d, The internal mammary Veins.

E, E, The right and left Iliack Branches.

F, F, The internal jugular Veins.

G, G, The external Jugulars.

H, H, The Veins which bring Blood from the lower Jaw and its Muscles.

I, I, The Trunks of the internal Jugulars cut off at the *Basis* of the Skull.

f, The Veins of the *Thymus* and *Mediastinum*.

g, g, The Veins of the Thyroid Glands.

h, The *Vena Sacra*.

i, The internal Iliack Branch.

k, The external——

K, K, The occipital Veins.

L, The right axillary Vein.

M, The Cephalick.

N, The Basilick.

O, The Median Vein.

P, The Trunk of the Veins of the Liver.

Q, The Phrenick Vein of the left Side.

R, The right Phrenick Vein.

r, A large Vein from the left *Glandula Renalis* and Parts adjacent.

S, The left emulgent Vein.

T, The right emulgent, in this Subject very much lower than the left, which is not usual.

V, V, The two Spermatick Veins.

X, X, Two communicant Branches between the ascending Trunk of the *Vena Cava* and *Vena Azygos*, by which the Wind passes into the descending Trunk of the *Cava*, when we blow into the ascending at A. P. C. tho' the Trunk at A. A. and C. is firmly tyed on the Blow-pipe.

* An uncommon Branch between the lower Trunk of the *Vena Cava* and the left emulgent Vein.

y, A Vein which brings Blood from the Muscles of the *Abdomen* into the external Iliack Branch.

z, The Epigastrick Vein of the right Side.

I, The *Vena Saphena*.

The rest of the Branches here displayed commonly differ so much in various Subjects, that the particular Descriptions of them (which none but the *Operator* who dissected them could pretend to be Master of) would be perhaps as useless, as tedious to repeat: Wherefore I pass to those considerable venous Trunks which are wanting in this Scheme.

F I G. 7.

SOME of the large Trunks of the Veins and their *Sinus's* within the Skull, with the Beginnings of the internal Jugular Veins, filled with Wax, and dried together with the *Falx*, &c.

A, The Extremity of the *Falx* cut from the *Cri-fia Galli*.

a, Its lower *Limbus* that touched the *Corpus Callosum*, as it divides the right Hemisphere of the

the Brain from the left; where the fifth *Sinus* passes, which are here dried and disappears.

B, B, The second *Process* of the *Dura Mater*, which supported the hindermost Parts of the Lobes of the Brain, and defended the *Cerebellum* from being press'd by those Parts of the *Cerebrum*.

C, A Portion of the *Dura Mater* remaining to the Longitudinal *Sinus*.

D, D, Several Trunks of the Veins of the Brain cut off before they enter the Longitudinal *Sinus*.

E, E, The Longitudinal *Sinus*'s.

F, F, the two lateral *Sinus*'s.

G, The fourth *Sinus*.

g, The Veins from the *Plexus Choroides*.

H, H, The *Bulbi* or *Diverticuli* at the Beginnings of the internal Jugular Veins.

I, I, The internal Jugular Veins.

K, K, The Trunks of Veins, which bring Blood from the lower Jaw and Parts adjacent.

FIG. 8.

THE Trunks of the *Vena Porta* dissected and displayed; done from the Original Scheme in the *Repository* of the *Royal Society*.

A, A, The Branches of the *Vena Porta* freed from the Liver.

a, The Umbilical Vein.

B, The Splenic Branch.

C, C, The Mesenterick Branches which are continued from the Intestines.

b, The Trunk of the *Vena Pancreatica*, which receives Branches also from the *Duodenum*.

c, c, The *Vena Gastrica dextra Coronaria Superior*.

D, The Superior Coronary Vein of the Stomach of the left Side.

E, The inferior Coronary Branch of the Stomach of the right Side, and

F, The same Coronary Vein of the left Side removed from their proper Situations; from these two last are continued the *Vena Epiploica superior dextra* 1, and the *sinistra* 2, with the *Media* 3.

G, The Vein call'd *Vas Breve*.

d, The *Vena duodeni*.

H, The *Vena Hemorrhoidalis* arising from the *Rectum* and *Anus*, in this Subject emptying it self into the left Mesenterick Branch; but in other Bodies (and particularly in a Preparation of these Veins, which I have now by me) I find this Trunk of the *Hemorrhoid* Veins ending in the *Ramus Splenicus*.

The Length of the Trunk of this *Hemorrhoid* Vein, and its Progress under the *Intestines*, renders it liable to be compress'd, and its reflux Blood retarded; whence its Branches in the *Intestinum Rectum* and *Anus*, become distended with Blood, and cause the *Hemorrhoides Caeae* and *Aperte*; which are frequently attended with *Apostumations* in the *Anus* and Parts adjacent; which Disorders are the more incident, not only because these *Hemorrhoid* Veins (like the rest of the Bran-

ches of the *Vena Porta*) are without *Valves*, and the Blood has an ascending Progress in them, as also that the long Trunk (H) is not only exposed to the Compressions made by the *Intestines* in both Sexes: But particularly the *Uterus* in *Women* in time of *Gestation*, especially near the Birth, so compresses this *Trunk*, that 'tis no wonder we find *Women* more afflicted with the *Hemorrhoids* at that time, than at any other. Nor are the *Iliack* Veins and the *Lympheduct* that accompany them, without being exposed to the like Incumbrance in *Women* with Child, whence the Veins of Legs and Thighs become *Varicose*, and those Limbs are so frequently swoln, which in a late Instance I was acquainted with, when the Intumescence proved so great, that at Length the Abdominal Teguments were vastly extended; but the *Gentlewoman* recovered (beyond the Expectation of some) on the happy *Delivery* of two large Children.

ARTHRISIS, or Articulation; amongst the Writers of Anatomy is divided into (1) *Diarthrosis* or De-articulation, which is a more loose Articulation of the Bones where there is a manifest natural Motion of one Bone on the other; in which it differs from the (2) *Synarthrosis* or Co-articulation, which is a much closer Juncture, and where there is no such natural apparent Motion of one Joint on the other. (3) *Ginglymus*, where each Bone receives into its *Sinus* the *Processus* of the other; as in the Articulation of the *Ulna*, *Tibia*, *Humerus*, & *Os Femorum*.

ARYTENOIDÆUS Minor, is a Muscle which runs on the Surface of the *Arytenoidus Major*, arising from that Part of one of the *Cartilagine Arytenoidæ*, next the *Cricoides* on one Side, and terminating in that Part of the other *Arytenoidæ* *Cartilage*, which is farthest from the *Cricoides* on the other Side. Its Use is to assist the other Muscle of this Name in its Action, which is much strengthen'd by this manifest Decussation of the Fibres.

ASAPHATUM, is a Kind of *Impetigo*, *Serpigo*, or running Itch.

ASHLAR, is the Work-Men's Term for common or free Stone, as it comes out of the Quarry.

ASPECT Double, is a Term in painting, us'd for a single Figure representing two or more different Objects; which is caused either by a Change of the Position of the Eye, or by angular Glasses, &c.

ASSEMBLY, in the Military Art, is the second Beat of a Drum before a March; on hearing this, the Soldiers strike their Tents, and roll them up; and then stand to their Arms. The third beating is called the *March*, as the first is called the *General*.

ASSISA magna, was a more solemn Trial by a Jury of 12 or more Knights, to give their Verdict in a Cause prosecuted *per Breve de Recto*; i. e. where the Dispute lies not about the bare Possession, but of the *Right* and *Property*; in this distinguished from the *Assisa parva* or *minor*, where the Question is only of Possession, in which the Jury were 12 ordinary Legal or Freemen return'd by the Sheriff.

ASSISÆ Judicium, is the Judgment of the Court given against the Plaintiff or Defendant for Default.

ASTROLABE, this *Planisphere* considered as a Projection of the Sphere is of two Kinds. The first is a Projection of the Sphere on the Plane of the

the Equinoctial in the Stereographick Way, the Eye being supposed to be placed in the Pole of the World. The other *Astrolabe* is of *Gemma Fri-sius*; which supposes the Eye in the Point of the Interjection of the Equator and Horizon, projecting

the Sphere on the Plane of the opposite Meridian. *ASTRONOMICAL Hours*, are such as are accounted from the Noon of one natural Day, or as some will have it from Midnight, to the Noon or Midnight of the next natural Day.

The former Equation of apparent Time.

Subtract from the apparent Time, if it be the Sun's mean Anomaly.

LUNAR TABLES.

A Table of the Moon's mean Motion in Hours and Parts of an Hour.

[illegible]

If it be Leap-Year, after *February*, you muſt to the Time given, add a Day, and to the collected Sums of her Motion.

A Table of Physical Parts to be added to, or taken from the Moon's mean Motion, according to the Sun's mean Anomaly.

	Add.						Sol. med.
Anomal.	0	1	2	3	4	5

31	00 17 54 47	In Leap-Year, add a Day to the time given, and the Motion of a Day to the Motion: before coll'd.			
32	01 00 06 13				

Sir Isaac Newton augments the equation of P. 355. as 71. is to 69. and P. 356. as 22. to 21. And he diminishes that of P. 360. as 224. is to 228. in the Sun's Perigee: and as 158. to 228. in the Apogee; and that of P. 361. as 9. to 10.

The Ann. Equation of the Node to that of P. 355. as 95. to 118. of the same kind. The Ann. Equation of the Apogee to the same as 120. to 71. of the contrary kind.

Excentr. } P. 357 } Greatest, } 66782 } 11731 } Greatest Equat. } 7. 40. 0.
 } 358 } Middle, } 55050 } 11731 } Least Equat. } 4. 57. 2.
 } 359 } Least, } 43219 } 11731 }

The

The Uses of the ASTRONOMICAL TABLES, in the Calculation of Eclipses, &c.

BEFORE I shew you the Method of the Calculation of the exact Time of the Eclipses of the Sun and Moon, it will be proper to premise these Observations by way of *Lemmata*; as Mr. Whiston hath done in his *Praelect. Astronom.*

1. That there is this great Difference between an Eclipse of the Sun and of the Moon: That a Lunar Eclipse is the *same entirely*, from what Part of the Earth soever it be look'd upon, and doth not receive any Alteration from the divers Position of Places on the Surface of the Earth; for where there is a real Loss or Deprivation of Light, 'tis all one if you look upon it from the Equator, or from the Poles; for the Beginning, End, and Quantity of the Eclipse of the Moon depends on real Causes, and not only on the different Position of the Observer. But in the Sun the Case is quite otherwise: A Solar Eclipse is not any real Deprivation or Loss of Light in him; 'tis only a local Interruption of the Sun's Light to some particular Places, occasioned by the Interposition of the Moon's Body. For in such Parts of the Earth as have the Centre of the Moon's Body interposed between them, and the Centre of the Sun, there may be had a *Total Solar Eclipse*; whereas in Regions lying at some Distance side-ways from thence, the Eclipse may be only *Partial*; and if they lye very remote, they may not see the Sun eclipsed at all. And therefore *Lunar Eclipses* are of the greatest Use in the finding the Longitude of Places, the Observation of those of the Sun being useless for that Purpose.

2. There are, universally considered, more *Solar* than *Lunar Eclipses*, but there are more of the *Moon* in any one particular Place; for since the Earth's *Disk* is much greater than the *Disk* of its Shadow seen at the Moon, it must needs be that the *Penumbra* of the Moon shall fall oftner into the broader *Disk* of the Earth while the Sun is eclipsed, than the narrower Moon can into the narrower *Disk* of the Earth's Shadow while she is eclipsed. But since the Eclipses of the Moon will be all observable in the same Place, as often as she is never so little above the Horizon of that Place; whereas such of the Sun only will be visible any where, as happen when the Moon is interposed between that particular Place and the Sun: 'Tis easily seen, that in particular Places *Lunar Eclipses* must be most frequent.

3. *Total Eclipses* of the Sun are very rare; so that if you consider them with regard to any particular Place, you will hardly have above two or three in the Compass of an hundred Years. The Reason of which is, that the Vertex or Point of the Conical Shadow of the Moon's Body doth fall beyond the Earth's Surface, and sometimes doth not quite reach it: Nor is that strange, when we take notice, that the Moon's apparent Diameter doth so little exceed that of the Sun, that it can't totally cover or obscure it, but only in some very Rare, Total, and Central Eclipses;

nor in every Central one neither; for if no Eclipse happen when the Sun is in his *Perigaeum*, and the Moon in her *Apogaeum*, the apparent Diameter of the Sun will exceed the Lunar one; and so the Eclipse will appear annular, or the Shadow of the Moon will be environed with a Ring of Light all round about it.

4. The Moon is never eclipsed by the very Shadow of the Earth it self, but only by that of the Earth's Atmosphere. This was a Proposition perfectly unknown to the Ancients, but is sufficiently apparent and manifest from the Consideration of Refraction.

For those Rays of Light which are next the Earth enter into its Atmosphere, and then go out of it again: But while they do thus pass out of a *Rarer Medium* into a *Denser*, they must by the known Laws of Refraction tend towards the Perpendicular; nor can it be otherwise when they go out of the Atmosphere again, for then they will recede from the Perpendicular; and as well in the former Case as in the latter, the Perpendicular being changed, they are inclined the same way; that is, towards the Axis. And from this double Refraction, when brought to Calculation, it appears that those Rays of the Sun, which pass near the Earth, are so *inflected*, as to concur in a Point long before they reach to the Distance the Moon is placed at.

5. In *Lunar Eclipses*, the Consideration of *Parallaxes* and *Refractions* hath no Place; but in *Solar* ones, tho' there be not much regard had to the latter, there must be the greatest to the former. The Reason whereof is, that with regard to Refraction and Parallax, the Shadow of the Earth, in the same Place of the Lunar Transit, is affected after the same manner as the Moon herself would be in passing thro' it, and so produces no Difference in the Calculation. And in like manner in Solar Eclipses, the Refraction of either the Solar or Lunar Light, at the same Elevation above the Earth's Horizon, is still one and the same; (as by late Observation hath been ascertained) as if both Luminaries had been at the same Distance from the Earth.

But with respect to the Parallax, the Case is to be deemed far otherwise: The Sun's Parallax, whether Horizontal, or in any Degree of Altitude, being much less than that of the Moon; and therefore must be accurately considered in the Calculation of Solar Eclipses.

6. The middle Time of Eclipses is not the very Moment of the Full or New Moon, but in or near that Place, where a Perpendicular let fall from the Centre of the Sun, or of the Shadow of the Earth to the Lunar Orbit, doth intersect it. For since the Direction of the Lunar Orbit is diverse from the Direction of the Ecliptick, making with it an Angle of at least five Degrees; and also since the exact Time of the full and new Moon's

The Uses of the Astronomical Tables

is, by Consent of all Astronomers, observed to be in a Plane, not Normal to the Moon's Orbit, but to the Ecliptick, the nearest Approach of the Centres, which is the very middle Moment of the Eclipse, can't happen in the exact New or Full Moon; but a little before or after, according to the Moon's Latitude, and the Position of the Nodes, and in a Plane Normal to the Plane of the Lunar Orbit, and not to that of the Ecliptick.

7. The Investigation and Calculation of Solar Eclipses is much more difficult than that of the Lunar ones, because the Parallaxes of the Sun and Moon are so very different; and also that in the Time of a Solar Eclipse, according as the Altitude of the Luminaries above the Horizon is greater or less, they are very much changed; and during all the Time of the Eclipse, are mutable and variable. Besides the divers Positions of the Ecliptick in different Horizons, whether you consider the Places of the Luminaries, as to Latitude or Longitude, do every where occasion no small Inequalities.

These Things premised, I proceed to the Calculation of Eclipses, beginning with those of the Moon. And the first Work is, *To find the Time of the mean and true Syzygies*. Which is done thus:

1. Out of the Table of the mean Motions of the Moon from the Sun, (which you will find amongst the other Astronomical Tables in this Vol.) write down the proper Numbers for their Time sought, from the Columns of the Radical Year, the Intermediate Year, Month, &c. and then add them all into one Sum, which Sum subtract from an entire Circle or 12 Signs; and the remaining Numbers, either by themselves, if you seek the Conjunction, or with the Addition of a Semicircle (or six Signs) if you desire the Time of the Opposition, being turned into Time, will give the exact middle Moment of the Conjunction or Opposition sought. That is, if you first subtract that Number which is next less than the given Number, and which is to be taken out of the Table of the mean Motions proper for Days, out of the said given Number, and then seek for the Remainder in the same Table for the *Hours*, and subtract the Number there next less out of it, repeating the same Process also for Minutes, Seconds, &c. Then will the Day, with its annexed Hours, Minutes, Seconds, &c. of the mean Time of the Syzygy sought, be most accurately determined. Unless indeed it be Leap-Year; for then the Day next less than it, with its proper Minutes, Seconds, &c. will be the exact Time of the Conjunction or Opposition required.

And having thus got the equable or mean Time of the mean Syzygies, both the *middle* and *true* Time of the true Syzygies may be thus found.

2. The next Work is to find the Sun's Longitude, or his true Place in the Ecliptick for the Time given. Which is done thus:

Seek the Time given in the left Hand Column of the Table of the Earth's mean Motions, and that not only for the Radical, but also for the Intermediate Years, with the Month, Day, Hour, Minute and Second: Write all these down in their Order, with the Tabular Numbers corresponding to them (which are called the *mean Motion* of the Earth and of the Perihelion) in a double Order, so that you may preserve distinctly, not

only the Signs, but also the Degrees and Minutes, and even the Seconds, as they shall occur.

Then add into one Sum, all the mean Motions of the Earth, of the Radix, of the Intermediate Years, of the Month, Day, Hour, Minute and Second, in order to obtain the Earth's mean Place, (or Sun's, if reckon'd in directly opposite Parts of the Ecliptick.) Then add the mean Motions of the Perihelion (taken from both the Tables) after the same manner together, that its *middle Place* also may be had for the Time given.

Next, subtract the *Place* or *Longitude* of the Perihelion before found, from the Earth's *mean Place*, and the Remainder will be the Earth's *mean Anomaly*; which is the Basis and Foundation of all the succeeding Operations.

Then you may next gain the *Coequate Anomaly* of the Earth, or the true Place of the Earth, with regard to the Centre of the Sun: Thus, from the *Table of the Equations of the Earth's Orbit*, in which the Difference between the *True* and *Mean* Motions of the Earth are always given, seek the *middle Anomaly* of the Earth above found, on the Left Hand, if it be within the first six Signs; but on the Right, if it be in the six latter Signs; and find by the Rule of Proportion, the Quantity of the Equation answering thereunto; that is, not only that which the Table gives in whole Degrees, but also what corresponds to the Minutes and Seconds of the *mean Anomaly*; as by the Rule of Three 'tis easy to do: Then will this entire Equation, *deducted* in the former six Signs from the mean Motion of the Earth, and *added* to it in the latter six, give the Earth's *true Place*; and that most exactly, if the Time at first given were the *mean Time*: But if, as it is most usual, it were the Vulgar and Apparent, the Numbers found as above, must be corrected by the Equation of Time: Thus,

Consult the *first Table of the Equation of the apparent Time*, (or that which is made for the Ecliptick Figure of the Earth's Orbit among these Tables, N. 1.) and there seek the Earth's mean Anomaly, either in the right or left Hand Column, (as above shewn) and write down thence the corresponding *Temporary Equation*, either to be added or subtracted according as is there directed: Next go to the *latter Table of Equation*, or that which depends on the Inclination of the Equator and Ecliptick, and entering the Sun's Place in the Ecliptick, either at the Top or Bottom; against it, you have that proper Equation, either to be added or subtracted as occasion requires. And thus having gotten these two Equations, if they are *both* to be *added*, or *both subtracted*, the absolute Equation will be their *Sum*; but if they are different, it will be their *Difference*: And this absolute Equation will help us to investigate the Sun's Place at any given *apparent Time*, tho' at present it is done only as to the *middle Time*. For if out of the *Table of the Earth's Horary Motion*, accounted with respect to the *mean Anomaly*, you find (by the Rule of Proportion) the Earth's Motion corresponding to this *absolute Equation*, and add it to, or *subtract* it from, as occasion requires from the Sun's true Place before found; what results, will be the Sun's correct Place in the Ecliptick for the Time given. An Example will make all this plain.

Suppose

To find the Moon's true Place in the Heavens.

Suppose you would have the Sun's Place in the Ecliptick for *October* 25. at one Hour, five Minutes, and thirty Seconds Afternoon, in the Year of Christ 1668 past.

Note 1. That the *Radix*'s of the mean Motions in *Flamsteed*'s Tables, are accommodated to the Meridian of *London*, and deduced from the Noon of the Day immediately preceding the Kalends of *January*; and therefore, every Leap-Year, a Day must be added to the Time given; and since the Year before us in this Question was Leap-

Year, and the Month given *October* is at a distance from *February*, (and it will be the same in all Months after the last of *February*) you must reckon the Time, not the 25th but the 26th of *October*. Look then into the Table of the Earth's mean Motions for the Year 1661. (which is the next preceding *Radix*) where you find the Sun's Place to be 9 Signs, 20 Degrees, 25 Minutes, and 42 Seconds, and the *Perihelion* to be 3°. 7'. 6". 50".

Make a little Table, and write all things down thus:

		h. ' "					
		What is the Sun's Place Oct. 25. 1. 5. 30. p. m.					
		In the apparent Time A. D. 1668 ?					
		Sun's Motion.				Perihelion's Motion.	
		S.	0	'	"	S.	0 ' "
1661.		9	20	25	46	3	6 35 0
7.		11	29	18	48		5 50
Bissect. Oct. 26.		9	24	42	30		41
Hour 1.				2	28		
Min. 5.					12	3	6 42 31
Seconds 30.					1		
Sum of all		34	14	29	45	Sum of all, and the Place of the Perihelion.	
Deduct		24					
						for 2 Circles.	
Remains		7	14	29	45	For the Sun's mean Motion. Being the Place of the Perihelion.	
Deduct		3	6	41	31		
Remains		4	7	48	14	Which is the mean Anomaly. The mean Motion. The proper Equation found as above.	
Again from		7	14	29	45		
Subduct				1	32	1	
Remains		7	12	57	44	The Sun's Place. The proportionable Parts to be subtracted, as above shewn.	
Subtract again					40		
Remains		7	12	57	04	For the Sun's corrected Place.	

And thus may the Sun's Place be truly calculated for any Time assign'd.

To find the Moon's true Place in the Heavens.

IN order by these Tables to calculate truly the Place of the Moon, which is much more intricate and troublesome than the former; it will be proper previously to remember these Particulars about her Motion.

1. That her *very mean Motion* it self is subject to some Variation; and according to the various Distance of the Earth from the Sun, which is called its Anomaly, (and belongs to the Moon as well as the Earth) is sometimes compleated quicker and sometimes slower: So that her middle menstrual Motion is a little swifter in the *Aphelia*, and a little slower in the *Perihelia*.

2. Besides, the Motions of the Moon her self and of the *Apogaeum*, (such as we had in the Sun) here is to be considered peculiarly, the Retrograde Motion of the Nodes of the Lunar Orbit; and this Motion is to be *added*, where the former Motions were to be *subtracted* from the Place of the *Radix*, and *vice versa*.

3. The very Motion it self of these Nodes is *unequable*; so that according to the different Position of the Line of the Nodes of the Moon's Orbit, with regard to the Sun, the Quantity of its Velocity is various and mutable, and therefore this *Inequality* must be *equated* before the Calculation can go on well.

4. The Eccentricity of the Moon's Orbit is subject to the greatest Inequality; for in the same Position of the monthly Lunation, when the *Linea Apfidum* is in the Syzygies, the Eccentricity is much greater than when 'tis in the Quadratures: For the Moon doth not revolve in an Ellipse, whose Figure is given in Specie, but in one perpetually changing, and whose Form is much more *oblong* in the Syzygies than in the Quadratures, when she comes nearer to a circular Figure: And this Inequality or continual Variation of her Excentricity, and which can scarce be accurately determined,

The Uses of the Astronomical Tables.

mined, causes a very considerable Difficulty in Lunar Calculations.

5. The Motion of the *Apsis* is as unequal, if not more so, than that of the Excentricity; sometimes Stationary, sometimes Progressive, and sometimes Retrograde.

6. The Moon in every Month moves faster in the Syzygies, than she doth in her Quadratures; and this Variation also must be equated, before the Calculation of the Moon's Motions can succeed well.

7. The Angle of Inclination of the Plane of her Orbit to that of the Ecliptick is also continually changing; and this too must be brought to an Equation, before the Place of this every way variable Planet can be exactly calculated. See Sir Isaac Newton's *Theory of the Moon*, in Vol. I.

The Things being premised, let us attempt to calculate the Moon's true Place in the Heavens for any given Moment of Time.

1. First, the Sun's true Place, his mean Anomaly, both the proper Parts of their corresponding Equation, and the *Absolute Equation* thence arising, must be found by the Method above described, without which the Lunar Calculations will not be exact: For the Lunar Inequalities depend chiefly upon the Sun's Place; and without his mean Anomaly, the mean Motions of the Moon, and her other compound and irregular Motions, cannot be adjusted. And indeed unless both these are had, the absolute Equation of Time can't be obtained; which yet is so very necessary to be known, that nothing can be done without it: For the given apparent Time must first, by Means of this Equation, be reduced to the mean Time; the mean Motions in the Tables being accommodated to that, and not to the apparent Time.

2. From the Tables of the mean Motions of the Moon, of the Apogee, and of the Node, take out the mean Place of the *Radixes* in their several Columns; and then from the following Tables, write out also the mean Motions of the Moon and of the Apogee, for the proper Years elapsed from the Radix, and of the Month, Day, Hour, Minute and Second, placing them in Order, in two Columns (one for the Moon, another for the Apogee) and adding them up severally into one Sum, as you see in the Example annexed to these Directions. By which means you will gain the mean Place of both the Moon and the Apogee for the mean Time given. It was said before, that the Radical Place not only of the Moon and Apogee, but also of the Node, was to be placed in the first Series; but in the others, the intermediate mean Motions of the Node were designedly omitted: For altho' those intermediate mean Motions, answering to the Year's distance from the Radical, and to the Month, Days, Hours and Minutes, are to be taken out as was done in the rest; and moreover to be collected into one Sum, as well as the Radical ones; yet because the Motion of the Nodes (contrary to all the rest) is always Retrograde, the intermediate Numbers are to be subtracted from, not added to the Radical, in order by the Difference to find the true Place of the ascending Node at the Time given. And having thus gotten the mean Places of the Moon, Apogee and Node, the next Work is,

3. To find their true Places. In order to which, let the Numbers answering to the Sun's mean Ano-

maly before found, be taken out of the Table of the Physical Parts, to be added to, or taken from the Moon's mean Motion; and if the Anomaly be less by six Signs than the mean Motion of the Moon, let those Numbers be added to; but if it be greater by six Signs, let them be subtracted from the mean Motion of the Moon, and then you will gain her correct mean Motion.

To gain the true Place of the Apogee, subtract its mean Motion or Place from the Sun's true Place the Remainder will be what they call the *Annual Argument*: Which thus found, you must take out of the Table of the Equation of the Moon's Apogee, &c. the Equation corresponding to this annual Argument; and this either added to, or subtracted from (according as the Table directs) the middle Place of the Apogee will, by the Sum or Difference accordingly, give the true one for the Time given.

4. Out of the same Table take the Excentricity of the Moon's Orbit for the Time given; and if it be less than the mean Excentricity (in the Head of the next Table) subtract it thence; if greater, take the mean Excentricity from it, reserving the Difference for other Astronomical Uses.

5. That you may gain the Moon's Place yet nearer to the true, subtract the true Place of the Apogee of the Lunar Orbit from the correct mean Motion of the Moon (found in Art. 3.) and note the remaining Numbers, for they will shew you the mean Anomaly of the Moon: Which as soon as you have obtained, carry to the Table of the Equations of the Moon's Centre, and thence (making a Proportion when there is occasion for it) take out two Equations, as well that which belongs to the mean Excentricity, as that which answers to the greatest, if the Excentricity before found be one of the greater; or that which answers to the least, if the former Excentricity be one of the lesser; and find the Difference of these two Equations, by carefully subtracting the lesser from the greater. This being rightly done, you may by the Rule of Three thus find the Parts proportional. Say, as the Difference between the greatest or least Excentricity, and the mean one, is to the Difference of the two Equations last found: So is the Difference between the mean and the true Excentricity, to the proportionable Parts sought. Which being thus found, if they are either added to, or subtracted from, as occasion requires, the mean Equation; the Sum or Difference will give the true Equation of the Lunar Orbit, to be added to, or taken from the Moon's mean correct Place, according as the Title directs, and by this means you will obtain the Moon's equated Place. And yet with all this Pains, you have not gotten the Moon's Place ultimately correct; but only such a Place of her, as is supposed to be without the Business of Reflection or Variation, (and also setting aside the Consideration of Latitude) a Matter perfectly unknown to the Ancients both in Name and Nature. But you must go farther thus:

6. Subtract the Sun's true Place from this equated Place of the Moon, and the Difference will be the Distance of the Moon from the Sun, but yet not exactly true. Wherefore out of the Table of the Variation of the Moon, take the Numbers answering to this Difference or Distance between the Sun and Moon, and they will give the true Quantity of the Variation, as the last and consummate Equation.

To find the Moon's true Place in the Heavens.

Equation. Which Equation if it be added to, or taken from the Moon's equated Place, according as Occasion requires, the Sum or Difference will give you what hath been so long sought, *The true Place of the Moon in her proper Orbit*. The next thing to be done, is to gain her true Place, with Respect to the Ecliptick, both in Longitude and Latitude. In Order to which,

7. Subtract the mean Place of the Node (which was before found) from the true Place of the Sun; the Remainder is the Sun's Distance from the Node, which having gotten out of the Table of the Equations of the Node, take the Equation proper to the Distance, which being added or subtracted according to the Title of the Table, will give the *true Place of the Node* for the Time given. And because not only the Equation of the Node, but even the mutable Inclination of the Limit, or of the Plane of the Moon's Orbit to the Ecliptick, is Proportional to this Distance; take also from the same Table, the various Inclination of the Limit, or the Numbers expressing the Excess above the least Inclination (five Degrees) out of the proper Column; that so having gained the true Place of the Moon's Node, and the Equation of the Limit, you may the better obtain the Moon's Longitude and Latitude for the Time given.

8. Take then this true Place of the Node, from the true Place of the Moon in her proper Orbit, before determined, the Remainder is what they call the *Argument of Latitude*: And out of the Table of the *Reduction and Excess* of the Inclination of the Orbit, take the proper Number corresponding to such Reduction or Excess: And say by the Rule of Three, As the greatest Increment of the Limit (in Minutes of Degree) is to the Excess given; so is the present Increment of the Inclination of the Limit (*viz.* above five Degrees) to the Parts Proportional required; which Parts thus found, added to the simple Reduction, shall give a *Reduction true and perfect*, which being after the Manner of an *Equation*, added to, or taken from the Moon's true Place in her proper Orbit; will give her *Longitude*, or her true Place in the Ecliptick.

9. And this Longitude of the Moon being obtained, you must thus proceed to seek her Latitude.

From the *Table of the Moon's Latitude*, which not only shews her simple Latitude, (supposing the least Inclination to be of five Degrees only) but also the Parts Proportional to be added to it, when 'tis near a third of a Degree or 18 Minutes more, Out of this Table I say, take her *simple Latitude* answering to the Moon's Argument of

Latitude, with the Parts Proportional to be added to it, and then say by the Rule of Proportion, As the greatest Increment of these Minutes, is to the present Increment: so is the Excess of the Inclination of the Orbit above the least Inclination before found, to the Parts Proportional; and those added to the *simple Latitude* of the Moon, will give her *true Latitude* from the Ecliptick.

And these Directions are sufficient for finding the Moon's true Place, both in her proper Orbit, and in the Ecliptick; and both as to Longitude and Latitude, at least according to *Horrox's Theory*. But there are yet behind some other Enquiries of no contemptible Consideration, which must be pursued to compleat the true Theory of this every way changeable Planet. As first, to find the Quantity of the Moon's Horizontal Parallax for any Time assigned. 2. Her apparent Diameter. 3. Her true Horary Motion in either Syzgy; and the Knowledge of these, is very necessary for the exact Calculation of the Eclipses of the Luminaries. Wherefore let us next go on thus.

10. To find the true Horary Motion of the Moon in either of the Syzgies, out of the *Table of the Moon's Horary Motions correspondent to the mean Anomaly*, take out the proper Numbers when the Eccentricity is greatest and least, and note the Difference; then seek the true Eccentricity of the Moon's Orbit, in the very Moment of the Syzgy (according as directed in Number 5 above) and observe well the Difference between that, and the *least Eccentricity* of all; then work thus according to the Rule of Proportion. As the Difference between the greatest and the least Eccentricity, is to the Difference of the Horary Motions now found: so is the Difference between the present and the least Eccentricity, to the Parts Proportional; which Parts so found, if *added* to the Horary Motion corresponding to the least Eccentricity, when 'tis *less* than the Horary Motion belonging to the greater Eccentricity, or *subtracted* when 'tis *greater*; will give the true Horary Motion of the Moon, both with regard to the Sun, and also to the Ecliptick, in the very Moment of the Syzgies. And from this, taking the Horary Motion of the Sun (above found) you will have the Horary Motion of the Moon from the Sun.

And when thus the Reason and Method of finding the Moon's *Horary Motion* is known, that of determining her *Horizontal Parallax*, and *apparent Diameters* will be so too, the Reason of both being one and the same.

The Calculation of Eclipses.

IN order to make the Nature of Eclipses, their several Phenomena, and the Calculation of the Times of their Appearances more clear and intelligible, it may be useful (with Mr. Whiston) to premise these following Preparatory Propositions.

1. That the Moon is a Body perfectly Opaque, having no Manner of Light of her own, nor a Power of transmitting the Light she receives from the Sun.

2. That the Earth and Moon are both Bodies very little, in Comparison with the Bulk of the Sun, as appears from their several Diameters: That of the Sun being about half a Degree; whereas that of the Earth is not above a Third of a Minute, and that of the Moon scarcely a Fourth of the Diameter of the Earth, if they were both to be seen from the Sun.

3. Wherefore the Figure of the Shadow in both a Solar and Lunar Eclipse must be conical, and terminating in a Point.

4. The *Mucro* or *Vertex* of this Cone of Shadow in either Eclipse, falls short of any of the other Planets; which therefore can never be concerned in these Deficiencies of Light.

5. Were the Plane of the Lunar Orbit coincident with that of the Ecliptick, there would be a total and central Eclipse of each Luminary in every *Sudation*; and the *Lunar* Eclipses would be visible all over those Parts of the Earth, whose Horizon she is above: But the *Solar Eclipse* only to those Parts of the Earth directly opposite to the Sun and Moon at that Moment, which is the very Moment of the Syzgy: And consequently to determine these Eclipses *then*, we need only calculate *that*.

6. But because there is for the most Part, an Inclination, or Angle of a little more than five Degrees, made between those two Planes; it will be plain that Eclipses can only happen at those Full and New Moons, in which she is in or near the *Nodes*, or the Points of Intersection of the two Orbits: And this happens usually in every *Lunation*. Wherefore were the *Lunar Nodes* *immoveable* (with respect to the Sun) there would be even now, an Eclipse of each Luminary, in every Synodical Month.

7. And because for the producing an Eclipse, not only the *Access* of the Moon to the Nodes is necessary, but also *such an Access* as shall happen at the time of any of the *Syzgies*, or at either New or Full Moon, 'tis plain, that the Eclipses of the Luminaries can *only* happen at those Times of the Year, in which the *Syzgies* are in or near the Nodes.

8. Wherefore there will be, for the most Part, four notable Eclipses, or such as shall be visible and conspicuous to some or other of the Inhabitants of the Earth, every Year. Two Solar, and two Lunar. For since for many Days together, the Sun's Place is once in every Year, but a little distant from the Northern Node: and then after about a Fortnight, (for the same Time) as near to the Southern Node of the Moon, there must happen (generally) two *Syzgies*, during each of these *Accesses* of the Sun to the Node, and consequently at each *Syzgy*, there must be an Eclipse.

Having thus in Part prepared the Way for the Calculation of Eclipses by these Preliminary Considerations; the Work it self will follow by Degrees. And first in Order,

To calculate an Eclipse of the Moon.

YOU must proceed thus, *To find the Time of the mean and true Syzgies.*

1. From the Table of the mean Motion of the Moon from the Sun, take out the proper Numbers for the radical Year, and the present Year, and Month, and writing them down, add them up into one Sum; which Sum take out from an entire Circle or 12 Signs: Then if you seek for the *Conjunction*, the remaining Numbers alone, or with the Addition of six Signs or half a Circle if you want the *Opposition*, being turned into Time, will give you the *mean Moment* of the *Conjunction* or *Opposition* sought; that is, if first you deduct (out of the next Table of the mean Motion for Days) the Number which is next less than the given one, from that given Number; and so do also out of the Columns for Hours, Minutes, Seconds, &c. for then the Day with its Hours, Minutes, Seconds, &c. so found shall be the accurate *mean Time* of the *mean Syzgies*,

provided it be not Leap-Year: For if it be, you must take the Year that is next less with its Months, Days, Hours, Minutes, Seconds, &c. adjusted as before.

And thus having got the mean or equable Time of the *mean Syzgy*, you may by the following Method, find the *mean* and *true Time* of the *true Syzgies*.

2. First find the *Longitude* of the Sun in the Ecliptick, and of the Moon in her Orbit, as hath been before shewn: Then if the Places of the Sun and Moon agree in Longitude exactly, which very rarely happens; or if they are diametrically opposite, then both the *mean* and *true Syzgies* do both happen at the same Moment of Time: But if, as it will most Times happen, they be not the same, the *Difference* between them must be noted, and turned into *Time*, in order to find the *true Syzgies*, thus.

Write

To determine the Duration and the Time, &c.

3. Write down the true Horary Motion of the Sun, corresponding to the mean Anomaly (found above) and from the same Tables do the same by the Moon; then subtract the Sun's Horary Motion from the Moon's, the remaining Numbers will shew the Horary Motion of the Moon from the Sun, or what she gains in one Hour. Then say by the Rule of Three, As the Motion of one Hour, is to that one Hour, or to 60 Minutes in Time :: so is the Difference of Longitudes, or the Distance of the Sun from the Moon, to the Interval or Space between the *mean* and *true* Syzygy; which Space of Time, if the Moon hath not yet overtaken the Sun, must be added to the mean time of the Syzygy; but if she be gone pass'd him, it must be taken from the mean Syzygy, and the *Sum* or *Difference* will be the *true Syzygy*, to a Moment.

But two Things must here be noted, that this Matter may be truly understood. (1.) That the Moon's mean Anomaly should not be entred in the Table of the Horary Motions, till 'tis first augmented by half its Distance from the Sun, if the Moon have not yet overtaken him; but if she hath, then the Anomaly must be lessened as much. For since the Reason of bringing the Anomaly to that Table, is only to shew with what Velocity the Moon hath attained, or will attain her Distance from the Sun; 'tis plain her Horary Motion is to be taken neither in the Beginning nor End of that Interval, when it may be quicker or slower, but when 'tis at a *mean* in the middle. (2.) The Interval between the *mean* and *true* Syzygy, seldom exceeds 12 Hours, never 14, as by Astronomical Computations is apparent.

4. Having thus found the *mean* Time of the true Syzygy, the true Place of the Sun in the Ecliptick, and of the Moon in her Orbit, must be found (as above directed) corresponding thereunto, together with the Moon's true Latitude from the Ecliptick agreeable to the Moment of the true Syzygy, as hath been already shewn. Then

5. From the *mean* Time thus found, an Equation may be formed to find the *Apparent* thus; Get (as is above shewn) the *absolute Equation of Time*, either *adjectitious* or *ablatitious* by help of the Sun's *mean Anomaly*; and contrary to its Title, add it to,

if it be *ablatitious*, or subtract from, if *adjectitious*, the *mean Time* now found: By which means the *apparent Time* of the true Syzygies will be gained.

6. Having thus obtained the *true* Moment of *apparent Time* of the true Conjunction and Opposition, there are yet two things more to be done, before we can advance any farther; *i. e.* to know the Moment of the *apparent Time*, in which the *Centres* of the Luminaries are at their *least Distance*, and at what Moment of the *same* Time the Syzygies happen in the *Ecliptick*.

There is usually a great Difference between the nearest Approach of their Centres, and the Moment of the full or new Moon, and therefore between those Moments of Time, and the Time of the true Syzygy in the Moon's Orbit, accounting from the Beginning of *Aries*. For the Time of the Ecliptical full or new Moon, in a Plane Normal to the Ecliptick: The Time of the nearest Approach of their Centres, in a Plane nearly Normal to the Lunar Orbit: The *Apparent* Time of the Syzygy in the Lunar Orbit, where the Arches drawn from the Beginning of *Aries*, to the Centres of the Sun and Moon, are equal, is observed to happen in a Plane Normal, neither to the Ecliptick, nor the Moon's Orbit, but in an intermediate one between both. The half therefore of the Excess or Defect of the least Distance of their Centres in the Ecliptical Syzygy, is nearly equal to the Difference between the Time of the full or new Moon in the Lunar Orbit, and that in the Ecliptical Orbit, and consequently to the least Difference of their Centres, and this *half Difference* is called the *Reduction*; which if *taken from* the Time of the true Syzygy, accounted from the Beginning of *Aries*, will give the Moment of the Ecliptical Syzygy; if *added to it*, the Moment of the nearest Approach of their Centres.

To get this Reduction by the Astronomical Tables, note the true Horary Motion of the Moon from the Sun (or Earth) in the Front of the Table, and in the Column under it, and over-against the *Argument of Latitude* placed in the Side, you will find the Reduction sought, to be used, as is just now shewn.

To determine the Time and the Duration, and other Circumstances of the Eclipses of the Luminaries: The first and chief Thing to be done, is to find the least Distance of their Centres.

FOR whether there will be any Eclipse or not; and if one, what its *Quantity*, *Duration*, &c. will be, can only be known this Way.

Now this *least Distance* is always equal to the Moon's *Latitude*, in the apparent Time of the Syzygy, in her proper Orbit. This *Latitude* therefore, at the Time of the Opposition in a Lunar Eclipse must be first sought, as hath been above shewn: And then the next Work will be, to calculate the *Magnitude* or *Semidiameter* of

the Earth's Shadow, in the Place of its Transit over the Moon.

Which being compared with the least Distance of their Centres, will account for the chief Phenomena of Lunar Eclipses. As for Instance,

1. If from the Sum of the Sun's and Moon's Horizontal Parallaxes, you take the apparent Semidiameter of the Sun; the Difference will be the *apparent Semidiameter of the Earth's Shadow*, in the Place of its Transit over the Moon, as is plain

The Uses of the Astronomical Tables.

plain from the Diagram of *Hipparchus* (*vid. Whiston Astronom. p. 62.*) Wherefore the Horizontal Parallax of the Sun and Moon, for the several Degrees of the Anomaly, being given from the Astronomical Tables, and also the apparent Semidiameters; it will be easy to determine the *Magnitude of the Earth's Shadow*.

2. The apparent Semidiameter of the Shadow being thus found, add to it the apparent Semidiameter of the Moon: If their Sum exceed the *least Distance of the Centres* before found, there will be at least a Partial Lunar Eclipse. But if it be less than the least Distance between the Centres, the Moon will not be at all obscured by the Terrestrial Shadow.

3. Next subtract the apparent Semidiameter of the Moon, from that of the Shadow: And if the Difference be equal to the *said least Central Distance*, there will be a *total Eclipse of the Moon*; but *sine mora*, as they say, that is, the Moon will begin to emerge out of the Shadow, as soon as ever she is *totally* obscured. If this *Difference* be less than the Distance aforesaid, only some Parts of the Moon's Body will be covered: But if it be greater, the Eclipse will not only be *total*, but *cum mora*; that is, the Body of the Moon will remain perfectly covered for *some time*.

4. In order to find the *Quantity of the Eclipse*, especially in *Partial* ones, (which Quantity is commonly estimated by Digits and 60th Parts of Digits; for the Moon's Diameter is supposed to be divided into 12 Parts or Digits, and each Digit into 60 equal Parts) From the Sum of the *apparent Semidiameters of the Shadow, and of the Moon*, subtract the *least Distance of the Centres*, and then the *Difference or Remainder*, reduced to Digits by the *Rule of Proportion*, will give the *Quantity of the Eclipse*: Therefore say, As the Measure of the Lunar Semidiameter in Degrees and Parts is the *same* in Digits:: that is 60, so shall that Difference which answers to the Quantity of Obscuration in Degrees and Parts, be to the *same*, accounted in Digits and Parts.

5. To find the *Angle of Incidence*, proceed thus; As the Sum of the apparent Semidiameters of the *Shadow, and of the Moon*, is to *Radius*:: so is the least Distance between their Centres, to the Cosine of the Angle of Incidence, which therefore will be found; as also, its Equal, the *Angle*

of the *Exit*. But since in total Eclipses, not only these two Angles of *Incidence* and *Exit*, but also that of *total Immersion and Emergence* is to be considered, you must next proceed to find it. Which this Proportion gives,

6. As the *Difference* of the *apparent Semidiameters* of the *Shadow* and of the *Moon*, is to *Radius*:: so is the *least Distance of the Centres* to the Cosine of the Angle of Immersion. Wherefore the Quantity of the Eclipse being known, you will have the Angle of *Incidence* and *Immersion*.

7. To find the *Mora or Time of the Duration of a Lunar Eclipse*.

Say, As *Radius* to the Sine of the Angle of Incidence:: so is the Sum of the apparent Semidiameters of the *Shadow* and of the *Moon*, to the *Semi-mora*, or half the Duration of the Eclipse.

8. To find the *Duration of the absolute Darkness in a total Lunar Eclipse*.

Say, As *Radius* to the Sine of the Angle of Immersion:: so is the Difference of the apparent Semidiameters of the *Shadow* and *Moon* to the Motion of the *Semi-mora*, or the Duration of absolute Darkness. I say the Motion of the *Semi-mora*, because the Motion of the Moon during that Space of Time, or the Line that she describes during this *Semi-mora*, or half Space of Time in which the absolute Darkness continues, is rather meant, than the *Mora* or Space of Time it self. But if you would have it express'd in Time; say, As the Horary Motion of the Moon from the Sun, is to an Hour or 60 Minutes in Time:: so is the Motion of the *Semi-mora* in the absolute Darkness, to the half Time of its continuance: And thus the *middle Moment* of the Eclipse is found.

9. To find the *Moment of the Beginning and End of a Lunar Eclipse*.

From or to the middle Moment of the Eclipse, take or add the Semi-duration, and you must have the Beginning and End. And if from or to the middle Moment you take or add the *Semi-mora* of absolute Darkness, you will have the Beginning and End of that Darkness.

And thus have you a Calculation of a Lunar Eclipse, not very difficult, if compared with that of a Solar one, and free from the Trouble of Parallaxes and Refractions. An Example follows.

A Calculation of the Moon's Place.

A Calculation of the Moon's Place for April 5. 1707. at 1^h. 46^m. p. m.

		Mid. Motion				Apogæum.				Retrogr. Node.			
		S.	°	'	"	S.	°	'	"	S.	°	'	"
Radix	1701	10	15	19	50	11	8	18	20	4	27	24	20
Years since	6	2	9	28	55	8	4	5	44	3	26	1	29

Former Equation add				7	15	True Mean							
Latter Equation subtract				7	39								
The Dif. is Equation now add				0	24								
Wherefore the apparent Times of the Eclipse will be thus,													
Beginning	11	42	42	}		The Horary Motion of the Moon				29 56			
Middle	13	40	9			Of the Sun				2 26			
End	15	37	36			Horary Motion of the Moon from the Sun				27 30			

As 1650". 60' :: 172. 6 $\frac{1}{4}$. Wherefore the Difference of Time to be subtracted, is 6 $\frac{1}{4}$.
And therefore the middle of the Eclipse will be 13 h. 39'. 45"

The Moon's Horizontal Parallax add 54'. 48".
The Sun's 10

Sum 54 58
The Sun's Semidiameter Subtr. 16 01

Remains Semidiameter Shadow 38 57
Moon's Semidiameter 14 52

Sum 53 49

Then say 27. 5 : 60' :: 53, 8 : 117. 7 = 1h. 57. 7. Wherefore the Duration of the Eclipse, is 3h. 55'.
Beginning 11h. 42m. 18"
End 15h. 37m. 12".

To

To Calculate the Eclipse of the Sun.

IN order to which, let it be premised, 1. That this Eclipse of the Sun is *improperly* so call'd, and may with much more Justness take the Name which some of our Modern Astronomers have given it, when they call it an *Eclipse of the Earth*; for so in reality it is, the Sun by no means being deprived of his Light, but only some Parts of our Earth lose theirs, by being within the Shadow of the Moon's Body, when it happens to be interposed between them and the Sun.

To illustrate this the better, let us *suppose* the Earth for a Time deprived of its diurnal Rotation round its Axis, while the Moon freely revolves round us. And suppose the Moon to be in the very Nodes, and so without any Latitude: Then 'tis plain that the Centre of the Moon, being in the Plane of the Ecliptick, directly interposed between the Centres of the Sun and Earth, will occasion a Central Eclipse of the Sun, to such People as inhabit the Earth's Equator; which will be *total*, if in that Place the apparent Diameter of the Moon *exceed* that of the Sun, but if it *fall short* of it, as is most usual, then the Eclipse will be *annular*.

2. But if at the Time of the Eclipse, the Moon be not in the *very Node*, but a little Di-

stance from it; then the Centre of the Moon's Shadow will not describe the Ecliptick, nor any *great Circle* on the Earth, but a *lesser Circle*, or a Chord of a great Circle in the *Plane* of the *Disk*.

3. The Figure of the *true* Line or Path, which the Centre of the *Penumbra* and Shadow describes on the Spherical Surface of the Earth, is not exactly Circular, but a Portion of a Curve *more or less regular*, according to the Motion of the Earth and the obliquity of its Incidence.

4. The Moon's *true Parallax*, to be estimated in a Vertical Circle, here puts on the form of other Parallaxes, and makes a Difference, not only in a Vertical Circle, but even in those of Longitude and Latitude; So that on this Account, the apparent Longitude and Latitude of the Moon, do very much vary, and render the *exact* Calculation of Solar Eclipses very difficult.

5. However there hath been a Geometrical Method found out by Sir *Christopher Wren*, Mr. *Flamsted* and Mr. *Halley*, to avoid this tedious and precarious way of Parallaxick Calculation, and of delineating a Solar Eclipse by Scale and Compass. See *Flamsted's Doctrine of the Sphere*, in Sir *Jonas Moore's Mathematicks*. Vol. I.

To determine the Moment of the Beginning and Ending, and the Duration of a Solar Eclipse.

1. **F**ROM the Moon's Horizontal Parallax, subtract the Solar, the Remainder will be the *Semidiameter of the Sun's Disk*. Then collect into one Sum, the *Horizontal Semidiameters* of the Sun and Moon, which Sum will be equal to the Semidiameter of the whole *Penumbra* of the Moon, from whence a Solar Eclipse arises.

2. To the Semidiameter of the *Disk*, add that of the *Penumbra*; and if the Moon's Latitude at the Moment of the true Conjunction in her proper Orbit be *less* than that Sum; there will be, somewhere on the Earth, an Eclipse of the Sun: But if it be *greater*, there will be no Eclipse at all. And if the Moon's Latitude be, alone, *less* than the Semidiameter of the Disk, then the Centre of the Shadow will fall upon the Earth, and so cause somewhere a *Central* Solar Eclipse, but if it be *greater*, there will be only a *Partial* one.

3. From the Semidiameter of the Earth's Disk, take that of the *Penumbra*, and Note the Remainder carefully; for if the Latitude of the Moon, in the Time of the Syzygy in her proper Orbit, be *less* than such Remainder; then will

the whole *Penumbra*, at the middle Moment of the Eclipse, be confined within the Circumference of the Earth's Disk; but if otherwise, it will not be so. And if by Multiplication, you reduce all these Quantities to *Seconds*, you will have the *Angles of Incidence* as they are call'd; that is, the Distances of the Points where the *Penumbra* touches the Disk in its Ingress and Egress; and also the Point where, in the middle Time between both, the Centre of the *Penumbra* enters into, and goes out of the *Disk*.

For these Distances being given in Angles, from the Velocity of the Monthly Motion of the Moon from the Sun, there may, by the Rule of Three, be found the Space of Time proper to each Distance; that is, the whole Duration of the Eclipse will be given, and of the absolute Darkness, and also the Time of the *Mora* of the *Penumbra* within the Earth's Disk, as will appear below.

4. From the Latitude of the Moon at the Time of the Conjunction in her own Orbit (which, as hath been said above, is the same with the least Distance of the Centres so often mentioned) you

To determine the Moment of the Beginning and Ending of a Solar Eclipse.

may find these Angles of Incidence, of the Immersion and Emergence of the Centre, by these Analogies.

As the Sum of the Semidiameters of the Terrestrial Disk, and of the *Penumbra*, is to Radius :: so is the Moon's Latitude, or the least Distance of their Centres, to the Cosine of the Angle of Incidence: And then,

As the Semidiameter of the Earth's Disk is to Radius :: so is the Moon's Latitude, to the Cosine of the Angle of the Immersion of the Centre of the *Penumbra*. And

As the Difference between the Semidiameters of the Terrestrial Disk, and of the *Penumbra*, is to Radius :: so is the Moon's Latitude, to the Cosine of the Angle of the total Immersion.

And since in the *Egress* of the *Penumbra*, the Angles are equal to those in the *Ingress*, the same Numbers will express both.

5. Having thus gained the Cosine of these Angles, and consequently, the Angles themselves; you must next investigate the Motion of the Moon corresponding to each of the Angles respectively. By saying,

As Radius is to the Sine of the Angle of Incidence :: so is the Sum of the Semidiameters of the *Penumbra* and the Earth's Disk, to the Motion of half the Duration of the whole Eclipse; And,

As Radius to the Sine of the Angle of Immersion of the Centre :: so is the Semidiameter of the Disk, to the Motion of half the Duration of Central Eclipses. And again,

As Radius to the Sine of the Angle of total Immersion :: so is the Difference between the Semidiameters of the Disk and *Penumbra*, to the Motion of half the *Mora*, or continuance of the *Penumbra* within the Disk.

6. And when the Motions are thus found, you may gain the corresponding Times by this Analogy: As the horary Motion of the Moon from the Sun, is to one Hour, or 60 Minutes :: so is the Motion of half the Duration, (whether belonging to the Angle of Incidence, to the Angle of the Immersion of the Centre, or to the Angle of the whole Immersion) to the Space of Time corresponding to each Motion respectively.

And having thus gained these *Intervals of Time*; if you add them to, or take them from, the middle Moment of the Eclipse, you will obtain the *Moment of Time*, in which is the Beginning and End of the Eclipse Central or other; the Beginning and End of the *Mora* of the Centre of the *Penumbra* universally, for that Place where you are, or for the Meridian of that Place for which your Tables were calculated; which *Time*, by the Consideration of the Difference of Meridians or Longitudes of Places, may easily be accommodated to any other Place.

And thus may the general *Phænomena* of Solar Eclipses be accounted for and calculated. Their more particular *Affections* may be obtained from the following Considerations, and Methods of Investigation. But let us premise,

1. That in that very Place, where the *Penumbra* first touches and enters the Earth's Disk, the Inhabitants will see the Beginning of the Eclipse, in the uppermost Point of the Sun's vertical Diameter, or in the upper Extremity of the Limb. (2.) In that Place where the Centre of the *Penumbra* enters the Earth's Disk, the Spectators

will see a Central Eclipse of the Sun. (3.) But in that Place where the whole *Penumbra* is first received or contained within the Disk, there the End of the Eclipse will be observed, at the lower End of the Sun's vertical Diameter. (4.) Where the Path of the Centre of the *Penumbra*, in the Meridian Circle intersects the Earth's Axis; and where it intersects the Axis of the Ecliptick in the Nonagesimal Degree, or the Point that is most elevated above the Horizon, there a Central Eclipse will be visible. (5.) In that Place where the *Penumbra* begins to emerge out of the Earth's Disk, the Eclipse will begin in the Western Luminary, in the nadir Point of his vertical Diameter. (6.) In that Place where the Centre of the *Penumbra* goes out of the Limb, a total Eclipse will be visible in the Sun in the West.

7. But where the Centre of the *Penumbra* goes out of the Disk, there will be the perfect End of the Eclipse, which will go off in the Zenith Point of the Sun's vertical Diameter.

These are the general Phænomena of Solar Eclipses; only you may observe, that by Reason the Menstrual Motion is swifter than the Diurnal, they will always begin from the West, and so will proceed on from West to East, during the whole Time of the Eclipse.

Before I quite leave this Affair, it will be proper and useful to acquaint the Reader briefly with Mr. Flamsteede's late invented Method of representing Solar Eclipses by a Geometrical Construction, because 'tis free from all the Embarrassment of Parallaxes, and in some Cases hath the Advantage of Calculation.

Suppose then a Plane to touch the Moon's Orbit, and which shall be posited so as that it shall be at right Angles to the Line which connects the Centres of the Sun and Moon; and that through this Plane, innumerable right Lines be drawn from the Centre of the Sun, to any Circles upon the Earth's Surface, then will these Lines so drawn, project the terrestrial Sphere, and its Circles on that Plane; so that an Eye placed in the Sun, would observe the Earth and its Annual and Diurnal Motion, as if all were transacted in that Plane: Just as we who live on this Earth, observe the Sun and Moon, and their various Motions and Changes, as if performed in Circles of the Sphere projected on a Plane.

From such a Projection therefore of the Earth's Spherical Surface, there will arise in that Plane a Circle for a Base, which will be nearly equal to a great Circle on the Earth, and which is called the Earth's Disk, and will be every where Normal to the Plane of the Ecliptick. From its Centre, suppose a right Line drawn both ways, representing the Earth's Axis, and which according to the different Seasons of the Year, will be variously inclined to the Plane of the Ecliptick, which will be represented by one of the Diameters of the Disk; for the Parallelism of the Earth's Axis, by reason of its various Position to the aforesaid Plane, will make three unequal Angles. Let there be imagined also in the same Plane, innumerable Eclipses to be described by the Diurnal Motion or Rotation of any Point on the Earth's Superficies, these will be the *Elliptical Paths* of the several *Vertexes*, as they are called; by each of these, the Situation of any particular Place is determined, and distinguished from all other in this given Plane. Whence, it will follow, that

if

The Uses of the Astronomical Tables.

if in Solar Eclipses, you can (within the Plane of this Disk) find the Lines and Paths which the Moon her self touches or describes; you may find also the very Places on our Earth which will be then eclipsed by the Interposition of the Moon's Body.

Having then gained by the Precepts above given, the *least Distance* between the Centres of the Earth (or of the Disk) and of the *Penumbra*, and the Distance of this Line of the *least Distance*, from the Axis of the Ecliptick, described or drawn on the Plane aforesaid; let there be drawn thereto, in the Plane of the Disk a perpendicular from the Point of that least Distance, that Line will shew the *Path of the Centre of the Penumbra*, as it transits the Disk; of which you have a Calculation above given, with regard to the Angles of Incidence, of the *Immersion of the Centre*, and of the *total Immersion*. In this right Line, or in this *Path of the Centre of the Penumbra*, note the Hours of your Meridian, with the Quarters, Minutes, &c. (if there be occasion) corresponding to the *Phænomena* of the Eclipse, found as above by Calculation; and let the Hours, &c. also be noted in the *Elliptick Path* of your particular Place, which must be delineated in this Plane; so that each Hour, and each particular part of every Hour, may determine the very Point where *your Place* described by that Ellipsis, is at that Moment of Time. And having thus given these Moments of Time in the *Rectilinear*

Path of the Centre of the Penumbra, and in the *Elliptick Path* of your particular Place, you may by Scale and Compass construct the *Phænomena* of the Eclipse, as they will appear in your particular Place; thus, Take from the same Scale of equal Parts, by which you drew all the rest, the *Semi-diameter of the Penumbra*, and moving one Point of the Compasses along the *Path of the Penumbra*, direct the other towards the *Path of the Place*. If you find it will not reach to it so as to touch it, you may conclude there will be no *Eclipse of the Sun in your particular Place*; but if it doth either touch it, or reach over it, there will be an Eclipse; a *Partial* only, if it touch; a *Total* one, if it reach over the *Elliptick Path*; the beginning of which Eclipse will be at that Hour, or part of an Hour, where the Compasses Legs being carried along *both Paths*, do mark out the same Time in *each Path*: In like manner, the *middle* of the Eclipse will be found to be at that Moment of Time, which the Legs of the Compasses (being opened still at the same Distance, and now carried Parallel to the Axis of the Ecliptick in your particular Place,) will be at that Moment of Time, which shall be markt out both in the *Paths of the Penumbra*, and in the *Path of your particular Place*: See farther in *Mr. Flamsteede's Doctrine of the Sphere in Sir Jona. Moor's Math. Vol. I.*

For the Calculation of the Eclipses of the *Satellites of Jupiter*, See *Jupiter* in Vol. II.

A Table of the Latitudes of many of the most Eminent Places on the Earth; together with their Differences of Meridians in Time and of Longitude in Degrees, accounted from the Meridian of Her Majesty's Royal Observatory at Greenwich, near London.

Note, Those Places Markt thus * having been determined by Celestial Observations; the rest have been corrected by their help.

ASTRONOMY, in order to prepare the Way for the right understanding of this noble Science, as it now stands in the Writings of the modern Astronomers, who have revived and demonstrated the *Ancient Pythagorean System of the World*: And besides those necessary Precognita of the Doctrine of the Sphere, its *Projection in Plano*, and the *Spherick Trigonometry* (which every one ought to know that will pursue this Study;) I shall here (from Mr. Hayes's *Fluxions*, p. 291, &c.) give you such *Physical* and *Mechanical* Propositions, as will qualify you to obtain a sufficient Knowledge of the Doctrine contained in the present Books of Astronomy.

P R O P. I.

The Area's which Bodies (suppose any Planets or Comets) revolving about an immoveable Center, (as suppose the Sun in S) describe by the Rays drawn to the same, are Proportional to the Times of Description, and are all in the same immoveable Plain.

Let the Time be divided into equal Parts, and suppose in one of them, a Body describes the Space AB (by a Power which it has to move in the right Line Ax from A towards x) in the next Moment of Time, if nothing hindred, it would move from B to x , describing the Line Bx equal to AB , so

that drawing the Rays AS , BS , xS to the immoveable Center S , the Areas ASB and BSx described, would be equal: But when the Body comes to B , let a Force in S attract the same, and by one single but strong Impulse, make the Body deviate from the right Line Bx , and move in the right Line BC ; draw xC Parallel to BS , intersecting BC in C , then at the End of the second Moment of Time, the Body will be found in C , in the same Plain with the Triangle ASB ; join SC and the Triangle $SB C$, because of the Parallels SB and Cx , will be equal to the Triangle SBx , and consequently it will also be equal to the Triangle SAB : In like Manner, if the Central Force (or *Vis Centripeta*) act successively in C , D , &c. and make the Body in successive Moments of Time describe the Lines CD , DE , &c. they will be in the same Plain, and the Triangle SCD will be equal to the Triangle $SB C$, and SDE will be equal to $SCD = SB C$. Whence it is manifest that the Body revolving about an immoveable Center in an immoveable Plain, describes equal Areas in equal Times; and by Composition, the Area $SAC S$ is to the Area $SAES$, as the Time which the Body takes to describe *that*, is to the Time it takes to describe *this*.

Vol. II.

Let the Number of the Triangles be increased, and their Breadth diminished in *infinitum*, then the Perimeter $ABCDE$ will be a Curve Line, and consequently the *Vis Centripeta* which perpetually draws back the Body from off the Tangent of this Curve, acts continually; and the Areas $SACS$, $SAES$ Proportional to the Times of their Description, will also in this Case be Proportional to the same Times. *Q. E. D.*

C O N J E C T A R R I.

If a Body or Planet revolving in the Curve ABC , be attracted by a Central Force in S , or gravitate towards the Sun there; and if the Body describe the infinitely little Portions of the Curve AB and BC in equal Times, then the infinite little Triangles ASB , BSC will be equal; and if on the Center S , and with the Radii SA , SB , the little Arches Ab , Bc , be described, then the Triangle SAB or $SAb = \frac{1}{2} SA \times Ab$, and the Triangle $SB C$ is $= \frac{1}{2} SB \times Bc$; therefore it is, $\frac{1}{2} SA : \frac{1}{2} SB :: SA : SB :: Bc : Ab$; that is, the infinitely little Arches Ab , Bc , are Proportional to the Radii SA , SB .

D E F I N I T I O N I.

The Center of Attraction is that Point to which the revolving or moving Body is attracted or impelled by the Force or Impetus of Gravity; thus the Sun is such in the respect of the primary Planets, and the Earth in respect of the Moon.

D E F. II.

Paracentric Motion of Impetus is so much as the revolving Body approaches nearer to, or recedes farther from the Center of Attraction; thus if S be the Center of Attraction, and if a Body in A move to B , then $SB - SA = Bb$, is called the Paracentric Motion of that Body.

D E F. III.

Circular Velocity of a Body is measured by the Arch of a Circle; thus if a Body in A move to B , or b , its Circular Velocity is measured by the Arch of the Circle Ab describe on the Center of Attraction S , and the Circular Velocity of a Body moving from B to C is measured by the Circular Arch BC .

D E F. IV.

Conatus Excussorius is measured by a Line let fall from a Point infinitely near to another Point, Perpendicular to a Line drawn to touch the Curve in that other Point: whence it is manifest that the *Conatus Excussorius Circulationis*, or *Conatus Centrifugus* may be express'd by BN the versed Sine of the Angle of Circulation CSN (or by ck , because the Difference between the Radii SC , SB is incomparably little) for the versed Sine is equal to a Tangent drawn to the other End of the Arch.

DEFIN. V.

Solicitatio Paracentrica Gravitatis vel Levitatis, or the *Paracentric Solicitation* of Gravity or Levity, is express'd by the right Line AL , drawn from the Point A , Parallel to the Ray SB (infinitely near SA) until it intersect the Tangent BL .

LEMMA I.

The versed Sines of infinitely little Arches are in a duplicate Ratio of the Chords of the said Arches.

Let the right Line AD touch the Circle ABG in A , then DAB is the Angle of Contact; Let AB be an infinitely little Arch, AB the Chord, and AC the versed Sign thereof, I say AC or BD is as the Square of AB ; that is, if another infinitely little Arch Ab be taken, then the versed Sine Ac (or bd): Versed Sine AC (or BD): $Abq: ABq$.

Draw the Diameter AG , and draw the Lines GB , Gb ; then by the Property of the Circle, we have $ABq = AC \times AG$ and $Abq = AG \times Ac$; whence it is, $ABq: Abq:: AC \times AG: AG \times Ac:: AC: Ac:: BD: bd$.

Now when the Points B, b , are infinitely near the Point A , then the Chords AB, Ab , are equal to the Arches AB, Ab , and consequently the Versed Sines AC, Ac , or the Subtenses of the Angle of Contact BD, bd , are in a duplicate Ratio of the conterminal Arches AB, Ab .

And if the Lines BE, be , subtend the Angle of Contact DAB , and be Parallel to any Line (less than the Diameter AG) drawn within the Circle, as AR , then the Lines BE, be , will be as the Squares of the conterminal Arches AB, Ab , for $BD: bd:: BE: be:: ABq: Abq$.

COROLLARY.

The Subtenses of the Angles of Contact of Curves, whose Curvature in the Point of Contact is the same with that of some Circle (or when the Difference between them is incomparably little) are in a duplicate Ratio of the conterminal Arches.

LEMMA II.

In unequal Circles ABD, GbE , if the infinitely little Arches BD, bd be equal, then the versed Sines BN, bn of these Arches will be reciprocally Proportional to the Radii SB, Sb .

Produce SD unto E , and draw EF Parallel to Sb , and draw the Lines DN, EK, dn perpendicular to SB .

Then it is, $bK: BN:: Sb: SB$.

And $bn: bK:: bdq: bEq$.

But $bE = \frac{Sb}{SB} BD$.

Therefore, $bn: BN:: Sb \times BDq: \frac{Sbq}{SB} BDq$.

That is, $bn: BN:: \frac{bdq}{Sb}: \frac{BDq}{SB}$.

And sup- } $bd = BD$
posing.

We have $bn: BN:: SB: Sb$. Q. E. D.

PROP. II.

The *Conatus Centrifugi* (or *Vires Centripetæ*) of Bodies revolving in equal Circles, with an equable Motion, are in a duplicate Ratio of their Velocities.

The *Conatus Centrifugus* is equal to the versed Sine of the Angle of Circulation, and the versed Sines of Arches infinitely little are in a duplicate Ratio of the Chords of those Arches; that is, in a duplicate Ratio of the Arches themselves, and the Velocities (the times being supposed equal) are as the Arches, therefore the *Conatus Centrifugi* are in a duplicate Ratio of the Velocities.

CONSECTARY I.

If two Bodies B, b , revolve in unequal Circles, ABD, GbE , and describe the Areas SBD, Sbd ; then the *Conatus Centrifugi* (or *Vires Centripetae*) DC, dc , will be in a Ratio compounded of the duplicate Ratio of the Velocities directly, and the simple Ratio of the Radii inversely.

For if the Radii be equal, the *Conatus Centrifugi* are as the Squares of the Velocities; and if the Velocities be equal, the *Conatus Centrifugi* are reciprocally as the Radii; therefore if neither the Radii nor the Velocities be equal, the *Conatus Centrifugi* are in a Ratio compounded of the Rationes of the Squares of the Velocities directly, and of the Radii inversely.

This *Corollary* is demonstrated more universally, in one of the Steps of the Second Lemma; for it is there, $bn : BN :: \frac{bdq}{Sb} : \frac{BDq}{SB}$.

CONSECTARY II.

And if the Bodies B, b , describe the equal Areas BSD and bSd in equal Times (that is, if $SB \times BD = Sb \times bd$, then $bd : BD :: SB : Sd$) then the Velocities BD and bd will be reciprocally as the Radii, and the Squares of the Velocities will be as the Squares of the Radii inversely,

whence the proportion $bn : BN :: \frac{bdq}{Sb} : \frac{BDq}{SB}$ will become $bn : BN :: \frac{SBq}{Sb} : \frac{Sbq}{SB} :: \overline{SB}^3 : \overline{Sb}^3$, that is, the *Conatus Centrifugi* are reciprocally in a triplicate Ratio of the Radii.

CONSECTARY III.

If the Velocities be directly as the Radii, then the periodic Times will be equal, and the Analogy $bn : BN :: \frac{bdq}{Sb} : \frac{BDq}{SB}$ will become $bn : BN :: Sb : SB$; that is, the *Conatus Centrifugi* are proportional to the Radii.

CONSECTARY IV.

If the Bodies B, b , describe the Arches BD, bd in equal Times, then the periodic Time of b will be to the peroidic Time of B , as $\frac{Sb}{bd}$ is to $\frac{SB}{BD}$; because the Times are directly as the Spaces and reciprocally as the Velocities; and because $bn : BN (:: dc : DC) :: \frac{bdq}{Sb} : \frac{BDq}{SB} :: \frac{SB}{BDq} : \frac{Sb}{bdq} :: (\text{Multiplying by } SB \times Sb) \frac{SB \times Sb}{BDq \times bdq} : \frac{SB \times Sb}{SB \times Sbd} : \frac{SB \times Sbq}{BDq} : \frac{SB \times Sbq}{bdq}$. Therefore the *Vires Centripetae* are in a Ratio compounded of the Rationes of the Radii directly, and the Spaces of the periodic Times inversely.

CONSECTARY V.

And if the Squares of the periodic Times be as

the Radii, that is, if $\frac{Sbq}{bdq} : \frac{SBq}{BDq} :: Sb : SB$, then it will be $bn : BN :: \frac{Sb \times SBq}{BDq} : \frac{SB \times Sbq}{bdq} :: (\text{by substitution}) Sb \times SB : Sb \times SB$; that is, the *Vires Centripetae* are equal; and because $\frac{Sb}{bdq} = \frac{SB}{BDq}$, therefore $\sqrt{Sb} : \sqrt{SB} :: bd : BD$; that is, the Velocities are in a Subduplicate Ratio of the Radii. *Et vice versa*.

CONSECTARY VI.

And if the Squares of the periodic Times be as the Squares of the Radii, that is, if $\frac{Sbq}{bdq} : \frac{SBq}{BDq} :: Sb : SB$, then it will be $bn : BN :: \frac{Sb \times SBq}{BDq} : \frac{SB \times Sbq}{bdq} :: (\text{by substitution}) Sb \times SBq : SB \times Sbq :: SB : Sb$; that is, the *Vires Centripetae* (or *Conatus Centrifugi*) are reciprocally as the Radii; and because (in this Supposition) $SBq \times \frac{Sbq}{bdq} = Sbq \times \frac{SBq}{BDq}$, therefore $BD = bd$; that is, the Velocities are equal: *Et vice versa*.

CONSECTARY VII.

If the Squares of the periodic Times be as the Cubes of the Radii, that is, if $\frac{Sbq}{bdq} : \frac{SBq}{BDq} :: Sb^3 : SB^3$, then it will be $bn : BN :: \frac{Sb \times SBq}{BDq} : \frac{SB \times Sbq}{bdq} :: SB \times \overline{SB}^3 : SB \times \overline{Sb}^3 :: SBq : Sbq$; that is, the *Vires Centripetae* are reciprocally in a duplicate Ratio of the Radii; and because $\frac{SB}{bdq} = \frac{Sb}{BDq}$, therefore $\sqrt{SB} : \sqrt{Sb} :: bd : BD$; that is, the Velocities are reciprocally in a subduplicate Ratio of the Radii: *Et vice versa*.

SCHOLIUM.

And because it is found by Observation, that the Squares of the periodic Times of Planets, are as the Cubes of their Distance from the Sun; and that in equal Times they describe equal Areas about the Sun: Therefore it is manifest, that the Sun is the Centre of all the Planetary Motions; and that the *Vis Centripeta* (or Force of Gravity) of one Planet, is to the *Vis Centripeta* of another Planet, as the Square of this Planet's Distance from the Sun, is to the Square of that Planet's Distance from the Sun.

It is also evident that those Planets which are nearest the Sun move swiftest, for the Velocity of one Planet is to the Velocity of another Planet, as the Distance of this Planet from the Sun is to a mean Proportional between the Distances of this and that Planet from the Sun.

P R O P. III.

If the Area which a Body, revolving about an immoveable Center, describes by Rays drawn to the said Centre, be proportional to the Times of Description, the Elementum or infinitely little Increment or Decrement of the Paracentric Impetus is equal to the Difference or Sum of the Paracentric Solicitation (Solicitation of Gravity, or the Impression made by the Action of Gravity or Levity, or any such like Cause) and twice the Conatus Centrifugus, viz. to the Sum, if it be the Solicitation of Levity; or to the Difference, if the Paracentric Solicitation arise from the Action of Gravity.

From the Points P and M, draw the Lines P v, M o perpendicular to S N; then because the Triangles P S N, N S M are equal, (the times being supposed equal) therefore (because

the Base S N is common to both) the Altitudes P v, M o are equal; take $N n = L M$, and draw $M n$ parallel to $L N$; then the Triangles P N v, M n o will be equal and similar, and $P N = M n$, and $N v = o n$; again in the Right Line S N (produced if need be) take $S V = S P$, and $S m = S M$, then is N V the Difference between the Radii S P, and S N, and M m is the Difference between the Radii S N and S M; now $N V = (N v) n o + V v$; and $N m = N n + n o = o m$, therefore $N V - N m = V v + m o - N n =$ to the differentio-differential, or infinitely little Increment or Decrement of the Paracentric Velocity, $= 2 m o - N n$ (because $V v$ and $m o$, the versed Sines of two Angles and Radii, whose Difference is incomparably little, are equal.) Now the Difference between the Radii S P, S N, and S N, S M, expresses the Paracentric Velocity, and their Difference again is the infinitely little Increment or Decrement of the said Paracentric Velocity; and $m o$ or $V v$ is equal to the Conatus Centrifugus Circulationis, and $N n$ is = to the Solicitation of Gravity; therefore the Elementum of the Paracentric Velocity is equal to the Difference between twice the Conatus Centrifugus ($2 m o$) and the simple Solicitation of Gravity ($N n$) or (which may be proved in like manner) to the Sum of twice the Conatus Centrifugus, and the simple Solicitation of Levity.

CONSECTARY I.

Hence it appears, that if the Solicitation of Gravity prevail, then $N V - N m$ will be Negative, that is, $N m$ will be greater than $N V$, and the descensive Paracentric Velocity increases, and the ascensive decreases. But if twice the Conatus Centrifugus prevail, then $N V - N m$ will be positive, and the ascensive Paracentric Velocity increases, and the descensive decreases.

CONSECTARY II.

If the Elementum, or infinitely little Increment or Decrement of the Paracentric Velocity be given, the Solicitation of Gravity or Levity may be found; for the Conatus Centrifugus is always given, (by Conf. 2. Prop. 2.) it being constantly in a triplicate Reciprocal Ratio of the Radii.

P R O P. IV.

The Angles which a Planet describes about the Sun, in equal Times, are reciprocally in a duplicate Ratio of the Radii.

The Circular Velocities are in a Ratio compounded of the Rationes of the Angles and Radii, jointly; therefore the Angles are in a Ratio compounded of the direct Ratio of the Circular Velocities, and the reciprocal Ratio of the Radii: But because in equal Times the Areas are equal, (Conf. 2. Prop. 2.) therefore the Circular Velocities are reciprocally as the Radii, and consequently the Angles are reciprocally in a duplicate Ratio of the Radii.

And such are the apparent Diurnal Motions of the Planets observ'd from the Sun (for Days, in such Cases, are Parts of Time little enough, especially in Planets more remote from the Sun) which are almost reciprocally as the Squares of their Distances from the Sun; so that a Planet, in a given Element of Time, describes but the fourth Part of that Angle, which it would describe at half its present Distance from the Sun.

L E M M A III.

The Spaces which a Body describes in the beginning of its Descent, are in a duplicate Ratio of the Times.

Let the Right Line A E be divided into an infinite Number of equal Parts d D, e E, &c. representing equal Moments of Time; and draw

the Ordinates B D, E C, &c. proportional to the Velocities of the heavy Body, at the end of the Times represented by A D, and A E, and describe the Curve A B C. Now because the Space which a Body describes, is proportional to the Time of Description, and the Velocity jointly; it

it is evident, that the Space which the heavy Body describes in the Moment of Time Dd , is proportional to the Rectangle Db ; and the Space which the same heavy Body describes in the Moment of Time Ee , is proportional to the Rectangle Ee : Whence the Space which the Body describes in the Time AD , is to the Space it describes in the Time AE , as the Curvilinear Space ADB , is to the Curvilinear Space AEC , but when the Body begins to descend, the Ordinates DB , EC are indefinitely near the Point A ; in which Case the trilineal Figures ADB , AEC become rectilinear similar Triangles, the indefinitely little Portions AB , BC being in the same straight Line. Now the Areas of similar Triangles are in a duplicate Ratio of the Homologous Sides; that is, the Area ABD : Area AEC :: AD : AE ; therefore the Spaces which a heavy Body describes in the Beginning of its Descent, are in a duplicate Ratio of the Times. *Q. E. D.*

PROP. V. Problem I.

If a heavy Body revolving in the Periphery of a Curve, about an immoveable Centre, describe Areas proportional to the Times; 'tis required to find the Law of the *Vis Centripeta* tending to the said Centre.

Suppose a Body P to be projected in the Line PR from P towards R , and let the Body at the same Time be attracted by a Force in S , so

that by a Motion compounded of the projectile and attractive Forces, it describe the Curve APp ; and let the Line PR touch the said Curve in P ; draw SP , and assume any Point B in the Curve indefinitely near P ; and draw BR parallel to SP , and BT perpendicular to SP ; assume another Point p in the Curve; and draw Sp , the Tangent pr and rb parallel, and bt perpendicular to Sb , and suppose the Body describes the Arches Pd , pb in equal Times; and draw dc parallel to SP : Then the Ratio of the *Lineola Nascens* BR to the *Lineola Nascens* br , is compounded of the Rationes of BR to dc , and of dc to br : But (*Lem. 1. and Cor.*) BR is to dc , as the Square of the Arch PB , is to the Square of the Arch Pd ; and because the Arches PB , Pd are indefinitely little, they are proportional to the Triangles PSB , PSd ; (*Lemma 3.*) that is, they are proportional to the Times the Body takes to describe them, or to the Times which the Body takes to describe the Arches PB , pb , and consequently BR is to dc , as the Square of the Time which the Body takes to describe the Arch PB , is to the Square of the Time it takes to describe the Arch pb ;

again, because Pd and pb are suppos'd to be describ'd in equal Times, therefore dc is to br , as the *Vis Centripeta* in P is to the *Vis Centripeta* in p ; whence it is evident that BR is to br in a Ratio compounded of the Rationes of the Squares of the Times in which the Arches PB , pb are describ'd, and of the *Vis Centripeta* in P to the *Vis Centripeta* in p ; that is, (because the Times of describing the Arches PB , pb , are proportional to the Triangles PSB , PSb , or to the Rectangles $SP \times BT$, $Sp \times bt$.)

$$BR : br :: V \times SPq \times BTq : v \times Spq \times btq$$

$$\text{And by division } \frac{BR}{SPq \times BTq} : \frac{br}{Spq \times btq} :: V : v.$$

$$\text{Or } \frac{Spq \times btq}{BR} : \frac{SPq \times BTq}{BR} :: V : v.$$

That is, the *Vis Centripeta* in P is as the Solid $\frac{SPq \times BTq}{BR}$ inversely.

This may be more briefly demonstrated thus: If the Times be equal, BR is as the *Vis Centripeta*; and if the *Vis Centripeta* be given, then BR (*Prop. 1. Lem. 3.*) is as the Square of the Times; and if neither the Times nor the *Vis Centripeta* be equal, then BR is (supposing $V =$ to the *Vis Centripeta* in P , and $T =$ to the Time of Description) as VT , therefore V is as $\frac{BR}{T}$; and because the Time is as the Area PSB , or as the Rectangle $SP \times BT$, therefore V is as $\frac{BR}{SPq \times BTq}$ directly, or as $\frac{SPq \times BTq}{BR}$ inversely. *Q. E. D.*

COROLLARY.

Hence if any Figure, as APp , be given, and the Point S , to which the *Vis Centripeta* tends; then the Value of the Solid $\frac{SPq \times BTq}{BR}$ may be determined from the Nature of the Figure; and consequently the Law of the *Vis Centripeta*, which is reciprocally as the said Solid, may be found.

PROP. VI. Problem II.

If a Body revolve in the Periphery of an Ellipsis; 'tis required to find the Law of the *Vis Centripeta*, tending to the Focus of the Ellipsis.

Let ABD be the Ellipsis, and S the Focus to which the *Vis Centripeta* tends. Draw the Axis AN ;

AN ; and AN , the Conjugate Diameter BE ; draw the Line PR touching the Curve in any Point (P) and draw the Diameter PG , the Conjugate Diameter DK , PF perpendicular to DK , and Qv parallel to PR : Draw SP intersecting DK in H , and intersecting Qv in x ; and draw QR parallel to SP . Then (*Hayes, Art. 51.*) $PH = AC$; draw QT perpendicular to SP ; and suppose the Parameter of the Axis $\left(\frac{2BCq}{AC}\right) = L$. Then,

$$L \times QR : L \times Pv :: QR : Pv :: Px : Pv :: PH : PG :: AC : PC.$$

$$L \times Pv :: Gv \times Pv :: L : Gv.$$

$$Gv \times Pv : Qvq :: CPq : CDq.$$

And because Qvq is $= Qxq$, when Q is infinitely near P . Therefore,

$$Qxq (= Qvq) : QTq :: (\text{by similar Triangles}) HPq (= ACq) : PFq :: (\text{Hayes, Art. 6c.}) CDq : CBq.$$

And multiplying the respective Terms of these Analogies into one another, there will arise this;

$$L \times QR : QTq :: L \times AC \times CPq : Gv \times CBq \times CP.$$

$$Vir. L \times QR : QTq :: 2BCq \times CPq : Gv \times BQC \times CP.$$

$$L \times QR : QTq :: 2PC : Gv.$$

But when the Point Q is indefinitely near P , then $2PC = Gv$.

$$\text{Whence } L \times QR = QTq.$$

And multiplying both sides of the Equation by $\frac{SPq}{QR}$, we shall have $L \times SPq = \frac{SPq \times QTq}{QR}$.

(*Cor. Prop. V.*) Therefore the *Vis Centripeta* is reciprocally as $L \times SPq$; and because L is a determinate Quantity, therefore the *Vis Centripeta* is reciprocally as the Square of (SP) the Distance of the Body in P from the Centre of Attraction S . *Q. E. I.*

COROLLARY I.

The Parameter of the Axis (L) is equal to $\frac{QTq}{QR}$.

COROLLARY II.

If the Centre of Attraction S , and the adjacent Vertex N , be supposed immovable, and if the other Foci I approach nearer and nearer to S , and at last coincide with the same, then the Body will revolve in the Periphery of a Circle, and the Law of the *Vis Centripeta* will be the same as in the Ellipsis.

COROLLARY III.

If the Vertex's A and N be given, and if the Focus I coincide with A , and the Focus S coincide with N , then the Ellipsis APN will become a straight Line coinciding with the Diameter AN , and the Body will move in the same, without any Attraction from without the Line.

COROLLARY IV.

If the Vertex N , and the (Focus of the Ellipsis, or) Centre of Attraction S be given; and if the other Focus I be at an infinite Distance from S , then the Ellipsis NPA will degenerate into a

Parabola, and the *Vis Centripeta* in P will be as the Square of the Distance NP inversely.

COROLLARY V.

The same things being supposed, if the Focus I be at more than an infinite Distance from S ; that is, if it fall on the contrary Side of N in respect of S , then the Body will move in the Curve of an Hyperbola, and the *Vis Centripeta* will be reciprocally as the Square of the Distance from the Focus S .

COROLLARY VI.

If the Focus I and the Vertex A be given; and if the Centre of Attraction S be supposed at an infinite Distance from I , then the Curve AP will be a Parabola, and the *Vis Centripeta* will be the same in every Point of the Curve; and contrarily, if a Body moving at first in a straight Line, be attracted to a Centre at an infinite Distance from the same, then that Body will move in the Curve of a Parabola, and the Centre of Attraction will be in the Axis of the Parabola, at an infinite Distance from the Vertex.

SCHOLIUM.

It may be observ'd that the Paracentric Solicitation of Gravity, and the Vis Centripeta, are Terms signifying the same thing.

PROP. VII.

The Solicitation of Gravity, or Vis Centripeta of a Planet, is to the Conatus Centrifugus of the same Planet, as its present Distance from the Sun is to $\frac{1}{2}$ the Parameter of the Planetary Ellipsis.

Suppose $SM = D$, and $L =$ to the Parameter of the Axis; and let $t \times L$ be a constant Plane equal to twice the Elementary Triangle

MSN : Then the Arch Mm is $= \frac{t \times L}{D}$, and

$Mm q$ is $= \frac{t^2 \times L^2}{D^2}$, and $mo = \frac{Mm q}{2SM} =$

$\frac{t^2 \times L^2}{D^3} =$ to the Conatus Centrifugus.

Again,

Again, the Solicitation of Gravity is as D : inversely, or as $\frac{1}{D^2}$, or $\frac{t^2 \times L^2}{D^2}$ directly, or as (dividing by the invariable Quantity $\frac{1}{2} L$) $\frac{2 \times t^2 \times L}{D^2}$ directly. Whence 'tis evident that the Solicitation of Gravity is in the *Conatus Centrifugus*, as $\frac{2 \times t^2 \times L}{D^2}$ is to $\frac{t \times L^2}{2 D^2}$, or as D is to $\frac{1}{4} D$; and because $\frac{1}{4} L$ is an invariable Quantity, the Rationes of the Solicitation of Gravity to the *Conatus Centrifugus* are proportionable to the Distances of the Planet from the Sun.

P R O P. VIII.

The greatest Ascensive or Decensive paracentrick Velocity of a Planet, is when the Distance of the Planet from the Sun is equal to $\frac{1}{2}$ of the Parameter of the Axis of the Ellipsis.

Draw SW perpendicular to the Axis AD , I say the greatest Paracentrick Velocity is in W or X . For the Solicitation of Gravity is to the *Conatus Centrifugus*, as D is to $\frac{1}{4} L$; and the Solicitation of Gravity is to twice the *Conatus Centrifugus*, as D is to $\frac{1}{2} L$; and because $SW = D$ is $= \frac{1}{2} L$, therefore in the Point W (or X) the Solicitation of Gravity, is equal to twice the *Conatus Centrifugus*; and (by Prop. 3.) consequently the Fluxion of the Paracentrick Velocity is $= 0$: Whence it is evident, that if on S as a Centre, a Circle be describ'd with a Radius $= \frac{1}{2}$ the Parameter of the Axis, it will cut the Orbit of the Planet in two Points W and X , in which the greatest Paracentrick Velocity happens.

C O R O L L A R Y.

The *Conatus Centrifugus* of receding from the Sun, is always less than the Solicitation of Gravity; for the Solicitation of Gravity is always to the *Conatus Centrifugus*, as the Distance of the Planet from the Focus is to $\frac{1}{4}$ part of the Parameter of the Axis; and in the Ellipsis, the Distance of a Planet from the Focus, is always greater than $\frac{1}{4}$ part of the Parameter of the Axis. Therefore, &c.

P R O P. IX.

The Impetus which a Planet acquires (during the whole time of its Motion) by the continued Attraction of the Sun, are proportional to the Angles of Circulation; that is, as the Angles of apparent Motion from the Sun.

I say, That *Impetus* which a Planet acquires, as it moves from A to P , is to the *Impetus* which it acquires, moving from A to M , as the Angle ASP is to the Angle ASM : For the Increments of those Angles (Prop. 4.) are reciprocally as the Squares of the Radii or Distances; that is (Cor. Prop. 5.) as the Solicitations or Impressions of Gravity: Therefore the Sum of these is proportional to the Sum of those; that is, the Sum of all the *Impetus* or Impressions of Gravity acquir'd from A to P , is to the Sum of all the Impressions of Gravity acquir'd from A to M , as the Angle at ASP is to the Angle ASM .

Vol. II.

C O R O L L A R Y.

Hence in the Point W (in which an Ordinate to the Axis drawn through the Focus S , intersects the Ellipsis) the *Impetus* which a Planet hath acquired since it descended from the Aphelion, is equal to half the *Impetus* acquir'd from the Aphelion to the Perihelion; and in the said Point W , the Distance of the Planet from the Sun is $= \frac{1}{2}$ the Parameter of the Axis of the Figure.

And the *Impetus* which a Planet, describing any Arch of its Orbit, acquires, is to the *Impetus* acquir'd in a Semi-revolution, as the Angle of apparent Motion is to two right Angles; the *Impetus* here meant is that impress'd by Gravity or Attraction, simply consider'd by themselves, the contrary *Impetus* arising from the *Conatus Centrifugus* not being considered.

P R O P. X.

To explain the Motion of a Planet through the whole Revolution; and to show how a Planet approaches to, and again recedes from the Sun, Alternis Vicibus.

If a Planet be at its greatest Digression from the Sun, or in the Aphelion A , the *Conatus Centrifugus* and the Solicitation of Gravity, are less than if it were nearer to the Sun. But at that Distance, viz. in the Aphelion A , the Solicitation of Gravity is greater than twice the *Conatus Centrifugus*, (because SA , the Distance of the Aphelion from the Sun, is greater than $\frac{1}{2}$ the Parameter SW) therefore the Planet will descend towards the Sun in the Curve Line $APMD$, and (Prop. 3.) the descensive *Impetus* will continually increase, as in heavy accelerated Bodies, so long as the Solicitation of Gravity is stronger than twice the *Conatus Centrifugus*: For the descensive Paracentrick Motion increases, as long as the Solicitation of Gravity is greater than twice the *Conatus Centrifugus*; and therefore the descensive Paracentrick Motion will increase (although the infinitely little Increment of the Paracentrick Motion decrease at the same time) until the Planet arrive at W , in which Point the Solicitation of Gravity is equal to twice the *Conatus Centrifugus*; and consequently the Paracentrick Velocity is greatest at W , when the Distance of the Planet from the Sun is equal to $\frac{1}{2}$ the Parameter of the Orbit: Afterwards, although the Planet continues to approach nearer and nearer to the Sun, until it come to D , yet the Paracentrick Velocity decreases; for the Solicitation of Gravity is to twice the *Conatus Centrifugus*, as the Distance of the Planet from the Sun, is to $\frac{1}{2}$ the Parameter of the Orbit; and consequently, all the while the Planet is in describing the Portion of the Orbit WDX , twice the *Conatus Centrifugus* is greater than the Solicitation of Gravity; and from W to D the Paracentrick Velocity decreases; which it continues to do, until the Centrifugal Impressions collected into one, from the Aphelion A , precisely destroy all the Impressions of Gravity collected into one, from the Aphelion A , or until the Centrifugal *Impetus* be equal to the Centripetite *Impetus*. Now this happens in the Perihelion D , where the Paracentrick Velocity vanishes, and in which the *Conatus Centrifugus* and Solicitation of Gravity are equal and contrary, so that the Planet cannot approach nearer the Sun than it is in this Point D .

P

After-

Afterwards, the Motion being continu'd: As the Planet hath hitherto approached to, so now it begins to recede from the Sun in the Focus S , and endeavours to move from D by X towards A . For twice the *Conatus Centrifugus*, which began to exceed the Solicitation of Gravity in W , continues to prevail from D to X ; and therefore, seeing the Planet begins to move (as it were anew) from D to X , the former contrary Impetus (mutually destroying each other) the Centrifugal Paracentrick Velocity increases from D to X , but the Increment thereof, or the Impression decreases, until the Planet arrive in X , where the Solicitation of Gravity is equal to twice the *Conatus Centrifugus*; therefore the greatest Centrifugal Paracentrick Velocity is in X ; from X to A , the Solicitation of Gravity prevails above twice the *Conatus Centrifugus*; and consequently, the Centrifugal Paracentrick Velocity decreases, until the Planet arrive in the Aphelion A , in which point the *Conatus Centrifugus* and Solicitation of Gravity become equal and contrary, and consequently mutually destroy each other: And thus the Planet returns to A , from whence it departed, and begins and finishes new Revolutions successively, and without Interruption.

CONSECTARY I.

Hence we have six remarkable Points in the Elliptic Orbit of a Planet, viz. four obvious, A the Aphelion, D the Perihelion; E and B the mean Distances (for SB or SE is $= \frac{1}{2}$ the transverse Axis AD , and consequently an Arithmetical Mean between SA and SD , the greatest and least Di-

gression of a Planet from the Sun) and two more, viz. W and X , being the Extremities of the Parameter of the Orbit applied to the Axis in the Focus S , which Points happen in the greatest ascensive or descensive Paracentrick Velocity.

CONSECTARY II.

The Impetus which a Planet acquires by the Action of Gravity from A to W is equal to half the Impetus which it acquires in its descent from

A to D , and the Impetus acquir'd from A to W is $=$ to that acquir'd from W to D ; for the Impetus are proportional to the Angles of apparent Motion, and the Angles ASW and WSD are right Angles.

CONSECTARY III.

Hence to determine the Species of the Planetary Ellipsis; the Focus of the Ellipsis S is given; and the Point A where the Planet is when the Sun begins to attract it, being supposed at the greatest Distance of the Planet from the Sun, the remoter Vertex of the Ellipsis is also given, and the proportion between the Solicitation of Gravity, or Force of Gravity, wherewith the Sun begins to attract the Planet in A , and the *Conatus Centrifugus* in the same Point A being known; the principal Parameter of the Orbit WX , or an Ordinate applied to the Axis in the Focus S , may be found. For SA (given) is to SW ($= \frac{1}{2}$ the Parameter of the Orbit) as the Force of Attraction in A is to twice the *Conatus Centrifugus*, and if $\frac{1}{2}$ the Parameter be subtracted from SA , the greatest Distance of the Planet from the Sun, the remainder will be to SA , as SA is to SD ; therefore AD the transverse Axis of the Ellipsis is also given: Whence the Planetary Ellipsis may be describ'd.

CONSECTARY IV.

A Planet will describe a Circle when the Solicitation of Gravity, and twice the *Conatus Centrifugus* are equal at the Beginning of the Attraction; for in that Case they will remain equal, there being no Cause to make the Planet approach nearer to, or recede farther from the Centre of Attraction about which it revolves; but when in the Beginning the Force of Attraction and twice the *Conatus Centrifugus* are unequal (provided the simple *Conatus Centrifugus* be always less than the Attraction) then the said Planet will describe an Ellipsis; and if the Force of Attraction prevail, the Point where the Motion begins, is the Aphelion; or if twice the *Conatus Centrifugus* prevail, then the said Point is the Perihelion.

PROP. XI.

If several Bodies revolve round a common Centre, and if the Vires Centripetæ be reciprocally as the Squares of their Distances from that Centre, then in Ellipses, the Squares of the periodic Times will be as the Cubes of the transverse Axes of the Ellipses.

Reassume the Symbols in Prop. 6. then the Parameter of the Axis of the Figure L (Prop. 6. Cor. 1.)

is $= \frac{QTq}{QR}$, when the Point Q is infinitely near P , and if the Times be equal, then QR is directly as the *Vis Centripeta*, or reciprocally as (the Square of the Distance) SPq ; therefore L is as $QTq \times SPq$; that is, the *Latus Rectum* (L) is as the Square of the Area $QT \times SP$; and the Area $QT \times SP$, or $\frac{1}{2} QT \times SP$ is in the subduplicate Ratio of the Parameter (L .)

And if the periodic Times be equal, the Areas of the Ellipses, are in a subduplicate Ratio of the Parameters; and if the Parameters be equal, the Areas are proportional to the periodic Times; and if neither the Parameters nor the periodic Times be equal, then the Areas of the Ellipses are in a Ratio compounded of a subduplicate Ratio of the Parameters, and the simple Ratio of the periodic Times; therefore the periodic Times are in a Ratio compounded of the direct Ratio of the Areas, and the reciprocal subduplicate Ratio of the Parameters. Now the Areas of unequal Ellipses, are (*Art. 105. Hayes N^o 4.*) in a subduplicate Ratio of the Parameters, and the subduplicate Ratio of the Cubes of the transverse Axis jointly. Therefore the periodic Times are in a Ratio compounded of the subduplicate Ratio of the Parameters directly, the subduplicate Ratio of the Cubes of the transverse Axes directly, and the subduplicate Ratio of the Parameters inversely; that is, the periodic Times are in a subduplicate Ratio of the Cubes of the transverse Axes, and consequently the Squares of the periodic Times are proportional to the Cubes of the transverse Axes. *Q. E. D.*

C O R O L L A R Y.

The Squares of the periodic Times of Bodies revolving in Ellipses, are as the Cubes of their Distances from the (Focus of the Figure or) Centre of Attraction.

ATHENATORIUM, in Chymistry, is a thick Glass Cover (or Head) fixt to a Cucurbite in some Kinds of Sublimations.

ATMOSPHERE. From what hath been shewn in *Vol. I.* under this Word, it appears to be plainly impossible to account for so great a Rarefaction and Conderfation as is discovered to be in the Atmospheric Air, without the Supposition of the Particles of Matter being endued with a *Repelling*
Vol. II.

or *Levitating Force*, whereby they mutually avoid one another, till they come within the Distance where the *attractive Force* begins. See *Attraction*. For as the Learned Mr. *Halley* observes, at the close of his Proposition about the Heights of the mercurial Cylinder, at any Elevation above the Earthy Surface. See *Phil. Transf. N. 187.* It seems a *very hard Question*, that the *Texture or Composition of Parts* can be capable of so great an Expansion and Contraction as is found to be in the Air, and can scarce be accounted for, from comparing it to *Wooll*, or such like Spungy Bodies.

ATTAINED, in the common Law is used particularly for such as are found guilty of some Crime or Offence, especially Felony or Treason: But a Man is also said to be attained of *Disseisin*. *West. 1. c. 24. and 36. and 3. Ed. 1.* A Man is attained two Ways; by *Appearance* or by *Process*: *Attainder* by *Appearance*, is either by *Confession*, *Battel*, or by *Verdict*. *Attainder* by *Confession* is when a Man pleads *Guilty*, and doth not put himself upon his Country for Tryal. A Man is *attainted* by *Battel*, when being appealed by another, and chusing the Combat rather than the Jury, he is vanquisht; and he is *attainted* by *Verdict* when he is found *Guilty* by a Jury.

ATTAINER by *Process*, is otherwise called *Attainder* by *Default* or *Utlary*, and is where a Person flieth and is not found, after he hath been three Times publickly called in the Country, and at last is Outlawed by Default.

ATTENDANT, in Law is used in this Sense, for one that oweth a Duty or Service to another; or after a sort dependeth upon another. *v. gr.* There is a Lord, Mesne and Tenant. The Tenant holdeth of the Mesne by a Penny, the Mesne holdeth over by two Pence. The Mesne releaseth to the Tenant all the Right he hath in the Land, and the Tenant dies: Then shall his Wife be endowed of the Land, and be *Attendant* to the Heir of the third part of the Penny, and the third part of the two Pence, for she shall be endued of the best part of the Possession of her Husband. They say also, that where the Wife is endowed by the Guardian, she shall be *Attendant* to her Heir at his full Age.

ATTITUDES, in Painting or Sculpture, are the proper Postures that the Figure should be placed in, so as agreeably to answer the Design of the Piece.

ATTRACTION. Sir *Isaac Newton* at the end of the *Latin* Edition of his excellent Book of Opticks, *Qu. 22.* sheweth that of those Bodies which are of the same Nature, Kind, and Virtue, by how much less any Body is than another, the greater is its *attractive Force*, in proportion to its Magnitude. Thus 'tis found that the *Magnestick Attraction* is stronger in a small Loadstone, in proportion to its Weight, than in a larger: For the Particles of small Magnets, being nearer one to another, can more easily combine or join their Forces into one. Wherefore the *Rays of Light*, being the least of all Bodies that we know, must needs have the *greatest and strongest attractive Force*; and how very strongly those Particles do attract, may be collected by the following Calculation. The *Attraction* of a Ray of Light, with regard to the Quantity of its Matter, is to the *Gravity* which any projected Body hath, in proportion to the Quantity of Matter in that Body :: in a Ratio compounded of the Velocity of a Ray of Light, to the Velocity of that projected Body, and of the Flex-

ture or Curvature of the Line which the Ray describes in the place of its Refraction, to the Curvature or Flexure of the Line which the said projected Body describes. That is, supposing the Inclination of the Ray, to the refracting Surface be the same with that of the Horizon. And from this Proposition he Calculates that the Attraction of the Rays of Light is above 1000000000000000000
a Thousand Millions of Millions of Times greater than the Force of Gravity on the Earth's Surface, according to the Quantity of matter in each; and supposing Light to come from the Sun thither in about seven or eight Minutes. And in the very point of Contact of the Rays, their attracting Force may be yet much greater.

Now such a prodigious Force of *Attraction* in the Rays of Light cannot but have wonderful Effects in those Particles of Matter, with which they are joyned in the Composition of Bodies; and must cause that those Particles attract one another, and that they are moved variously among themselves.

'Tis very probable therefore that the *small Particles of Bodies* have certain *Virtues, Powers or Forces*, by which at a small Distance they may act not only on the *Rays of Light* to *Refract, Reflect* or *Infect* them, but also mutually on one another, in order to produce *most of the Phenomena in Nature*. 'Tis very well known that some Bodies do thus act on one another by the *Attractions of Gravity, Magnetism and Electricity*: And these Examples shew what the *Reason and Order of Nature is*, and make it very probable that there may be yet some *other Attractions*, for Nature is very uniform and agreeable to it self.

Now the *Attractions* of *Gravity*, *Magnetism* and *Electricity*, extend themselves to considerable Distances, and therefore are commonly observed and taken notice of by every one. But 'tis very possible that there may be many *others* also, which are contain'd in such narrow Limits, and performed within such a little Distance, as yet to have escaped all our Observations.

For when Salt of Tartar runs *per deliquium* or, dissolves into an Oil as the Chymists call it, 'tis very probable that it is occasion'd by some *Attraction* which is mutual between the Particles of the Salt, and those of Water, which rove up and down in the Air in the Form of Vapour; and the Reason why common *Salt*, *Nitre* and *Vitriol*, don't run thus *per deliquium*, is because they are without any such Attractions; and when Salt of Tartar hath drawn as much Water out of the Air as its Quantity will bear, it draws no more, because when it's Saturated, the Attraction is at end. It must be also from its attractive Force, that the Water thus imbibed by the Salt, *cannot be separated from it in Distillation, but by a very violent Heat*; whereas, Water will usually distill off with a very easy Heat, from other things. 'Tis much the same thing with *Oil of Vitriol*, which till it is Saturated with it, attracts the Moisture of the Air in very considerable Quantity, and afterwards parts with it with great Difficulty. And when Oyl of Vitriol and Water being mingled together in the same Vessel, grow so hot, as it is known they will do, it appears plainly by that Heat, that a very great Motion is excited in the Particles of the two Liquors; and from that Motion it appears that their Particles in mingling Coalesce with a great Force and Impetuosity, and consequently attract or gravitate towards one another with an accelerated Motion. Thus

also when *Aqua fortis*, Spirit of *Vitriol* or *Nitre*, or any other corrosive *Menstruum* dissolves Filings of Iron or any other Metal with Heat and Ebullition; 'tis plain that the Acid Particles of the *Menstruum* attract and rush upon those of the Metal with a very great Force, enter into their Pores with violence, and disjoyn or separate the small Corpuscles of which the Metal is composed, one from another; tho' the Particles of the Acid *Menstruum* are drawn off at first when they are made by a moderate Heat, yet after their Union they with the Parts of the Metal, cannot be drawn off as yet by Distillation, but by a most intense and violent Heat.

When Spirit of *Vitriol* poured upon common *Salt* or *Nitre*, makes an Ebullition and Coalesces with the Salt; and when after this, if the Compost be distilled, a Spirit of Salt or *Nitre* will be drawn off much easier than without such a Mixture; it shews plainly that the *Fixt Alkali* of the Salt *Attracts* the Acid Spirit of the *Vitriol* much more strongly than it doth its own Spirit, and because it cannot detain them both, it parts with its own Spirit freely. When Oil of *Vitriol* is distill'd from an equal Weight of *Nitre*, and from both is drawn off a *Compound Spirit of Nitre*, and that Spirit is poured upon half its Weight of Oil of *Cloves*, of *Caraway-Seed*, or any ponderous Oil distill'd from vegetable or animal Bodies, or upon Oil of *Turpentine*, mix'd with a little Balsam of *Sulphur* to thicken it; when in any of these Mixtures an actual Flame will be produc'd, 'tis apparent that the Particles of the Spirit and Oil must rush towards one another with a strong accelerated Motion, and struggle and fight with a most violent Force and *Impetus*. 'Tis the same thing when that compound Spirit is poured upon well rectified Spirit of *Wine*, for a Flame will immediately arise on their Mixture. The *Pulvis fulminans*, as they call it, which is compos'd of *Sulphur*, *Nitre* and Salt of *Tartar*, goes off with a more quick and violent Explosion than even *Gun-powder* it self. The Acid Spirits of the *Sulphur* and the *Nitre* rushing together with such Violence, that all the Parts of the Powder are rarified, as it were, at once and all together.

Thus also common crude and impure *Brimstone* it self, if it be powder'd and mingled with an equal Weight of Filings of *Iron* or *Steel*, and with a little *Water* be made up into thick *Paste*, like *Dough*, the *Sulphur* will act so upon the *Iron*, that in five or six Hours time, the *Mass* will grow so hot as not to bear handling, and at last will plainly burn and emit a *Flame*. Now from all these Experiments, and from the Consideration of the great Quantity of *Sulphur* that there is in the *Earth*, and of the great Heat of the inner Parts of it, from the hot *Springs*, the burning *Volcanos*, the *Fire Damps* and burning *Exhalations* that are found in the Bowels of the *Earth*; from the Considerations of *Earthquakes*, *Whirlwinds*, and the wonderful Convulsions that the *Sea* is sometimes put into; we may understand, That the Particles of Bodies, before at Rest (and 'tis the same thing also in all Fermentations, &c.) may be and are put into most violent Motions, by some Principle of very great Force and Activity, which yet doth not discover it self till the Parts approach and come very near one another; but that they do then attract one another with great Force and Rapidity, and thereby produce their wonderful Effects.

Again, when *Oil of Tartar per deliquium* is poured upon the Solution of any Metal, there is a *Precipitation* of the Metalline Particles produc'd, which

which all fall down to the Bottom of the Vessel; From whence it appears, That the Particles of the Liquor are more strongly *attracted* by those of the Oil of *Tartar* than by those of the Metal, and by that *Attraction* are precipitated down from the Liquor: So also when a Solution of *Iron* in *Aqua Fortis* will dissolve *Cadmia*, and precipitate its *Iron*; or when a Solution of *Copper* will dissolve *Iron*, and let go the *Copper* (*see depart*) &c. this seems to prove plainly, that the Acid Particles are more *strongly attracted* by those of the Metal that they dissolve, than by those of that which is let go. When we find that those Menstruums which will dissolve one Kind of Metal or mix'd Body, won't touch another, it must be attributed to the *Attraction* that there is between the Particles in some Cases, and there being *no such* in the other. And in the general it is owing to this Principle, that *Heat*, according to *Aristotle's* Definition of it, *doth congregate or gather together homogeneous Things, and separate those which are of a different Nature*: After this he shews how on this Principle, and by the Help of *Chymical Analyses*, to come to the Knowledge of what Kind of Parts natural Bodies are composed.

The Reason why Drops of Water, or other liquid Body usually put on a spherical Form, he saith, is also from the *mutual Attraction* of their Parts; after the same Manner as the Earth and Seas make one round Body by the *mutual Attraction* or *Gravitation* of their Parts.

And because when Metals are dissolv'd in Acids, they attract but a small Portion of the Menstruum to them, therefore he concludes, that their Force of *Attraction* extends but a *very little Way*. And as in *Algebra*, when affirmative Quantities vanish and terminate, their negative begin: So in *Mechanicks*, where *Attraction* ceases to exert it self, a Kind of *repelling Force* should succeed; and that there is in Nature such a *Force*, seems to follow from the *Reflection* and *Inflection* of the Rays of Light; for in both these Cases, the Rays are repelled from Bodies without the immediate Contact of the *reflecting* or *inflecting* Body. And the same Thing seems concludable from the Emission of Light; for a Ray of it, as soon as it is shaken out of the lucent Body by the vibrating Motion of its Parts, and is got without the Sphere of its *Attraction*, is propelled with a very great Degree of Velocity; and the same Force which in *Reflection* serves to *repel* the Ray, now serves to *emit* it.

The *Production of Air and Vapours* doth also shew, that there is a *repelling Force*; for those Particles which are forced out of the Bodies by Heat or Fermentation, as soon as ever they are out of the Sphere of the *Attraction* of these Bodies, do immediately recede from it, and from another with a great Force, and do avoid coming together again; so that sometimes they take up above a Million of Times the Space which they did before, when they were in the Form of a Dense Body, which is so very great a *Contraction* and *Expansion* as is hardly conceivable, if the Particles of the Air be only *elastical, ramose* and *coiled* up one within another, like the Tendrels of Vines, or Springs of Watches, as some have imagin'd: Nor indeed, will any other Hypothesis account for this wonderful Phenomenon, but this of their being endu'd with a *repelling Force*, by which they mutually avoid one another, as well as the Bodies from whence they at first came.

ATTRIBUTIVE *Justice*: See *Justice*.

AVERCORN, was anciently a *reserved Rent* in Corn paid to Religious Houses by their Tenants or Farmers.

AVOIR DU POIS, in *French* signifies to be of just Weight; but in Law 'tis taken in two Senses, for a peculiar Kind of Weight of sixteen Ounces to the Pound, and thereby distinguish'd from *Troy Weight*, whose Pound hath but twelve Ounces: And also such Merchandize and Goods as are weighed by this Weight, and not by *Troy Weight*, as *Pitch, Tarr, Rosin, Wax, Flesh, Tallow, Cheese, Soap, Hemp, Flax, Copper, Tin, Lead, Steel, Iron, &c.* Mr. Ward saith, he found that 1 Pound *Avoir du pois* was exactly 14 Ounces, 11 Penny-Weights, 15 $\frac{1}{2}$ Grains *Troy*: And he saith, he can find no Law for the Introduction of this Weight, nor at what Time it came into Use, which it seems to have done only by Custom. See *Weights* in Vol. I.

AURELIA, is a Term used by the *Natural Historians* for the first apparent Change of the *Eruca* of any Insect: 'Tis the same with what some Writers call *Nympha*.

AURISCALPIUM is an Instrument to clean the Ears.

AURORA Borealis is a white Pyramidal Glade of Light, which Dr. *Childry*, Mr. *Cassini* and Mr. *Derham* have mentioned as appearing like the Tail of a Comet in the Northern Hemisphere of the fix'd Stars.

AUXILIUM *ad filium Militem faciendum & ad filiam maritandam*, was a Writ formerly directed to every County, where the King or other Lord had Tenants, to levy of them a reasonable Aid towards the knighting of his Son, and Marriage of his Daughter; but this is now utterly taken away by a Statute made 12 Car. 2. c. 24.

AXIS in *Peritrochio*. See its Description in Vol. I.

In this Instrument, and all such like, (as all Crane-wheels, Mill-wheels, &c. the *Vis Matrix*, which is to sustain or lift up any Weight, need only be to such Weight as the *Perimeter* of the Axis A B is to that of the *Tympanum* or *Peritrochium* C D; and then there will be an *Equilibrium*.

From the Fabrick of the Engine, 'tis plain, that the Weight W is at every Revolution of the Axis rais'd so much, as is the Girt of the Axis; and consequently the larger the Axis, the *quicker* rises the Weight (with a Proportionable Power) but yet the *harder*: and the less the Axis is, the *slower* rises the Weight, but the *easier*.

Wherefore

Wherefore if the Weight be to the Power, as the Perimeter of the *Peritrochium* is to the *Perimeter* of the Axis, then will the Velocity of the Power to that of the Weight, be as the Weight to the Power; and consequently the Moment of the Power will be equal to that of the Weight. Wherefore 'tis plain, that the greater the Perimeter or outermost Wall, the longer the Stick or Lever DC: Or on the other, the lesser the Diameter of the Axis, the easier will the same Force move the Weight assigned.

AYDE, in Law, is where a particular Proprietor is impleaded, and not being able to defend the Thing for which he is so impleaded, he *prayeth ayde* of some better able: which is done two Ways, 1. In a *Plea real*, and *Tenens petit auxilium de A B sine quo respondere non potest*. 2. In a *Plea personal*, and then the Defendant, *petit auxilium ad manutenendum Exitum*.

AYEL is a *Writ* which lies where the Grand-father (called by our common Lawyers *Besayel*, it should be *Besayen*) was seized in his Demesne, as of Fee of any Lands and Tenements in Fee Simple, the Day that he died, and a Stranger abaseth and entereth the same Day, and dispossesseth the Heir.

ASIAMENTA, *Easements*, in Grants of Conveyance and Demise did include any Liberty of Passage, High-way, Water-course, or other customary Benefit for the Ease and Accommodation of the Owners or Inhabitants of any House, or the Tenants of any Land. *Kennet's Glossary*.

AZIMUTH of the Sun. To find it readily by projecting Part of the Analemma, having the Latitude of the Place, and the Sun's Declination and Altitude: With 60 of the Chords draw the Circle PEZ for the Solstitial Colure or Meridian of their Place, and cross it in the Center with the 2 Lines Zn and SN, at right Angles to another for the *Azimuth* of E and N, and for the Horizon of the Place. Set the Latitude from N to P, so shall P be the Pole of the World: and set it also from the Zenith in Z to E, and draw ECQ for the Equinoctial, draw also PU for its Axis. Then from the Chords set the Sun's Declination from E

to D, and from Q to F, if it be North Declination; or from E to d, and from Q to f, if it be South, and draw the respective Parallel to the Equinoctial DF, or df: Then set the Sun's Altitude from S to A, and from N to O, and draw

the Parallel to the Horizon, A O, where this Intersects, the Parallel of Declination will be the Representation of the Sun's Place, as at $\odot 1$ in Summer, or $\odot 2$ in Summer. Fit then the Sector to the Radius A M, and M O, or M $\odot 1$, or M $\odot 2$ shall be to that Radius, the Sine of the Sun's Azimuth from the East or West Southwards, according to the Time of either Before or Afternoon.

If no Sector be at Hand, you may measure the Azimuth on the Chords to the Radius of the Diagram thus; Set M A from the Center C to r in C S, on which Point r, as a Center, with the Extent M O 2 strike above the Arch x; for then a Ruler laid from C the Center, just to touch the Convexity of the Arch x, will cut the Limb in L, and then L S measur'd on the Chords, will give you the Degrees of the Azimuth.

I

B A R

BABYLONISH Hours. The *Babylonians*, *Persians*, and *Syrians*, &c. accounted their 24 Hours of the natural Day to begin from Sun-rising, and to continue till the Sun setting of the next Day. Wherefore Hours thus accounted, and thus put in (as is common) among the Furniture of Dials, are in Dialling called the *Babylonish Hours*.

BACK and Bottom Nails, are such as are made with flat Shanks that they may hold fast, and yet not open the Grain of the Wood. They are used for nailing Boards together for Coolers, for Gutters to save Water under the Eaves of a House, or for any Vessel made with Planks or Boards, and design'd to hold the Liquors.

BALDACHIN, in Architecture, is a Building in Form of a Canopy or Crown supported by Pillars, often serving for the Covering of an Altar. Some also call the Shell over a Door by this Name and pronounce it *Baldaguin*.

BALLISTERS, are a Row of small Pillars which support a Rail. They are sometimes called *Bannisters*, and are placed on Stairs, and in the Front of Galleries, Balconies, &c.

BANK, is a Carpenter's Term for a Piece of Firwood unsplit from 4 to 10 Inches Square, and of any Length.

BANNERET, was anciently a Knight made in the Field with the Ceremony of cutting off the Point of his Standard, and making it as it were a Banner. And this was accounted so Honourable a Knighthood, that they were allowed to display their Arms in the Field in the King's Presence as Barons do. They were next to Barons in Dignity. *Henry VIIIth* made divers *Bannerets* upon the Cornish Rebellion, *A.D.* 1495: See *Selden's Titles of Honour*, *Camden's Britannia*, *Sir Tho. Smith, Lib. de Rep. Angl. c.* 18.

BARBICAN, is a Term in Architecture taken from the *French*, and signifies any Outwork belonging to a great Building.

BARCO-Longo, is a small, low, long, sharp built Vessel without a Deck, going with Oars and Sails; much used in *Spain*.

BARGAIN and Sale, in Law, is a Contract made of Mannors, Lands, Tenements, Hereditaments, and other things, transferring the Property thereof from the *Bargainor* to the *Bargainee*. The Author of the new Terms of the Law saith, it ought to be for Money, &c. and that the Fee-simple passeth thereby, though it be not said in the Deed, *To have and to hold, the Land to him and his Heirs*; and though there be no *Livery & Seisin* made by the Vender, so it be by Deed, indorsed, sealed, and enrolled either in the County where the Land lies, or within one of the Courts of Record at *Westminster*, and this within 6 Months after the Date of the Deed: According to 27 *H. 8. c.* 16.

BARK, or *Barque*, is a Vessel with 3 Masts, viz. Main-mast, Fore-mast, and Mizen-mast, and carrying usually about 200 Tuns.

BAROMETER. In *Phil. Tran. N.* 292. there is a pretty Experiment of Mr. *Hawksbee*, to shew the Cause of the Descent of the Mercury in the Barometer in Storms, to be the collateral Pressure or Current of Wind on the Surface of the stagnant

B A R

Mercury in the Cistern, which abates the Force of the Perpendicular Pressure, or the usual Gravity of the erect Column of Air, equal in Base to the Orifice of the Tube.

BAROMETER Portable, is one that can be safely and conveniently carried about from Place to Place, without the Danger of spilling the Mercury out of the Cistern, or letting the Air get in at the Bottom of the Tube, or of the Mercury included in the Tube, breaking the Top of it off by the Motion it will be put into by being carried from one Place to another. You may prevent the two former Inconveniencies by tying some gentle Leather fast over the Brim of the Cistern, which must be of Glass or close grained Wood; and must have a Neck or Hollow round the Outside of the Brim to tie on the Cover of Leather. And the last may be remedied, by either a way to screw or squeeze the included Mercury quite up to the Top of the Tube, so that the Tube in its Carriage from Place to Place shall be always full; or else by pinching the Head of the Tube at about an Inch from the Top, so as to make it there have a very narrow Neck, not so big as a Straw: By which Means the Force of the Mercury striking against the Top, will be very much bridled, and therefore the Tube secured from having its Top broken off.

BARON hath divers Significations: First, 'Tis used for a Degree of Nobility next to a Viscount. Some of our Historians say, that soon after the Conquest, all *Barons* came to Parliament, and sat as Peers in the upper House of course; but they being then very numerous, it grew an Order and a Custom, that none should come, but such as the King thought fit to Call by *Writ*, which *Writ* ran then, *pro hac vice tantum*. But this State of the Nobility being very precarious, and depending solely on the Prince's Pleasure, they at length got a surer hold, and obtained of the King Letters Patents; and these were called *Barons by Patent* or *Creation*, whose Posterity are now *Lords of Parliament*. And *Cowel* saith, there are nevertheless *Barons by Writ*, as well as by Letters Patents; and that those are distinguished from these by having their own Surnames annexed to the Title of Lord; whereas *Barons by Patent* are named by their Baronies. The Original of *Barons by Writ*, *Camden* refers to *Henry 3.* and *Barons by Patent* or *Creation* commenced in the Time of *Rich 2.* To these *Segar (Norroy)* adds a third Kind of Baron, which he calls *Baron by Tenure*; and such are the Lords the Bishops, who, by virtue of Baronies annexed to their Bishopricks, sit in the upper House and are called *Lords Spiritual*.

BARON is also an Officer, as *Baron of the Exchequer*, of which the Principal is called *Lord Chief Baron*, and three others in that Court are his Assistants.

There are also *Barons* of the *Cinque Ports*, which are two Members of the House of Commons chosen at each Port, and at the two Ancient Towns of *Winchelsea* and *Rye*.

BARON is also used for the Husband in Relation to the Wife; which two in Law, are called *Baron and Feme*.

The Chief Magistrates also of the City of *London*, before they had a Lord Mayor, were called *Barons*.

Ever since the Reign of *William* the Conqueror, the Bishops hold their Temporaries *per Baroniam*; and by that are obliged to attend the King in Parliament.

Sir *W. Temple*, in his Essay on *Heroick Virtue*, says, that Baronies were originally the *larger* Shares of the Lands of conquer'd Countries, which the Northern Invaders (such as the *Goths*, &c.) used to divide among their Generals and Chief Commanders; as the *smaller* Shares divided amongst the Soldiers were called *Feuda* or *Fees*; and he guesses the Word *Baron* to be of Northern Original.

BASIL is the sloping Edge of a *Chissel*, or of the Iron of a Plane used in Joinery.

BATCHELOURS, *i. e.* *Basse Chevaliers*, were Anciently a lower or inferior Sort of Knights, as distinguished from *Barons* and *Bannerets*, which then were reckoned the Chief or Superior Knights. And now our lower Order of Knights which are inferior to Baronets, are called *Knights Batchelours*. And so in our Universities, there is an Academical Degree of *Batchelours*, (who have the Title of *Sir*) and which is inferior to that of Masters and Doctors.

BATTEN is the Workmens Name for a scantling of wooden Stuff from two or four Inches broad, and about an Inch thick; the Length is pretty considerable, but undetermined as to Numbers.

BEAD, in Architecture, is a Moulding which in the *Corinthian* and *Roman* Orders is cut and carved into short Embossments, which look like Beads born in Necklaces: And sometimes an *Astragal* is thus carved.

A *Bead plain* is sometimes set also on the Edge of each *Fascia* of an *Architrave*. Its Convexity is usually about a Quarter of a Circle, and differs from a *Boultine* only in not being so large. A Bead is often placed on the lining Board of a Door-Case, and on the upper Edges of skirting Boards.

BEAM, in any Building, is a Piece of Timber lying across it, and into which the Feet of the principal Rafters are framed. No Building hath less than two of these Beams, *viz.* one at each Head; and into these Beams the Girders of the Garret Floor are framed; and if it be a Timber Building, into them the *Teazle Tenons* of the Posts are also framed. These *Teazle Tennonns* stand at right-Angles to those which are made on the Posts to go into the *Raisons*, and the *Relish* or Cheats of these Teazle Tennonns stand up within an 1½ Inch of the Top of the *Raison*; and then the Beam is *cauked* down (which is all one as Dove-tailing across) till the Cheeks of the Mortices in the Beam conjoin with those of the Teazle Tennon on the Posts.

BEARER, in Architecture, is a Post or Brick Wall, which is trimmed up between the two Ends of a Piece of Timber to *shorten its bearing*, or to prevent its bearing with the whole Weight at the Ends only.

BEAUPLEADER is, in common Law, a Writ upon the Statute of *Malridge* for not fair Pleading; and this lies where the Sheriff, or other Bayliff in his Court, will take a Fine of the Party, Plaintiff or Defendant, for that he pleaded not fairly.

BEDMOULDING, in Architecture, is a Term used by the Workmen for those Members in a Cornish, which are placed below the Coronet or Crown; and now-a-days a Bedmoulding usually consists of these 4 Members, 1. an O----G. 2. a Lift, 3. a large Boultine, and 4thly, under the Coronet another Lift.

BEDRIP, *Bedrepe*, was the Customary Service which inferior Tenants formerly paid to their Lords, in cutting down their Corn, or doing any Work or Labour in the Field.

BENDS, in a Ship, are the same with the *Wailles* or *Wales*, which are the outmost Timbers of a Ship on which the Men set their Feet in climbing up: They are reckoned from the Water the first, second, and third *Bend* or *Wail*. They help much to strengthen the Ship, and have the Beams Knees and Foot hooks bolted into them.

BENEPED: They say at Sea a Ship is *beneped*, when it being a Nepe-Tide, the Water doth not flow high enough to bring her off from the Ground, out of the Dock, over the Bar, &c.

BENEFICES. All Church Preferments, except Bishopricks, are by some called Benefices: *Vid. Godolph. c. 18.* And all Benefices are by the Canonists sometimes called *Dignities*. But we now apply the Word Dignity to Bishopricks, Deaneries and Archdeaconries, and as some will have it to Prebends.

BENEFICES are either *Parsonages*, *Vicarages*, or *Donatives*.

Parsonages, are Churches endowed with Glebe, Manse, Tythes, and all other Duties payable by the Parishioners.

Vicarages, are Benefices which were created for the Maintenance of such Clergymen as served in Churches, where some or all the Tythes were impropriated. At first the Vicar was a meer Curate; but by Degrees some of them got a settled Maintenance distinct from the Impropiator, which consisted of a Manse and Glebe, and some Portions of Tythes usually; but in some Places only a Pension from the Impropiator. And these are what the Law calls *perpetual Vicars*, or *Vicars endowed*.

Donatives, are such as being exempt from the Jurisdiction of the Ordinary are visitable only of the King or other Secular Patron, who puts his Clerk into Possession of the Benefice, by Virtue of an Instrument under Hand and Seal, without any *Institution* or *Induction*, and without any Examination by the Ordinary. But the Clerk is obliged to subscribe the *Declarations*, and to take the Oaths enjoined by 14. c. 2. and 1. W. and M. the former before the Bishop in whose Diocese the Donative lies, and the latter before the Patron, saith *Watson*. And if it be a Benefice with Cure, he is also bound to subscribe the 39 Articles before the Bishop, to read the Common-Prayer, and to make the same Declaration as other Incumbents do.

BENEFICIO primo Ecclesiastico habendo, is a Writ directed from the Queen to the Chancellor or Lord Keeper, to bestow the Benefit that first shall fall in the Queen's Gift, above or under such a Value, on this or that particular Man.

BENEVOLENCE is used both in our Statutes and Chronicles, for a voluntary Gratuity given by the Subjects to the Sovereign.

BESANTINE was a Piece of Money coined by the Western Emperors at *Byzantium* or *Constantinople*, and was of two Sorts, Gold and Silver, formerly both Current in *England*: The Silver *Besantine* was the Value of two Shillings, and the Gold

was

was of the Weight of a Duck, as *Chaucer* seems to represent. *Kennet's Glossary*.

BENEFICIUM Cedendarum Actionum, is the Right which one Surety hath who is sued for the whole Debt, to force the Creditor by Exception to assign over his Action against the rest of the Sureties, or else he shall not force that one to pay the Debt.

BENEFICIUM Divisionis, in the Civil Law, is a Right by which the Creditor shall be forced, by way of Exception, to sue each Surety for their Share and Proportion, especially when the rest of the Sureties are under the Jurisdiction of the same Judge, and able to pay.

BENEFICIUM Ordinis sive Excussionis, in the Civil Law, is a Right by which the Surety can by way of Exception force the Creditor to sue the principal Debtor, before he shall recover against him as the Surety, except the Surety was given judicially in a Cause depending.

BIRDS, are either *Land-fowl* or *Water-fowl*: Of *Land-fowl*, some have crooked Beaks and Talons; and of these some are *Carniverous* and *Rapacious*, being call'd *Birds of Prey*; some *Frugiverous*, and these are called by the general Name of *Parrots*. Of *Birds of Prey* some are *Diurnal*, preying in the Day Time; and of these they reckon a *greater* and *lesser* Sort: The greater are either of a more bold and generous Nature, as the *Eagle* Kind; or of a more cowardly and sluggish, as the *Vulture*: The lesser *Diurnal* *Birds of Prey*, in *Latin* are called *Accipitres*, the *Hawk* Kind; and these are either of a more bold and generous Nature, and are wont to be reclaimed and *manned* for fowling, and are called *Hawks*; which our Falconers distinguish into *Long-winged*, as the *Falcon*, *Lanner*, &c. whose Wings reach almost as far as the End of their Train; and *short-winged*, as the *Goshawk* and *Sparrow Hawk*, whose Wings, when closed, fall much short of the End of their Trains. Those of the *Hawk* Kind which are of a Nature more cowardly and sluggish, or else *indocile*, are neglected by our Falconers, and so live at large; and of these also there is a *greater* Sort, as the *Buzzard* Kind, and a *lesser*, as the *Butcher-Bird* or *Shrike* (about as big as a *Black-bird*, and found in *England*). The *Bird of Paradise*, which is *exotick*.

Of *Birds of Prey* with crooked Beak and Talons, some are *Nocturnal*, as the *Owl* kind, which fly and prey by Night; and these are either horned or eared, as the *Eagle-Owl* and *Horn-Owl*, &c. or without Horns, as the *Brown-Owl*, *Grey-Owl*, &c.

There is a sort of *Land-Birds* with crooked Beak and Talons which is called *Frugiverous*, because though they do sometime eat *Flesh*, and so are of the *Carniverous* and *Rapacious* Kind, yet they eat *Fruits* too; and these are known by the general Name of *Parrots*, and are distinguished into three Sorts according to their bigness, the greatest Size being called *Macaws*; the middle sized, and most common, *Parrots* and *Popinjays*; and the least sort *Parrakeets*; and all this Kind make use of their Beak in climbing, and move the upper Jaw.

Land-Birds that have their Bill and Claws more strait, are distinguished into three Sizes. The greatest Kind are such as by reason of the Bulk of their Bodies, and smallness of their Wings cannot fly at all; these are *Exotick* *Birds* of a singular Nature, such as the *Ostrich*, the *Cassowary*, and the *Dodo*. The middle sized Kind are divided by their Bills into such as have *large*, *thick*, *strong*, and

Vol. II.

long ones; some of which feed promiscuously on *Flesh*, *Insects*, and *Fruits*, as the *Crow* Kind, which are wholly black; and the *Pie* Kind, which are party coloured: Some feed on *Fish* only, as the *King's-fisher*; and some on *Insects* only, as the *Wood-pecker*. And into such as have a *smaller* and a *shorter* Bill, whose *Flesh* is either *white*, as the *Poultry* Kind; or *blackish*, as the *Pigeon* and *Thrush* Kind. The least sized Kind of *Land-Birds* with strait Bills and Claws, are called *small Birds*; and these are of two kinds, viz. *soft beaked*, which have slender, straight, and pretty longish Bills most of them, and feed chiefly upon *Insects*; or *hard beaked*, which have thick and hard Bills, and feed mostly on *Seeds*,

Water-fowl, are either such as frequent *Waters* and watry Places to seek their Food; and these are all *cloven-footed*, and generally have long Legs, and those naked or bare of Feathers for a good way above the Knees, that they may the more conveniently wade in *Waters*. Of these they reckon two Kinds; a *greater*, as the *Crane*, *Jabiru*, &c. and a *lesser* which are either *Piscivorous*, feeding on *Fish*, as the *Heron*, *Spoon-bill*, *Stork*, &c. or *Mudsuckers* and *Insectivorous*: Of which some have very long Bills, which are sometimes *crooked*, as in the *Curlew* and *Whimbrell*; and sometimes *straight*, as in the *Woodcock* and *Godwitt*. Others have *middle sized* Bills, as the *Sea-pie* and *Red-shank*, &c. and a third sort have short Bills, as the *Lapwing* and *Plover*. Those are reckoned short Bills which exceed not an Inch and $\frac{1}{2}$; middle sized are between two Inches $\frac{1}{2}$ and 1 $\frac{1}{2}$; and long Bills above two Inches $\frac{1}{2}$.

There is another Kind of *Water-fowl* which swim in the Water; some of which, as the *Moor-hen* and *Coot*, &c. are *cloven footed*, but most are *whole footed*: And of these some few have very long Legs, as the *Flammant*, the *Avosetta*, and *Corrija*, (see *Willoughby*, Part 2. §. 2) but mostly they are *short leg'd*: Of which some few have but three Toes on each Foot, as the *Penguin*, *Razor-bill*, &c. but generally they have four Toes on each Foot; and these either all connected together by intervening Membranes, as in the *Pelican*, *Soland Goose*, &c. or more usually with the *back Toe* loose: And this Kind are either *narrow bill'd*, or *broad bill'd*; those with *narrow Bills* have them either *blunt* and *hooked* at the Tip, of which sort some are *serrate*, as in the *Diver-kind*, and some not *toothed*, as in the *Puffin*; or *sharp pointed* or *straighter*, of which sort some have long Wings, as the *Gull* Kind; and some *shorter*, as those *Diving Birds* called *Douckers*. Those with *broad Bills* may be divided into the *Goose* Kind, which are larger, and the *Duck* Kind which are smaller; and these latter into *She Ducks*, or *River* or *Plash Ducks*. Most *Water-Fowls* have a short Tail; and none of this Kind have their Feet disposed like *Parrots* and *Woodpeckers*, that have two Toes forward and two backward, none having more than one back Toe, and some none at all.

BINDING Joysts, in Architecture, are those Joysts in any Floor into which the *Trimmers* of the *Stair-Cases* and *Chimney-Ways* are framed; and these should be stronger than common Joysts.

BISHOP. The whole Process of the Creation of a Bishop, according to the *English* Law, is thus. On the Vacancy of any See, the Dean and Chapter are to certify the King thereof in *Chancery*, and to request his Leave to chuse another Bishop. The King, when he pleases, sends his *Conge de*

Q

Esire,

Esquire, or Leave to elect to the Dean and Chapter, nominating the Person whom he thinks fit to have chosen. The Dean and Chapter are obliged within twenty Days after the Receipt of this *Conge de Esquire* to make the Election, which being accepted by the Person elected, is certified both to the King and the Archbishop of the Province. On this the King grants his Royal Assent under the Great Seal, directed to the Archbishop, together with a Mandate to Confirm and Consecrate him. The Archbishop gives a Commission to his Vicar General to proceed to Confirmation, which is a long formal Process, of which the most observable Parts are two, *viz.* a Citation of all such as have any Objections against the Bishop Elect, to appear before them and offer them; and then a Deduction of all that has past in relation to the Election and the Royal Assent; the Particulars whereof are exhibited by the Proctor of the Dean and Chapter to the Vicar General. After this the Oaths of Supremacy, Simony, and Canonical Obedience are taken by the Bishop Elect; on which Sentence is read, and subscribed by the Vicar General, whereby the Election is ratified and decreed to be good. Next to this follows the Consecration, which is performed by the Archbishop and two other Bishops: Then the Archbishop sends a Mandate to his own Archdeacon, to install the Bishop in that Cathedral Church which belongs to his See; and this is oftentimes done by Proxy. And the publick Notary there present, records the whole Process in an Authentick Instrument to be kept to Posterity; and after this the new Bishop is introduced to the King to do Homage. On his Consecration the Bishop hath a Right to his Temporalities, but he cannot sue for them till his Consecration be certified by the Archbishop; but the King may grant the Bishop his Temporalities immediately after his Confirmation. By his Confirmation he is instated in the Jurisdiction of his Diocese, so as to excommunicate and certify it; and therefore the Power of the Guardian of the Spiritualities ceases from that Time forward. *Clergyman's Vade Mecum.*

BISSEXTILE. To prevent all Ambiguity which may arise on the Account of the Intercalation of a Day every fourth Year, 'tis appointed by the Statute *de Anno Bissextili*, 21. H. 3. that the Day increasing in the Leap-Year, and that next before, shall be accounted but as one Day.

BLACKNESS. The Incomparable Sir *Isaac Newton* in his Opticks, shews, That for the Production of Black Colours, the Corpuscles must be *less* than any of those which exhibit other Colours, because at greater Sizes of the component Particles, there is too much Light reflected to constitute this Colour; but if they be a little *less* than is requisite to reflect the White and very faint Blue of the first Order: (*Vid. Book 2. Obj. 4. 17, and 18.*) they will reflect so little Light as to appear intensely Black, and yet may perhaps reflect it variously to and fro within them so long, till it happen to be stifled and lost: by which means they will appear Black in all Positions of the Eye without any Transparency.

And from hence it appears why Fire, and that yet more subtle Dissolver *Putrefaction*, by dividing the Particles of Substances, turn them Black: Why small Quantities of black Substances impart their Colour very freely and intensely to other Substances to which they are applied; the minute Particles of these, by reason of their very great Number, easily over spreading the gross Particles

of others. Hence also it appears, why Glass ground very elaborately with Sand on a Copper Plate, till it be well polished, makes the Sand, together with what by rubbing is worn off from the Glass and Copper, become very black: And why black Substances do soonest of all others become hot in the Sun's Light, and burn; (which Effect may proceed partly from the Multitude of Refractions in a little Room, and partly from the easy Commotions of so very small Particles:) And also why Blacks are usually a little inclined to a bluish Colour; for that they are so, may be seen by illuminating white Paper by Light reflected from black Substances, where the Paper will usually appear of a bluish White; and the Reason is, that Black borders on the obscure Blue of the first Order of Colours describ'd in the above-mention'd 18th Observation, and therefore reflects more Rays of that Colour than of any other.

'Tis necessary also to the Production of *Blackness* in any Bodies, that the Rays be stopt, retain'd, and lost in them; and these conceive Heat (by means of a burning Glass, &c.) more easily than other Bodies, because the Light which falls upon them is not reflected outwards, but enters the Bodies, and is often reflected and refracted in them till it be stifled and lost.

BLOOD-RED Heat, is the last Degree of Heat given by Smiths to their Iron in the Forge, and is used only when Iron hath already its Form and Size, but wants a little Hammering to smooth it; and that is done with the Face of the *Hand-Hammer* with light flat Blows.

BLOOM, in the Iron Works, is a four-square Mass of Iron about two Foot long, brought from a *Loop* into that Form at the *Fintry*, and under the Hammer: See *Iron*.

BLOWING Houses, in the Tin Miner's Language are the Furnaces where the Tin Ore (after it hath passed the *Stamping Mill*, and is thoroughly washed and separated from the Parts not Metalline, which they call the *Causalty*; and after it hath been again dry, and hath passed the *Cruzing Mill*) is melted and then cast.

BOMBARDEERS are Men employ'd to fire Bombs or Shells out of Mortars. They drive the Fusee, fix the Shell, load and fire. They work also with the Fire-workers on all sorts of Fire-works.

BOMB-KETCH is a small Vessel built and strengthened with large Beams for the use of Mortars at Sea.

BONNY, the Miner's Term for a distinct Bed of Ore that communicates with no Vein. See *Squat* and *Tin*.

BORDAGE and *Board-half-penny* is a Fee or Duty paid in Markets and Fairs for Boards and Tables, Booths and Standings.

BORDARII are often mention'd in the *Doomsday Book*, and were distinct from the *Servi* and *Villani*, and seems to have been of a less Servile Condition: For these had a *Bord*, i. e. a *Cottage* with a small Parcel of Land allowed them, on Condition they should supply the Lord with Poultry and Eggs, &c. Hence,

BORDLODE was the Farm or Quantity of Food which they paid by this Tenure: And the small Estates so held, called.

BORDLANDS, which therefore are such Demesnes as Lords kept in their Hands, for the Maintenance of the Board or Table. *Kennet's Glossary.*

BOTTOMRY is borrowing or lending Money on the Credit of a Ship or Vessel's safe Voyage.

BOULTINE in Architecture is the Workmens Term for a Convex Moulding, whose Convexity is just $\frac{1}{4}$ of a Circle: 'Tis plac'd next below the *Plinth*, in the *Tuscan* and *Doric Capital*.

BOW is an Instrument which hath been sometimes used at Sea, consisting of only one large Arch of 90 Degrees, well and truly graduated, Three Vanes, and a Shank or Staff, as you see in the Figure annexed:

Where D E C is the Arch, A E the Staff or Shank passing the Arch at 45 Degrees inmost, but in some in 50° or 55°. F is the Shade Vane, G the Sight Vane, and A B the Horizon Vane.

To take the Sun's Altitude by it.

By the Handle C hold the Bow upright, and move the Sight Vane G up and down, still looking through the Sight till you see the Shade of the

upper Part of the Shade Vane upon the Slit of the Horizon Vane; and that at the same Time you see also the Horizon through the Slit of the Horizon Vane: In doing of which, if you see the Sky and not the Horizon, then draw the Sight Vane a little lower down towards C, but if you see the Sea and not the Horizon, then slide it a little upwards.

If it be the Meridian Altitude that is to be observed, you must wait and make Observation as oft as you think fit, till at last you begin to see the Sea instead of the Horizon. Then desist; and the Differences between the Degrees and Minutes cut by the Sight Vane, and those cut by the upper Edge of the Shade Vane, is the Distance of the Sun's upper Limb from the Horizon, from which if you subtract 16 Minutes, which is the Sun's Semi-diameter, the Remainder will be the Distance of the Sun's Centre from the Horizon, allowing for the Refraction: And you need not subtract above 8 or 10 instead of 16 Minutes for the Sun's Semi-diameter, when a Ship-board, since you must allow for the Height of your Eye above the Level of the Water.

To observe the Height of a Star.

Place the Sight Vane at A, and the Horizon Vane at G, and looking through the Sight Vane at A, move the Vane F higher or lower, till you can see the Star at the Horizon, through the Horizon Vane at G: So shall the Degrees and Minutes between the two Vanes F and G be the Altitude of the Star sought.

To take the Distance between two Stars.

Place the Sight Vane at A, and the Horizon Vane at G, as in the last Practice, and look through the Vane at A, moving the Vane F still to and fro, till you can see the one Star through the Vane G, and the other by the Vane F, for then will the Distance between those 2 Vanes F and G, be the Distance in Degrees and Minutes of the 2 Stars required.

BOWGE, or rather *Bouch*, of Court, was formerly an Allowance of Diet or Belly Provision, from the King or Superior Lords to their Knights, Esquires and other Retinue, that attended them in any Expedition. *Kennet's Glossary.*

BOWLING BRIDLES in a Ship, are the Ropes by which the *Bow-lines* are fastned to the *Leech* of the Sail.

BOW-SPRIT-LADDERS, are Ladders in a Ship made fast at the Beak Head over the Bow-sprit, to get upon it when there is Occasion.

BRACE in Architecture, is a Piece of Timber framed in with Bevil Joynts, and is used to keep the Building from swerving either Way: When a Brace is framed into the Kingleses or principal Rafters, 'tis called by some a *Strut*.

BRACKETS in Gunnery are the Cheeks of the Carriage of a Mortar: They are made of strong Planks of Wood, of near a Semi-circular Form, and bound round with thick Iron Plates; they are fix'd to the *Bed* by four *Bolts*, which are called *Bed-bolts*; they rise up on each Side of the Mortar, and serve to keep her at an Elevation, by the Means of some strong Iron Bolts (called *Bracket-bolts*) which go through these Cheeks or Brackets.

BRADS, are Nails used in Building, having no spreading Heads as other Nails have: Of these some are called *Joyners Brads*, and are for hard Wainscot; others *Batten Brads*, and are for soft Wainscot; and some *Bill Brads* or *Quarter Heads*, which are us'd when a Floor is laid in haft, or for shallow Joynts which are Subject to warp.

BRAKE in a Ship, is the Term for the Handle of a Pump.

BRASS is a Metal made out of a Mixture of Copper and *Lapis Calaminaris* (which is usually called *Calamine*). This Stone is dug out of several Mines in the *West of England* (as about *Mendipp*, &c.) about 20 Foot deep. It is burnt or calcined in an Oven or Kiln made red hot, then ground to Powder, and sifted as fine as Flour; then mix'd with ground Charcoal, because the *Calamine* is apt to be clammy, to clod, and so is not easily incorporable. Then they put about 7 lb of *Calamine* into a melting Pot, holding about a Gallon, and uppermost about 5 lb of Copper. The *Calamine* must be mix'd with as many Coals as will fill the Pot. This is let down with Tongs into a wind Furnace 8 Foot deep, and remains there 11 Hours; for they cast not off above twice in 24 Hours. One Furnace holds 8 Pots. After melting

it is cast into Plates or Lumps. 45 lb of *Cude Calamine* produces 30 lb burnt or calcined. They use *Brass Shruff* sometimes instead of so much Copper; but that cannot always be procur'd in Quantities, being only a Collection of Pieces of old Brasses.

The best Brass Guns are made of malleable Metal, and cannot be made of pure Copper or Brasses; but it is necessary to put in courser Metals to make it run close and sounder, such as Lead and Pot-metal. *Bell-metal* being Copper and Tin, and *Pot-metal* Copper and Lead. About 20 lb of Lead is usually put into 100 lb of *Pot-Metal*, but about 6 lb is sufficient to put into a 100 lb of *Gun Metal*.

The *Calamine Stones* were heretofore fetch'd from *Poland*, but are now exported from us by the *Dutch*.

The Manufacture of Brasses was privately kept in *Germany* for many hundreds of Years, wherein many thousands are employ'd, and all were maintain'd, some having thereby rais'd themselves to great Estates. *Phil. Transf. N. 200 and 260.*

BRAZING is a Kind of soldering of Iron, when the Work is so thin that it will not bear *Welding*; they lay small Pieces of Brass on the Places that are to be brazed, and strew a little Powder of Glass upon it to make the Brasses run, and give it an Heat in the Forge till they find that the Brasses is run, and then they take it out and let it cool.

BREASTS, in Women and other Females, are of a Substance consisting of a great Number of oval Glands, lying in a great Quantity of Fat: Their excretory Ducts approach the Nipple, join and unite together, till at last they form seven, eight, or more small Pipes call'd *Tubuli Lactiferi*, which have seven cross Canals, by which they communicate with one another, that if any of them be stopp'd, the Milk which was brought to it might not stagnate, but pass through by the other Pipes, which all terminate in the Extremity of the Nipple.

The Nipple is a spongy Substance, made of two Orders of Fibres: the smallest make a fine Net-work within the largest Spaces of the Net-work of the bigger Fibres. Through it pass the *Tubuli Lactiferi*, which grow smaller and smaller to their Extremities, that the Milk might not run out, but when the Breasts are full, or upon Suction; It has an exquisite Sense, and a small Erection when it is handled.

The Arteries and Veins of the Breasts are Branches of the Subclavian and Intercostal. They have Nerves from the Vertebral Pairs, and from the sixth Pair of the Brain.

The Use of the Breasts is to separate the Milk for the Nourishment of the *Fetus*. The Arteries which terminate in the Glands, which compose the Substance of the Breasts, bring the Blood pregnant with a Child which has received its last Perfection by its Circulation through the Lungs; this Chyle being separated by the Glands of the Breasts, runs through the *Tabuli Lactiferi* upon the Suction of the Child.

The Breasts in Men are very small; they are chiefly for Ornament. I have seen some Men who have had milk in them. *Keil.*

BREDEWITE was anciently a Fine, Penalty or Amercement in Default in the due Assize of Bread: And K. Henry II. granted, among other Things, to the Tenants of the Honour of *Wallingford*,

ford, Oxon, That they should be *Quieti de Brede-wite*.

BREST is a Term in Architecture, used by some for that Member or Column which is called the *Thorus* or *Tore*.

BREST Summers, in a Timber Building, are the Pieces in the outward Parts of any Building, and in the middle Floors, (not in the Garret, nor in the Ground Floor) into which the *Girders* are framed.

BRICKS. The several Kinds of Bricks used in Architecture are these: 1. *Compass Bricks*, which are of a Circular Form, and are used in steining of Wells. 2. *Concave* or hollow Bricks, being on one Side flat like a common Brick, but on the other hallowed: They are used to convey Water. 3. *Cogging Bricks* are used to make the indented Work under the Copping of Walls built of great Bricks. 4. *Coping Bricks*, which are formed on Purpose for coping of Walls. 5. *Dutch* or *Flemish Bricks*, used to pave Yards and Stables, and for Soap-Boylers Fatts, and for Cisterns. 6. *Glin-kers* are such Bricks which are glazed by the Heat of the Fire in the making. 7. *Feather-edg'd Bricks* are like the common Statute Bricks, only they are thinner on one Edge than on the other, and are used to pen up the Brick Pannels in Timber Buildings. 8. *Didoron*, was a Brick used by the Ancients of $1\frac{1}{2}$ Foot, or two Spans long, (whence the Name) and one Foot broad. This was the smallest Sort of Bricks used by the Greeks in their private Houses, for there was a large Sort in Use in their publick Edifices, which they called, 9. *Pentadoron*, which was 3 Foot 9 Inches long, and 1 Foot broad. 10. *Samel* or *Sandal Bricks*, are such as lie outmost in a Kiln or Clamp, and consequently are soft and useless, as not being thoroughly burnt. 11. *Great Bricks* are 12 Inches long, 6 broad, and 3 thick. The Weight of one about 15 Pound; so that 100 will weigh 1500, and 1000 of them 15000 Pound. Their Use is to build Fence Walls, together with, 12. *Pilaster* or *Buttress Bricks*, which are of the same Dimensions with them, only they have a Notch at one End of half the Breadth of the Brick. Their Use is to bind the Work at the Pilasters of Fence Walls, which are built of great Bricks. 13. *Paving Bricks* or *Tiles*, these are of several Sizes in several Counties or Places. 14. *Place Bricks* are such as are made in a Place made on Purpose for them near the Building they are to be used in. 15. *Statute* or *small common Bricks*: These ought to be 9 Inches long, $4\frac{1}{2}$ broad, and $2\frac{1}{2}$ thick; 100 of these usually weighs about 550 Pound, and consequently 1000, 5500 Pound, and about 407 in Number are a Tun Weight. These are commonly used in paving of Cellars, Hearths, Sinks, &c. 30 or 32, if true Measure, will pave a Yard Square, and 330 will pave a Square of 100 Foot, laid flat; but if laid edge-wise, they must be double in Number.

Bricks are burnt either in a *Kiln* or a *Clamp*: Those that are burnt in a *Kiln*, are first set or placed in it, and then the Kiln being covered with Pieces of Bricks, they first put in some great or cord Wood to dry the Ware with a gentle Fire, which is continued till the Ware is pretty dry: which they know by the Colour of the Smoaks turning from a whitish dark to a black transparent Smoak: then they put in no more Wood, but proceed to burn the Bricks with Bush, Nurze Straw, Heath, Brake or Fern Faggots, having first

damm'd up the Mouth of the Kiln with their *Shin-log* as they call it (which is Pieces of Bricks piled up one on another, and then closed up with wet Brick Earth instead of Mortar) only leaving just Room to put in a Faggot. They then continue to put in more and more Faggots, till they make the Kiln and its Arches look white with Heat, and that the Fire begins to appear at the Top of the Kiln. Then they begin to slacken the Fire for about half an Hour or an Hour, and so let all cool by Degrees. The Ware will be burnt usually in about 48 Hours. But now-a-days about London, they usually burn Bricks in *Clamps*, which are built of the Bricks to be burnt, something after the Manner of the Arches in Kilns, viz. with a Vacancy between each Brick's Breadth, &c. for the Fire to play through; but with this Difference that instead of arching, they *truss* or *span* it over, by making the Bricks project one over another on both Sides the Place for the Wood and Coals to lie in, till they meet, and are bonded by the Bricks at the Top which closes all up. The Place for the Fuel is carried up strait on both Sides, till about 3 Foot high, then they fill it almost with Wood, and over that lay a Covering of Sea-coal; and then they over-span the Arch: But they strew Sea-coal also over at the Clamp, betwixt all the Rows of Bricks, then they fire the Wood, and then the Coal, and when all is burnt out, they conclude the Bricks burnt enough. *Builder's Dictionary*.

BRIDGE of Communication, is a Bridge made over a River, by which two Armies or Forts which are separated by that River, have a free Communication one with another.

BRIGADE Major, is an Officer appointed by the Brigadier to assist him in the Management and Ordering of his Brigade, and he there acts as a Major General does in an Army.

BRINGERS up, in a Battalion, are the whole last Rank of Men in it, or the last Man in every File.

BUDDLE, is the Word in the Works for dressing *Tin Ore*, for a Tye of Boards or Slate about 4 Foot deep, 6 long, and 3 over, wherein stands a Man with a Shovel in his Hand (called a *Trambling Shovel*, as this is also called the *Trambling Buddle*) bare-footed, to cast up the Ore about an Inch thick, on a long square Board placed just before him, and as high as his Middle, which is called the *Buddle Board*: There are several of these *Buddles* in which the Ore is still trampled over again and again, till it be at last so well wash'd, as to become what they call *black Tin*, which is compleatly ready for the *blowing House*.

BUILDING. There are some good Rules and Directions about Building which are given in *Moxon's Mechanick Exercises*, and other Books of that kind, which 'tis very proper every Gentleman should be acquainted with, that he may not be cheated or imposed upon by his Workmen: And those are such as these; First with Respect to the Foundation, Care ought to be taken, that after the Cellars are dug, if there be any, or if none, after the Trenches are dug, in which the Walls are to stand, to try all the Foundations either by a Crow, a Rammer, or which is best, with a *Borer*, such as Well Diggers, Miners, &c. use, whether they are thoroughly sound, and are fit to bear the Weight that is to be laid upon them. If the Foundation be not very loose, it may be cured by ramming in great

great Stones with an heavy Rammer, the Stones being placed close together, about a Foot wider on each Side of the Trench than the Breadth of the Wall is to be; but if it be so loose that this will not do, you must get good Pieces of Oak, whose Length must be the Breadth of the Trench, or about 2 Foot longer than the Breadth of the Wall, and these should be laid a-cross the Foundation, about a Foot asunder, and being well ramm'd down, lay long Planks upon them, which must be pinn'd down to them: and if this be not sufficient, Piles of a much greater Length must be driven down so deep, till they touch good Ground, and then strong Planks pinn'd down to their Tops, &c. If the Foundation be faulty only in Patches, there may Arches be turned over the insufficient Places, which will take off the Weight from bearing upon them. And sometimes it may be proper to use *inverted Arches*.

The Foundation being well secured, the next Care is to see that the Walls be all made of the same Thickness as they are in the Design; for which Purpose there should be Numbers to express their Thickness in the Draught.

The Walls also must be well wrought and *bounded* as they call it: In order to which the Mortar must be well made of good well burnt Lime and sharp Sand; the usual Proportion is a Load of Sand of 36 Bushels to a Hundred of Lime of 25 Bushels, or a Bushel of Lime to one and an half of Sand; but when the Sand is not very sharp, there must be a greater Proportion of it to the Lime.

In slacking of Lime, Care should be taken, that though it be wetted every where a little, yet it be not over-wetted; and every Layer or Bed of Lime should be covered with Sand to keep in the Steam, that it may not fly away, but be forced to mix it self with the Sand; and this will make the Mortar much stronger. The Mortar also must be well *beaten* with a Beater three or four times over before it is used, that the Knots of the Lime may be all broken, and the Lime and Sand mingled very well together: And it will be still better, if after the first beating, it be let lie three or four Days, and then let it be beat well over again when 'tis used.

If the Bricks are laid in very hot dry Weather, and it be some small Piece of Work which you would have very strong, it will be worth while to dip every Brick as 'tis laid in a Pan of Water; and it will be of good Use in great Work to throw Water on the Walls, after the Bricks are laid, by a *Wirtenburgh Syphon*, or some such Way. And the Walls also should be covered in Summer Time, to keep them from drying too hastily, as well as in Winter Time from Rain, Snow, or Frost, which last is a great Enemy to all Kinds of Mortar, especially to that which hath been newly wetted.

Let the Workmen also in doing up the Walls, not carry any one above three Foot high, before the next adjoining Wall is brought up equal with it, that so they may join together, and make *good Bond* in the Work.

In the middle of Walls, Care should be taken that Joint is not laid on Joint, at least as seldom as may be, that *good Bond* may be made there as well as on the Outfides.

When Timber is laid on Brick-Work, as Torsels for Mantle Trees, or Lintels for Windows, Templets for Girders, &c. let it be always laid in *Loam*, for that is a great Preserver of Timber, which Mortar will eat and corrode: The same thing should be done with the Ends of Joists and

Girders, some Workmen dawb their End with Pitch, to preserve them from the Mortar.

BULL, perhaps from *Bull's Consilium*, is an Instrument so called, granted by the Bishop of Rome, and sealed with a Seal of Lead, containing in it his Arbitrary Decrees, Command, or other Actions. By the Statute of 28. H.8. c. 16. it was enacted, that all Bulls, Briefs, Faculties, and Dispensations, of whatever Name or Nature, had or obtained from Rome, should be void. *Matt. Paris, A.D. 1237.* describes the Seal of the Bull to be a Cross in the middle, with *St. Paul* on the Right, and *St. Peter* on the left Hand.

BURNING Glasses. In *Philos. Transact. N. 4c.* there is an Account of one *S. Setalla* at *Millan* who was causing a burning Glass to be made of 7 Foot in Diameter, and he pretends to make it burn at the Distance of 50 Palm or 33 Foot.

And in *N. 188.* there is mention of a burning Concave which was made at *Lusace* in Germany of near 3 *Leipsick Ells* in Diameter, which exceeds the great one at *Paris* by $\frac{1}{2}$ of an Ell. This was made of a Copper Plate, scarce twice so thick as the Back of a common Knife, and so may easily be moved from Place to Place, and ordered for Use; and the Workmanship of it may, by the Contrivances I have invented (saith the German) be easily, and in a little Time, performed by one Man. The Polish hereof is very good, and represents by distinct Reflexions, all those Appearances which arise from the Concave Figure thereof.

The Force of this Speculum is incredible: For, 1. a Piece of Wood put in the *Focus* (which is 2 Ells off) Flames in a Moment, so as a fresh Wind can hardly put it out. Water applied in an Earthen Vessel presently boils. 3. A Piece of Lead or Tin 3 Inches thick melts away in Drops, and in 2 or 3 Minutes time will be melted quite through. 4. A Plate of Iron or Steel is presently red hot, and soon after hath a Hole burnt through it. I have made 3 such Holes in a Plate in 6 Minutes time. 5. Copper and Silver, and the like, applied to the *Focus* melt; I tried with a Rix-Dollar: And the Iron aforesaid will run in 5 or 6 Minutes. 6. Slate at first is red hot, but in a few Minutes turns into a fine sort of black Glass, of which, if any Part be taken in the Tongs, and drawn out, it runs into Glass Threads. 7. Tiles and Earthen Pot-threads, in a little time melt into Glass, as also doth Pumice Stone into a very white one: A Piece of a very strong Crucible runs into Glass in 8 Minutes. I have seen Bones turn into Glass of an Opaque Kind, and a Clod of Earth into Greenish Glass. These Experiments were made in *August* and *September*.

Dr. Hook proposed to the Society, that one might be made after this Manner, of many Feet in Diameter for a small Price; being hammered out of a Copper Plate, and tinn'd over with a Mixture of Tin, Lead, and Tin-glass, which is found to bear a very good Polish.

The Uses of such a Speculum would be very many, and perhaps its Effects wonderful, there being no other Heat in the World any thing like that of the Sun's Rays, whose Weight and Fineness are not possible to be equalled by any common Fire; yet the Moon's Rays, though the Light was augmented by the Glass, gave no Manner of Heat.

Mr. Tschirnhaus is said to have made Convex Burning Glasses of 3 or 4 Foot Diameter, and whose *Focus* is 12 Feet distant, and of $1\frac{1}{2}$ Inch in Diameter; and to make this *Focus* yet stronger, he

he contracts it by a second *Lens*, placed parallel to, and at a due Distance from the first, and then the *Focus* is but of 8 Lines in Diameter. This Glass in a Moment vitrifies Tiles, Slates, Pumice Stones, Dutch Ware, and Talk. It melts Sulphur, Pitch, and all Rosins under Water; any Metal exposed to it in little Lumps upon a Coal, melts in a Moment, and Iron sparkles as in a Smith's Forge. All Metals vitrify on a Piece of *China* Plate, if it be not so thin as to melt it self; and Gold in vitrifying receives a Purple Colour: *Histoire de l'Academie des Sciences, Anne 1699.*

The *Linum Vivum* or *Asbestos* would be vitrified by this Glass, even in January, in about 10 Minutes Time: *Vid. Act. Erud. Leips. April. 1688.*

The Incomparable Sir *Isaac Newton* presented a Burning Glass to the Royal Society of London, whereof he is the most worthy President, consisting of seven Concave Glasses, and so placed, as that all their Foci join in one Physical Point. Each

Glass is about $11 \frac{1}{2}$ Inches in Diameter; six of them are placed round the seventh, to which they are all contiguous, and they compose a kind of Segment of a Sphere, whose Subtense is about $34 \frac{1}{2}$ Inches. The Central Glass lies about an Inch lower or farther in than the rest. The common Focus is about $22 \frac{1}{2}$ Inches distant, and of about $\frac{1}{2}$ an Inch in Diameter. It vitrifies Brick or Tile in a Moment, and in about half a Minute melts Gold.

If another round of Concaves were added about these seven, perhaps it would outdo any thing we have an Account of.

BUTMENTS, in Architecture, are the Mason and Bricklayer's Term for those Supports or Props, on or against which the Feet of Arches rest. Also little Places taken out of the Yard of the *Ground-Plot* of a House, for a Buttery, Scullery, &c. are sometimes called *Butments*.

CAN

CADE, in the Book of Rates is us'd for a certain determinate Number of some kinds of Fish; as a *Cade* of Herrings is 500, of *Sprats* is 1000.

CALCAGE, *Calcagium*, was a Tax or Contribution formerly paid by the neighbouring Inhabitants, towards the making and repairing of common High-ways, Cause-ways and Roads; as

CALCEARUM Operationes, were the Work and Labour of this Kind done by the inferior servile Tenants; and from this it was a Privilege to be free.

CALCULUS differentialis; *J. Barnoulli* in the *Leipsick Acts* for Jan. 1691. owns that our famous *Dr. Barrow* had given some Specimens of this Method above 10 Years before that Date in his *Geometrical Lectures*, and of which, all his Apparatus of Propositions there contain'd are so many Examples. He acknowledges also, that *Mr. Leibnitz's* Method of this *Calculus differentialis* is founded on *Dr. Barrow's*, and differs from it only in Notation and some compendious Abridgments. And in this Discourse *Mr. Bernoulli* gives some Specimens of the Use of this *Calculus*, in the Dimension of the Parabolick Spiral, and of the Flexures and Evolutions of Curves in general.

See on this Subject *Mr. L' Hospital*, *Mr. Neimintis's Analysis Infinitor*.

CAMBER Beam, in Architecture, is a Beam or Piece of Timber cut hollow or arching in the Middle: They are us'd in Plat-forms, Church Leads, &c. and are very proper where-ever is occasion for long Beams, being much stronger than flat Beams of the same size; for being laid with the hollow Side downwards, and having good Butments at the Ends, they serve for a kind of Arch.

CANON, in the Ecclesiastical Law, was originally a Book wherein the Religious of every Convent had a fair Transcript of the Rules of their Order: These were often read over to them as their *Local Statutes*, and therefrom were called *Regula*, and *Canon* their Rule.

CANON in Musick; *Ptolemy* rejecting the *Aristoxenian* Way of measuring the *Intervals* in Musick by the Magnitude of a *Tone* (which they suppose to be formed by the Difference between a *Diapente* and *Diateffaron*) thought that Musical *Intervals* should be distinguish'd according to the Ratio's or Proportions which the *Sounds terminating those Intervals* bare one to another, when consider'd according to their Degree of being *Acute* or *Grave*, which was also before *Aristoxenus*, the old *Pythagorick* Way. *Ptolemy* therefore made the *Diapason* to consist in a double Ratio, the *Diapente* in a *Sesquialteral*, the *Diateffaron* in a *Sequitertion*, and the *Tone* it self (by which the *Diapente* and *Diateffaron* differ) in a *Sesquioctav*; and all the other *Intervals* according to the Proportion of the *Sounds* that terminate them. Wherefore taking as *Canon* (as 'tis call'd) a determinate Line of any Length, he shews how this *Canon* is to be cut accordingly, so that it may represent the respective *Intervals*; and this Method answers exactly to Experiment in the different Lengths of Musical Chords. And from this *Canon*, *Ptolemy* and his

CAR

Followers have been called *Canonici*, as those of *Aristoxenus* were called *Musici*.

There is a Tract call'd *Sectio Canonis* attributed, but falsely, to *Euclid*; and which you will find at the End of his Works, in the *Oxford Edition*. *G. L.*

CANTALIVERS, in Architecture, are a Kind of *Modillions*, only those are plain, but these are carved. They are much the same with *Cartouzes*, and are set as *Modillions* are, under the *Corona* of the Cornish of a Building.

CAPIAS Conductos ad Proficisendum, is a Writ that lies for taking up such Men as having receiv'd *Press-money* to serve the King, flink away, and come not in time. 'Tis an original Writ directed to the *Serjeant at Arms*, having included a Clause of Assistance.

CARACT is not any certain Weight or Quantity, but the $\frac{1}{4}$ Part of any Quantity of Weight. And the *Minters* and *Goldsmiths* divide it into 4 Parts, which they call *Grains of a Caract*; and one of these they subdivide in Halves and Quarters.

CARKE seems formerly to have been the Word for a certain Quantity of Wool, whereof Thirty made a *Sarpler*, 27. *H. 8. c. 2.*

CAPSULATE Plants are such as have a *Tetrapetalous regular Flower* consisting of four distinct *Petala* in each Flower, and which bear their Seeds in short *Capsule*; by which they are distinguish'd from the *Siliquise*, which bear their Seed in long *Cases* or *Capsule Seminales*, and are the other Branch of this Genus of Plants.

CAPSQUARES, in Gunnery, are those strong Plates of Iron which come over the Trunnions of a Gun, and keep her in the Carriage. They are fastned by Hinges to the Prize Plate, that it may lift up and down; it forms a Part of an Arch in the Middle, to receive a third Part of the Thickness of the Trunnions, for $\frac{2}{3}$ of them are let into the Carriage, and the other End is fastened by two Iron Wedges, which are called the *Fore-locks* and *Keys*.

CAPTION, when a Commission is executed, the Commissioners Names subscribed and return'd, that is call'd a *Caption*.

CARCASE of a House, in Architecture, are the Partitions, Floors, Rafters, &c. made by the Carpenter.

CARTESIAN System of the World.

Mr. Des Cartes, in order to account for the Celestial Appearances, supposes the Matter of the World to have been at first divided by Almighty God, into *innumerable little equal Parts*, each endow'd with an equal Degree of Motion, both about its own Centre and separately, so as that this Matter constituted a *Fluid*. He suppos'd also that several Collections of this Matter, were endow'd with a Motion about different Points, as common Centres, which Points were placed at equal Distances; so as that the Matter round them compos'd different *Vortices*, as he calls them. He supposes also, that the first Particles of Matter by those intestine Motions were rendred or ground of a spherical Figure, and so did compose *Globules* of several Magnitudes: And these he calls the Matter of his *second Element*.

But the very small Particles which, by the aforeſaid Motions, were ground and rubb'd off from the firſt Particles of Matter, and driven violently many different Ways, made up a new Matter, which he calls his *firſt Element*. And ſeeing that there would be more of this firſt Element, than was ſufficient to fill the Vacuities between the Globules of the *ſecond Element*, he ſuppoſes that the remaining Part would be driven towards the Centre by the circular Motion of theſe Globules, which did for that Reaſon recede from it; and this Matter being there amasſed into a Sphere, would in the Centre of every Vortex produce a Body like the Sun: which Sun being thus form'd, and moving about its own Axis with the common Matter of the Vortex, would neceſſarily throw out ſome Parts of its Matter, through the Vacuities of the Globules of the ſecond Element conſtituting the Vortex, and this eſpecially at ſuch Places as are fartheſt from its Poles, receiving at the ſame Time in by theſe Poles as much as it loſes in its Equatorial Parts, or about the Equator: And by this Means it would be able to carry round with it thoſe Globules that are neareſt, with the greater Velocity, and the remoter with leſs. And by this Means thoſe Globules which are neareſt the Centre of the Sun muſt be leaſt; becauſe were they greater or equal, they would by Reaſon of their Velocity have a greater centrifugal Force and recede from the Centre. And if it ſhould happen that any of theſe *Sun-like* Bodies in the Centres of the ſeveral Vortices, ſhould be ſo incruſtated and weakened, as to be carried about in the Vortex of the *true Sun*; if it were of leſs Solidity, or leſs Motion than the Globules towards the Extremity of the Solar Vortex, then it would deſcend towards the Sun, till it met with Globules of the ſame Solidity, and capable of the ſame Degree of Motion with it ſelf; and then being fix'd there, it would be for ever after carried about by the Motion of the Vortex, without either approaching any nearer to, or receding from the Sun, and ſo become a Planet.

Suppoſing then all this, we are next to imagine that our *System* was at firſt divided into ſeveral Vortices, in the Centre of each of which was a lucid Spherical Body; and that ſome of theſe being gradually incruſtated, were ſwallowed up by others which were larger and more powerful, till at laſt they were all deſtroyed and ſwallowed up by the biggeſt Solar Vortex, except ſome few which were thrown off in right Lines from one Vortex to another, and ſo became Comets. And from hence it appears, that thoſe Planets which are neareſt the Sun are leſs ſolid: That is alſo *Des Cartes's* Reaſon why we ſee always the ſame Face of the Moon; becauſe the Hemisphere which is oppoſite to the Sun and the Earth is ſomewhat more ſolid than the other: Becauſe alſo the Matter of the *firſt Element* which makes up the Body of the Sun, moves with greater Velocity the Parts of the Vortex, and the Bodies ſwimming in it, than thoſe that are remoter: Therefore thoſe Planets which are nearer to the Sun, muſt finiſh their Periods ſooner than thoſe which are more remote from him. And the Reaſon why the Planets revolve round their Axis, is, becauſe according to this Hypotheſis, they were lucid, Sun-like, and revolving Bodies before.

But notwithſtanding all this fine Romance, it is (*Firſt*,) certain that a Vortex produced by the Revolution of a Sphere about its Axis, muſt be propagated in *infinitum*, if nothing hinder it: And

therefore, ſince there muſt be as many Vortices as there are *fix'd Stars*, one Vortex would certainly run into another, and every Particle would be acted by a Motion compounded of the Motion of all the central Spheres; which is abſurd and contrary to that Conſtancy, Limitation and Uniformity which is obſerved in the *Phænomena* of the Heavenly Bodies.

2. Since the Motion and Parts of the Vortices neareſt the Centre, is ſwifter than that of the more remote, they muſt preſs upon the exterior Parts, and thereby perpetually impart ſome Part of their Motion to them; and therefore thoſe interior Parts of the Vortex will be continually leſſening ſome Part of their Motion, which never being reſtored, theſe Parts muſt ſtill move ſlower and ſlower by Degrees, till at laſt all the Motion will be quite deſtroyed.

3. According to this Hypotheſis, each Planet is of the ſame Density with the Parts of the Vortex in which it ſwims, being govern'd by the ſame Laws of Motions, and is, as it were, only ſome concreted Parts of the Vortex. But the Times of the Periodical Motion of Bodies carried about by a Vortex, are in a duplicate Ratio of their Diſtances from their Centre; as the incomparable Sir *Iſaac Newton* hath demonſtrated in *Seſt. IX.* of his *Princip.* Whereas the Squares of the Times of the Periodical Revolutions of the Planets are as the Cubes of their mean Diſtance from the Centre, or from the Sun: Wherefore the Planets cannot be carried about by a Vortex.

4. If a Vortex run out in *Infinitum*, then would a Body carried round by it certainly deſcribe a perfect Circle, unleſs ſomething ſolid did hinder it; and therefore the greater Diſtance there were between thoſe ſolid Bounds, or the larger the Baſon be which contains the Vortex, in reſpect of the Orbit of the Body carried about in it, the nearer would this Orbit be to a Circle; that is, the Excentricity of the Planets neareſt the Sun, would be leſs than *that* of thoſe which are more remote: But the direct contrary to this is true in Fact, the Eccentricity of *Mercury* being greater than that of *Saturn*.

5. A Body carried about in a Vortex of the ſame Density with it, would neceſſarily deſcribe a Circle, to whoſe Plane the Axis of the central Body producing the Circulation of the Fluid, would be perpendicular: And yet there is not one Planet to the Plane of whoſe Orbit the Sun's Axis is perpendicular.

6. The Comets have their Orbits, not only oblique to, but ſometimes at right Angles, with the Plane of the Ecliptick; ſometimes the Courſe of theſe Comets is diametrically oppoſite to that of the Sun: They perſevere in their Motion without any Change: By Lines drawn from them to the Sun, they deſcribe equal Areas in equal Times; and ſometimes they enter into the Vortex of the Sun. All which is impoſſible, if the Solar Vortex moved round forcibly enough to carry theſe vaſt Bodies of the Planets along with it.

Mr. *Leibnitz* hath indeed a little altered and mended this Hypotheſis of *Des Cartes*; he hath accommodated it better to the Celeſtial Phænomena, and made it more agreeable to the Rules of Geometry.

And *Firſt* he ſhews, That all Bodies, which in a Fluid deſcribe a *Curve-line*, are moved by that Fluid, for of themſelves they would de-

scribe right Lines, and nothing (he saith) but the Fluid concurs to turn them out of the Way.

Secondly, He endeavours to shew, that every Planet is carried about by a Motion compounded of two other Motions; *viz.* the Harmonical Circulation of the deferent Fluid, and the Paracentric Motion of Access to, or Recess from the Sun.

The Planets by a Radius from the Sun describe Areas proportional to their Times; now the Fluid that carries the Planets, must of Necessity circulate so as to produce this Effect; which cannot be done otherwise than by supposing innumerable concentric Orbits of exceeding Thinness to make up the Vortex; every one of which, hath its own proper Way of Circulation, *viz.* Those Orbs which are nearest the Sun move fastest, and the Velocities of the Circulations are every where reciprocally proportional to the Distances of the respective Orbs from the Sun, which will necessarily make the Planet to describe equal Areas in equal Times, let it be in any Part of the *Vortex*: For these Areas are in a compounded Ratio of their Radii or Distances from the Sun, and in a reciprocal one of the Arches or Lengths of the Circulation, which in this Case will make a Proportion of Equality: And this Law of Circulation of the Vortex, he calls *Harmonical*.

The *Paracentrick* Motion is compounded of two others; that is, the *Excussory* Impression of the Harmonick Circulation, whereby all Bodies moving in a Curve, endeavour to recede from the Centre by the Tangent; and the Attraction of the Sun, or the Planets Gravitation towards him. And this, Mr. *Leibnitz* is of Opinion, arises from an Impulse communicated by the circulating Fluid. Now since the Planets move in *Ellipses*, in one of whose *Foci* the Sun is placed, and by Lines drawn from him do describe equal Areas in equal Times, which no other Law of a circulating Fluid, but the *Harmonick* Circulation can account for, we must find out a Law for the *Paracentrick* Motion that may make the Orbits elliptical. The excussory Impression of the circulating Fluid, would throw off the Planet from the Centre by the Tangent, wherefore the Attraction of the Sun or the Gravitation of the Planets towards it, must be sufficient to destroy that Effect; and besides, to make them move in elliptick Orbits, which cannot be brought about, unless this Attraction or Gravitation be reciprocally as the Squares of the Distances from the *Focus*: And this is the Sum of Mr. *Leibnitz*'s Improvement of this Hypothesis.

But this Account must be false for these Reasons; *First*, Because the *Comets*, as hath been said before, have their Orbits, some of them very oblique too; nay, sometimes at right Angles with the Plane or the *Ecliptick*, and their Courses are sometimes quite contrary to those of the Planets. Now these *Comets* describing about the Sun Areas proportionable to the Times, must also according to their Motion be carried about by an harmonically circulating Fluid: But then we shall have *Vortices* moving contrary to *Vortices*, which is very absurd.

2. In equable Motions, the Times are always *directly* as the Spaces, and *reciprocally* as the Velocities, but in a circular Motion, the Spaces in one Revolution are as the Radii; and in an harmonical Circulation, the Velocities are reciprocally as the *Radii*, and therefore the Periodical Times of

a Fluid circulating harmonically are in a duplicate Proportion of the *Radii*: whereas the Periodical Times of the Planets are in sesquialate Proportion of their Distances from the Centre, or of their *Radii*, and consequently the Planets cannot be carried by an *harmonically circulating Fluid*.

It may, perhaps, be alledged here, that this harmonical Circulation is not continued from *Mercury* to *Saturn*, but is interrupted, and reaches only from the *Perihelion* of *Mercury* to his *Aphelion*, and is there again interrupted, and so on through the whole System of the Planets; but this would produce a Deformity, which is very unlike the simple uniform Measures of Nature every where else. And besides, the *Comets* moving forward in the *Zodiack*, pass through all these imaginary Chasms and Interstices, and yet move in the same Manner as if they were carried by a Fluid circulating harmonically, according to some uniform Law; neither do their Appearances give any Ground to suspect such Interruptions as these. *Vid Dr. Cheyne Phil. Prin. of Natural Religion.*

CARTILAGO Scutiformis, is one of the 5 Cartilages of the *Larynx*; 'tis called in *Greek* *Δυσκοειδής* because of its Figure. It makes that Protuberance in the fore-part of the *Larynx* called *Pomum Adami*. It is about one Inch broad, but not so long, being Concave within, and Convex without. Its four Angles have each a small Production; the two upper, which are longer, are tied to the Horns of the *Os Hyoides*; and the two lower to the second Cartilage, which is called *Cricoides* or *Annularis*, from its being like a Ring.

CARTONS, in Painting, are the most perfect Sort of Drawings on Paper, which are subservient to great Works, that must be thoroughly finished; all Sketches, Drawings, Models, and all other Works being Preparatory only, and to be reduced to *Cartons*. This Way was practised by *Michael Angelo* and *Raphael Urbin*, &c. the *Cartons* at *Hampton Court* being the Work of *Raphael*.

They are sometimes made by measuring the Height and Breadth of the Place where the Painting is design'd to stand; and then by dividing that Space into Squares, and one afterwards of the same Dimensions on Paper; they draw on the latter the Subject of their Story or Design, transferring it afterward from the *Carton* to the Wall, by painting it there in Oil, &c.

But some great and experienc'd Masters will be able to do all this without the Help of the *Grate*, as they call it; that is, the Division of the Space or Table into Squares, tho', after all, 'tis a good secure Way.

CARTOUCH, is a Case of Wood about 3 Inches thick at the Bottom, girt round about with Marlin, and holding about 48 Musket Balls, besides 6 or 8 Iron Balls of a Pound Weight. 'Tis fired out of a *Hobit*, as they call it, that is, a small Mortar; and is very proper for defending a Pass.

CARTOUCES, in Architecture, are much the same with *Modillions*, only these are set under the Cornish in Wainscoting, and those under the Cornish at the Eaves of a House. Some Workmen call them *Dentils* or *Teeth*.

CARUCATE, from *Caruca*, and the *French Carui*, a Plough, was the Ancient *Plough Land*; and signified as much Arable Land as could be tilled with one Plough in a Year. This in *Rich. 1.* Reign, was computed at 60 Acres, but 'twas afterwards varied; and the Measure of a *Carucate* was different according to Time and Place.

CASE-

CASE HARDENING, is a Way of making the Outside of Iron hard. And 'tis used sometimes by File-Cutters, when they make Course Files for Cheapness; and formerly most *Rasps* were *Case-hardened*. Gunsmiths also use it to harden the Barrels of Guns; and for Tobacco Boxes; Cane Heads, Buttons, &c. 'Tis done thus: They take Hoofs or Horns of Kine, dry them in an Oven, and powder them, then put an equal Quantity of Bay Salt to it, and mingle both together with stale Urine or Whitewine Vinegar. Some of this Mixture they lay upon Loam, and wrap it about the Iron, putting also more Loam over all. Then lay it upon the Hearth of the Forge to dry and harden; and when 'tis dry and hard they put it into the Fire, and blow till they give the whole Lump a *blood-red Heat*, but no greater. Then 'tis taken out and quenched, and at last the *Case-hardened* Iron is taken out of the Case.

CASEMENT, the same with *Cavetto*, in Architecture, is a hollow Moulding; some say $\frac{1}{4}$, some $\frac{1}{2}$ of a Circle in Compass.

CASSINE, in the Military Language, is a Farm House, where a Number of Soldieis have posted themselves, in order to make a Stand against the Approaches of an Enemy.

CASTELLORUM Operatio, was formerly Service of Work and Labour to be done by inferior Tenants for the Repair or Building of Castles. To this some came in Person, and others contributed, and it was one of the three necessary Taxes from which few Persons were exempted. Dr. Kennet.

CASTING of Drapery, is a Term in Painting, signifying a free, easy, genteel, negligent way of cloathing any Figure: and when the Drapery is so managed, they say 'tis *well Cast*.

CAVAZON, in Architecture, is the digging or hallowing away of the Earth from the Foundation of a Building. *Palladio* saith it ought to be $\frac{1}{4}$ of the whole Height of the whole Building.

CAVETTO, in Architecture, is a hollow Moulding of about $\frac{1}{2}$ or $\frac{1}{4}$ of a Circle in Compass.

CAUKING, in Architecture, signifies Dove-tailing across.

CAULICOLI are, in Architecture, the little carved Scrolls which are under the *Abacus* in the Corinthian Capital.

CASUALTY, is the Tin-miner's Words for the Earth, a Stony Matter which is by washing in the Stomping Mills, &c. separated from the Tin Ore, before 'tis dried and goes to the Crazing Mill.

CAZERN: See *Casern*.

CEMENT, in Architecture, is a strong binding Mortar. 'Tis used to cement Bricks together for some Kinds of Moulding; to make a *Block of Bricks* for the carving of *Scrolls*, *Capitals*, &c. 'Tis of two Sorts: The *hot Cement*, which is common, is made by putting to a Pound of Rozin and a Quarter of a Pound of Bees Wax, half an Ounce of fine Brick-Dust, and as much Powder of Chalk; and boiling all together in a Pipkin, &c. for about $\frac{1}{4}$ of an Hour, stirring it all the while; then let it stand 4 or 5 Minutes, and 'tis fit for Use.

The Brick to be *cemented* must be heated in or by the Fire, and rubb'd one upon another like Boards in glewing. The *cold Cement* is less common, and is thus made.

Grate half a Pound of old Cheshire Cheese, well pared, very small, and to it in a Pot put half a Pint of Milk, and so let it stand all Night;

Vol. II.

the next Morning put it into a *Tray*, &c. With the Cheese and Milk, put half a Pound of very fine powdered and sifted quick Lime, and stir all well together with a Trowel, breaking the Knots of the Cheese if any remain; and then add the Whites of 12 or 14 Eggs, which incorporate well with the Mixture, and then it will be fit for Use: If you would have it reddish, colour it with a little very fine Powder of Bricks.

CENTRE of Attraction, in the New Astronomy, is that Point to which the revolving Planet or Comet is impelled or attracted by the Force or Impetus of Gravity. Thus the Sun is such a Centre of Attraction with regard to all the Primary Planets, and as they themselves are toward their Secondary ones, or Satellites, if they have any.

CENTRE of Gravity. The Consideration of the *Centre of Gravity* is one of the Noblest Speculations in Geometry; and since the *New Methods* have been in Use, such Advancements in it have been made, that hardly much more is to be expected: For the whole Business of the *Investigation of Centres of Gravity* is now reduced to one *General Proposition*, which depends on a few simple *Mechanical Principles*, such as these:

Balance, as that their Masses be reciprocally Proportional to their Distances from C the Point of Suspension.

Suspension, then they will be in *Æquilibrium*, as is the known Case of the *Libra*, (see *Libra* :) That is, if D represent the Distance of the Weight B , and $3D$ that of $4B$, and $2D$ that of $6B$, all from the Point of Suspension C ; then will the Weights $4B$ and $6B$ be in *Æquilibrium*, because $3B : 6B :: 2D : 3D$.

2. The *Moment* of any Weight is = to the Rectangle under its Velocity, and the Quantity of Matter in the same. *V. gr.* The *Moment* of $6B$ is $= 6B \times 2D$ ($2D$ I say, for the Velocities are as the Distances from C) $= 12BD$.

3. And if the *Moment* and Weight (or Quantity of Matter) be given, the Distance of the Point of Application from C the Point of Suspension will be found, by dividing the *Moment* by the Weight. Thus, if the *Moment* of the Weight $6B$ be $12BD$, (as in *Principle 2.*) then the Distance of the Point of Application from C will be $\frac{12BD}{6B} = 2D$.

4. If several Bodies be suspended on each Side the Point C , then multiply every Weight by its respective Distance from the Center of Suspension C : And then if the Sum of all the Rectangles on one Side, be equal to the Sum of all those on the other, the Weights or Bodies will be in *Æquilibrium*; if they are not equal, that Side will preponderate, whose Sum is the greater. Thus, *v. gr.* the Sum of all the Rectangles on the Right Hand C is $18BD$: I say, $+ 18BD$ (supposing $+$ to signify towards the Right Hand, and $-$ towards the Left; and the Sum of all the Rectangles on the Left of C , will be $- 33BD$: Whence it is evident, that the Preponderancy is toward the Left Hand, and is equal to $- 15BD$, which therefore is the *Moment* of all the Weights.

5. The *Moment* then of all the Weights being in this Case $- 15BD$, and the Sum of all the Weights $19B$; 'tis plain, if you divide the former by the latter, the Quotient $\frac{15}{19}D$ will be (by *Princip. 3.*) equal to the Distance of the *Common Centre of Gravity* of all the Weights from the Point C .

6. When the Weights, B , $6B$, and $5B$, hang all on the same Side of C , the Sum of their *Moments* is $= 33BD$, as the Sum of the Weights is $12B$. Wherefore one Weight $= 12B$, and hung at $\frac{33}{12}D$ distant from C , will gravitate in the same Manner as the separate Weights did before at their respective Distances: That is, the said Point is the *Common Centre of Gravity* of those Weights, since it is that Point in which all their Forces unite; and whereat, if they were all jointly suspended, they would produce the same Effect as before they did separately.

7. Let the Line AB be suspended at A , and suppose it divided into an infinite Number of heavy Points; 'tis then plain, that the farther any

Point is from A , the more it will gravitate; and the *Moment* of each Point will be a Rectangle under its Distance from A , multiplied by its self or Unity: Wherefore the *Moment* of all the Points must be equal to the Sum of all the said Rectangles; and therefore if the whole *Moment* be divided by the whole Gravity of all the Points, or by the Gravity of the whole Line AB , the Quotient (by *Princip. 3.* and *6.*) will be equal to the Distance of a certain Point from A , at which, if all the Points be suspended, their *Moment* will be the same as it is now; that is, that Point shall be the *Common Centre of Gravity* of the Line AB .

8. If a Line, Plane, or Solid, be bisected so by a Line or Plane, as that all the Parts in one Segment be equal to the respective Parts in the other, and also equi-distant from the said Line or Plane; 'tis then clear, that the Center of Gravity of all such Figures, must be in that Line or Plane. And from hence it naturally follows,

Prop. General, That to find the *Centre of Gravity* of any Line, Plane or Solid, you must imagine Lines to consist of an infinite Number of Points, Planes of an infinite Number of Lines, and Solids of an infinite Number of Planes or Surfaces; and then that all these are suspended to the same Arm of a Balance common to them all: And let the Point of Suspension be as in A , at the End or Extreme of the said Line in the Edge of the Surface, or in the Surface of the Solid; and then find the Sum of the *Moments* of all those Points; which Sum divide by the Sum of the Weights, or the Weight of all the Parts, and the Quotient will be the Distance of the *Centre of Gravity*, or the Line, Plane or Solid, from the Point or Axis of Suspension. *The Practice of all which in particular Instances, see in Hayes's Fluxions, p. 261, &c.*

CENTRES of Gravity. 'Tis plain that the Centre of Gravity of a Circle, and of a Sphere or Globe (supposing the Matter truly Homogeneous all over them) will be their Centre of Magnitude; the Centre of Gravity of all Parallelograms will be in the Point of Intersection of the two Diagonals; and the Centre of Gravity of all solid Parallelograms or Parallelopipeds will be in the same Point of the Plane of Gravity, *i. e.* in the Point found to be the common Intersection of the two Diagonals of that Plane which cuts the Solid into two Triangular Prisms, and consequently is easily found. The Centre of Gravity of all Planes of Triangles, is in the Point of Intersection of two Right Lines bisecting any two of their Angles; and of all solid Triangles or Triangular Prisms it will be in the middle Point of the *Diameter of Gravity*: And that *Diameter* is found by the common Intersection of two Planes, each of which bisects one Angle of the Top and Base, and consequently of all the Triangles of which the Prism may be conceived to be composed.

If the Prism be of a Quadrilateral, or any other more compounded Form, the thing will be more difficult, because the Centre of Gravity will lie at a proportionable Distance from the Centre of Gravity of all the Triangular Prisms, that the Multangular Solid can be divided into. But tho' this be a little more troublesome, 'tis by no Means impossible, any more than to find the Centres of Gravi-

Gravity of *Cones, Pyramids, &c.* for which you have Rules enough in *Stephinius, Lib. 2. Elem. Stat.* and in many other Authors.

CENTRE of an *Hyperbola*, or an *Ellipsis*. In these Curves, and in the opposite Sections of *Hyperbola's*, all the Diameters terminated in the Section (or in the opposite Sections) do naturally bisect one another in one and the same Point, which Point is called the *Centre*. And this Point in the *Ellipses* is within the Figure, but in the *Hyperbola* without, being there the Middle of the *Latus Transversum*.

CENTRE of *Oscillation*. That Point of any Figure where all the Forces are united, is but one; (supposing the Figure to revolve round a Point or Axis) and consequently only one single Pendulum can be made, whose Vibrations (the Forces in both being equal) shall be *Isochronical* to those of the whole Solid; and because that Point in the Figure wherein all the Forces are so united, determines the Length of the simple *Isochronical* Pendulum, and is that wherein all the Figure is supposed to be contracted with all the Forces, while it vibrates, therefore 'tis called the *Centre of Oscillation*; and since the *Centres of Percussion and Oscillation* in every Figure are the same, the way of Investigation of both must be the same: See *Centre of Percussion*.

CENTRE of *Percussion* of a Body in Motion, is that Point wherein all the Forces of that Body are considered as united in one; so that the Force of *Percussion* in that Point, is greater than any where else; so that the *Centre of Percussion* is the same with respect to the Forces, as that of Gravity is in respect of the *Weights*.

In calculating the *Centres of Gravity*, we suppose the Figures to be simply suspended to a Point or Axis: But in order to calculate the *Centres of Percussion*, the Figures are supposed to be actually revolving about a Point or Axis; and as there the simple *Momenta* are considered, here they are considered also with the Velocity super-added. And as the Sum of all the simple *Momenta* on each side the *Centre of Gravity* are equal, so here the Sum of all the Forces on every side the *Centre of Percussion* must be equal; and therefore, as the *Centre of Gravity* is found by dividing the Sum of all the *Moments*, by the Sum of all the *Weights*; so to find the *Centre of Percussion*, you must divide the Sum of all the Rectangles under all the *Momenta*, and their respective Velocities, by the Sum of all the *Moments*: See more of this in *Hayes's Fluxions, P. 281*.

CENTRIFUGAL Force. All moving Bodies endeavour after a rectilinear Motion, because that is the easiest, shortest, and most simple. Whenever therefore they move in any Curve, there must be something that draws them from their rectilinear Motion, and detains them in the Orbit. Whenever this Force, which is called *Centripetal*, ceases, which attracts them towards a Centre, the moving Body would strait go off in a Tangent to the Curve in that very Point, and so would get still farther and farther from the Centre or Focus of its former curvilinear Motion: And that Endeavour to fly off in the Tangent, is the *Centrifugal* Force. The Effect of this Force is such, that if a moving Body were to describe a Circle, it would cause it to describe the largest possible, because a great Circle is less curved, and differs less from a right Line than a small one: A moving Body therefore will suffer more Violence of Attraction, and consequently will exert more of its *Centrifugal* Force

when it describes a less Circle, than in a greater. It is much the same in other Curves as in the Circle; for every Curve may be considered as composed of an Infinity of Arks of infinitely small Circles, all described by different Radii; and so, that where the Curve hath the greatest Curvature, there it is composed of such Arks as are Portions of the least Circles, or which are described by the shortest Radii. A Body therefore moving in a Curve, doth every Moment endeavour by the *Centrifugal* Force to get off from a Point which is the Centre of the Ark of an infinitely small Circle then described. And this Endeavour is so much the greater, by how much the Ark of the infinitely small Circle is the Portion of a lesser Circle; so that in one and the same Curve, the *Centrifugal* Force of the revolving Body may vary according to the different Points of the Curve in which it may at any time be. It may be therefore, that in a Curve where the Force of Gravity in the describing Body is continually variable; the *Centrifugal* Force may also continually vary in the same manner, and so, that one may also supply the Defect, or abate for the Excess of the other, and consequently the Effect be every where equal to the absolute Gravity of the revolving Body. And this as a Problem, viz. To find such a Curve in a vertical Plane, hath been proposed by Mr. *Bernoulli* of *Groningen*. Vid. *Hist. de l'Academ. Royal, P. 80.* for the Year 1700.

CENTRUM *Phonicum*,

CENTRUM *Phonacampiticum* } See *Echo*.

CENTRY-BOX, the same with the *Gueritte*; only the former is of Wood, and the latter of Stone. It is made to save the *Centry* from Injuries of Weather. In a Fortification they are usually placed on the Flank'd Angles of the Bastions, on those of the Shoulder, and sometimes in the Middle of the Curtin.

CERT Money, quasi *Certa Moneta*, was the Head-Money or common Fine paid by the *Resiants* and Tenants of several Mannors to their Lords. In some ancient Records this is call'd *Certum Leta*.

CERUSSE. In *Phil. Transf. N. 137*. there is this Account of the way of making *Cerusse*. Pigs of clean and soft Lead are cast into thin Plates, a Yard long and six Inches broad; these are rolled round so as the Surfaces no where meet to touch, for where they do no *Cerusse* grows. Each of these is put into a Pot just capable of holding one, and upheld by a little Bar from the Bottom, that it come not to touch the Vinegar which is put into each Pot to effect the Conversion. Twenty of these abreast are put into a square Bed of new Horse-Dung; and each Pot is covered with a Plate of Lead, and then over that with Boards as close as can well be. This repeated four times makes one *Heap* as 'tis called, containing 1600 Pots.

After three Weeks the Pots are taken up, the Plates unrolled, laid on Boards, and beaten with a Battledore, till all the Flakes come off, which, if good, are thick, hard, and weighty. These Flakes are ground with Water between Millstones to almost an impalpable Fineness; after which 'tis moulded into several Parcels, and exposed to the Sun to dry, till it become hard and fit for use.

'Tis observed that some Pots will yield thick and good Flakes, while others alike ordered and set by them, without any possible Distinction of Disadvantage, yield few, small, or none at all. Sometimes the Pots are taken up all dry, and sometimes

times they prove best; sometimes they are taken up wet. The Plates that cover the Pots yield better and thicker Flakes than do the Rolls within; and the Outsides next to the Planks bigger and better than the Insides next to the Rolls, and to the Spirits which first rise from the Vinegar.

CESSION, is one manner of an Ecclesiastical Benefices becoming void. By the Canon Law, if a Clerk have one Living, though under 8 Pound *per Annum* Value, and takes a Second of what Value soever, the former is void without a Dispensation; that is, 'tis void *de Jure, sed non de Facto*. But by Statute, if a Clerk have one Benefice of 8 Pound *per Annum*, or upwards, and takes another of any Value whatsoever with Cure of Souls, and without Dispensation, the former Living is *ipso facto*, void: And this kind of Voidance of a Living is called *Cession*. And what is called *Cession* in other Benefices, is called *Creation* in relation to a Bishoprick; for if an Incumbent be made a Bishop, his Benefice is said to be void by *Creation*.

CESSION, in the Civil Law, is putting another Person, who therefore is called the

CESSIONARY, into the Place and Right of the true and proper Creditor, in any Case. This is called also *Subrogation*.

CESSOR, in Law, is one that ceaseth or neglecteth so long to perform some Duty belonging to him, as that by this his *Cessie* or *Ceasing*, he incurs the Danger of the Law, and hath, or may have, the Writ *Cessavit* (see *Vol. I.*) brought against him. And where it is said in their Terms, the Tenant *Cesseth* without any more Words, it is to be understood, the Tenant ceaseth to do by his Lands or Tenement.

CHAFERY, is the Term for one of the *Forges* in an Iron-work, (see *Iron.*) The other is called the *Finery*.

CHAFE-WAX, is an Officer belonging to the Lord High Chancellor, who fits the Wax for the Sealing of Writs, and such other Instruments as are by his Order made to be sent out.

CHALCOGRAPHY, is the Art of Engraving, Sculpture, &c.

CHAMBERLAIN, from the French *Chambellan*, i. e. *Cubicularius vel Praefectus Cubiculi*, is used in divers Senses in our Chronicles, and old Books of Laws and Statutes: As the Lord Great Chamberlain of England, Lord Chamberlain of the King's House, the King's Chamberlain, 13 E. 1. c. 41. 17 R. 2. c. 16. To whose Office it appertaineth to look to the King's Chambers and Wardrobe, and to govern the Under-Servants and Officers there. There is also a Chamberlain of any of the King's Courts; as *Chamberlain of the Exchequer*, 51 H. 3. Stat. 5. 13 E. 3. 11. 14 E. 3. 14. 26 H. 8. 2. There is a *Chamberlain of North Wales*, of *Chester*, of the *City of London*: This Officer is commonly the Receiver of all Rents and Revenues belonging to the City whereof he is Chamberlain. When there is no Prince of Wales and Earl of Chester, the Chamberlain of Chester hath the Receipt and Return of all Writs coming thither out of any of the King's Courts.

In the *Exchequer* there be two Officers of this Name, who were wont to keep a Controulment of the *Pells of Receipt and Exitus*; and kept certain Keys of the Treasury and Records. They kept also the Keys of that Treasury where the Leagues of the King's Predecessors, and divers

ancient Books, as *Dooms-day Book*, and the black Book of the *Exchequer*, remain.

CHAMPION, in the Common Law, is used no less for him that trieth a Combat in his own Cause, than for him that fighteth in the Quarrel or Place of another: And according to *Bracton* and some others, it is used for one that holdeth by *Serjeantry*, or some such Service, of another. There is also an Officer now called,

CHAMPION of the King, who is at a Coronation, while the King is at Dinner, to ride armed, *Cap-a-pee*, into *Westminster-Hall*, and by a Herald make a Challenge, That if any Person shall deny the King's Title to the Crown, he is thereby ready to defend it: Which done, the Kings drinks to him, and sends him a gilt Cup with a Cover, full of Wine, which he hath for his Fee.

CHANCELLOR, is a Title given in our Kingdom, to him that is the chief Man for matter of Justice (in private Causes especially) next to the Prince: For whereas all other Justices are tied by the Law, and may not swerve from it in Judgment; the Chancellor hath in this the King's absolute Power to moderate and temper the written Law, subjecting himself only to the Law of Nature and Conscience, and ordering all things *juxta Aequum & Bonum*. And therefore *Stamford*, in his *Prerogative*, c. 20. p. 65. saith, that the Chancellor hath two Powers, one Absolute and the other Ordinary; meaning, that though by his ordinary Power, in some Cases he must observe the Form of Proceeding, as the other ordinary Judges do; yet that in his absolute Power he is not limited by the written Law, but by Conscience and Equity, according to the Circumstances of the Matter in question. This high Officer now bears the Title of *Lord High Chancellor of Great-Britain*. But there are others that bear this Name of Chancellor, as the

CHANCELLOR of the Exchequer; who sits in the Court and *Exchequer* Chamber, and with the rest of the Court ordereth things to the King's best Benefit. He is always in Commission with the Lord Treasurer for the letting of Crown Lands, &c. and hath by the Privy Seal from the King. Power with others, to compound for Forfeitures of Bonds upon penal Statutes; and his Power extends to the First-Fruits Office, &c.

CHANCELLOR of the Dutchy of Lancaster, is an Officer in that Court principally to judge and determine all Controversies between the King and his Tenants about the *Dutchy Land*, and otherwise to direct all the King's Affairs belonging to that Court.

CHANCERY, is a Court of Equity and Conscience, moderating the Rigors of other Courts, and is not tied strictly to the Letter of the Law. The Officers in it are, The Lord Chancellor, or Keeper of the Great Seal: Twelve Masters of Chancery, whereof some are always Sitting in their turn on the Bench, as Assistants. The six Clerks, who have under them about 90 Clerks, in the Nature of Attorneys in the Court; two chief Examiners, who have each of them several Clerks. One chief Register, who usually hath four or five Deputies. The Clerk of the Crown. The Warden of the Fleet, the Usher, Serjeant at Arms, and Cryer of the Court. The Curfitors and their Clerks of the Petty Bag. The Clerk of the Appeals, of the Faculties, Patents, Presentations, Dismission, Licenses to alienate, Injunctions,

tions, Enrollments, Protections, *Subpenas*, and of the Affidavits, &c. The Sealer, Chafe-wax, &c.

CHAPEL, is of two sorts; either *adjoining* to a Church, as a Parcel of the same, which Men of Worth hold; *ut ibidem Familiaria Sepulchra sibi constituent*; or else *separate* from the Mother Church, where the Parish is wide; and is usually called a *Chapel of Ease*, because built for the Ease of such Parishioners as dwell too far from the Church. Sometimes this is served by a Curate, provided at the Charge of the Rector, and sometimes at *Theirs* that have Benefit by it, according to Custom or Composition. And some of these latter Chapels which have a Maintenance perpetual by some Lands charitably bestowed on them, or otherwise, without the Charge of the Rector of the Church, are called *Free-Chapels*.

CHAPTER, *Capitulum*; in the Canon and Common Law, is either *Congregatio Clericorum in Ecclesia Cathedrali, regulari vel Collegiata*; or *Locus in quo fiunt communes tractatus Collegiatorum*. Cowel. These Chapters arose thus; in ancient Times the Bishops had their Clergy residing with them in their Cathedrals, to assist them in the Performance of sacred Offices, and in the Government and Discipline of the Church. And even after Parochial Settlements were made, there were still a Body of Clergymen, which continued with the Bishop at his Church; and were indeed his Family, and maintained out of his Income. After the Monastic Life grew into Request and Reputation, many Bishops chose to have *Monks* rather than *Seculars* to reside with them and attend them in their Cathedrals. And these Bodies of either *Monasticks* or *Seculars*, had the same Privilege of choosing the Bishop and being his Council, which the whole Clergy of the Diocese had before. But by degrees, their Dependence upon the Bishop and Relation to him grew less and less; and when they had distinct Parcels of the Bishop's Estate assigned for their Maintenance, at last the Bishop had little more left than the Power of visiting them. And on the other hand, these *capitular* Bodies did by degrees also lose their Privileges; particularly that of choosing the Bishop, for which the Kings of England had a long Struggle with the Pope, but at last Henry 8. got this Power vested in the Crown, and now the Dean and Chapter have only the Shadow of it.

The same Prince did also eject the Monks out of these Cathedrals, and placed Secular Canons in their Room. And those whom he thus regulated are called *Deans and Chapters of the new Foundation*: As are *Canterbury, Winchester, Worcester, Ely, Carlisle, Durham, Rochester and Norwich*; and of such sort are the Chapters of the five new Sees of *Peterburgh, Oxford, Gloucester and Bristol*, to which may be added *Westminster*; tho' this last Bishoprick is now sunk, and the Monastery turned into a Collegiate Church by Queen Elizabeth.

CHAPTRELS, in Architecture, are the same with *Imposts*, and signify those Parts on which the Feet of Arches stand. Their height or thickness ought to be equal to the breadth of the lower Part of the Key Stone.

CHARGED CYLINDER is that Part of the Chace of a great Gun where the Powder and Ball are placed.

CHARGE of Lead is 36 Pigs, and each Pig contains six Stone, wanting two Pound; *i. e.* every Stone (here) is twelve Pound.

CHARTER, in Law, is a written Evidence of any Thing done between Man and Man: And sometimes Charters are called *Charters of the King*, and when the King passeth any Grant to any Person, Body Politick, &c. to excuse a Man from being impanelled on a Jury: *Charters of Pardon*, whereby Men are forgiven Felonies, &c.

CHARTER-LAND is such Land as a Man holds by *Charter*, *i. e.* by Deed or Evidence in Writing; and this is otherwise called *Freehold*.

CHARTS used at Sea, are either the *Plain* or *Mercator's Charts*, as 'tis usually called, though it should indeed be rather called *Wright's Chart*. See the Word *Plain Chart* and *Mercator*, in Vol. I.

CHATELS, *Catalla*, is a Word which came to us from the *Normans*, who called all moveable Goods by this Name, the contrary was called *Fief*, or as we now call it *Fee*: But now in our Law, *Chattels* are all Sorts of Goods moveable and immoveable, except such as are in the Nature of *Freehold* or Parcel thereof. They reckon *Chattels* also to be either *personal* or *real*. The Former are such as either do belong immediately to the Person of a Man, as his Horse, Sword, &c. or such Things as being injuriously withheld from him, a Man hath no way to recover but by personal Action. But *Chattels real* do not appertain to the Person, but to some other thing by way of Dependence, as a Box with Charters of Land, Apples upon a Tree, &c. Such things also as necessarily issue out of some immoveable Thing to a Person, as a Lease or Rent for Years, they call a *Chattel real*. Also to hold at Will, is a *Chattel real*.

CHAUNTRY is a Church or Chapel endowed with Lands or other yearly Revenue, for the Maintenance (formerly) of one or more Priests daily saying or singing Mass for the Souls of the Donors, and such others as they shall appoint.

CHEMICE, the Art of casting Figures in Metals.

CHEST-ROPE in a Ship, is the same with the *Guest* or *Gift-Rope*, and is added to the Boat-Rope, when the Boat is towed at the Stern of the Ship, to keep her from *Shearing*; *i. e.* from swinging to and fro.

CHILIADS are the *Tables of Logarithms*, and so called because they were at first divided into Thousands. Thus in the Year 1624. Mr. Briggs publish'd a Table of *Logarithms* for 20 *Chiliads* of absolute Numbers, and again for 10 *Chiliads* more, and then for one more, that is, for 31 *Chiliads*. The Book is called *Arithmetica Logarithmica*.

A. D. 1628. *Adrian Viacq* publish'd this again with a Supplement (according to Mr. Briggs's Direction) of the *Chiliads* before admitted; in all making up 101 *Chiliads*.

CHINALRY, in our Law, signifies a Tenure of Land by Knight's Service, or by Obligation to perform some Martial or Military Office to the Lord.

CHISSELS used in Joynery and Carpentry are of several Kinds; as 1. The *Former*, which is used first of all before the *Paring Chissel*, and just after the Work is scrib'd, and a little without the scrib'd Strokes, and with its Basil outwards.

2. The *Paring Chissel* hath a very fine and smooth Edge, and 'tis used to pare off, or smooth the Irregularities which the *Former* makes. This is not struck with the Mallet as the *Former* is, but pressed with the Shoulder of the Workman, who holds

holds the *Chissel* between the Fore and Little Finger of his right Hand, and with the two middle Fingers clutched upon it.

3. The *Skew Former*, which is a *Chissel* used for cleansing acute Angles by the Point or Corner of its narrow Edge, and where the Angles of other *Chissels* cannot come.

4. The *Mortefs Chissel* is narrow, but very thick and strong to endure hard Blows with the Mallet, and 'tis ground to a very broad Basil; its Use is to cut deep square Holes in the Wood, which are called *Mortesses*: These are of several Sizes, according as the Breadth of the *Mortesses* require.

5. The *Gough* is a *Chissel* with a round Edge, one size of which serves to prepare the way for an Augre; and others to cut such Wood as is to be rounded or hollowed, &c.

6. *Socket Chissels* are such as are chiefly used by Carpenters, and have their Shank made with a hollow *Socket* at the top, to receive a strong wooden Sprig made to fit into that *Socket*, with a square Shoulder above it; which makes them very strong to bear the heavy Blows of the Mallet. They distinguish these *Socket Chissels* according to the Breadth of the Blade, and call them half Inch, three quarter Inch *Chissels*, Inch and half, two Inch, and three Inch *Chissels*.

7. The *Ripping Chissel* is a *Socket Chissel* about an Inch broad, and having a blunt Edge with no Basil to it; its Use is to rip and tear two Pieces of Wood fastned together from one another, by forcing in the blunt Edge between the two Pieces.

CHORDS. On all plain Scales, and particularly on the Sector, there is a Line drawn called the *Line of Chords*, whose Uses are very numerous; as,

1. To measure the Quantity of an Angle plain given.

With 60 of the Chords, and one Foot of the Compasses in the Vertex of the Angle, strike an Arch between the Legs of the Angle, and then taking that Arch in the Compasses, and applying the Length of the Chord which subtends it to the same Lines of Chords, you will find the Quantity of the Angle by the Numbers there placed.

2. By the Chords on the Sector to divide any Circle into its proper Degrees, and to measure the Quantity of an Arch of a given Circle.

Apply over the Radius of the Circle between 60 and 60 in the Lines of Chords, and then if you take out the parallel Chords of one Degree, &c. and apply them to the Circumference of the Circle given, they shall divide it into its proper Degrees: And the Degrees of any Arch shall be known by entering the Distance between its Extremities in the Sector, parallel to the Radius between 60 and 60; or by so applying it into the Sector, that it fall on the same Numbers on each Leg.

3. To divide the Circumference of a Circle into any Number of equal Parts, or to inscribe any regular Figure in a Circle.

Divide 360 by the Number of equal Parts requir'd, or by the Number of the Sides of the regular Polygon, and the Quotient will be a Num-

ber of Degrees, whose Chord apply'd round the Circumference will divide it as requir'd. As if you would divide any Circle into 32 equal Parts; set the Sector to the Radius, and then dividing 360 by 32, the Quotient is 11°, 15': The Chord of which taken off parallelly, will divide the Circle into 32 equal Parts; or into the Points of the Mariner's Compass.

CHOREPISCOPI were anciently *Rural* Bishops delegated by the prime Diocesan; but their Authority became restrained by some Councils, and this very Office by Degrees abolish'd; after whom the *Rural* Deans were so commissioned to exercise Episcopal Jurisdiction, till inhibited by Pope Alexander III. and the Council of Tours.

CHRISM was anciently (in times of Popery) a Confection of Oil and sweet Balsam, which was consecrated by the Bishop, and used in Baptism, Confirmation, Extreme Unction, &c.

CHRISOM, *Chrismale*, was the Face-cloth or Piece of Linen laid over the Child's Head when it was baptized: Whence in our Weekly Bills of Mortality, such Children as die in the Month are called *Chrisoms*.

CHOROIDES is the fourth Coat of the Eye, lying under the *Sclerotic*; it hath many little Glands which separate a black Liquor, which tinges the Inside thereof; otherwise of a white Colour, in order to hinder the reflected Light from disturbing or confounding the Pictures of Objects from being truly represented on the *Retina*. This Coat hath a hole before, which is called the *Pupilla*, which serves to admit Light and Colours into the Eye.

CHRONOLOGY, Authors on this Subject are *J. Bap. Riccioli Chronologia Reformata*. 2 Tom. Bonon. 1669.

Guil. Beveregii Institutiones Chronologicae.

Mar. Boxhornii Chronologia.

Sethi Calvisii Opus Chronologicum.

Alstedii Thesaurus Chronologicus.

Mestlini Chronolog. Theses & Tabula.

Helvici Chronologia.

Jos. Scaliger de Emendatione Temporum.

Stranchii Chronolog.

CHRYsalis, a Term used by the modern Writers of the natural History of Insects, for the same with *Nympha*, which see. Indeed the Word, as well as *Aurelia* used in the same Sense, seems to imply a peculiar Yellow or golden Colour in the *Nympha*; but this is purely accidental, and is by no means found in all *Nymphae*: Though some confine this Word *Chrysalis* to the *Nymphae* of Butterflies and Moths only. See *Swammerdam Hist. Insect general*. Sect. 2.

CHURCH-SCOT, Payment or Contribution; by the *Latin* Writers was frequently called *Primitia Seminum*, because it was at first a Quantity of Corn paid to the Priest on St. Martin's Day as the first Fruits of Harvest: This was enjoyn'd by the Laws of King *Ina*, c. 4. and by *Canute*, c. 10. but after this, it came to signify a Reserve of Corn Rent paid to the Secular Priests, or to the Religious; and sometimes was taken in so general a Sense, as to include Poultry or any other Provision that was paid in kind to the Religious.

CHYROGRAPHUM, in the *Saxon* Times, signified any publick Instrument of Conveyance attested by Witnesses: This the *Normans* called *Charta*.

To prevent Frauds and Concealments, they made their Deeds of mutual Covenant in a *Script* and

and *Rescript*, or in a *Part* and *Counter-Part*, upon the same Sheet of Paper or Parchment; and in the middle, between the two Copies, they draw the Capital Letters of the Alphabet, or sometimes the Word *Syngraphies* in the like great Letters; and then *talliated* or cut the said Sheet asunder in an indented Manner, which being deliver'd to the two Parties concerned, were proved Authentick by matching with or answering to one another, like our present Indentures, or like Tallies in Wood. And when this prudent Custom had for some time prevail'd, the Word *Chirographum* was appropriated to such *bipartite Writings*.

CIMA, in Architecture, is a moulding somewhat resembling an S. *Vitruvius* makes it of two Quarter Circles join'd together. Our Workmen call it an O---G---.

CIMATIUM, in Architecture, is what our Workmen call an O - G-- with the Hollow downwards, 'tis part of the Ornament of the Dorick Capital; it stands just above the Square, and hath a Fillet over it.

CIRCLE. Its Quadrature, or the squaring of the Circle. This according to Mr. *Leibnitz's* 7. *Philos. Collect.* may be understood as twofold; viz. either by *Calculation*, or by *Linear Construction*: And each of these may be either perfectly exact, or else almost so, or pretty near. Of these, that which is done by accurate or exact Calculation may be called the *Analytical Way*, as that which is done by exact Linear Construction is the *Geometrical Way*; that which is done by pretty near but not exact Calculation, may be called the *Approach*; and that by a Construction, only pretty near, may be called the *Mechanical Way*.

The Approaches have been further carried on by *Ceulen*, *Vieta* and *Hugenius*; and others have given several Mechanical Ways.

The accurate Geometrical Construction may be had, by which not only an entire Circle may be measured or squared, but any Section or Arch of it also: Indeed this is by an exact and ordinate Motion, but it is in those that they call transcendental Curves; which, saith *Leibnitz*, are erroneously accounted Mechanical, for they are as Geometrical as those which are commonly so esteem'd. Though indeed they are not all Algebraical, nor can they be reduc'd to Algebraick Equations of certain Degrees, because they have Degrees proper to themselves; and though not Algebraical, are yet Analytical.

The *Analytick Quadrature* may be again subdivided into three Kinds, the *Analytical Transcendent*, the *Algebraical*, and the *Arithmetical*.

The *Analytical Transcendent* is to be obtain'd, amongst others, by Equations of Degrees Indefinite, hitherto consider'd by; as if $Xx + X$ be = 30, and X be sought, it will be found to be 3, because $3 + 3 + 3 = 27 + 3 = 30$.

The Algebraical is done by Vulgar, though irrational Vulgar, or by the Roots of common Equations; which for the general Quadrature of the Circle, or its *Sectors*, is indeed impossible.

There remains therefore the Arithmetical Way, which is perform'd by certain Series exhibiting the Quantity of the Circle exact, by a Progression of Terms (first) Rational; such as I shall here propound.

Vol. II.

I have found (saith he) that if the Square of the Diameter be put 1, i. e. one, the Area of the Circle will be $\frac{1}{2} - \frac{1}{3} + \frac{1}{5} - \frac{1}{7} + \frac{1}{9} - \frac{1}{11} + \frac{1}{13} - \frac{1}{15} + \frac{1}{17}$, &c. that is, diminishing the entire Square of the Diameter by a third Part (that it may not be too big); and then again, because hereby too much is taken away, augment it one fifth, and then diminish it by one seventh; and so on continually in that alternate Order of the Signs, and the natural Order of the odd Numbers.

CIRCULAR-LINES, in Mathematicks, are such straight Lines as are divided from the Divisions made in the Arch of a Circle; such as *Sines*, *Tangents*, *Secants*, &c. an Account of the Construction of which you have under the Word *Scale* in Vol. I.

CIRCULAR-VELOCITY is a Term in the new Astronomy, signifying that Velocity of any Planet or revolving Body which is measured by

the Arch of a Circle; as suppose by *Ab* described on the Centre of Attraction *S*: and the circular Velocity of a Body moving from *B* to *C*, is measured by the Ark *B C*.

CIRCUMSCRIBED *Hyperbola* is one that cuts its own *Asymptotes*, and contains the Parts cut off within its own proper Space. See *Curves*.

CIRCUMSTANCES are such Things, which tho' they are not essential to any Action, do yet some Way affect it. And they reckon that some Circumstances are purely *Physical*, which don't connect any moral Good or Evil with an Action; such as killing a Man with a *Right* or *Left Hand*, &c. And others, they account properly *Moral*, because they do really influence our Actions, and render them more Good or Evil than they would be without such Circumstances. And the Writers of *Ethicks* sum them all up in this one Verse;

Quis, quid, ubi, quibus auxiliis, cur, quomodo, quando. Vid. *Whitley's Ethicks*, p. 13.

CIVIL Law. The Civil Law is not received at this Day in any one Nation without some Addition or Alteration, for sometimes the *Feudal Law* is mixt with it, or *general* or *particular Customs*; and often Ordinances and Statutes cut off a great Part of it.

In *Turkey* the *Justinian Greek Code* is only used. In *Italy* the Canon Law and Customs have excluded a good Part of it. In *Venice*, Custom hath almost an absolute Government. In the *Milanese*, the *Feudal Law* and particular Customs bear sway. In *Naples* and *Sicily* the Constitutions

S

and

and Laws of the *Lombards* are said to prevail. In *Germany* and *Holland* the Civil Law is esteemed to be the Municipal Law; but yet *many Parts* of it are there grown obsolete; and *others* are alter'd either by the Canon Law, or a different Usage. In *Friezeland* it is observ'd with more strictness. But in the *Northen Parts* of *Germany*, the *Jus Saxonicum*, *Lubecense* or *Culmense* is preferred before it. In *Denmark* and *Sweden* it hath scarce any Authority at all. In *France* only a Part of it is received, and that Part is in some Places as a customary Law; and in those Provinces nearest to *Italy* the Municipal written Law. In criminal Causes the Civil Law is more regarded in *France*, but the manner of Trial is regulated by Ordinances and Edicts. The Civil Law in *Spain* and *Portugal* is corrected by the *Jus Regium* and Custom. In *Scotland* the Statutes of the *Sederunt*, Part of the *Regie Majestatis*, and their Customs, controul the Civil Law.

CLAMP-NAILS, are such Nails as are used to fasten on Clamps in building and repairing of Ships.

CLAMP'D. When a piece of Board is fitted with the Grain to the End of another piece of Board across the Grain, the former Board is said to be *clamp'd*. And thus are the Ends of Tables usually *clamp'd*, to keep them from *warping* or *casting*.

CLARO-OBSCURO, is a Term in Painting; and signifies the Art of distributing Lights and Shadows advantageously, as well on particular Objects as on a Picture in general. On particular Objects 'tis necessary to give them an agreeable Roundness, and a particular Relieve; and in the Picture in general, to expose the Objects with Pleasure to the View of the Spectators, by giving the Eye an Occasion to rest; which is best done by an happy Distribution of great Lights and Shadows, which by their Opposition set off one another.

CLASP-NAILS, are such whose Heads are brought into a little Compass, so that they will sink into the Wood, and when drove home, let a Smoothing Plane go over them.

CLENCH-NAILS, are such as will drive without splitting the Boards, and draw without breaking. They are used by Boat and Barge Builders; and are proper for any Building with Boards that must be taken down again: For fine Work they are made with Clasp-heads.

CLEPSYDRA. In the Memoirs of the *French Royal Academy* for April 1699. there is an Account by Mr. *Varignon*, of a General and Geometrick Method to make *Clepsydra* or *Water-Clocks* with any kind of given Vessels, and with any given Orifices for the Water to issue out at, and according to any given Velocity of the Water's Descent.

CLERK. This Word did anciently signify a Secular Priest, in Contradistinction to a Religious or a Regular. But by Degrees it came to be in general attributed to every Scholar, and at last was common to every Scribe and Notary; and hence so many of our Law Officers have the Title of *Clerk*.

CLINCH-BOLTS in a Ship, are such as are clinched with a riveting Hammer at those Ends which come through.

CLOSE-FIGHTS, are, aboard a Ship, such Bulk-heads as are in a close Fight put up fore and aft in the Ship, for the Men to stand behind them

secure, and fire upon the Enemy; and if the Ship is boarded, to scour or clear the Decks.

CLOVE, is a Weight of Cheese containing the 32d Part of the Weight; and so is 8 Pound by 9 *H. 6. c. 8*.

CLOUTS, are thin Plates of Iron nailed on that Part of the Axle-Tree of a Gun-Carriage which comes through the *Nave*, through which the *Lins-pin* goes.

CLOUT-NAILS, are such as are commonly used for nailing on of *Clouts* (or Plates of Iron) to the Axle-Trees of Carriages; and are proper to fasten any Iron to Wood.

COCCYGEUS, is a Muscle of the *Os Coccygis*, arising *Tendino Carnous* from the acute Process of the *Os Ischium*, between the Ligament that reaches from thence to the *Os Sacrum*, and one of the Heads of the *Gemini*; from a narrow Beginning it gradually dilates its self into a thin fleshy Belly, interspersed with some tendinous Fibres. It is inserted into the whole Length of the *Os Coccygis*, laterally.

Its use is to draw that inwards or forwards after the Excretion of hardened *Feces*, &c. This Muscle was first discover'd by Dr. *Douglas*; See his *Myogr. Comp. Specim.*

COCKET, is a Seal appertaining to the King's Custom-House: And also a Scroll of Parchment sealed and delivered by the Officers of the Custom-House to Merchants, as a Warrant that their Merchandize be Customed. This Word is used also in the Statutes of Bread and Ale, made 15 *H. 3*. where there is mentioned *Cocket Bread*, among several other kinds: And it seems to have been hard Sea-Bisket, which perhaps had then some *Cocket Mark* or *Seal*; or else was so called from its being designed for the use of the *Cock-swains* or Seamen.

COCKS, aboard a Ship, are little square Pieces of Brass with Holes in them, and put into Wooden Shivers, to keep them from splitting and galling by the Pins of the Blocks in which they move.

COCK-WATER, is a Stream of Water brought in a Trough through a long Pole, in order to wash out the Sand of the Tin-Ore into the *Launder*, while it is bruising in the *Coffer* of a *Stamping-Mill*: See *Tin*.

COCHLEA,

COCHLEA, is one of the Mechanical Powers, consisting of a Cylinder sulcated or hollowed in a Spiral manner, and moving or turning in a Box or Nut, cut so as to answer to it exactly. Now the Power or Force of this Engine may be thus estimated: Suppose in the Figure annexed the Weight *P* to be raised by the Turn of the Male Screw *CA*, by means of the Handle or Lever *BC*. 'Tis plain that in one Revolution of the Cylinder *AC*, the Weight can be raised no more than is the Distance between any of the two adjoining Leaves of the Screw; and that the Power moves as far as is

the Compass of one Revolution: That is, the way of the Power to that of the Weight in the same time, is as the Ambit of the Power in one Revolution of the Cylinder, to the Distance between any two contiguous Leaves of the Screw. Wherefore the Celerity of the Power to that of the Weight will be in the same Ratio. And consequently, if you apply a Power, which shall be to the Weight to be raised, as the way of that Power in each Revolution, shall be to the aforesaid Distance between any two next adjoining Leaves of the Screw; the Power shall be in *equilibrio* with the Weight, and therefore being increased never so little more shall raise it. This Power is plainly a Combination of the Lever and the *Axis in Peritrochio* together.

CODICIL, is a Schedule or Supplement to a Will or other Writing. 'Tis used as an Addition to a Testament, when any thing is omitted which the Testator would add, explain, alter, or retract; and is of the same Nature with a Testament, but that it is without an Executor: So that a *Codicil* is a less solemn Will of one that dies either Testate or Intestate, without the Appointment of an Heir. *Testate*, when he that made his *Codicil*, hath either before or afterwards made his Testament, on which that *Codicil* depends, as to which it refers. *Intestate*, when one leaves behind him only a *Codicil* without a Testament, wherein he gives Legacies only to be paid by the

Heir at Law, and not by any Heir instituted by a Will or Testament. *Codicils* first came in use in the time of *Augustus*. A *Codicil* as well as a Will may be either written or nuncupative. *Institute of Imp. or Civil Law*.

COFFER is a long square Box of the firmest Timber, about 3 Foot long, and $1\frac{1}{2}$ Foot broad, wherein Tin Ore is broken to Pieces in a stamping Mill. See *Tin*.

COFFERER of the King or Queen's Household, is a principal Officer in the Court, next under the *Comptroller*; that in the Counting-House and elsewhere at other Times, hath a special Charge and Oversight of other Officers of the House for their good Demeanor and Carriage in their Offices, to all which he pays their Wages. *Vid. 39. Eliz. c. 7.*

COHÆSION of the Parts of Matter. Sir *Isaac Newton* at the end of the *Latin* Edition of his admirable *Opticks*, concludes from the Coherence of the Parts of hard and solid Bodies, that their Particles do attract one another by a certain Force, which acts most intensely when the Particles touch one another. At some little Distance it produces those *Chymical Effects or Operations*, which you will find an account of under the Word *Attraction*, and which doth not extend to *remoter Distances*, as far at least as Sense can determine; and indeed 'tis hardly possible to account for the Firmness and Solidity of many Bodies, which have either a vast number of Pores, or *Meatus* in them, and consequently whose Particles cannot touch one another with their whole Surfaces, without supposing that those Particles be either strongly compressed together, or do strongly attract one another. But it doth not seem reasonable to attribute this CohæSION of the Parts of Matter to any *Pressure* of the *Æther*, as some have imagined; because there is no certain Experiment of the Existence of any such thing as their *Æther*, nor if there were, would it be effectual to solve this Phenomenon, any more than it is for many others, which they account for only by this means. But this mutual Attraction of the Particles of Matter within such very narrow Bounds and Limits, which seem to be as much the Law of Nature, as Gravity, &c. will fairly account for this hitherto Inexplicable Phenomenon. Dr. *Cheyne* takes into Consideration the plainness of the Surfaces of the cohering Parts of Matter, in order to account for this Property; which indeed seems a necessary requisite. He thinks we may suppose some of the primary Atoms of Matter of which Bodies are constituted, to be terminated with plain Surfaces on all Sides. And such produce Bodies of the strictest and firmest Cohesion; others may be terminated partly with Curve, as well as partly with plain Surfaces, and these combined may produce Bodies of a middle Degree of Cohesion; and such as have Surfaces *entirely Curve* may produce Fluids, &c. But this will not do alone, for though it will bring Bodies to immediate Contact, it will not keep them there, nor hinder them from being separated by any Force, how small soever: And the Fluids which surround our Globe, as the Particles of Light and Air, will get in between the Surfaces of Bodies when they are at any Distance greater than the Diameters of the constituent Particles of those Fluids, and so by their lateral Pressure will destroy the Efficacy of that attractive Force by which Bodies cohere. For since Light and Bodies act mutually one upon another; and that the Particles of Air endeavour

to recede one from another (*see Air and Light*) they will render that part of Attraction whereby Bodies cohere, altogether insensible at any Distance greater than the length of the Diameters of the Particles of these Fluids: So that the Force by which Bodies cohere, cannot act but at very small Distances, and certainly is much greater in immediate Contact, than at any Distance how small soever.

COLAPTICE, is the Art of Carving or Cutting the Resemblances and Figures of Natural Things in Stone. The Term for the Artist here is *Lithoxos*.

COLD. It hath been observ'd by Mr. *Geoffroy* (in a Discourse which he read before the *French Royal Academy of Sciences*, and which is mentioned in *Phil. Trans.* N. 274.) that a Mixture of the greatest Part of all the several Kinds of Salts, in many Liquors is accompanied with a *sensible degree of Coldness*, notwithstanding the violent Fermentations which such Mixtures do sometimes produce. As indeed the Learned and Ingenious Dr. *Stare* had before Experimented (*see Phil. Trans.* N. 150.) in a Mixture of an Acid Menstruum, and the Volatile Spirit of human Blood. Mr. *Geoffroy* found that pouring but half an Ounce of *Sal Armoniac* into three Ounces of Spirit of *Vi-triol*, though a very violent Fermentation ensued, yet the Spirit of Wine in the included Thermometer descended three Inches and a half.

COLD SHIRE Iron, is such as is brittle when it is cold. *See Iron*.

COLLATION, is the bestowing of a Living on a Clerk by an Archbishop or Bishop, when that Living is the Bishop's or Archbishop's own Gift: But when the Living is in the Gift of another, the Bishop is said to give the Clerk *Institution* into it on the Patrons Presentation, and the Arch-deacon gives him *Induction* into it on the Bishops Mandate, as well from the Collation as Institution.

COLLATIONE Heremitagii, is a Writ whereby the King confers the keeping of a Hermitage upon a Clerk.

COLLEGIATE Churches, are Churches built and endowed for a Body Corporate, of a Dean or other President and Secular Priests; as Canons or Prebendaries in the said Church. Such as are with us, *Westminster, Windsor, Rippon, Wolverhampton, Southwel, Manchester, &c.* None of these Collegiate Churches are Episcopal Sees or Cathedrals.

COLLUM Minus Uteri, is the Cavity of the Womb next its internal Orifice, where it is more contracted than it is at the Bottom.

COLONNADE, in Architecture, is a Range of Pillars running quite round a Building, and standing within the Walls of it.

COLOUR, in a Law Sense, is a Plea that is probable, though in truth false; and hath this End, to draw the Trial of the Cause from the Jury to the Judge.

COLOUR of Office, is always used in the Law in an ill Sense, signifying some ill Act done under Countenance of an Office; and so 'tis opposed to *Virtute Officii*, which is always taken in the best Sense; and implies a Man's doing a right and just Thing under the Execution of his Office.

COLOUR. It hath been observ'd, that transparent Substances, as Glass, Water, Air, &c. when made very thin by being blown into Bubbles, or otherwise formed into Plates, do exhibit various Colours according to their various Thinness, al-

though at a greater Thickness they appear very clear and colourless. About these Sir *Isaac Newton*, in his *Opticks*, Book 2. made many excellent Observations serving to illustrate and demonstrate the Theory of Colours.

As, 1. By compressing two Prisms hard together, so that their Sides, which by chance were a little Convex, might somewhere touch; he found the place where they touch'd to become *absolutely transparent*, as if they had been there but one continued piece of Glass: For when the Light fell so obliquely on the Air, between them in other Places as to be *all reflected*, it seemed in the place of Contact to be *all transmitted*, insomuch that when look'd upon, it appear'd like a little dark Spot, and when look'd through, it seem'd like a hole in that Air which was formed into a thin Plate by being compressed between the Glasses; and through that hole all Objects that were beyond it might be seen distinctly, which could not be seen at all through other Parts of the Glasses where the Air was interjacent. By pressing the Prisms hard together, this Spot would become considerably broader.

2. When the Plate of Air, by turning the Prisms about their common Axis, became so little inclined to the incident Rays, that some of them began to be *transmitted*, there arose many slender Arks of Colours in it, which increased by continuing the Motion of those Prisms, and bended more and more about the said transparent Spot, till they were compleated into Circles or Rings encompassing it, and afterwards continually grew more and more contracted. These Arks at their first Appearance were of a *Violet and Blue*, and between were *White* Arks of Circles, which presently, by continuing the Motion of the Prisms, became a little tinged in their inner Limbs with *Red and Yellow*, and to their outward Limbs the *Blue* was adjacent. The Motion of the Prisms round their Axis being continued, these Colours contracted more and more, shrinking towards the *Whiteness* on either Side of it, till at last they totally vanished into it, and then the Circles in those Parts appeared black and white, without any other Colours intermixed; but by farther moving the Prisms, the Colours would emerge out of the *Whiteness* again.

In his 4th Observation he considered more nicely the Order of the Colours arising out of the white Circles, according as the Rays became less and less inclined to the Plate of Air; and by using two Object Glasses of pretty long Telescopes, he observed the Succession and Quantity of the Colours to be thus: Next to the Pellucid Central Spot succeeded blue, white, yellow and red; the blue was so small that he could not discern it in the Circles made by the Prisms, nor could he well distinguish any violet in it; but the yellow and red were pretty copious, and seem'd about as much in extent as the white, and four or five times more than the blue. The next Circuit or Order of Colours succeeding and compassing these, were violet, blue, green, yellow and red; and these were all copious and vivid, except the green, which was very little in Quantity, and very faint and dilate. Of the other four the Violet was the least in extent, and the blue less than the yellow and red. The third Circuit or Order was purple, blue, green, yellow and red; in which the purple seem'd more reddish than the violet

Violet in the former Circuit; and the Green much more conspicuous, and as vivid and copious as any Colour there but the Yellow; but the Red began to look faded, and very much inclining to Purple. After this succeeded a fourth Circuit or Order of Green and Red: The Green was very copious and lively, inclining on one Side to Blue, on the other to Yellow. But here was neither Violet, Blue, nor Yellow, and the Red was imperfect and dirty. Also the succeeding Colours became more and more imperfect and dilute, till after three or four Revolutions they ended in perfect Whiteness.

In Observation the 5th and 6th he determines the Thickness of the Air lying between the Glasses, by which each Colour was produced: And in the 7th gives a Table of it in all the Obliquities of the Angle of Incidence: (See *Air*.) In the 9th he shews, that the Air between the two Object Glasses exhibited Rings of Colours, as well by *transmitting* Light, as by reflecting it; which he found by looking through the Glasses. But the Central Spot was now *White*, and the Colours opposite to those made by Reflexion in the former Cases; *i. e.* those Parts of the Glass, were now Black, which before were White, & *vice versa*; and those which were then Red were now Blue; which were then Yellow, were now Violet, &c.

In the Tenth he found, that by wetting the Object Glasses a little at the Edges, the Water crept slowly in between them, whereby the Circles became less, and the Colours more faint; and he found the Diameters of the coloured Circles made now by Water to those before made by Air, to be about seven to eight; and that if any other Medium, more or less dense than Water, be compressed between the Glasses, their *Intervals* at the Rings caused thereby, will be to those made by Air, as the Sines measuring the Refraction made out of that Medium into Air.

In the 12th he found, that by viewing these Rings in a darkened Room, they became more visible and distinct, and appear'd in a greater Number.

In the 13th Observation he found, that when the Prism was made to turn round its Axis, so that all the Colours might successively fall on that Part of the Paper which he saw by Reflection from that Part of the Glasses where the Circles appeared, so that all the Colours might be successively reflected from the Circles to the Eye, while it was held immovable; he found, I say, that the Circles which the *Red* Light made, were manifestly bigger than those made by the *Blue* and *Violet*; and it was pleasant to see them gradually swell and contract, according as the Colour of the Light was changed: And in the 14th Observation, he found then the Contraction or Dilatation of the Colours was swiftest in the Red, and slowest in the Violet, and in the intermediate Colours had intermediate Degrees of Celerity: and he gives you the Proportions in Numbers; and he shews also, that the Thickness of the Air between the Glasses there where the Ring is successively made by the Limits of the five principal Colours (Red, Yellow, Green, Blue, Violet) in order, are to one another very nearly, as the six Lengths of a Chord which found the Notes in a sixth Major *sol, la, mi,*

fa, sol, la. But that it agrees better with Observation to say, that the Thickness of the Air between the Glasses there where the Rings are successively made by the Limits of the seven Colours, Red, Orange, Yellow, Green, Blue, Indico, and Violet in order, are to one another as the Cube Roots of the Squares of the eight Lengths of a Chord, which found the Notes in an Eighth, as *sol, la, fa, sol, la, mi, fa, sol*; that is, as the Cube Roots of the Squares of the Numbers 1, $\frac{8}{27}$, $\frac{64}{27}$, $\frac{8}{27}$, $\frac{27}{64}$, $\frac{1}{27}$.

Then in Observation 15. he manifestly shews the *Origin of these Rings*; for he found that these Rings in the preceding Observation, were not of various Colours like those made in the open Air, but appeared all over of that Prismatic Colour only with which they were illuminated; and by projecting the Prismatic Colours immediately upon the Glasses, he found that the Light which fell on the dark Spaces which were between the coloured Rings, was transmitted through the Glasses without any Variation of Colour; for on a white Paper placed behind, it would paint Rings of the same Colour with those which were reflected, and of the Bigness of their immediate Spaces: so that 'tis plain, *That the Air between the Glasses, according to its various Thickness, is disposed in some Places to reflect, and in others to transmit the Light of any one Colour; and in the same Place to reflect that of one Colour, where it transmits that of another.*

In Observation 16. he found, that the Squares of the Diameters of these Rings were in Arithmetical Progression. In Observation 17 and 18, he considers the Phenomena arising from the Colours seen in Bubbles of Water, made tenacious by a little Soap; and in the 19th he collects the *Thickness* of the Water requisite to exhibit one and the same Colour at several Obliquities, and expresses their Proportions in a Table: And in the 21st Observation he shews, by Help of Observation 10. and 16. the *Thickness* which Plates of *Muscovy* Glass, Water, or any other Substances, have, at any Colour exhibited by them.

Sir Isaac Newton, in the 22d Observation of his Second Book of *Opticks*, found, that a thin transparent Body, which is *denser* than its ambient Medium, exhibits more brisk and vivid Colours than that which is so much rarer: as he particularly observed in the Air and Glass: for blowing Glass very thin at a Lamp Furnace, those Plates encompassed with Air, did exhibit much more vivid Colours than those of Air made thin between two Glasses: *Vid. Observ. 1. and 4.*

And he shews farther, that since by his 10th Observation, the *Thickness of Air to the Thickness of Water*, which between the same Glasses exhibited the same Colour, was as 4 to 3; and since it appears (by the 21st Observation) that the Colours of thin Bodies are not varied by varying the Ambient Medium; therefore the *Thickness of a Bubble of Water exhibiting any Colour, will be $\frac{3}{4}$ of the Thickness of Air producing the same Colour.* And so according to Observation 21. the Thickness of a Plate of Glass, whose Refraction of the mean Refrangible Ray is measured by the Proportion of the Sines of 31 to 20, may be $\frac{10}{31}$ of the Thickness of Air producing the same Colours, and the like of

of other Mediums. And on these Grounds the excellent Author gives a Table, wherein the Thickness of Air, Water and Glass, at which each Colour is most intense and specifick, is expressed in Parts of an Inch, divided into 100,000 equal Parts. And by means of this Table, he shews how to conjecture at the Bigness of the Parts of Natural Bodies by their Colours.

In the 24th *Observation* he takes Notice of something very odd and surprizing; and that is, that Bubbles of Water, or of Glass, and Plates of *Muscovy* Glass, which are not quite thin enough to represent the various Colours above-mentioned, yet when look'd on through a Prism, should appear adorn'd with *Rings* or *Wavings*; whereas a Prism usually makes Objects appear coloured only where they are terminated with Shadows, or have Parts unequally luminous: And the Reason of this he explains largely at p. 42, 43, &c. of Book the 2d, Part the 2d. And from the whole he effectually proves those Properties of Light above discovered to be connate with the Rays and immutable; and consequently that all the Productions and Appearances of Colours in the World, are derived not from any Physical Change, caused in the Light by Refraction or Reflexion, but only from the various Mixtures or Separations of Rays by virtue of their different Refrangibility or Reflexibility. And in this Respect the Science of Colours becomes a Speculation as truly Mathematical as any other Part of Opticks, so far as they depend upon the Nature of Light, and are not produced or altered by the Power of Imagination, or by striking or pressing the Edges.

Then in the following Part of the Second Book he considers the Phenomena of the permanent Colours of Natural Bodies; and the Analogy between them, and the Colours of thin transparent Plates: And having before shewn, *That Bodies appear of divers Colours, according as they are disposed to reflect most copiously the Rays originally endued with these Colours*; he proceeds to examine their Constitutions, and to shew the Reason of their thus reflecting some Rays more copiously than others; which he doth in the following Propositions.

PROP. I.

Those Superficies of transparent Bodies reflect the greatest Quantity of Light, which have the greatest refracting Power: That is, which intercede Mediums which differ most in their refractive Densities. And in the Confines of equally refracting Mediums there is no Reflexion.

PROP. II.

The least Particles of almost all Natural Bodies are in some Measure transparent; and the Opacity of those Bodies ariseth from the Multitude of Reflexions caused in their internal Parts.

PROP. III.

Between the Parts of opaque and coloured Bodies are many Spaces, either empty, or replenish'd with Mediums of other Densities; as Water between the tinging Corpuscles with which any Liquor is impregnated; Air between the Aqueous Globules that constitute Clouds or Mists: And for the most part

Spaces void of both Air and Water, but yet perhaps not void of all Substance, between the Parts of hard Bodies.

PROP. IV.

The Parts of Bodies and their Interstices, must not be less than of some definite Bigness, to render them coloured and opaque.

PROP. V.

The transparent Parts of Bodies, according to their several sizes, must reflect Rays of one Colour, and transmit those of another, on the same Grounds that thin Plates or Bubbles do reflect or transmit those Rays. And this I take to be the Ground of all Colours.

For if a thinn'd or plated Body, which being of an even thickness, appears all over of an uniform Colour, should be slit into Threads, or broken into Fragments of the same thickness with the Plate; I see no Reason why every Thread or Fragment should not keep its Colour, and consequently, why an heap of those Threads or Fragments should not constitute a Mass of Powder of the same Colour which the Plate exhibited before it was broken.

And the Parts of all natural Bodies being like so many Fragments of a Plate, must on the same Grounds exhibit the same Colours; and that they do so, will appear by the Affinity of their Properties. The finely coloured Feathers of some Birds, and particularly those of Peacocks Tails, do in the very same Part of the Feather appear of several Colours in several Positions of the Eye, after the very same manner that thin Plates were found to do in the 7th and 19th *Observations*; and therefore arise from the thinness of the transparent Parts of the Feathers; that is, from the Slenderness of the very fine Hairs, or *Capillamenta*, which grow out of the sides of the grosser lateral Branches or Fibres of those Feathers. And to the same Purpose it is, that the Webs of some Spiders, by being spun very fine, have appeared coloured, as some have observed; and that the coloured Fibres of some Silks, by varying the Position of the Eye, do vary their Colour: Also the Colours of Silks, Cloaths, and other Substances which Water or Oyl can intimately penetrate, become more faint and obscure by being immersed in these Liquors, and recover their Vigor again by drying, much after the manner of the thin Bodies mentioned in the 10th and 12th *Observations*. Leaf Gold, some sorts of painted Glass, the Infusion of *Lignum Nephriticum*, and some other Substances, reflect one Colour and transmit another, like thin Bodies in the 9th and 20th *Observations*: And some of those coloured Powders which Painters use, may have their Colours a little changed, by being very elaborately and finely ground. Where I see not what can be justly pretended for those Changes, besides the breaking of their Parts into less Parts by that contrition, after the same manner that the Colour of a thin Plate is changed by varying its thickness. For which Reason also it is, that the coloured Flowers of Plants and Vegetables, by being bruised, usually become more transparent than before, or at least in some Degree or other change their Colours. Nor is it much less to this Purpose, that by mixing divers Liquors, very odd and remarkable Productions of Colours may be effected;

effected; of which no Cause can be more obvious and rational, than that the saline Corpuscles of one Liquor, do variously act upon or unite with the tinging Corpuscles of another, so as to make them swell or shrink, (whereby not only their *Bulk*, but their *Density* also may be changed;) or to divide them into smaller Corpuscles, (whereby a coloured Liquor may become transparent;) or to make many of them associate into one Cluster, whereby two transparent Liquors may compose a colour'd one. For we see how apt those saline Menstruums are to penetrate and dissolve Substances to which they are applied, and some of them precipitate what others dissolve.

In like manner if we consider the various Phenomena of the Atmosphere, we may observe, that when Vapours are raised, they hinder not the Transparency of the Air, being divided into Parts too small to cause any Reflexion in their Surfaces. But when, in order to compose Drops of Rain, they begin to coalesce, and to constitute Globules of all intermediate Sizes, those Globules, when they become of a convenient Size to reflect some Colours and transmit others, may constitute Clouds of various Colours according to their Sizes. And I see not what can be rationally conceived in so transparent a Substance as Water for the Production of these Colours, besides the various Sizes of its Fluid and Globular Particles.

PROP. VI.

The Parts of Bodies on which their Colours depend, are denser than the Medium which pervades their Interstices.

This appears by considering that the Colour of a Body depends not only on the Rays which are incident perpendicularly on its Parts, but on those also which are incident at all other Angles: And that according to the 7th Observation, a very little Variation of Obliquity will change the reflected Colour, where the thin Body or small Particle is rarer than the ambient Medium, insomuch that such a small Particle will at diversely oblique Incidences reflect all sorts of Colours in so great a Variety, that the Colour resulting from them all, confusedly reflected from a heap of such Particles, must rather be white or grey than any other Colour, or at best it must be but a very imperfect and dirty Colour: Whereas if the thin Body or small Particle be much denser than the ambient Medium, the Colours, according to the 19th Observation, are so little changed by the Variation of Obliquity, that Rays which are reflected least obliquely, may predominate over the rest so much, as to cause a heap of Particles to appear very intensely of their Colour. It conduces also something to confirm this Prop. that according to Observation 22. the Colours exhibited by the denser thin Body within the rarer, are more brisk than those exhibited by the rarer within the more denser.

PROP. VII.

The Bigness of the component Parts of Natural Bodies may be conjectured by their Colours.

For since the Parts of these Bodies, by Prop. 5. do most properly exhibit the same Colours with a Plate of equal thickness, provided they have the same refractive density; and since their Parts seem

for the most part to have much the same density with Water or Glass, as by many Circumstances is obvious to collect; to determine the Sizes of these Parts, you need only have recourse to the preceding Table where the thickness of Water or Glass exhibiting any Colour is express'd. Thus, if it were desired to know the Diameter of a Corpuscle, which being of equal density with Glass, shall reflect green of the third Order; (and what the meaning of these Orders are, I have explained above under Sir Isaac's 4th Observation:) The Number in the Table will be 16 $\frac{1}{4}$, which shews it to be $\frac{16\frac{1}{4}}{100000}$ Parts of an Inch. And from that 4th and his 18th Observation, he gathers these Particulars.

1. That *Scarlets*, and other *Reds*, *Oranges* and *Yellows*, if they be pure and intense, are most probably of the second Order: Those of the first and third also may be pretty good, only the yellow of the first Order is faint, and the orange and red of the third Order have a great Mixture of blue and violet.

2. There may be good *Greens* of the fourth Order, but the purest are of the third. And of this Order the green of all Vegetables seems to be, partly because of the Intensity of their Colours; and also that when they wither, some of them turn to a greenish yellow, others to a more perfect yellow or orange, or perhaps to red, passing first through all the aforesaid intermediate Colours. Which Changes seem to be effected by the exhaling of the Moisture, which may leave the tinging Corpuscles more *dense*, and something also augmented by the Accretion of the oily and earthy Part of that Moisture. Now the green is without doubt of the same Order with those Colours into which it changes, because the Changes are gradual; and these Colours, though usually not very full, yet are often too full and lively to be of the fourth Order.

3. *Blues* and *Purples* may be either of the second or third Order, but the best are of the third. Thus the Colour of Violets seems to be of that Order, because their Syrup by Acid Liquors turns red, and by Urinous and Alkalizate turns green. For since 'tis the Nature of Acids to dissolve and attenuate, and of Alkalies to precipitate and incrassate; if the purple Colour of the Syrup was of the second Order; an Acid Liquor, by attenuating its tinging Corpuscles, would change it to a red of the first Order, and an Alkali, by incrassating them, would change it to a green of the second Order: Which red and green, especially the green, seem too imperfect to be the Colours produced by these Changes. But if the said purple be supposed to be of the third Order, its change to red of the second, and green of the third, may without any Inconvenience be allowed.

If there be any Body of a deeper and less reddish purple than that of Violets, 'tis probable its Colour is that of the second Order.

The *Blue* of the first Order, though very faint and little, may possibly be the Colour of some Substances; and particularly the Azure Colour of the Sky seems to be of this Order. For all Vapours, when they begin to condense and coalesce into small Parcels, become first of that bigness whereby such an Azure must be reflected, before they

they can constitute Clouds of others Colours. And so this being the first Colour which Vapours begin to reflect, it ought to be the Colour of the finest and most transparent Skies in which Vapours are not arrived to that Grossness requisite to reflect other Colours; as we find it by Experience.

4. *Whiteness*, if most intense and luminous, is that of the first Order; if less strong and luminous, 'tis a Mixture of the Colours of several Orders. Of this last kind he takes the Whiteness of Froth, Paper, Linen, and most white Substances to be; and of the former that of white Metals. For since the densest of Metals (Gold) if foliated, is transparent, and that all Metals become transparent by being dissolved in Menstruums, or by being vitrified, the Opacity of white Metals ariseth not from this Density alone: They being less dense than Gold, would be more transparent than it, did not some other Cause concur with their Density to make them Opake. And this Cause he takes to be such a Bigness of their Particles as fits them to reflect the white of the first Order: For if they be of other Thicknesses, they must reflect other Colours, as is manifest by the Colours which appear upon hot Steel in tempering it, and sometimes upon the Surface of melted Metals in the Skin or Scoria which arises upon them in their cooling. And as the white of the first Order is strongest which can be made by Plates of transparent Substances, so it ought to be stronger in the denser Substances of Metals than in the rarer of Air, Water and Glass. Nor doth he see but that Metallick Substances of *such a Thickness* as may fit them to reflect the white of the first Order, may by reason of their great Density (according to *Prop. 1.*) reflect all the Light incident upon them, and so be as opake and splendent as 'tis possible for any Body to be. Gold or Copper mix'd with less than half their Weight of Silver, Tin or Regulus of Antimony, either in Fusion or amalgamated with a very little Mercury, become *white*; which shews both that the Particles of white Metals have much more Superficies, and so are *smaller* than those of Gold and Copper; and also that they are so opake as not to suffer the Particles of Gold or Copper to shine through them: Nor is it to be doubted but that the Colours of Gold and Copper are of the second Order, or of the third, and therefore the Particles of white Metals cannot be much bigger than is requisite to make them reflect the white of the first Order. The Volatility of Mercury argues that they are not much *bigger*, nor may they be much *less*, lest they lose their Opacity, and become either *transparent* as they do when attenuated by Vitrification, or by Solution in Menstruums; or *black* as they do when ground smaller, by rubbing Silver, Tin, or Lead on other Substances to draw black Lines. The first and only Colour which white Metals take by grinding their Particles smaller is *black*; and therefore their *white* ought to be that which borders upon the black Spot in the Centre of the Rings of Colours mentioned in the preceding Observation; that is, the white of the first Order: But if you would hence gather the Bigness of Metallick Particles, you must allow for their *Density*. For were Mercury transparent, its Density is such, that the Sine of Incidence upon it (by Sir Isaac Newton's Computation) would be to the Sine of its Refracting, as 71 to 30, or as 7 to 2. And therefore the Thickness of

its Particles, that they may exhibit the same Colours with those of Bubbles of Water, ought to be less than the thickness of the Skin of those Bubbles in the Ratio of 2 to 7.

Whence 'tis possible, that the Particles may be as little as the Particles of some transparent and volatile Fluids, and yet reflect the white of the first Order.

5. For the Production of *Blackness* (he shews) that the Corpuscles must be less than any of those which exhibit any other Colours, because at all greater sizes of Particles there is too much Light reflected to constitute this Colour: But if they be supposed a little less than is requisite to reflect the white and very faint blue of the first Order, they will, according to Observation 4, 8, 17, and 18, reflect so very little as to appear intensely black; and yet may perhaps variously refract it to and fro within themselves so long, until it happen to be stifled and lost, by which means they will appear black in all Positions of the Eye without any Transparence. And from hence may be understood why *Fire*, and that more subtle Dissolver *Putrefaction*, by dividing the Particles of Substances, turn them to black: Why small Quantities of black Substances impart their Colour very freely and intensely to other Substances to which they are applied, the minute Particles of these, by reason of their very great Number, easily overspreading the gross Particles of others: Why Glass, ground very elaborately with Sand on a Copper Plate till it be well polished, makes the Sand, together with what is worn off from the Glass and Copper, become very black: Why black Substances do soonest of all others become hot in the Sun's Light, and burn; (which Effect may proceed partly from the Multitude of Refractions in a little Room, and partly from the easy Commotion of so very small Particles:) And why Blacks are usually inclined a little to a bluish Colour; for that they are so, may be seen by illuminating white Paper by Light reflected from black Substances, when the Paper will usually appear of a bluish white: And the reason is, because black borders on the obscure blue of the first Order in the 18th Observation, and therefore reflects more Rays of that Colour than any other.

The *Sensations* of different Colours seem to arise from hence, That several sorts of Rays do make Vibrations of several Bignesses, which, according to their Magnitudes, do excite Sensations of several Colours; much after the manner that the Vibrations of the Air, according to their several Bignesses, do excite Sensations of different Sounds. And in particular 'tis probable, that the *most refrangible Rays* excite the *shortest* Vibrations, and so produce the Sensation of a *deep violet Colour*; and that the *least refrangible Rays* excite the *largest* Vibrations, and so produce the Sensation of a *deep Red*: And that the several intermediate Sorts of Rays do excite Vibrations of several intermediate Bignesses, and thereby produce the Sensations of the several intermediate Colours.

And 'tis probable also, that the *Harmony* and *Discord* of Colours (for some Colours, as that of Gold, Yellow, and Indico, are agreeable to the Eyes, and some not) arise from the *Proportions* of these Vibrations propagated through the Fibres of the Optick Nerves into the Brain, just as the *Harmony* and *Discord* of Sounds arises from the Vibrations

brations of the Air: See Newton's Opticks, at the End.

He shews also there at the 21st Query, That to the Production of all the *Varieties of Colours*, and the *various Degrees of Refrangibility* of the Rays of Light, there is nothing more necessary than that the Rays of Light be small Bodies or Particles of different Magnitudes. The *least Size* of which constitute a deep *Violet Colour*; as being the most dark and languid of all others, and as being most turned out of their way by the Action of refracting Surfaces upon them. And the other Sizes of the Rays of Light, according as they *increase in Magnitude*, do exhibit stronger and brighter *Colours*, as *Blue, Green, Yellow and Red*; and are, in Proportion to their Bigness, less and less capable of being refracted, or turned out of their Way.

COLOURS. Dr. Hook, in his *Oper. Post.* p. 54. from the Apparition of Colours in the Triangular or Hexangular *Stiria* of Crystal, where a lovely Variety of Colours is produc'd, in a way different quite from that which Nature takes in the Generation of Colours in other Bodies, as in Flowers, Blood, Metals, &c. he concludes, that all other *Hypotheses* of Colours are overthrown, and that nothing besides a *Refraction*, which is *considerable enough to obliquate the Pulse of Light*, is necessary for the Production of Colours.

COMBARONS are the *Fellow-Barons* or *Commonalty* of the Cinque-Ports, of the two ancient Towns, and their Members. The Members that represent them in the House of Commons, are called Barons of the *Cinque-Ports*.

COMBINATION of Quantities is defined by Mr. Strobe, in his Treatise on this Subject, printed, London, 1678. to be the many several Ways one may take any Number of Quantities, without having any respect to their Places.

Col. Thornycroft's *Treatise of Combinations from Phil. Trans. N. 299. in which the whole Affair of Combinations and Alternations is improved and compleated.*

And First, He premises,

That as in the Notation of Powers, $a a a a$ $b b b c c$ is design'd by $a^4 b^3 c^2$, and universally p times the Position of c , by a^p , &c. so in things expos'd likewise, (unless where 'tis propos'd they should be all different) which Indices, as they have here no relation to Powers; but express only the Occurrences of those Things to which they respectively belong, I therefore call Indices of Occurrences.

2^{dly}, That as often as I shall hereafter mention the *Combination* and *Alternations* of the $p^s q^s r^s$ or s^s , (which consider'd by themselves are capable of no Variation) I mean, of those things whose Indices they are.

3^{dly}, That m is generally put for the whole Number of things expos'd, whether all different or not, *i. e.* equal to the Sum of their Indices; and n for such a Number of them as each *Combination* and *Alternation* must consist of, (unless presuppos'd equal); which explains what is hereafter meant by the *Combinations* and *Alternations* of m things taken n and n , or of m things taken m and m ; and the like Expression, by whatever Symbols the Number of things out of which the *Combinations* and *Alternations* are to be made, or of which they are to consist, may be design'd.

Vol. II.

Lemma I.

If in a right Line, at any Distances, be plac'd any number of Things, $a b c d$, &c. the Number of the Intervals, $a b$, $b c$, $c d$, &c. terminated each by two adjacent Things, is one less than the Number of Things.

For whereas every Interval is terminated by two adjacent Things, if to any Number of Things be added one Thing more, one Interval only is thereby added. Q. E. D.

Lemma II.

The Number of the *Alternations* of m Things $a b c d$, &c. different each from other, taken m and m , is m times the Number of the *Alternations* of $m-1$ Things $a b c$, taken $m-1$ and $m-1$.

For (by Lemma I.) the last Letter d , besides the Position it hath, may have $m-2$ Positions, *viz.* in the Intervals which are between $m-1$ Things $a b c$; but it may also have one more, for it may be put first of all, it may therefore have m Positions; and those in all the different Orders, whereof $m-1$ Things are capable, which being all the possible Positions of d , in all the Varieties of $a b c$, is all the Variety whereof the whole Number of things expos'd $a b c d$, &c. is capable. Q. E. D.

Lemma III.

The Number of the *Alternations* of m things $a b c d$, &c. different each from other, taken m and m , is equal to $m \times m-1 \times m-2 \times m-3 \times m-4$, &c. continu'd to m places.

For let $m O$ express the Number of the *Alternations* of m things different each from other; $m-1 O$, of $m-1$ things, and the like.

'Tis evident, that if $m=1$, it will be $m O = m$; for there can be but one Order of one thing.

And if m be greater than Unity, then it will be (by Lem. 2.) $m O = m \times m-1 O = m \times m-1 \times m-2 O = m \times m-1 \times m-2 \times m-3 O =$, &c. till we have an Equation consisting of m places; *i. e.* $= m \times m-1 \times m-2 \times m-3 \times$, &c. continu'd to m places. Q. E. D.

Lemma IV.

If $m w$ express the Number of the *Alternations* of m things $a p$, $b p$, $c p$, $d p$, $e q$, $f r$, &c. taken m and m ; and a the Number of p 's, b the Number of q 's, γ the Number of r 's, it will be,

T

$m \times =$

$m \omega = \frac{m \times m - 1 \times m - 2 \times m - 3 \times m - 4 \times m - 5 \times, \text{ etc. continued to } m \text{ places.}}{p \times p - 1 \times p - 2 \times, \text{ etc. } a \times q \times q - 1 \times, \text{ etc. } \beta \times r \times r - 1 \times, \text{ etc. } \gamma \text{ each Series continued to } p, q, r, \text{ etc. places respectively.}}$

For the Number of the Alternations of any Number of things, however divided into Parts, is produc'd by a continual Multiplication of the Alternations of those things amongst themselves respectively, which compose each Part, into the Number of their Alternations one amongst the other; *i. e.* in the present Case (the several Occurrences being supposed to compose the several Parts, and consequently the Number of the Alternations of

the things composing each Part equal to Unity) $m \omega =$ to the Number of the Alternations of the things composing the Parts one amongst the other; but the Number of their Alternations one amongst the other, is the same in this Case, as if the things expos'd, being all different, were divided into the same Parts; for the things which compose each Part in both Cases, are different from the rest of the things expos'd; *i. e.* by *Lem. 3.*

$m \omega = \frac{m \times m - 1 \times m - 2 \times m - 3 \times m - 4 \times m - 5 \times, \text{ etc. continued to } m \text{ places.}}{p \times p - 1 \times p - 2 \times, \text{ etc. } a \times q \times q - 1 \times, \text{ etc. } \beta \times r \times r - 1 \times, \text{ etc. } \gamma \text{ each Series continued to } p, q, r \text{ places respectively. Q. E. D.}}$

Lemma V.

The Number of the Combinations of m things $a b c d$, etc. different each from other, taken n and n , is equal to $\frac{m \times m - 1 \times m - 2 \times m - 3 \times, \text{ etc.}}{n \times n - 1 \times n - 2 \times n - 3 \times, \text{ etc.}}$ each Series continued to n places.

ences are n and $m - n = \frac{m \times m - 1 \times m - 2 \times m - 3 \times, \text{ etc. continued to } m \text{ places.}}{n \times n - 1 \times, \text{ etc. } \times m - n \times m - n - 1 \times, \text{ etc.}}$ each Series continued to n and $m - n$ places respectively, (by *Lem. 4th*;) *i. e.* because $n + m - n = m$ $\frac{m \times m - 1 \times m - 2 \times m - 3 \times, \text{ etc.}}{n \times n - 1 \times n - 2 \times n - 3 \times, \text{ etc.}}$ each Series continued to n places, by *Lem. 3.* Therefore,

Lemma VI.

The Number of the Alternations of m things $a b c d$, etc. different each from other, taken n and n , is $\frac{m \times m - 1 \times m - 2 \times m - 3 \times, \text{ etc.}}{n \times n - 1 \times n - 2 \times n - 3 \times, \text{ etc.}}$ continu'd to n places. *Q. E. D.*

Scholium.

Since in the things expos'd the same things may occur more than once, and also n be less than m , the Indices of the Occurrences which are in some of the Combinations of m things taken n and n , may differ from those which are in others; but those Combinations, the Indices of whose Occurrences are the same, are said to be in the same Form: Therefore whereas n is equal to the Sum of the Indices which are in each Combination taken n and n , if n be express'd by all the different Combinations of such Indices only (being integer Numbers) whereof no one may exceed the highest Index of the things expos'd, and being more than one in a Combination, are each of them, which are in the same Combination, comprehended in a distinct Index thereof; these Expressions of n will necessarily be the several Forms of the Combinations taken n and n , whereof m things are capable: Whence is deriv'd a General Theorem

$n \times n - 1 \times n - 2 \times n - 3 \times n - 4 \times n - 5 \times n - 6 \times, \text{ etc. continued to } n \text{ places.}$
 $p \times p - 1 \times p - 2 \times, \text{ etc. } a \times q \times q - 1 \times, \text{ etc. } \beta \times r \times r - 1 \times, \text{ etc. } \gamma \times, \text{ etc. each Series continued to } p, q, r, \text{ etc. places respectively, shall be the Number of their Alternations.}$

But the Sum of all the Combinations and

For if the things expos'd be divided in two Parts, *viz.* in the Ratio of n and $m - n$, 'tis evident that their different Combinations taken n and n , are produc'd by the Alternations of the composing the Parts one amongst the other: And therefore the Number of those = to the Number of these = to the Number of the Alternations of m things taken m and m , the Indices of whose Occurrences are n and $m - n$, the Indices of whose Occurrences are n and $m - n$, rem for finding the Combinations and Alternations of m things taken n and n universally; *i. e.* Whether m consist of things all different or not; and whether n be equal to, or less than m .

Theorem.

If n be express'd, according to all the different Forms of Combination which the things expos'd are capable of, and

$p =$ the highest Index $a =$ the number of p in ev'ry
 $q =$ the next highest $\beta =$ the number of q } form of
 $r =$ the next highest $\gamma =$ the number of r } Combi-
 $f =$ the next highest $\delta =$ the number of f } nation.
 etc.

$A \left\{ \begin{array}{l} = \text{the Number of all In-} \\ \text{dices not less than} \end{array} \right. \left\{ \begin{array}{l} p. \\ q. \\ r. \\ f. \end{array} \right\} \left\{ \begin{array}{l} \text{Which are} \\ \text{in the} \\ \text{things ex-} \\ \text{pos'd.} \end{array} \right.$

etc. And $b = a + \beta, c = b + \gamma, d = c + \delta, \text{ etc.}$

I say the Number of the Combinations of m things taken n and n , in any one Form of Com-

bination, shall be $\frac{A \times A - 1 \times A - 2}{a \times a - 1 \times a - 2} \times, \text{ etc. } \times \frac{B - a \times B - a - 1}{B \times \beta - 1} \times, \text{ etc. } \times \frac{C - b \times C - b - 1}{\gamma \times \gamma - 1} \times, \text{ etc. } \times \frac{D - c \times D - c - 1}{\delta \times \delta - 1}, \text{ etc. continued to}$

so many Terms as there are different Indices in the Form of Combination, and each Term to $a, \beta, \gamma, \delta, \text{ etc. places respectively, and this Number multiply'd into}$

$n \times n - 1 \times n - 2 \times n - 3 \times n - 4 \times n - 5 \times n - 6 \times, \text{ etc. continued to } n \text{ places.}$

Alternations which are in every Form of n , shall be the whole Number of Combinations and Alternations of m things taken n and n .

Demon-

Demonstration.

First then 'tis evident, that those Combinations, which are in different Forms, differ from each other.

Again, 'Tis evident that the Combinations of m things, as $a^p, b^q, c^r, d^s, e^t, f^u, g^v, h^w, i^x, \&c.$ (the Indices simply consider'd) taken n and n , in a Form wherein are p, q, r , shall be equal to the Number of the Combinations of the p , which are in the things expos'd, taken a and a , multiplied into the Number of the Combinations of the q taken β and β , multiply'd into the Number of the Combinations of the r taken γ and γ .

But because p , and all lesser Indices, are comprehended in every Index which is greater than themselves, therefore is $A =$ to the Number of p , which are in the things expos'd; and for the same Reason would $B =$ the Number of the q , and $C =$ the Number of the r : But the Number of the p , which are in every Form of Combination, is $= a$; therefore is $B - a =$ to the Number of q : Also because the Number of p s and q s together, which are in every Form of Combination, wherein there are q s, is $= a + \beta = b$; therefore is $C - b =$

$n \times n - 1 \times n - 2 \times n - 3 \times n - 4 \times n - 5 \times n - 6 \times n$, &c. continu'd to n places.

$p \times p - 1 \times p - 2 \times p$, &c. $a \times q \times q - 1 \times q$, &c. $\beta \times r - 1 \times r$, &c. γ , each Series continued to p, q, r , &c. places respectively. Q. E. D.

Now to make an Application of this General Rule to those particular Cases which have already been consider'd by others, and which are contain'd in our 3d, 4th, 5th and 6th Lemma's, and by us

ons $= \frac{m \times m - 1 \times m - 2 \times m - 3 \times m - 4 \times m}{p \times p - 1 \times p - 2 \times p}$, &c. $a \times q \times q - 1 \times q$, &c. $\beta \times r - 1 \times r$, &c. γ , each Series to p, q, r , &c. places respectively; i. e. (if $p=1$) $= m \times m - 1 \times m - 2 \times m - 3 \times m - 4 \times m$, &c. continu'd to m places, which are the Cases of the 4th and 5th Lemma's.

But if the things expos'd are all different, and n be less than m , which is the Case of the 5th and 6th Lemma's, then also can there be but one Form of Combination, and it will be $A = m$ and $a = n$, and the whole Number of Combinations

$$= \frac{A \times A - 1 \times A - 2 \times A}{a \times a - 1 \times a - 2 \times a}, \&c.$$

i. e. $= \frac{m \times m - 1 \times m - 2 \times m}{n \times n - 1 \times n - 2 \times n}$, &c. each Series continued to n places, and therefore the Number of Alternations $= m + m - 1 \times m - 2 \times m$, &c. continu'd to n places.

But fully to illustrate this Theorem, which, as delivered in general, may seem somewhat too abstracted to be commonly understood, I shall subjoin one short Example.

Example.

Let the things expos'd be $a a a b b b c c c$, or according to our way of Notation, a^3, b^3, c^3 ; 'tis requir'd to find the Number of their Combinations and Alternations taken 4 and 4.

to the Number of r s, and so on, how many forever were the different Indices in any Form of Combination.

But (by Lem. 5.) the Number of the Combinations of the p s, which are in the things expos'd, whose Number is A , taken a and a , is $= \frac{A \times A - 1 \times A - 2 \times A}{a \times a - 1 \times a - 2 \times a}$, &c. continu'd to a places; and the Number of the Combinations of the q s, whose Number is $B - a$, taken β and β , is $= \frac{B - a \times B - a - 1 \times B - a - 2 \times B - a - 2}{\beta \times \beta - 1 \times \beta - 2 \times \beta}$, &c. continu'd to β places; and the Number of the Combinations of the r s, whose Number is $C - b$, taken γ and γ , is $= \frac{C - b \times C - b - 1 \times C - b - 2 \times C - b - 2}{\gamma \times \gamma - 1 \times \gamma - 2 \times \gamma}$, &c. continu'd to γ places. Q. E. D.

But every Combination in one and the same Form, affords the same Number of Alternations: Therefore the Number of Alternations in any one Form, is so many times the Number of Combinations, as is the Number of Alternations in any one of these Combinations.

But (by Lem. 4.) the Number of Alternations in any of those Combinations shall be

more generally demonstrated; I say,

If $n=m$, there can be but one Form of Combination, and but one Combination in that Form; and therefore the Number of Alternations

is $= m \times m - 1 \times m - 2 \times m - 3 \times m - 4 \times m$, &c. continu'd to m places.

Then (because in the things expos'd there is no one thing occurs more than thrice, nor more than three things different from each other) will all the Forms of Combination, which the things expos'd are capable of, be these,

$$\text{Viz. } \left\{ \begin{array}{l} 3 \cdot 1 \\ 2 \cdot 2 \\ 2 \cdot 1 \cdot 1 \end{array} \right\} \text{ Then}$$

In the first Form will $p = 3, q = 1, a = 1, \beta = 1$, $A = 2, B = 3$.

In the 2d Form will $p = 2, a = 2, \beta = 2$, $A = 3, B = 3$.

In the 3d Form will $p = 2, q = 1, a = 1, \beta = 2$, $A = 3, B = 3$.

The Number of Combinations in the First

$$\text{Form} = \frac{A \times B - a}{a \times \beta} = \frac{2 \times 2}{1 \times 1} = 4$$

The Number of Combinations in the Second

$$\text{Form} = \frac{A \times A - 1}{a \times a - 1} = \frac{2 \times 2}{2 \times 1} = 3$$

The Number of Combinations in the Third

$$\text{Form} = \frac{A \times B - a \times B - a - 1}{a \times \beta \times \gamma - 1} = \frac{2 \times 1}{2 \times 1} = 3$$

And the whole Number of Combinations $= 10$

Also the Number of Alternations:

$$\text{In the First Form} = 4 \times \frac{n \times n - 1 \times n - 2 \times n - 3}{p \times p - 1 \times p - 2} \times q^{\beta} = 4 \times \frac{4 \times 3 \times 2 \times 1}{3 \times 2 \times 1} = 4 \times 4 = 16$$

$$\text{In the Second Form} = 3 \times \frac{n \times n - 1 \times n - 2 \times n - 3}{p \times p - 1} \times q^{\alpha} = 4 \times \frac{4 \times 3 \times 2 \times 1}{2 \times 1} = 3 \times 6 = 18$$

$$\text{In the Third Form} = 3 \times \frac{n \times n - 1 \times n - 2 \times n - 3}{p \times p - 1} \times q^{\alpha} \times q^{\beta} = 3 \times \frac{4 \times 3 \times 2 \times 1}{2 \times 1} \times 1 \times 2 = 3 \times 12 = 36$$

And the whole Number of Alternations = 70

Many are the Properties of this *Theorem*, in common with others; as, To find the *Uncia* of a Multinomial rais'd to any integer Power: To raise an infinite Series to an integer Power, though of an interrupted Order, without introducing any thing immaterial, or which must afterwards be expung'd; and many others. But then so many Terms of the Series must be taken in at first, as shall serve to the Purposes of the intended Approximation, otherwise as often as it shall fall short of that, the Operation must be began *de novo*.

Many likewise are the Properties peculiar to this *Theorem*, and great Variety of Problems might be fram'd; and I scruple not to say, many may occur in Practice, which are solvable by this, and no other Method whatever.

Hence may be found the Number of all Words whereof the 24 Letters are capable, from one Letter in each Word, to any Number of Letters given.

Hence may be found the Number of all Numbers, to any given Number of Places, which may be produced from any Number of Figures given.

Hence also the Compass of a Musical Instrument being given, the Time and Number of the Bars, whereof each Tune shall consist, the Numbers of Tunes may be found, which that Instrument is capable of.

To give an Instance of the prodigious Variety that there is in Musick, I have calculated the Number of Tunes in common Time, consisting of eight Bars each, which may be play'd on an Instrument of one Note Compass only; and it is this, *viz.* 27584. 270157. 013570. 368586. 999728. 299176. whereas the Changes on 24 Bells is but 620448. 401733. 239439. 360000. which is but $\frac{401733 \times 239439 \times 360000}{27584 \times 270157 \times 013570 \times 368586 \times 999728 \times 299176}$ of the Number of Tunes: And yet Dr. Wallis in his *Algebra* demonstrates, could not be dispatch'd in 31557. 600000. 00000 Years.

If then the Instrument were of as many Notes Compass as any Instrument now in Use, how prodigiously must the Number of Tunes be increas'd; the Calculation of which (though much more intricate and operose) would be equally attainable by our *Theorem*.

COMETS. See *Cassini's* Dissertation in the *Memoirs of the French Academy of Sciences*, 1699. In the *Art. Erud. Lips.* May 1682. there is a way of finding the Distance of a Comet from the Earth, by P. M. Kavina, Mathematick Professor of Faenza: And another in *December*, 1685. by G. S. D. whereby the Comet's Distance from the Earth is found, without any Change of Place or Station of the Observator, or taking any Altitudes or Azimuths,

Dissertation sur le Nature des Cometes, per M. Petit.

Mr. Edmund Halley, *Savilian Professor of Geometry in Oxon*, and F. R. S. his Synopsis of the Astronomy of Comets is as follows:

The ancient *Egyptians* and *Chaldeans*, (if we may credit *Diodorus Siculus*) by a long Course of Observations, were able to predict the *Apparitions* of Comets. But since they are also said, by the Help of the same Arts, to have prognosticated Earthquakes and Tempests; 'tis past all doubt, that their Knowledge in these Matters was the Result rather of mere *Astrological Calculation*, than of any *Astronomical Theories* of the Cœlestial Motions. And the *Greeks*, who were the Conquerors of both those People, scarce found any other Sort of Learning amongst them than this; so that 'tis to the *Greeks* themselves as the Inventors (and especially to the great *Hipparchus*) that we owe this *Astronomy*, which is now improv'd to such a heighth. But yet amongst these, the Opinion of *Aristotle* (who wou'd have Comets to be nothing else but sublunary Vapours, or airy Meteors) prevail'd so far, that this most difficult Part of the Astronomical Science lay altogether neglected; for no body thought it worth while to take notice of, or write about the wandering uncertain Motions of what they esteem'd Vapours floating in the *Aether*; whence it came to pass, that nothing certain concerning the Motion of Comets can be found transmitted from them to us.

But *Seneca* the Philosopher, having consider'd the *Phænomena* of two remarkable Comets of his Time, made no Scruple to place them amongst the Cœlestial Bodies, believing them to be Stars of equal Duration with the World, though he owns their Motions to be govern'd by Laws, not as then known or found out. And at last (which was no untrue or vain Prediction) he foretels, That there should be Ages some time hereafter, to whom Time and Diligence shou'd unfold all these Mysteries; and who shou'd wonder that the

Ancients

Ancients could be ignorant of them, after some lucky Interpreter of Nature had shewn in what Parts of the Heavens the Comets wander'd, what and how great they were. Yet almost all the Astronomers differ'd from this Opinion of *Seneca*; neither did *Seneca* himself think fit to set down those Phenomena of the Motion, by which he was enabled to maintain his Opinion, nor the Times of those Appearances which might be of use to Posterity, in order to the Determining these Things. And indeed, upon the turning over very many Histories of Comets, I find nothing at all that can be of Service in this Affair, before A. D. 1337. at which Time *Nicephorus Gregoras*, a Constantinopolitan Historian and Astronomer, did pretty accurately describe the Path of a Comet amongst the fix'd Stars, but was too lax as to the Account of the Time; so that this most doubtful and uncertain Comet only deserves to be inserted in our Catalogue for the Sake of its appearing near 400 Years ago.

Then the next of our Comets was in the Year 1472. which being the swiftest of all, and nearest to the Earth, was observ'd by *Regiomontanus*. This Comet (so frightful upon the Account both of the Magnitude of its Body and the Tail) mov'd Forty Degrees of a great Circle in the Heavens in the Space of one Day; and was the first of which any proper Observations are come down to us. But all those that consider'd Comets until the Time of *Tycho Brahe* (that great Restorer of Astronomy) believ'd them to be below the Moon, and so took but little Notice of them, reckoning them not other than Vapours.

But in the Year 1577, (*Tycho* seriously pursuing the Study of Stars, and having gotten large Instruments for the performing Cælestial Mensurations, with far greater Care and Certainty than the Ancients could ever hope for) there appear'd a very remarkable Comet; to the Observation of which, *Tycho* vigorously apply'd himself, and found by many just and faithful Trials, that it had not a Diurnal Parallax that was at all perceptible; and consequently was not only no aerial Vapour, but also much higher than the Moon; nay, might be plac'd amongst the Planets for any Thing that appear'd to the contrary: The cavilling Opposition made by some of the Schoolmen in the mean Time being to no purpose.

Next to *Tycho* came the Sagacious *Kepler*. He having the Advantage of *Tycho's* Labours and Observations, found out the true Physical System of the World, and vastly improv'd the Astronomical Science.

For he demonstrated that the Planets perform their Revolutions in Elliptick Orbits whose Planes pass through the Center of the Sun, observing this Law, That the Areas (of the Elliptick Sector taken at the Centre of the Sun, which he proved to be in the common Focus of these Ellipses) are always proportional to the Times in which the correspondent Elliptical Arches are describ'd. He discover'd also, That the Distances of the Planets from the Sun are in the Sesquialteral Ratio of the Periodical Times,

or (which is all one) That the Cubes of the Distances are as the Squares of the Times. This great Astronomer had the Opportunity of observing two Comets, one of which was a very remarkable one. And from the Observations of these (which afforded sufficient Indications of an Annual Parallax) he concluded, That the Comets mov'd freely through the Planetary Orbs with a Motion not much different from a Rectilinear one; but of what Kind he could not then precisely determine.

Next, *Hévelius* (a noble Emulator of *Tycho Brahe*) following in *Kepler's* Steps, embraced the same Hypothesis of the Rectilinear Motion of Comets, himself accurately observing many of them; yet he complain'd, that his Calculations did not agree to the Matter of Fact in the Heavens: And was aware, That the Path of a Comet was bent into a Curve Line towards the Sun. At length came that prodigious Comet of the Year 1680. which descending, as it were, from an infinite Distance perpendicularly towards the Sun, arose from him again with as great a Velocity.

This Comet, which was seen for four Months continually) by the very remarkable and peculiar Curvity of its Orbit (above all others) gave the fittest Occasion for investigating the Theory of their Motion. And the Royal Observatories of Paris and Greenwich having been for some Time founded and committed to the Care of most excellent Astronomers, the apparent Motion of this Comet was most accurately (perhaps as far as human Skill could go) observ'd by Messieurs *Cassini* and *Flamsteed*.

Not long after, that great Geometrician, the illustrious Sir *Isaac Newton*, writing his *Mathematical Principles of Natural Philosophy*, demonstrated not only that what *Kepler* had found, did necessarily obtain in the Planetary System, but also that all the Phenomena of Comets would naturally follow from the same Principles; which he abundantly illustrated by the Example of the aforesaid Comet of the Year 1680. shewing, at the same Time, a Method of Delineating the Orbits of Comets Geometrically; wherein he (not without the highest Admiration of all Men) solv'd a Problem, whose Intricacy render'd it worthy of himself. This Comet he prov'd to move round the Sun in a Parabolical Orb, and to describe Area's (taken at the Center of the Sun) proportional to the Times.

Wherefore (following the Steps of so great a Man) I have attempted to bring the same Method to Arithmetical Calculation; and that with desired Success. For having Collected all the Observations of Comets I could, I fram'd this Table, the Result of a prodigious deal of Calculation; which, though but small in Bulk, will be no unacceptable Present to Astronomers. For these Numbers are capable of representing all that has been yet observ'd about the Motion of Comets by the Help of the following general Table; in the making of which I spar'd no Labour, that it might come forth perfect, as a Thing consecrated to Posterity, and to last as long as Astronomy it self.

The Astronomical Elements of the Motions in a Parabolick Orb of all the Comets that have been hitherto duly observ'd

This Table needs little Explication, since 'tis plain enough from the Titles what the Numbers mean. Only it may be observ'd, that the *Perihelium* Distances are estimatd in such Parts, as the Middle Distance of the Earth from the Sun contains 10000.

A General Table for Calculating the Motions of Comets in a Parabolick Orbit.

The Construction and Use of the General Table.

As the Planets move in *Elliptical* Orbs, so do the Comets in *Parabolick* ones, having the Sun in their common *Focus*, and describe equal *Area's* in equal *Times*. But now because all *Parabola's* are *similar* to one another, therefore if any determinate Part of the *Area* of a given *Parabola* be divided into any Number of Parts at Liberty, there will be a *like* Division made in all *Parabola's*, under the same Angles, and the Distances will be proportional: And consequently this one Table of ours will serve for all Comets. Now, the manner of the Calculation of this Table is thus: In the *Fig.* let *S* be the *Sun*, *P O C* the Orbit of a Comet, *P* the *Perihelion*, *O* the Place where the Comet is 90 *gr.* distant from the Sun, *C* any other Place. Draw the Right Lines *C P*, *C S*, and make *S T*, *S R* equal to *C S*; and then having drawn the Right Lines *C R*, *C T*, (whereof the one is a *Tangent*, and the other a *Perpendicular* to the Curve) let fall *C Q* perpendicular to the *Axis* *P S R*.

Now, any *Area*, as *C O P S*, being given, 'tis requir'd to find the Angle *C S P*, and the Distance *C S*. From the Nature of the *Parabola* *R Q* is ever $= \frac{1}{2}$ the Parameter of the *Axis*, and consequently if the Parameter be put $= 2$, then *R Q* $= 1$. Let *C Q* $= z$; then *P Q* shall $= \frac{1}{2} z z$, and the *Parabolick* Segment *C O P* $= \frac{1}{12} z z z$. But the *Triangle* *C S P* will $= \frac{1}{4} z$, and so the *Mixtilineal Area* *C O P S* $= \frac{1}{12} z^3 + \frac{1}{4} z = a$, whence $z^3 + 3z = 12a$. Wherefore resolving

this Cubical Equation, *z* or the Ordinate *C Q* will be known. Now, let the *Area* *O P S* be propos'd to be divided into 100 Parts; this *Area* is $\frac{1}{2}$ of

the Square of the Parameter, and consequently $12a$ is $=$ that Square $= 4$. If therefore the Roots of these Equations $z^3 + 3z = 0, 04 : 0,08 : 0,12 : 0,16, \&c.$ be successively extracted, there will be obtain'd so many *z* or Ordinates *C Q* respectively, and the *Area* *S O P* will be divided into 100 Parts. And in like manner is the *Calculus* to

to be continued beyond the Place O. Now the Root of this Equation (since RQ is equal 1) is the Tabular Tangent of the Angle CRQ , or $\frac{1}{2}$ the Angle CSP , and so the Angle CSP is given. And RC , the Secant of the same Angle CRQ , is a mean Proportional between RQ or Unity; and RT , which is the double of SC , as is plain from the Conicks. But if SP be put $= 1$, and so the *Latus Rectum* $= 4$, (as in our Table) then RT will be the Distance sought, viz. the double of SC in the former Parabola. After this manner therefore I compos'd the foregoing Table, which serves to represent the Motions of all Comets: For hitherto there has been none observ'd, but comes within the Laws of the Parabola.

It remains now, that we give the Rules for the Calculation, and shew the way of determining the Place of a Comet seen, by those Numbers. The Velocity of a Comet moving in a Parabola, is every where to the Velocity of a Planet describing a Circle about the Sun, at the same Distance from the Sun, as $\sqrt{2}$ to 1, as appears from Cor. 7. Prop. 16. Lib. 1. of the Princip. Phil. Nat. Math. If therefore a Comet in its Perihelium were suppos'd to be as far distant from the Sun as the Earth is, then the Diurnal Area which the Comet would describe, would be to the Diurnal Area of the Earth, as $\sqrt{2}$ to 1. And consequently, the Time of the Annual Revolution, is to the Time in which such a Comet would describe a Quadrant of its Orbit from the Perihelium, as 314159, 2653 (that is, the Area of the Circle) to $\sqrt{2}$. Therefore the Comet would describe that Quadrant in 109 Days, 14 Hours, 46 Minutes, and so that Parabolick Area (analogous to the Area POS) being divided into 100 Parts, to each Day there would be allotted 0.912280 of those Parts; the Log. of which, viz. 9.960128, is to be kept for continual Use. But then the Times in which a Comet, at a greater or less Distance, would describe similar Quadrants, are as the Times of the Revolutions in Circles, that is, in the *Squipplicate Ratio* of the Distances: And so the Diurnal Area's, estimated in Centesimal Parts of the Quadrant (which Parts we put for Measures of the mean Motion, like Degrees) are in each in the *Subsesquialteral* Proportion of the Distance from the Sun in the Perihelion.

These necessary things premis'd, let it be propos'd to compute the apparent Place of any one of the mention'd Comets for any given Time. Therefore,

1. Let the Sun's Place be had, and the Log. of its Distance from the Earth.

2. Let the Difference between the Time of the Perihelion, and the Time given, be gotten in Days and Decimal Parts of Days. To the Log. of this Number let there be added the constant Log. 9.960128, and the Complement Arithmetical of the $\frac{1}{2}$ of the Log. of the Distance in the Perihelium from the Sun: The Sum will be the Log. of the mean Motion, to be sought in the first Column of the General Table.

3. With the mean Motion let there be taken the correspondent Angle from the Perihelium, in the Table, and the Log. for the Distance from the Sun: Then in Comets that are direct, add, and in retrograde ones, subtract, if the Time be after the Perihelium, the Angle thus found, to or from the Place of the Perihelium; or in direct Comets subtract, and in re-

trograde ones add, if the Time be before the Perihelium, the foresaid Angle to or from the Place of the Perihelium; and so we shall have the Place of the Comets in its Orbit. And to the Log. found for the Distance, let there be added the Log. of the Distance in the Perihelium, and the Sum will be the Log. of the true Distance of the Comet from the Sun.

4. The Place of the Node, together with the Place of the Comet in its Orbit, being given, let the Distance of the Comet from the Node be found; then the Inclination of the Plane being given, there will be given also (from the common Rules of Trigonometry) the Comet's Place reduced to the Ecliptick, the Inclination or Heliocentrick Latitude, and the Log. of the curtate Distance.

5. From these things given (by the very same Rules that we find the Planet's Place from the Sun's Place and Distance given) we may obtain the Apparent or Geocentrick Place of the Comet, together with the Apparent Latitude. And this it may be worth while to illustrate by an Example or two.

Example I.

Let it be required to find the Place of the Comet of the Year 1664, March the 1d, 7h, 00', P. M. London. That is, 96d, 19h, 8', after the Perihelium, which happened Novemb. 24th, 11h, 52'.

At the Instant of Time specified in the first Example, 'twas observed (at *London*) that the Comet applied to the second Star of *Aries*; so that it was found to be 9' more Northerly, and 3' to the East, according to Mr. *Hook*'s Observation. But at that of the Second Example, I my self (near *London*, with the same Instruments whereby I formerly observed the *Southern* Constellations) found the Place of the Comet to be $5^{\circ} 11\frac{1}{2}'$ and $28^{\circ} 52'$ North Latitude, which agreed exactly with the Observation made at *Greenwich* almost the very same Moment.

As for the Comet of the Year 1680, which came almost to the very *Sun* it self (being in its *Perihelion*, not above $\frac{1}{2}$ of the Semidiameter of the *Sun* distant from the Surface of it) since the *Latus Rectum* is so very small, could hardly be contained within the Limits of the General Table, because of the excessive Velocity of the *Mean Motion*. Therefore in this Comet the best way is (after the *mean Motion* is found) to get from thence (by the Help of the foregoing Equation $z^3 + 3z = \frac{1}{4}$ of the *mean Motion*) the Tangent of half the Angle from the *Perihelion*, together with the Log. for the Distance from the *Sun*. Which things being given, we are to proceed by the same Rules as in the rest.

After this manner therefore the Astronomical Reader may examine these Numbers, which I have calculated with all imaginable Care from the Observations I have met with. And I have not thought fit to make them publick before they have been duly examin'd, and made as accurate as 'twas possible, by the Study of many Years. I have published this Specimen of Cometical Astronomy, as a *Prodromus* of a designed future Work; lest happening to die, these Papers might be lost, which every Man is not capable to retrieve, by reason of the great Difficulty of the Calculation.

Now it may not be amiss to put the Reader in mind, That our Five first Comets (the Third and Fourth observed by *Peter Apian*, the Fifth by *Paulus Fabricius*) as also the Tenth seen by *Maslin*, if I mistake not, in the Year 1586, are not so certain as the rest; for the Observations were made neither with fit Instruments, nor due Care, and upon that Account are disagreeing with themselves, and can by no means be reconcil'd with a regular Computation. The Comet which appear'd in the Year 1684, was only taken notice of by *Blanchinus*, who observed at *Rome*: And the last, which appear'd in the Year 1698, was seen only by those at *Paris*, who determined its Course in a very uncommon way. This Comet was very obscure; and although it moved swift, and came near enough our Earth, yet we, who were wont to be curious enough in these Matters, saw nothing of it. For want of Observations, I have left out of the foregoing Catalogue, those two remarkable Comets which have appear'd in this our Age, one in *November*, in the Year 1689. the other in *February*, in the Year 1702. For they directing their Courses towards the *Southern* Parts of the World, and being scarce conspicuous here in *Europe*, met with no Observers capable of the Business. But if any one shall bring from *India*, or the *Southern* Parts, an accurate Series of requisite Observations, I will willingly fall to work again, and undergo the Fatigue of representing their Orbits in Numbers, as I have done the rest.

By comparing together the Accounts of the Motions of these Comets, 'tis apparent their Orbits are disposed in no manner of Order; nor can they, as the Planets are, be moved indifferently every way, as well retrograde as direct: From whence it is clear, they are not carried about or moved in *Vortices*. Moreover, the Distances in their *Periheliums* are sometimes greater, sometimes less; which makes me suspect there may be a far greater Number of them, which moving in Regions more remote from the *Sun*, become very obscure; and wanting Tails, pass by us unseen.

Hitherto I have considered the Orbits of Comets as exactly *Parabolick*; upon which Supposition it would follow, that Comets being impell'd towards the *Sun* by a Centripetal Force, descend as from Spaces infinitely distant, and by their Falls acquire such a Velocity, as that they may again run off into the remotest Parts of the Universe, moving upwards with such a perpetual Tendency, as never to return again to the *Sun*. But since they appear frequently enough, and since none of them can be found to move with an *Hyperbolick* Motion, or a Motion swifter than what the Comet might acquire by its Gravity to the *Sun*, 'tis highly probable they rather move in very Excentrick Orbits, and make their Returns after long Periods of Time: For so their Number will be determinate, and perhaps not so very great. Besides, the Space between the *Sun* and the fix'd Stars is so immense, that there is room enough for a Comet to revolve, though the Period of its Revolution be vastly long. Now the *Latus Rectum* of an *Ellipsis*, is to the *Latus Rectum* of a *Parabola*, which has the same Distance in its *Perihelium*, as the Distance in the *Aphelium* in the *Ellipsis*, is to the whole *Axis* of the *Ellipsis*; and the Velocities are in a subduplicate Ratio of the same: Wherefore in every Excentrick Orbit, this Ratio comes very near to a Ratio of Equality; and the very small Difference which happens on account of the greater Velocity in the *Parabola*

rabola, is easily compensated in determining the Situation of the Orbit. The principal Use therefore of this Table of the Elements of their Motions, and that which induced me to construct it, is, That whenever a new Comet shall appear, we may be able to know, by comparing together the Elements, whether it be any of those which has appeared before, and consequently to determine its Period and the *Axis* of its Orbit, and to foretell its Return. And indeed there are many Things which *Apian* observed in the Year 1531. was the same with that which *Kepler* and *Longomontanus* took Notice of and described in the Year 1607. and which I myself have seen return, and observed in the Year 1682. All the Elements agree, and nothing seems to contradict this my Opinion, besides the Inequality of the Periodick Revolutions: Which Inequality is not so great neither, as that it may not be owing to Physical Causes: For the Motion of *Saturn* is so disturbed by the rest of the Planets, especially *Jupiter*, that the Periodick Time of that Planet is uncertain for some whole Days together. How much more therefore will a Comet be subject to such like Errors, which rises almost four times higher than *Saturn*, and whose Velocity, though increased but a very little, would be sufficient to change its Orbit from an Elliptical to a Parabolical one. This, moreover, confirms me in my Opinion of its being the same; that in the Year 1456. in the Summer Time, a Comet was seen passing retrograde between the Earth and the Sun, much after the same manner: Which, though no Body made Observations upon it, yet from its Period, and the Manner of its Transit, I cannot think different from those I have just now mention'd. Hence I dare venture to foretel, That it will return again in the Year 1758. And, if it should then return, we shall have no Reason to doubt but the rest must return too: Therefore Astronomers have a large Field to exercise themselves in for many Ages, before they will be able to know the Number of these many and great Bodies revolving about the common Center of the Sun; and reduce their Motions to certain Rules. I thought indeed that the Comet which appear'd in the Year 1532. might be the same with that observ'd by *Hevelius* in the Year 1661. But *Apian's* Observations, which are the only ones we have concerning the first of these Comets, are too rude and unskillfull for any thing of Certainty to be drawn from them in so nice a Matter. I design to treat of all these things in a larger Volume, and contribute my utmost for the Promotion of this Part of Astronomy, if it shall please God to continue my Life and Health.

In the mean time, those that desire to know how to construct Geometrically the Orb of a Comet by three accurate Observations given, may find it at the End of the Third Book of Sir *Isaac Newton's* Principles of Natural Philosophy, entitled *De Systemate Mundi*, in the Words of its Renowned Inventor. Which have since been more fully explained by my very worthy Colleague Dr. *Gregory*, in his Learned Work of *Astronomia Physica & Geometrica*.

One thing more perhaps it may not be improper or unpleasant to advertise the Astronomical Reader, That some of these Comets have their Nodes so very near the Annual Orb of the Earth, that if it shall so happen, that the Earth be found in the Parts of her Orb next the Node of a Comet, whilst the Comet passes by; as the apparent Mo-

tion of the Comet will be incredibly swift, so its *Parallax* will become very sensible; and the Proportion thereof to that of the Sun will be given. Wherefore such Transits of Comets do afford us the very best Means, though they seldom happen to determine the Distance of the Sun and Earth: Which hitherto has only been attempted by *Mars* in his Opposition to the Sun, or else *Venus* in *Perigæo*; whose Parallaxes, though triple to that of the Sun, are scarce any ways to be perceived by our Instruments; whence we are still in great Uncertainty in that Affair. This Use of Comets was the ingenious Thought of that Excellent Geometrician Mr. *Nicolas Facio*. Now the Comet of 1472. had a Parallax above twenty times greater than the Sun's. And if the Comet of 1618. had come down, about the Middle of *March*, to his descending Node; or if that of 1618. had arrived a little sooner at its ascending Node, they would have been yet much nearer the Earth, and consequently have had more notable Parallaxes. But hitherto none has threaten'd the Earth with a nearer Appulse than that of 1680. For by Calculation I find, that *Novemb. 11^o. 1 h. 6^l. P. M.* that Comet was not above the Semidiameter of the Sun to the Northwards of the Way of the Earth. At which Time, had the Earth been there, the Comet would have had a Parallax equal to that of the Moon, as I take it. This is spoken to Astronomers: But what might be the Consequences of so near an Appulse, or of a Contact; or lastly, of a Shock of the Celestial Bodies (which is by no means impossible to come to pass) I leave to be discuss'd by the Studious of Physical Matters.

COMMENDAM. Before the Reformation, it was common for the Ordinary to grant a Sequestration of a Living (especially if in his own Gift, or lapsed to him) for six Months Time: And such a Sequestration was called *Commenda-Semestris*. And this was the only *Commendam* that the Canon Law approved of: tho' *Commendams* for a longer Time, and even for Life, were all along used. A Bishop, now, is only capable of holding a Benefice, or other inferior Dignity, by this Title of *Commendam*; which he doth by License from the Archbishop of *Canterbury*, or from the King in *Chancery*. But the Bishop can't hold any Living in *Commendam* without the Patron's Consent; as *Watson* saith, c. 18. p. 141. In Case of a *Commendam*, no Institution is necessary; and a Bishop may be Licensed to hold a Living in his own Gift by these Words: *Auctoritate sua propria capere, & apprehendere absquere Institutione, Inductione, Collatione, &c.*

COMMISURA *Craffioris Nervi amula*, is a Medullary Process in the Brain, connecting together the *Corpora Striata*, or the Tips of the *Cruna Medulle oblongate*.

COMMUNICATION. Lines of Communication in the Art of Fortification, are Trenches made to continue and preserve a safe Correspondence between two *Forts* or *Posts*; or at a Siege, between two *Approaches*, that they may relieve one another on Occasion.

COMPARTITION, in Architecture, is the useful and graceful Distribution of the whole Ground-plot of an Edifice, into Rooms of Office, of Reception, or Entertainment.

COMPARTMENT, in Architecture, is a particular Square, or other figured Space (for an Inscription, &c.) mark'd out in some ornamental Part of a Building.

[Metius Lib. V. Doctrin. Sp.]

COMPERTORIUM, is a Judicial Inquest in the Civil Law, made by Delegates, to find out and relate the Truth of a Cause.

COMPOSITION of Motion. If a Body as *b*, be impelled or drawn by three different Forces, in the three different Directions, *ba*, *bc*, and *bd*, so

that it yield to none of them, but continue in *equilibrio*: Then will those three Powers or Forces be to one another, as three right Lines drawn parallel to those Lines expressing the three different Directions, and terminated by their mutual Concourses. Let *be* represent the Force by which the Body *b* is impelled from *b* to *a*; then will the same right Line *be* represent also the contrary equal Force, by which it is impelled from *b* to *e*. But by what hath been said before in Composition of Motion, the force *be* is resolvable into the two Forces acting according to the two Directions, *bd*, and *bc*, to which the other impelling from *b* to *e*, is as *be* to *bd*, and *bc* or *de*, respectively. So likewise two Forces acting without the Directions *bd*, *bc*, and being equipollent to the Force acting without the Direction *be*, from *b* to *e*; will be to the Force acting according to the Direction *be* from *b* to *e*, as *bd*, *bc* to *bd*; and therefore the Forces acting in the Directions *bd*, *bc*, and equipollent to the Force acting in the Direction *be*, are to the Force acting in the Direction, as *bd*, *bc*, or *de* to *be*:

Vol. II.

That is, if a Body be urged by three different equipollent Powers in the Directions, *ba*, *bd*, and *bc*, these three Forces shall be to one another, as *be*, *bd*, and *de*, respectively. Q. E. D. And this single Proposition is the Foundation of all the Mechanicks, as hath been often shewn by Geometers.

COMPOSITION of Quantities, with respect to the Doctrine of Combinations, in the joining in any Number of Given Quantities, Letters or Figures, one Row with another Row of the same, or with two or three, or more other Rows. See Combination.

COMPOSITION in Painting, comprehends two Parts, *Invention* and *Disposition*; one of which finds out (by the means of History) proper Objects for a Picture; and the other places them aright: the just Mixture of which two Things, according to a true Oeconomy, is properly *Composition*.

CONATUS Centrifugus: This is sometimes called the *Conatus Excussorius*, and is always expressed by the versed Sine of the Angle of Circulation, and these *Conatus Centrifugi* of Bodies revolving in equal Circles, with an equable Motion, are in a duplicate Ratio, or as the Squares of their Velocities. But if the Bodies revolve in unequal Circles, their *Conatus Centrifugi* will be in a Ratio, compounded of the Ratio of the Squares of the Velocities directly, and the Simple Ratio of the Radii of those Circles Inversely. If the Body describe equal Areas in equal Times (as is the Case of the Planets which revolve in Ellipses round the Sun) then the *Conatus Centrifugi* will be reciprocally as the Cubes of the Radii.

CONATUS Excussorius. See *Conatus Centrifugus*.

CONGENERES Musculi; are such Muscles in an Animal Body, as serve together to produce the same Motion; and they are so called, because they assist one another in their Action.

CONGRUITY: That there is such a Property as Congruity in the Particles of several Fluids, is plain from these and such like Instances: Quicksilver will stick to Gold, Silver, Tin, Lead, &c. and unite with them; but will roll off from Wood, Stone, Glass, &c. and Water that will wet Salt and dissolve it, will slip off from Tallow, &c. without adhering to it; as it will from a dusty Surface, and from the Feathers of Water-Fowls. Two Drops of Water, or of Mercury, will, on Contact, immediately join and coalesce: But Oil of Tartar poured on Quicksilver, and Spirit of Wine on that Oil, and Oil of Turpentine on that, and Air over all; tho' these are stopp'd in a Bottle, and shaken never so long, they will by no means continue mingled, but will separate and keep distinct. Whether the Cause of this Incongruity be not, that the Particles of the Fluids cannot be brought so near to one another, as to come within the Sphere of one another's Attraction; and why they cannot be brought to do so by shaking, are Enquiries worth pursuing. The Ingenious Dr. Hook calls Congruity both a *Tenacious* and *Attractive Power*, in which he's certainly right; but perhaps what he takes to be the Effects of Congruity, is the Cause of it.

CONICK SECTIONS. I thought fit to give the Reader here a Translation of *L'Hospital's* Sixth Book of Conicks; wherein he will see how the Sections and their primary Properties are deduced from the Cone it self, without the tedious Number of Lemmas, which some have premised about a Line cut Harmonically; whose Demonstrations alone,

are more than all these Propositions, and not so natural nor easy neither.

DEFINITIONS.

I. If an Infinite right Line, as xSZ , having one Part of it, as S , fix'd *there* as in an immoveable Point, plac'd above the Plane of the Circle VXR ;

Fig. 1.

be supposed to move round the Circumference of the said Circle; the Revolution of this Line $xSXZ$, will produce or form what we call a *Conick Surface*; and if the Line be continued each way beyond the immoveable Point S , it will generate two *Conick Surfaces*, which are called *Opposite*.

II. The fix'd Point S_2 is called the *Vertex* of *either Surface*.

III. The $\odot VXY$, is called the Base of the Cone $VXYS$; and the $\odot xyzS$, the Base of the Opposite Cone.

IV. For the Solid contain'd under the Base VXY , and that *Conick Surface* which is generated by the Motion of the Line SX , is called a *Cone*.

V. The Right Line SX , drawn from the *Vertex* to any Point in the Periphery of the Base, is called the *Side* (because 'tis one of the *Sides* of the Δ , which will be formed by cutting the *Cone* thro' the *Vertex*, and by the *Axis*.)

VI. The Line SO , drawn from the Centre of the Circle of the Base thro' the *Vertex*, is called the *Axis*.

VII. A *Right Cone*, is that whose *Axis* is Normal to the Plane of its Base; but if it be not so, 'tis called a *Scalene Cone*.

VIII. If a *Conick Surface* be cut by a Plane, which doth not pass thro' its *Vertex*, as *FAG*; and which also is not parallel to the Plane of the Base,

Fig. 2.

(for then a Circle will be produced, which though truly a *Conick Section*, is not here consider'd) the Curve Line formed by the Interfection of the Plane *FAG*, with the *Conick Surface*, is called a *Conick Section*.

IX. If thro' the *Vertex* S , a Plane be drawn parallel to any *Conick Section*, the Infinite Right

Fig. 3.

Line DE , which is the common *Section* of that Plane, with the Plane of the Base, is called the *Directrix*.

X. A Conick Section FAG , is called a *Parabola*, when the *Directrix* DE touches the Circle of the Base of the *Cone* (as in *Fig. 2.*) ; an *Ellipsis*, when the *Directrix* falls all without the *Cone* ; and an *Hyperbola* when the *Directrix* cuts the Circle of Base.

But in this last Case, if the Plane of the *Conick Section* be produced, it must cut the *opposite Conick Surface*; and *there* will form another *Conick Section*, which is called *Opposite*, and both together are called *Opposite Sections*, or *Opposite Hyperbola's*, as *FAG* and *KNH*, in *Fig. 4.*

XL. IF

CONSECTARIES.

Fig. 4.

III. In the *Hyperbola* and the *Opposite Sections*, all the *Sides* of the Cone (but SD , SE , drawn from the Vertex to the Points D , E , where the *Directrix* cuts the Base) being infinitely produced both ways from the *Vertex* S , must cut the Planes of the *Opposite Sections*: Because there are no other but those two *Sides*, which can fall in the Plane

Theorem I. PROP. I.

CONSECTARIES.

IV. It follows also, (from *Consect. I.*) That any two Points, one in each of the opposite Hyperbola's, (*Fig. 4.*) being joined by a Right Line, as AM , that Line will be wholly without and between the opposite Sections; but infinitely produced each way, will be ever after entirely within the *Opposite Hyperbola's*: For drawing through S the Lines SA , Sm , passing through the Points A , M , and supposing them to determine a Plane, extended every way from S , &c. it is evident, that *that* Part of the Plane which is contained within the Legs of the Angle SA , SM , where the Line AM falls, is compre-

comprehended between those two Surfaces; and that Part of the same Plane which is contained between the Productions of the Line AM , from A and M each way, will fall all of it within the opposite Hyperbola's.

V. From the 2d and 4th *Consectaries* it will follow, that a Right Line can't cut a Conick Section, or the opposite Hyperbola's, in more than two Points.

PROP. II.

If either of the opposite Conick Surfaces be cut by a Plane as $ouxy$, (see Fig. 1.) which is parallel to the Base $OVXY$, the Section will be a Circle, whose Centre shall be in o , the Point where that Plane cuts the Axis produced as far as is necessary beyond S .

For in the Base, drawing any where a Radius OX ; and from the Vertex S the Side SX ; which produced, shall meet the Plane $ouxy$ in x ; the Lines OX and ox will be parallel: And the Plane SOX being produced into the opposite Cone beyond S , the Δ 's SOX and Sox will be equal; and therefore 'twill always be that $SO:OX::So:Sx$. But the two first Terms being always the same, the 4th Term Sx can't change its Length, let the Point x fall where it will: Wherefore the Curve uxy is a Circle.

PROP. III.

If in the Plane of a Parabola, as FAG (Fig. 2.) you draw from any Point, as A , within the Cone, an infinite Right Line, as AB , parallel to the Side SD : I say, that Line shall always be within the Section; and though infinitely produced towards B , can never cut the Parabolick Circumference any more.

For drawing, or supposing to pass through the Vertex S and the Line AB , a Plane, as SAB ; that will, by its Intersection with the Conick Surface form two Sides; one of which shall always be the Line SD , (because AB is parallel to it) and the other the Line SA , which passes through the Point A . But the Plane DSA , contained between the Sides SD , SA , produced infinitely from D and a , will all fall within the Surface of the Cone (by *Conf. I. Prop. I.*) Wherefore the Line AB , which is always within that Plane, and is parallel to the Side SD , will fall all of it within the Parabola, and can cut its Circumference no where but in B .

PROP. IV.

A Line drawn in the Parabola FAG , from any Point, as A , within the Cone, and not parallel to the Side SD , will, if produced, meet the Parabola in another Point, as M . (See Fig. 2.)

For if you suppose a Plane to pass along that Line and the Vertex S , as SAM , that will be all of it within the Conick Surface, and can't pass by the Side SD : Whence it follows, that this Plane will form, by its cutting the Surface of the Cone, the two Sides SA and Sm , (see *Prop. I.*) one of which, SA , passes through the Point A ; and the other, Sm , is by no means parallel to the

Plane of the Section; (for by the Nature of it, only the Side SD is so, (see *Def. X.*) Wherefore the Side Sm produced, must cut the Plane of the Parabola in the Point M ; through which the Line AM passes, which is formed by the Intersection of the Plane aSm with that of the Parabola. But 'tis plain, that this Point M is one of the Points of the Parabola FAG , because 'tis both in the Plane of the Section, and also in the Surface of the Cone: Wherefore, &c.

PROP. V. Probl. I.

Through a Point given, as A , in any Conick Section, to draw a Tangent, as AF , to the Curve.

Having drawn through the given Point A , and the Vertex of the Cone, as S , a Right Line, as SA , cutting the Base in a ; and then to the Periphery of the Base in the same Point a , a Tangent, as EaF . The Line FA made by the common Section of the Plane $SEaF$, (produced, if necessary, beyond the Vertex S) with the Plane of the Section, shall be the Tangent required.

For since the Tangent EaF is entirely without the Base, but only in the Point a , it follows, that the Plane $SEaF$, infinitely produced above or be-

Fig. 5.

low S , can cut the opposite Conick Surface no where but in the Line SA , produced also infinitely either way; and that all the rest of that Plane will be without those Surfaces. Wherefore the Line AF , made by the Intersection of that Plane with that of the Section, can interfere with neither of those Surfaces but only in the Point A , where the Line SA cuts the Plane of the Section: Wherefore 'tis a true Tangent to the Curve in that Point.

CONSECTARIES.

I. As there can be but one Tangent to the Periphery of the Base in the Point a , so there can be but

but one to the Point A drawn in any of the Conick Sections.

II. Whence arises the way of drawing a Tangent, as AF parallel; a Right Line, as MN , given in Position in the Plane of any Conick Section; or in the two opposite Sections.

For having drawn through the Vertex S a parallel to MN , as SE , that will either meet with the Directrix in some Point, as E , or be parallel to it; because that Line SE may be parallel to the Plane of the Section, and consequently may fall in the Plane SDE . If it cut it in any Point, as E , falling without the Base of the Cone; then drawing from the Point E , to the Periphery of the Base, the Tangent Eaf ; 'tis plain, that the Plane $SEaf$ will make, by its Intersection with the Plane of the Section, a Tangent, as AF , which shall be parallel to the Line MN ; because the two Sections AF , SE , of the parallel Planes MAN , SED ; being cut by the Tangent Plane, $SEaf$, must be parallel to one another, as well as SE and MN .

III. The same things being supposed, as in the preceding Confectary, and Fig. 5. it will follow, 1. That in the Parabola this Problem will be impossible, when the Line MN is in a parallel Position to the Side SD ; drawing thro' the Point D where the Directrix touches the Periphery of the Base, for then the Points E and D will be co-incident; and thro' that Point D , no Tangent but DE can be drawn: And as the Plane which passes the Vertex S and the Directrix ED , is parallel to the Plane of the Section (by Def. 9.) by its Intersection with the Plane of the Parabola, no Tangent can be formed. But when the Line given in Position is not parallel to the Side SD , a Tangent, as AF , may always be drawn parallel to it; for then the Point E falling without the Circular Base of the Cone, two Tangents, as Eaf and EDL , may always be drawn from that Point to the Circumference of that Circle; of which one, EDL , will co-incide with the Directrix; and the other, Eaf , will find by the Intersection of the Plane $SEaf$ with that of the Parabola, a Tangent, as AF , which shall answer the Problem.

'Tis the same thing when the Line SE is parallel to the Directrix, for then the Tangent Eaf will always be parallel to the Directrix: And as there is but one Tangent that can be drawn parallel to it, because the Directrix it self touches the Base of the Point D ; it follows, that a Tangent may be drawn, &c.

2. In the Ellipsis, there may always be drawn two Tangents, AF , GB , parallel to the Right

Fig. 6.

Line MN , given in Position, and consequently to one another.

For here all the Points of the Directrix DE fall without the Base of the Cone; and therefore you may always draw from the Point E , two Tangents, Eaf , and Ebg to the Circle of the Base; and these will serve, by the Intersection of the Planes $SEaf$, and $SEbg$, with the Plane of the Section on two Tangents, AF and BG , which will answer the Problem.

'Tis the same thing when the Line SE is parallel to the Directrix, for then instead of the Tangents Eaf , Ebg , going from the Point E in that Directrix, you need only draw two parallel Tangents; which is always possible.

In the Hyperbola and opposite Sections, the Problem becomes impossible, when the Point E falls within the Circular Base of the Cone; because

Fig. 7.

When no Tangent can be drawn to that Point of the base. But when it falls without, you may always draw two Tangents, AF and AB , parallel to the Line MN given in Position: For the Directrix DE , cutting the Base, you may always draw from the Point E two Tangents, as Eaf , and Ebg to the Base; and which falling on each Side of the Directrix, will make, by the intersection of the Planes $SEaf$, $SEbg$, with the Planes of the Sections, two Tangents AF and BG , which will answer the Problem.

And 'tis the same, when the Line SE is parallel to the Directrix DE : for then instead of the two Tangents, Eaf and Ebo , you need only draw two Tangents parallel to the Directrix; which is always possible.

And here Note, that in this Case the two parallel Tangents AF and BG , will always belong to the opposite Sections, and never to the same, which is plain; because the two Tangents, Eaf and Ebg , drawn to the Base, fall on each Side the Directrix.

IV. From the last Confectary, it follows, 1. That in the Parabola or Hyperbola, you cannot draw two Tangents which shall be parallel one to another: But in the Ellipsis and in the opposite Sections; one Tangent being given in Position (as suppose AF); you may always draw another, as GB parallel to it: (See Fig. 6, 7.)

2. When the Line MN , given in Position, is terminated by the Section; you may always draw in the Parabola one Tangent, which may be

parallel to it; and in the Ellipsis and opposite Hyperbola's, two Tangents, as AF and BG ; because the Line SE drawn from the Vertex, parallel to MN , will cut the Plane of the Base produced somewhere without the Circle, or else be parallel to it.

DEFINITIONS.

XII. In the Parabola (vid. Fig. 5.) a Line, as AB drawn from any Point, as A parallel to the Side SD , which passes through the Point D , where the Directrix touches the Base, is called a Diameter; and the Point A its Orgine.

XIII. In the Ellipsis and Opposite Hyperbola's, (Fig. 6, 7.) a Right Line, as AB , connecting the Points of Contact of the two parallel Tangents, AF and BG , is called a Diameter; the Points A and B , its Extremities.

XIV. A Line, as MD , drawn thro' any Point, as P , of the Diameter AB produced, if there be occasion (Fig. 5, 6, 7.) terminated by the Section in the two Points M and N , and also parallel to the Tangent AF , which passes thro' A , the Orgine of the Diameter in the Parabola, or by one or other of the Extremities of it in the Ellipsis, or Opposite Hyperbola's; that Line is said to be an entire Ordinate to the Diameter AB , being continued on each Side the Point P , tho' its half, as PM or PN , is usually called an Ordinate.

XV. And when the Ordinates are at Right Angles with any Diameter, that Diameter is then called the Axis.

CONSECTARIES.

I. From Def. 12. it follows, that in the Parabola all the Diameters must be parallel one to another; because they are all so to the Side SD .

II. And that from one Point in that Section, there can go but one Diameter; for thro' one Point, there can be but one parallel drawn to any Line given in Position, as SD is.

PROP. VII. Problem II.

A Diameter, as AB , an Ordinate, PM , in any Conick Section, to describe the Figure.

Fig. 8.

Thro' the ordinate PM , describe any Plane whatever, so it be but different from the Plane, APM ,

APM . Then from the Point P , in that Plane draw to PM the infinite Part Pa , and taking in that Line Pa , any Point as C for a Centre, with the Radius CM describe a Circle, and 'tis done.

1. When the Section is to be a *Parabola*, draw, from one of the Points, a or D , where the Circle of the Base cuts the Part Pa (viz. a) thro' the Orgine of the Diameter, the Right Line aA , which shall meet in the Point S , another Line, as SD drawn parallel to AB ; and then suppose a Conick Surface described, whose Vertex is the Point S , and its Base the Circle $DMaG$. I say, that it will form, by its Intersection with the Plane APM , the Parabola MAN required.

For having drawn parallel to MN , and through the Points D and a , the Right Lines ED and fa ; 'tis clear, those Lines will be Tangents, because they are parallel to MP , which is to aP .

But the Plane SDE passing thro' S , the Vertex of the Cone, and thro' the Tangent DE , is parallel to the Plane APM , because SD parallel AP , and DE parallel MP : Wherefore the Section MAN , made by the Plane APM in the Conick Surface, will be a Parabola, whose Diameter is AB .

The Tangent Plane also, Saf , forms in the Plane APM (by Prop. 5.) a Tangent, as AF , which is parallel to MN , as being the common Section of the two Planes Saf , APM , which pass by the Parallels af , PM , and consequently (by Def. 14.) the Right Line PM , is an Ordinate to the Diameter AB .

2. When the Section is to be an *Ellipsis* or *Hyperbola*.

Draw thro' the Point ab , where the infinite Pa cuts the Circle; and through the Extremes of the Diameter A, B , the two Right Lines, aA and Bb , they will meet in the Point S , from whence a Conick Surface may be described, whose

Fig. 9.

Fig. 10.

Vertex may be that Point S , and its Base the Circle $aMbN$. Then, I say, that the Plane APM shall form, in this Conick Surface, the Section MAN required.

For drawing SD parallel to the Diameter of the Section AB , and meeting ab the Diameter of the Base, in the Point D thro' that Point, and also thro' a and b , draw the Parallels DE , af , and bg to PM : Then 'tis apparent, that the Plane SDE shall be parallel to APM ; and that DE (by Def. 9.) shall be the *Directrix*.

But in the *Ellipsis*, the Point D falls without the Diameter ab produced beyond the $\odot$, because the Diameter of the Section AB falls within the Angle aSb made by the Sides of the Cone aS and Sb . But in the *Hyperbola* the Point D falls within the Circle of the Base, because then the Diameter AB falls within aSb ; which is the Angle lying on the Side of the Angle aSb . Whence it follows, that (according to Def. 10.) the Section MAN , will in the former Case be an *Ellipsis*, and in the latter, an *Hyperbola*.

The Tangent AF passing thro' A , the Extremity of the Diameter AB ; being the common Section of the Tangent Plane Saf , and the Intersecting Plane APM , which passes thro' the Parallel af and PM , will be parallel to the Ordinate PM ; and for the same Reason also, the Tangent BG will be parallel to PM , for that is the common Section of the Tangent Plane Sbg , and the Secant Plane AMP , which pass by the two Parallels bg and PM , shall be parallel to PM . Wherefore the Line AB (by Def. 13, 14.) is a Diameter, whose Ordinate is PM .

It may happen in the *Ellipsis*, that the Line Aa and bB may be parallel to one another; but there can be but only one Point in the Line ab for C the Centre of the Circle of the Base.

DEFINITION XVI.

If thro' the Point D and E in the *Hyperbola*, where the *Directrix* cuts the Base of the Cone, you draw the Tangents DH and EK ; and thro' the

Fig. 11.

Vertex S , and those Tangents, you draw two Planes, SDH and SEK ; which shall cut the Surface of the Cone in the Right Line CH and CK infinitely produced: Then are those Lines, CH and CK , called *Asymptotes*.

CONSECTARY I.

If thro' any Point of Contact of the Base of the Cone, as D , you draw thro' the Vertex S , the Side or Right Line DS , infinitely produced: 'Tis then plain, that the Tangent Plane, SDH , can have nothing common with the opposite Conick Surfaces, but the Side SD , because the Points of the Tangent DH fall without the Periphery of the Base of the Cone, but only D . But the Plane SDE passing thro' the Vertex S , and the *Directrix* DE , being parallel to the Planes of the opposite Sections; the common Sections, SD and CH of those Planes, with the same Plane SDH , must be parallel to one another: And therefore the *Asymptote* CH must fall entirely without and between their opposite Conick Surfaces; and consequently must leave the opposite Hyperbolas on each Side entirely, without ever touching them or meeting with them. And the same thing may be shewn of the other *Asymptotes* CK : But as two *Asymptotes* CH , CK , are formed by the Plane SDH , SEK , which fall on each Side of the same Conick Surface, and its opposite; it follows, that all the

Points of the *Hyperbola* FAG are contained within the Angle HCK ; and all Points of the opposite Section within its vertically opposite Angle.

PROP. VII.

If thro' any Point, as B , in the *Asymptote* CK , you draw a Line, as BA parallel to the other *Asymptote* CH ; I say, that it shall intersect one of the opposite *Hyperbolas* in one only Point as A : and being produced infinitely, will be always within it.

See Fig. 12.

For, since the Lines BA and SD are parallel to CH , they must be so to one another, and so are both in the same Plane; which Plane will enter within the two Conick Surfaces, because it passes by one of their Sides SD , and makes an Angle with the Tangent Plane SDH .

The Plane of the Parallels, BA , SD , will form in the two Conick Surfaces, two Sides; of which, one is SD , and the other the Side SA , which must necessarily cut the Line BA , in some Point, as A ; because it lies in the Plane which passes thro' the Parallels SD , AB ; and which enters SD in S .

Wherefore, because the Point A is found at the same Time in one of the Conick Surfaces, and in the Plane of the *Hyperbola*'s, it must be in one of those *Hyperbolæ*. And since the Line BA being infinitely produced on the Side of the Point A , falls entirely in the Plane DSA , contained between the Sides DS , SA ; therefore the Point A will be in the *Hyperbola* FAG , and in the vertically opposite one ASD , when it belongs to the opposite *Hyperbola*: 'Tis apparent, it must always fall within one of the two Conick Surfaces; and consequently within the *Hyperbola* also, which is contained in the Section. *Q. E. D.*

CONSECTARY.

From hence 'tis plain, that between the *Hyperbola* FAG , and its *Asymptote* CH , no Line can be drawn parallel to that *Asymptote*.

But as the Line AB divides the *Hyperbola*, which it cuts into two indefinite Portions, of which one must fall entirely within the Space contained between the two Parallels BA and CH ; it follows, that the lesser CB becomes, the more or farther the Point A will get into that Space, and this still more and more, till CB become less than any Quantity: That is, the *Hyperbola* and its *Asymptote* will approach still nearer and nearer towards one another; so that their Distance will be less than any assignable Length, and yet can never meet, by *Cor. 1. of Def. 16.*

PROP.

PROP. VIII. Problem.

CH and CK, the Asymptotes of an Hyperbola, FAG, being given, and any Point in the Curve, as F, to describe the Hyperbola.

Having drawn through the given Point *F* any Right Line, as *HK*, cutting the Asymptotes, make a Plane to pass through that Line, any how

Fig. 12.

(so it be different from the Plane of the Asymptotes *HCK*) in which Plane draw through *P* the middle Point in *HK* an infinite Perpendicular, as *MN*. Then on any Point of it, as *O*, as a Centre, and with the Radius *OF*, describe the Circle *FMN*. Then draw through the Points *H* and *K* two Tangents to the Circle; and through their Points of Contact *D*, *E*, draw *DS*, *ES*, parallel to the given Asymptotes *CH* and *CK*. These will meet in a Point, as *S*; from which, as from a Vertex, if you describe a Conick Surface, whose Base shall be the Circle *FMN*; I say, this Conick Surface shall, by the Intersection of the Plane *HCK*, form the Hyperbola *FAG*; which was required.

For,

1. 'Tis clear, from the Property of the Circle, That the Chord *FG* is bisected in the Point *P*, by the Diameter *MN*, which is perpendicular to it. Wherefore since *PH = PK* (by the Construction) *FH* must be $= GK$, and $GH = FK$; and consequently $GH \times HF = FK \times KG$.

2. From the Circle also it follows, That $GH \times HF = HD^2$, and $FK \times KG = KE^2$; and consequently $HD = KE$.

3. If the Tangents *HD* and *KE* are produced, till they meet in the Point *Q*, *DQ* will be $= EQ$.

Wherefore $DQ : EQ :: HD : KE$.

Whence it will follow, That the Line *DE* joining the two Points of Contact, is parallel to the Line *HK*; and the Plane *SDE* to the Plane *CHK*: And therefore the Line *DE* is the Directrix, (by Def. IX.) And as it cuts the Base in two Points, the Section *FAG* will be an Hyperbola, by Def. X.

'Tis plain also, That this Hyperbola must pass through the Point *F*, since that Point is common both to the Conick Surface, and to the Plane *HCK*, which is that of the Hyperbola: and that Hyperbola shall have the Lines *CH*, *CK* for its Asymptotes, because they are the common Sections of the Tangent Planes *SDH*, *SEK*, with the Plane of the Hyperbola, (Def. XV.)

When it happens that the Tangents *DH*, *EK* are parallel, then will also the Lines *DE*, *HK* be parallel.

PROP. IX.

If two Right Lines, as *MN*, *AB*, terminate within any Conick Section, or within the opposite Sections, do intersect each other in a Point, as *P*; and if they be parallel to any two other Right Lines, as *SE*, *SD*, which are given in Position: I say, the Rectangle *MPN* is to that of *APB*, always in a given Ratio; or the Ratio between these Rectangles will always be the same, let the Lines *MN*, *AB*, lie where they are.

Fig. 13.

CONSECTARY.

Fig. 15, 16.

PROP. X.

a third Line, AB , which is also terminated within the Section; it will always be $\square MPN \square OQR :: \square APB, \square AQB$.

If thro' any Point, as A, of a Parabola or Hyperbola M A N, a Right Line, as A B be drawn parallel to the Side of the Cone S D; (that is, being drawn in the Parabola thro' the Point D, where the Directrix touches the Base; and in the Hyperbola thro' one of the two Points where the Directrix cuts the Base): And suppose thro' any Point, as P, in that Line A B, a Right Line M N be drawn parallel to the Line S E, given in Position, and terminated by that Section, or the opposite Section: Suppose also another Right Line, F G, drawn parallel to the Line D a, the common Section of the Plane S A B with that of the Base, and terminated by the Sides S a, S D: Then, I say, the Ratio of the Rectangle F P $\times$ P G, or F P G is given, i. e. it will be always the same, wherever the Point P be taken in the Line A B.

DEMON.

It may be proved also from the Similarity of the Triangles Fpa , SDa , and Gpb , SDb : That $ap \times pb$, $Fp \times pG :: aD \times Db : SD^2$.

'Tis evident therefore, That the Ratio of $PM \times PN$ to $AP \times PB$, is compounded of two Ratio's of SE^2 to $mE \times nE$, and of $aD \times Db$ to SD^2 : Which by the Property of the Circle (which Figure the Base of the Cone makes) will remain always the same, let the Lines MN, AB , lie how they will, because the Points do not change: Wherefore the Rectangle APB , is always in a given Ratio. *Q. E. D.*

CONSECTARY.

Hence 'tis evident, that if thro' any Point, as A of an Hyperbola or Parabola, MAN , if in the latter, a Diameter, as AB ; or in the former, a

Fig. 18.

Parallel to one of the Affymptotes, as AB , be drawn, and that thro' any two Points, a P Q , in that Line AB , two Parallels, M N , O R , be drawn and terminated by that Section, or by the opposite Sections; it will always be $\square MPN$, $\square OQR :: AP, AQ$.

For drawing the Plane SAB , forming by its Intersection with the Conick Surface, the two Sides SD, Sa : of which, the Side SD , (if the Section be a Parabola) passes thro' the Point D , where the Directrix touches the Base; and if it be an Hyperbola, thro' one of the two Points where it cuts it: And drawing also, in the Plane SDa , through the Points P, Q , the Right Lines FG, TV , parallel to Da : 'Tis plain, in the precedent Proposition, that $\square MPN, FPG :: OQR, TQV$; and then alternately, $\square MPN, OQR :: FPG, TQV$. But the Parts PG, QV , are equal to one another; because the Lines AB, SD , are parallel: And moreover, $\square MPN, OQR :: FP, TQ :: AP, AQ$; by reason of the Similar Triangles, APF , and AQT . Wherefore $\square MPN$, must be to $\square OQR :: AP, AQ$. *Q. E. D.*

After this, the Noble Author, because a *Cylinder* is a Solid less compounded than a Cone; for it hath all its Sides parallel one to another, instead of their terminating in a Point, as they do in the *Cone*; thinks fit to consider the *Ellipsis* as a *Cylindrick Section*, and from thence demonstrates the Properties of its Diameters, as also those of the *Parabola* and *Hyperbola*.

In order to which, he premises these Definitions.

And then, because the Point E varies not, in what Place soever the Point p be taken; and since all the Emn are equal, by the Property of the Circle; it will follow, that the Rectangle MPN must be to $\square FPG$ in a given Ratio. *Q. E. D.*

Of the Ellipsis in Particular.

DEFINITIONS.

XVII. If an Infinite Right Line, as Sz , which is without the Plane of the Circle VXY , be moved with one of its Points X , quite round the Circum-

Fig. 19.

ference of that Circle, and keeps always parallel to it self, till it come again to the Place or Point whence it set out; then the *Convex Surface*, described by the Motion of that Line, is called a *Cylindrick Surface*.

XVIII. The Describent Line Sz , in any kind of Position of its Motion round the Circumference of the Dirigent Circle, is always called the *Side*.

XIX. The Circle VXY , is called the *Base*.

XX. The Infinite Line CO , drawn from the Centre of the Base C , and parallel to the Sides, is called the *Axis*.

XXI. The Infinite Solid, comprehended under the Base VXY , and the *Cylindrick Surface*, is called a *Cylinder*.

XXII. If the *Cylinder* be cut by a Plane, neither parallel to its Sides, nor to the Plane of the Base, the Curve Line $AMBN$, formed by the Intersection of that Plane with the *Cylindrick Surface*, is called a *Cylindrick Section*.

PROP. XI.

If a *Cylinder* be cut by a Plane, (see Fig. 147.) as uxy , parallel to the Plane of its Base VXY ; the Section uxy , shall be a Circle, whose Centre shall be the Point c , where that Plane intersects the Axis: and its Radius shall be the Right Line $cx = CX$, the Radius of the Base.

DEMONSTRATION.

For having drawn through any Point x , of the Section uxy , a Side, as xX , of the *Cylindrick Surface* that shall be parallel to the Axis Co ; (by Def. 20.) wherefore a Plane may be made to pass through these two Lines, which by its Intersection with the two parallel Planes $CVXY$; and uxy will form the two Right Lines, Cx and cx parallel to one another; and which also might be equal to one another, because they are terminated by the two parallel and equal Lines, Cc and Xx .

But as this must always be the Case in what Point soever of the Section uxy , x be taken: It will follow, that the Lines cx , drawn from the Point c , to all the Points x , of the Section uxy , are equal to all the Radii, CX , of the Base; (i.e.) the Section uxy , must be the Circumference of a Circle, whose Centre is c , where the Plane uxy cuts the Axis of the Cylinder, and its Radius is cx , a Line $= CX$, the Radius of the Base. *Q. E. D.*

PROP. XII.

Every Ellipsis may be considered as a *Cylindrick Section*.

Having in the Base of any Cone, where an Ellipsis is formed, draw the Diameter ab , which shall be at Right Angles in the Point D with the

Fig. 20.

Directrix DE: Let there be drawn also in the Conick Surface, the Sides Sa , Sb , meeting the Plane of the Ellipsis in the Points A and B , and draw also in the parallel Planes AMB , SDE the Right Lines AB , SD .

Then taking DF , a mean proportional between aD and Db ; and drawing to SF , the Parallels AG , BH : Let a Circle be described on the Plane of the Base, whose Radius shall be GH ; and on that Circle let a *Cylindrick Surface* be formed, whose Sides shall be AG , BH .

This done, I say, that if through any Point, as P , in the Line AB , you draw a Parallel to the *Directrix*

retrix DE , which shall cut the Conick Surface in M , and the Cylindrick in O .

Those Two Points, M and O , will be co-incident.

For making a Plane to pass thro' that Parallel PM , which shall be itself parallel to the Plane of the Two Bases, both of the Cone and Cylinder; it will form, by its Intersection of the Conick Surface, the Circle KML , (by *Prop. 2.*) whose Centre will be the common Section of that Plane, with the Axis of the Cone; and in the Cylindrick Surface, another Circle, QMR , (by the Precedent) whose Centre will be the common Section of the same Plane Sab (by *Def. 6.*) passes thro' the Axis of the Cone; and the Plane $AGHB$, (which is co-incident with the Plane Sab) passes thro' the Cylinder, (by *Def. 20*) and consequently the Lines KL and QR , which are the common Sections of those Two Planes, with the Plane parallel to the Base, and which passes thro' the Line PO , or PM , will be the Diameter of the Two Circles; and that Line POM , shall be Normal to those Diameters, because 'tis parallel to DE , which (by the Construction) is Normal to ab , and also to GH , which must be coincident with ab , to which the Diameters KL and QR , (which also must be coincident) are parallel.

Moreover, the Lines AB , SD , being formed by the Intersection of the same Plane, Sab , with two others which are parallel, (and with the Plane SDE , and that of the Ellipsis) must be parallel to one another.

Which being well understood, it will follow:

1. That in the Cone, because of the Circle KML , you will have $PM = \square KPL$, and because of the Similar Triangles APK , SDa , and PBL , SDb ; you will have those Proportions: $AP, PK :: SD, aD$, and $PB, PL :: SD, Db$; whence it will follow, $AP \times PB, KP \times PL$ (or PM^2) $:: SD^2 aD \times Db$.

2. In the Cylinder, because of the Circle QOR , $PO^2 = \square QPR$, and from the Similar Triangles, APQ , SDf , and PBR , SDg ; these Proportions will arise, $AP, QP :: SD, Df$, and $PB, PR :: SD, Dg$: Whence it will follow, that $AP, PB, QP \times QR$ (or PO^2) $:: SD^2, Df \times Dg$, (or $Da \times Db$). Wherefore, $PM^2 = PO^2$; and therefore $MP = PO$, and consequently the Points M and O will be coincident: And because this will always be the Case in what Part soever of the Line AB , the Point P be taken; it will follow, that the Plane of the Ellipsis meets or cuts the Conick and Cylindrick Surfaces in the same Points; and therefore the Ellipsis may always be considered as a Cylindrick Section.

P R O P. XIII.

All the Diameters of the Ellipsis pass thro' one only Point: Which is that where the Plane of the Ellipsis cuts or intersects the Axis of the Cylinder, and do there bisect one another: And conversely, all Right Lines passing thro' that Point, and terminated at each End by the Ellipsis, are bisected in that Point, and are also Diameters of the Ellipsis.

They call that Point the *Centre* of the *Ellipsis*.

1. Let AB be any Diameter whatsoever; so let C be the Point where the Plane of the Ellipsis

Fig. 21.

intersects the Axis of the Cylinder. If you draw the Lines Aa , Bb , parallel to the Axis Cc , 'tis plain (by *Def. 20.*) that they will be the Sides of the Cylindrick Surface; and that the two Planes, FAa , GBb , passing thro' those Lines, and thro' the Tangents AF , BG , (which according to the Definition of the Diameter, will be parallel to one another) must be parallel, and must touch the Cylindrick Surface in the Sides Aa , Bb . From whence it follows, that those two Planes will form in the Plane of the Base, the two Lines af , bg , parallel to each other, and Tangents to the Base in the Points a, b ; where the Sides Aa , Bb , intersect it.

Now from the Elements of Geometry 'tis plain, that the Line ab , which connects the Points of the Contact of the two parallel Tangents; af , bg , in any Circle, must pass thro' its Centre c . Wherefore the Plane $AabB$ will pass thro' the Axis of the Cylindrick; and the Line AB , which is the Intersection of the Plane with that of the Ellipsis, must pass thro' the Point C , where that Axis intersects the Plane of the Ellipsis.

Again, by reason of the Parallels Aa , Cc , Bb , 'tis plain, that the Diameter of the Ellipsis AB , is divided into two equal Parts, or bisected in C ; because the Diameter of the Circle of the Base ab , is bisected in its Centre c , which was the first thing to be prov'd.

2. If thro' the Extremities of any Line, as AB , passing thro' C , where the Plane of the Ellipsis cuts the Axis Cc of a Cylinder, you draw the Aa , Bb , parallel to that Axis, 'tis plain, (from *Def. 17.*) that they will be the Sides of that Cylinder; and that the Plane $AabB$, must pass thro' its Axis. Whence you see, that the Line ab , which is the common Section of the Plane, and of the Plane of the Base, passes thro' c the Centre of the Base; and also that it is cut into two equal Parts, the Line AB must also be bisected in C .

Again, the Tangents af , bg , which pass thro' the Extremities of the Diameter ab , being parallel; the Tangent Planes faA , gbB , must be parallel also; and will form in the Plane of the Ellipsis two parallel Lines, Ac , BG , which shall be Tangents to that Curve in the extreme Points

A, B , of the Line AB ; wherefore that Line will be a Diameter.

Which was the Second Point to be prov'd.

C O N S E C T A R Y.

Hence 'tis evident, that through any one Point given in the Plane of an Ellipsis different from its Centre, there can one only Diameter be drawn:

P R O P. XIV.

Every Ordinate MPN (See Fig. 149.) of an Ellipsis is bisected in the Point P , by the Diameter AB , and conversely.

If a Right Line, as MPN , terminated within an Ellipsis, and not passing thro' its Centre C , is bisected in the Point by a Diameter, as AB , it shall be true Ordinate on each Side of that Diameter.

Having drawn thro' the Points A, B, M, N , the Sides Aa, Bb, Mm, Nn , parallel to Cc the Axis of the Cylinder, and intersecting the Plane of the Base in the Points a, b, m, n ; the Line Pp , which is the common Intersection of the two Planes $AabB, MmnN$, will be parallel to the Sides of the Cylinder; because all those Sides are parallel to one another. The Plane $AabB$ also must pass thro' Cc the Axis of the Cylinder, because the Diameter AB passes thro' the Point C , where that Axis intersects the Plane of the Ellipsis, and consequently it will form in the Plane of the Base a Line, as ab , which will pass through the Centre c , i. e. which will be a Diameter.

This being supposed:

I. Because by the Hypothesis the Line MPN is an entire Ordinate to the Diameter AB , it will be parallel to the Tangents AF, BG , which pass thro' the Ends of that Diameter; and consequently the Tangent Planes, FAa, GBb , will be parallel to the Plane $MmnN$; wherefore the three Lines, formed by those three Planes, by their Intersection with the Plane of the Base, as af, bg , and mn , must also be parallel; and consequently the Line mn will be Normal to the Diameter ab , and therefore will be bisected by it in the Point p ; wherefore, because of the Parallels Mn, Pp, Nn , it will follow, that the Line MN must also be bisected in the Point P .

2. And then, as to the Converse, if you draw in the Plane of the Ellipsis, the two Tangents, AF, BG , (Cor. 4. Prop. 5.) parallel to MN , and then from the Points of the Contact, the Diameter AB . 'Tis plain, (from Def. 13, 14.) that from the Right Line MN , will be an entire Ordinate to that Diameter, and consequently will be bisected in P by that Diameter.

But as there can but one Diameter be drawn thro' P , (by the Precedent) it will follow, That if a Line, as MN , terminated within any Ellipse, and not passing thro' its Centre, be bisected in P , by a Diameter AB , it shall be a true entire Ordinate to that Diameter.

P R O P. XV.

If in an Ellipsis there be two Diameters, AB, DE , (See Fig. 149.) and one of them, as DE , be parallel to the Tangents AF, BG , which pass thro' the Extremities of the other AB .

I say, that the Diameter AB , shall be parallel to the Tangents which pass thro' the Extremities of the Diameter DE .

Note, In this Case the Diameter AB , and DE , are called Conjugate one to another.

Having drawn thro' the Points A, B, D, E , the Sides Aa, Bb, Dd , and Ee , of the Cylinder, which cuts the Plane of the Base in the Points a, b, d, e : The Planes $AabB, DdeE$, will pass thro' the Axis of the Cylinder, because the Lines AB and DE are Diameters of the Ellipsis; and consequently they will form in the Plane of the Base, the two Diameters ab, de . But the Tangent Plane FAa , being parallel to the Plane $DdeE$, will form in the Plane of the Base a Tangent, as af , parallel to the Diameter de ; which Diameter also will be Normal to the Diameter ab .

If then, thro' one of the Extremities d , of the Diameter de , you draw a Tangent to the Circle, as dh , that will be parallel to af , and the Plane hdD , to the Plane $AabB$. Wherefore the common Sections of those two Planes, with the Plane of the Ellipsis, i. e. the Tangent DH , and the Diameter AB , must also be parallel one to another.

The same thing may be proved with regard to the Tangent that passes thro' the other End E , or of the Diameter DE .

Wherefore the Proposition is proved.

C O N S E C T A R I E S.

I. From hence 'tis plain, that if there be two Conjugate Diameters in an Ellipsis, as AB, DE ; the two Planes which pass thro' those Diameters, and thro' the Axis of the Cylinder, will form in the Plane of the Base two Diameters, ab, de , which shall be Normal one to another.

II. It follows also from this Proposition, that if thro' any Point, as P , of a Diameter, as AB , in an Ellipsis, you draw an entire Ordinate, as MPN , that shall be parallel to the Conjugate Diameter DE ; and you will have (by Consect. Prop. 9.) these Propositions; $MP \times PN$, (or PM^2): $DC \times CE$, (or CD): $AP \times PB$. $AC \times CB$, (or AC^2) and that will give us $PM^2 \cdot AP \times PB :: DC^2 \cdot AC^2$

$$:: \frac{DC^2}{4} (or DE^2) \frac{AC^2}{4} (or AB) : \text{That is, the}$$

Square of any Semi-Ordinate to the Diameter, that is, MP is to the Rectangle APB under the Parts of that Diameter: as the Square of the Conjugate Diameter DE , is to the Square of the Diameter AB .

PROP. XVI.

If thro' any Point, as M in an Ellipsis $A M B$, and Tangent $F M G$ be drawn, which in the Points $G F$, shall intersect any two parallel Tangents, as $A B$, $B G$; I say, $F M$, $M G :: A F$, $B G$.

For, drawing thro' the Points of Contact, A , B , M , the Sides $A a$, $B b$, $M m$, of the Cylinder; and thro' these Sides, and the Tangents $A F$, $B G$, $F G$, drawing the Planes $F A a$, $G B b$, $F M m$,

Fig. 22.

or $G M m$: 'Tis plain, that $F f$, $G o$, the common Sections of the first two Planes with the third, must be both parallel one to another, and to the Sides of the Cylinder. For the two Planes, $F M m$, $F A a$, passing thro' the Sides $M m$, $A a$, which are parallel, will have their common Section $F f$, parallel to those Sides; and for the same Reason $G o$, the common Section of the two Planes $G B b$ and $G M m$, will be parallel to the Sides $B b$, $M m$. Moreover, the Line $a f$, $b g$, which from the parallel Tangent Planes $F a$, $G B b$, with that of the Base being parallel: The Parts $f m$, $m o$, of the third Tangent formed in the Plane of the Base, by the third Tangent Plane $F M m$, or $G M m$, must be (by the property of the Circle) parallel to the Tangents $a f$, $b o$, *vid. fm parallel fa*, and *mo parallel ob*.

Which being supposed, by reason of the Right Lines $A a$, $F f$, $M m$, $G o$, $B b$, and $A F$, $B B$, and $a f$, $b o$, which are respectively parallel to one another, you will have,

$F M$, $M G :: f m$. or $f a$, $m o$, or $g b :: F A$, $G B$. Q. E. D.

CONSECTARIES.

I. If thro' the Points of Contact A , B , of the two parallel Tangents $A F$, $B G$, a Diameter, as $A B$ be drawn, which shall intersect in the Point T , another Tangent, as $F M G$; and if an Ordinate, as $M P$, be drawn to that Diameter; 'tis plain, that $A P$, $P B :: F M$, $M G :: A F$, $B G :: A T$, $B T$. And also that $P B - A P$, $B P :: B T - A T$, (or $B A$) $B T$.

Vol. II.

II. From hence the following manner of drawing to the Point M in an Ellipsis, a Tangent, as $M T$, is taken, when the Diameter $A B$ is given, with the Position of its Ordinates.

From one of the Ends B , of the Diameter $A B$, to give a Point M , let the Right Line $B M$ be drawn: And then having drawn the Ordinate $M P$ to the Diameter $A B$, and taken in that Diameter towards the Point P , a Part, as $P H = P A$, draw $H K$ parallel to $P M$, which shall intersect the Line $M m K$; thro' which Point, and the other End of the Diameter A , drawing $A K$, and then $M T$ parallel to it; that Line $M T$ shall be the parallel required.

For on account of the Parallels $M P$, $H K$, and $A K$, $M T$; you will have $B P$, $D H$, or $P A :: B M$, $M K :: T B$, $T A$.

III. If in an Ellipsis there be two Tangents, as $M T$, $N T$, which meet in the Point T .

I say, the Diameter $A B$, passing thro' the Point P , the middle of the Line $M N$, joining those two Tangents in their Points of Contact; shall pass also thro' T , their Point of Intersection.

For, $P N$ is an Ordinate to the Diameter $A B$, as well as $P M$; and consequently the (by Cor. 1.) Tangents $M T$, $N T$, must so meet or intersect the Diameter in a Point, as T ; that $P B - A P$, $P B :: A B$, $B T$, that is, in the same Point.

IV. If to the Point of Contact, M , N , of two Tangents to the Ellipsis, a Right Line, as $M N$ be drawn, and that it have a third Tangent, as $F A L$ parallel to it: I say, that $F A$, $A L$, the Parts of that third Tangent taken between its Points of Contact A ; and the two former Tangents will be equal one to another.

For, drawing thro' the Points of Contact A , the Diameter $A B$: 'Tis plain, the Line $M N$ will be an entire Ordinate to that Diameter, because it is parallel to the vertical Tangent $F L$; and therefore also it must be bisected in P , and (by Cor. 3.) will pass thro' T , the Point of Intersection of the two Tangents $M F$, $N L$; or will be parallel to them (by Prop. 15.) when the Line $M N$ is a Diameter.

But 'tis plain in both Cases, that $F L$ will be bisected in A , by the Diameter $A B$; because $M N$ is so bisected in the Point P , by the same Diameter.

Of the Parabola and Hyperbola, particularly.

PROP. XVII.

In the Parabola, every entire Ordinate (as $M P N$) to a Diameter, as $A B$, is bisected by that Diameter in the Point P , and vice versa.

Y

For

For having made an Elliptick Plane which shall pass thro' the Line MN , that will form with the

Fig. 23.

Tangent Plane SDE , parallel to the parabolick Plane, a Tangent, as DE parallel to MN .

Again, the Plane SAF , drawn thro' S the Vertex of the Cone, and thro' the Tangent AF , which passes thro' A , the Vertex of the Diameter AB , will form in the Elliptick Plane, a Tangent, as af ; and the Line Da jointly, the Points of Contact of the two Tangents DE , af , will pass thro' the Point P , because the Diameter AB is parallel to the Tangent Side SD .

This supposed,

Because by the Hypothesis AF and MN , are parallel, (*vid Def. 14.*) it will follow, that the Tangent af , which is the common Section of two Planes passing thro' those Lines, will be parallel to MN , and consequently to DE . Whence it appears, that the Line Da (by *Def. 13.*) joining the Points of Contact of the two parallel Tangents DE , af , is a Diameter of the Ellipsis; and also that the Line MN , which is parallel to those Tangents, and terminated by the Ellipsis, shall be (by *Prop. 14.*) bisected in the Point P .

The Converse will thus appear.

Draw in the Parabolick Plane, the Tangent AF (by *Cor. 4. of Prop. 5.*) parallel to the Line MN ; and thro' the Point and Contact A , a Diameter, as AB , the Line MN will be an Ordinate rightly apply'd (by *Def. 14.*) and consequently must be bisected in P .

And because there is but one only Diameter that can pass thro' that middle Point P , AB must be it, (by *Def. 15.*) and in the following Corollary.

CONSECTARR.

Hence 'tis evident, that if thro' any two Points P , Q , of a Diameter AB , two entire Ordinates, MPN , OQR , be drawn; you will always have this Proportion: (by *Consect. Prop. X.*) That $MP \times PN$, or PM^2 . $OQ \times QR$ (or OQ^2) $:: AP$, AQ ; that is, the Square of any two Ordinates, as of MP , OQ , to any Diameter, as AB , are always as the *Abcissæ* or intercepted Parts of that Diameter, AP , AQ .

PROP. XVIII.

(See Fig. 23.)

If thro' M any Point in a Parabola, you draw an Ordinate MP , to any Diameter AB , and also a Tangent MT , meeting in T , that Diameter produced beyond the Vertex A ; I say, AP will always be equal to AT .

The same thing being supposed, as in the last Proposition: Let there be also drawn thro' S the Vertex of the Cone, and the Line MT , a Tangent Plane STM , which will form in the Elliptick Plane, the Tangent MH , which will cut the Diameter of the Ellipsis AD , in a certain Point as H , thro' which the Line SU passes: And lastly, let the Right Line TG be drawn parallel to SA .

This being well understood, you will have (by *Cor. 1. Prop. 16.*) DH , $Ha :: DP$, Pa , and alternately DH , $DP :: Ha$, Pa . But by reason of the parallel Lines AB , SD , and SA , TG : 'Tis plain, that $DHDP :: SHST :: HaGa$; wherefore Ha , $Pa :: Ha$, Ga ; and consequently $Pa = Ga$; and therefore $AP = AT$. Q. E. D.

PROP. XIX.

In the opposite Hyperbola's, every Diameter, as AB , passeth thro' C , the Point of Intersection of the Asymptotes, and is there cut into two equal Parts, and vice versa; that Point is called the Centre.

Let HSb be one of the two common Sections of a Plane parallel to the Hyperbolick Plane, and the two opposite Conick Surfaces, and let the

Fig. 24.

Asymptote FG be formed by the Intersection of the Plane of the Hyperbola, with that which touches the two Surfaces HSb .

Let

Let there be drawn thro' the parallel Tangents AF, BG , which pass thro' the Ends of the Diameter AB , and intersect the Asymptote FG in the Points F, G , two parallel Elliptick Planes; and those will form with the Tangent Plane which passes thro' the Side HSb , the parallel Tangents FH , and Gbf ; and in the Tangent Plane SAF , the parallel Tangents, Af, af .

This proportion being made, the parallel Lines FH, Gb , being contained between the two other parallels FG, Hb , will be equal. And the similar Triangles, SHf, Sbf , and SFA, Sfa , will give $HF, bf :: Sf, sf :: FA, fa$; and also $HF, FA :: bf, fa ::$ (by *Prop. 16.*) to GGB . And hence, because HF, HG ; it will follow, that $AF = BG$, and because of the similar Triangles, ACF, BCG ; it will follow, that $AC = CB$: That is, the Asymptote FG , bisects the Diameter AB in C .

The same thing may be proved of the other Asymptote, that it shall pass also thro' C , the middle of the Diameter AB ; from whence 'tis apparent, That the Diameter AB passes thro' C the Centre of the two Asymptotes, and is there bisected.

Let there be then a Line, as AB , which passing thro' C the Intersection of the Asymptotes, shall intersect the opposite Hyperbola's in the Points AB . If then you draw thro' the Point A , the Tangent AF , and to the opposite Hyperbola, a Tangent DG , (by *Consect. 4. Prop. 5.*) parallel to AF ; 'tis plain, that since the Line AD may be proved to be a Diameter, it will pass thro' C , the Point of the Intersection of the Asymptotes. It must be co-incident then with AB , which (by the *Hypotheses*) passes thro' the same two Points, A, C ; wherefore the Line AB is a Diameter, and is bisected in C .

CONSECTARY.

Hence you see that from any Point given within an Hyperbola, there can be but one only Diameter drawn; because no other Line can pass through that Point, and thro' the Centre.

PROP. XX.

In the opposite Hyperbola's, every entire Ordinate MPN , is bisected in P , by its proper Diameter AB ; and vice versa.

Having made an Elliptick Plane to pass thro' the Line MN , it will form in the two Tangent Planes, SAF, SBG , the Tangents af, bg .

Fig. 25.

And the Line ab connecting the Points of Contact of those two Tangents, being the common Section of the Elliptick Plane of the Plane SAB , will pass thro' the Point P .

But because by the Hypothesis, the two Lines AF, MN are parallel; it follows, That the Line af , which is the common Section of two Planes passing thro' these two Lines, will be parallel to MN .

For the same Reason, the Tangent bg , which is the common Section of the Elliptick Plane, and of the Tangent Plane SBG , which two Planes do pass thro' the two parallels MN, BG , will be parallel to MN .

The Tangents then, af, bg , will be parallel one to another; from whence it will follow, that the Line ab (by *Def. 13.*) is a Diameter of the Ellipsis; and also that the Line MN (by *Prop. 14.*) is bisected in the Point P .

And to prove the *Converse*;

Draw in the Plane of the Hyperbola, two Tangents, as AF, BG , (by *Cor. 4. of Prop. 5.*) parallel to the Line MN , terminated within the Hyperbola: And then, having drawn thro' their Points of Contact, the Diameter; 'tis plain (from *Def. 14.*) that the Diameter will have the Line MN an entire Ordinate rightly apply'd, and that it shall bisect it in P . But as there can be but one Diameter pass thro' that Point (by *Cor. of Prop. 20.*); it will follow, that if a Line, as MN terminated in P by a Diameter AB ; it must be an entire Ordinate, and rightly applied in that Point.

CONSECTARY.

Hence 'tis apparent, that if you rightly apply two entire Ordinates MPN , and OQR , to one and the same Diameter; it will always be (by *Consect. Prop. 9.*) $MP \times PN$, (or PM^2) $OQ \times QR$ (or OQ^2) :: $AP \times PB$, $AQ \times QB$.

PROP. XXI.

If thro' any Point M in an Hyperbola, a Tangent MFG be drawn, intersecting two other parallel Tangents, AF , BG , in the Points F , G ; I say, that MF , MG :: AF , BG .

Drawing two elliptick and parallel Planes, which shal' pass thro' the Tangents AF , BG , they will form in this Tangent Plane SMG , two Tangents

Fig. 26.

HF , hG , which will be parallel; and the Elliptick Plane passing thro' BG , will form in the Tangent Plane SAF , a Tangent af , which will intersect the Tangent hg in the Point f , where the Line SF cuts the Elliptick Plane.

This being laid down or supposed: The Tangents af , BG , will be parallel, because each is so to the Tangent AF . And therefore (by *Consect.* from *Def. 15.*) you will have BG , Gh :: af , fh , (and because of the similar Triangles Sbf , SHF ; and Saf , SAF) :: AF , FH : Wherefore BG , AF :: Gh , FH (i. e. because of the similar Triangles MGH , MFH) :: MG , FG . Q. E. D.

N. B. 'Tis evident, That from this *Prop.* the same Corollaries may be drawn, as are in the Ellipsis (from *Prop. 16.*): And therefore there is no need to expose them at length here.

PROP. XXII.

If a Right Line FG , terminated between the Asymptotes of an Hyperbola, touch the Curve in a Point at A , it will always be bisected in that Point.

Let there be drawn thro' S the Vertex of the Cone, and thro' the two Asymptotes CF , CG , two Planes touching the Conick Surface. (See

Fig. 27.

Def. 16.) in the Sides SM , SN , where the Plane MSN , parallel to the Hyperbolick Plane, intersects it.

Let there be supposed drawn also an Elliptick Plane, passing thro' the Right Line FG ; this will form in the two Tangent Planes, two Tangents, MF , MG ; and in the Plane MSN , a Right Line MN parallel to FG ; and connecting the Points of Contact of the two Tangents.

This supposed, 'tis apparent, that the Line FG (by *Consect. 4. Prop. 16.*) is bisected in A ; because it touches both the Ellipsis, and the Hyperbola in that Point.

CONSECTARIES.

I. As there can be but one Line FG , which passing thro' a given Point A , within any Angle FCG , and terminated by its Legs, can be bisected in that Point: It follows, that if a Right Line FG , terminated by the Asymptotes of an Hyperbola meet the Curve in a Point, as A , and be there bisected, it will be a Tangent to the Hyperbola in that Point.

II. Hence 'tis evident, that to draw through a Point given, as A , in an Hyperbola, whose Asymptotes CF , CG , are given, a Tangent, as FAG ; you need only draw AD parallel to one of the Asymptotes CG , and terminated by the other; and having then taken $DF = CD$, draw the Line FAG , for that shall be the Tangent required.

For, by reason of the similar Triangles FCG , and FDA ; the Line FG must be bisected in A , because CF , (by the Construction) is so in D .

III. IF

III. If any two Points MN , within an Hyperbola, be joined by a Right Line, as MN , intersecting the Affymptotes in the Points HK : Then

Fig. 28.

will the two Lines MH , NK , being the Parts of MN , lying between the Curve and its Asymptotes, be always equal.

For having drawn thro' P , in the middle Point of MN , a Diameter, as CP , and thro' the Point A , where that Diameter meets the Curve, a Line, as FG parallel to MN , and terminated by the Affymptotes; 'tis plain, that that Line TG , FG , (by *Prop.* 20.) will be a true Tangent in the Point A , and consequently will be bisected in that Point (by this *Prop.* 22.) Whence 'tis clear, from the Similar Triangles CAE , CPH , and CAG , CPK ; that $PH = PK$, and consequently (because MN is bisected) $MH = NK$. *Q. E. D.*

Fig. 29.

IV. If thro' any Point, as *A*, in an Hyperbola, two Right Lines, *AF*, *AG*, be drawn and terminated by its Assymptotes; and if from any other Point, as *M*, in the same Hyperbola, or its Opposite, you draw two other Right Lines *MH*, *MK*, terminated also by its Assymptotes, and parallel to the two former *AF*, *AG*:

I say, the Rectangle FAG , will always be equal to the Rectangle HMK .

For,

1. When the Points AM , fall in one and the same Hyperbola, having drawn a Right Line joining the two Points A, M , and cutting the Affymptotes in P and Q ; the Similar Triangles PAF, PMH , and QMK, QAG , will give these Proportions: $AF, MH :: AP, MP$, (by Cor. 3.) $:: MQ : AQ :: MK : AG$; and then multiplying the Extremes and Means, you have $FA \times AG = HM \times MK$.

2. When the Points A, M , fall in the two opposite Hyperbola's; having drawn thro' the given

Point A , and the Centre C , the Diameter AB , and also the two Right Lines BD , BE , parallel to AF , AG , and terminated by the same Asymptotes; 'tis evident, that the Triangles CAF , CBD , and CAG , CBE , being not only Similar, but also respectively equal one to another, because $CA = CB$, (by *Prop. 19.*) Therefore $BD = AF$, and $BE = AG$, and consequently $BD \times BE = FA \times AG$. But from the former Case, $KM \times MH = DB \times BE$; whetefore now also $FA \times AG = KM \times HM$.

CONICK Surface. Let the Side of a right Cone be call'd a , the Radius of its Base r : Then by what is prov'd under the word Pyramid, the Area of the Convex Surface of the Cone is $= \frac{1}{2}$ the Periphery of the Base multiplied into the Side of the Cone. That is, Since $2r =$ to the Diameter, and $2re =$ to the Periphery, it will be exprest by rea . And from hence it will be easy to deduce that noble Proposition of *Archimedes*: That a Circle whose Area is equal to the Convex Surface of the Cone, will have its Radius a mean Proportional between the Side of the Cone and the Radius of the Base. For since $\sqrt{ra}$ is such a mean Proportional between a and r ; if you suppose that to be the Radius of the Circle required, its Diameter will be $2\sqrt{ra}$ and its Periphery $2\sqrt{ra}e$; and by multiplying the Periphery $2\sqrt{ra}e$ into $\frac{1}{2}\sqrt{ra}$, the half Radius, the Area will be rea , the very same with that of the Surface of the Cone.

Q. E. D.

The Surface of a right Cone may be easily had by having the Radius of the Circle of the Base; for as that Radius is to its Periphery, so will the Radii of the other Circles up to the Vertex be to their respective Peripheries. But all those Radii are the Elements of a right Angle Triangle, whose Altitude and Base are given, and consequently its Area is known: Wherefore as any one Radius to its Periphery, so will the Area of the Triangle, which is the Sum of all, be to the Sum or Aggregate of all the Peripheries, *i. e.* to the whole Conick Surface, which therefore will be known.

Conick Surface, is the Convex Surface of a Cone without its Base, and this is formed by the Motion of a right Line fix'd in a Point above and below moved round the Periphery of a Circle. CON.

CONJUGATE Diameters, in respect of one another in the Ellipsis, are such as are parallel to Tangents meeting the Curve in each others Vertices.

Conjugate Sections. See *Sectiones sequentes*.

CONSERVATOR, is a delegated Umpire, or standing Arbitrator, which as a third impartial Friend, was chose and appointed to compose and adjust all Differences that should arise between two other Parties. Dr. Kennet's Glossar.

CONSISTORY, is the Court Christian, or Spiritual Court. This was held formerly in the Name of the Cathedral Church, or in some Chapel, Isle, or Portico belonging to it, in which the Bishop presided, and had some of his Clergy for Assessors and Assistants: But this Consistory Court is now, half by the Bishop's Chancellor or Commissary, and by Archdeacons or their Officials.

CONSTITUENT Particles of any Natural Body, are those small Particles of which it is compos'd. See *Particles*.

CONSTITUM, in the Civil Law, is a Promise for a Debt upon a Nude Covenant, without Stipulation.

CONSTRUCTION of Equation, an easy way of constructing Cubic and Biquadratic Equations without the Parabola, communicated by the Ingenious J. P. M. A.

In order to this Method of Construction, I consider each Side of the Equation, as the Product of two Multipliers, the one of two Dimensions, the other of one, (each Term in a Cubick Equation being supposed of three Dimensions.) E. G. In this Equation $x^3 + px^2 = n$; I consider it as in this Form $x^2 \times x + p = n = b^2 \times c$, (b being taken at pleasure for any Number whose Square is less than n divided by b^2 gives c .) Or else in this Form, $x^2 + px \times x = n = b^2 \times c$; either of which Forms may be made use of, as seems less for Construction. And because x is yet unknown, and must be taken by guess, I put z instead of x the Multiplier of two Dimensions, and y for x in the other of one Dimension; and then the former Equation will stand thus $z z \times y + p = b^2 \times c$; or (the other way,) $z z + p z \times y = b^2 \times c$. In both which Forms, the given Quantity $b^2 \times c = n$, is the same as in the first Equation, and consequently the Result or Value of the other Terms is the same also.

The Design then, of this Method is, by taking a Number or Line by guess (suppose z) to represent x in one of the Multipliers of the given Equation, to find another Number or Line (y) which shall represent x in the other Multiplier; and then if z and y be not equal, to bring them by Tryals to Equality, which in most Cases, is easily done, observing their Difference and the Nature of the Scheme or Figure.

Before I give Examples, I will premise this Lemma, which shews the Ground and Demonstration of this way of Construction.

Let ABD , be a Semi-circle on the Diameter AD , AB and AZ , two Subtenses drawn at pleasure from the end of the Diameter A , from B and Z are drawn the infinite Lines BC and ZS perpen-

Fig. 1.

dicular to AD , BC intersecting it in m , and ZS in n ; from A draw the Line AS intersecting BC in R , and ZS in S ; I say, that $ABq : AZq :: mR : nS$.

For (by the Nature of a Circle) $DA \times mA = ABq$, and $DA \times nA = AZq$; then $DA \times mA : DA \times nA :: mA : nA :: mR : nS$; that is, $ABq : AZq :: mR : nS$.

Multiply the extreme and middle Terms, and 'tis $ABq \times nS = AZq \times mR$; if therefore we suppose $AB = b$, $nS = c$, $AZ = z$, to the Square Root of the Multiplier of two Dimensions (in a Cubick Equation reduc'd into the Form above directed) then will mR be equal to the other Multiplier of one Division. So in the first Form above, ($z z \times y + p = b^2 \times c$) if $AZ = z$, then is $mR = y + p$, and in the Second Form $z z + p z \times y = b^2 \times c$, if $AZ = \sqrt{z z + p z}$, then is $mR = y$, and if $y = z$, then $z = x$ in the given Equation.

Example I.

Suppose I would construct this Cubick Equation $x^3 - 4x^2 = 72$, or $x^3 - px^2 = n$. I take 16, as a convenient Square Number, (which I call bb) and therewith I divide 72; the Quotient

Quotient is $4\frac{1}{2}$ which I call c , [$\frac{n}{b} = c$, and $b b c = n = 72$] I deduce also the other Side of the Equation into two Multipliers (as above) and then 'tis $z z \times 4 - p = 72 = 16 \times 4\frac{1}{2}$, which is the first Form of Construction.

I describe a Semicircle ABD , (See Fig. 1.) of a convenient bigness for my Scale of equal Parts, (which here, for this Figure, is of 24 in an Inch, 10 of which parts make an Unite or 1.) and having drawn the Diameter AD , I take 4 (Units or large Divisions) off the Scale, and draw the Chord $AB = 4 = b$; from B I draw the infinite Line BC , perpendicular to AD , and intersecting it in m .

I take $4\frac{1}{2}$ ($=c$) off the Scale, and set that Distance with the Compasses from m to C , and thro' C I draw CS parallel to AD .

For the first Tryal I consider that the Root x must be bigger than 4 or p , (else the Negative Term $-4xx$, would take away more than xxx , and so the given Quantity would be Negative;) therefore taking 4 ($=p$) from the Scale, with Center A , and Radius $Ap = 4$, I describe the little Arch Pp ; and then (at a venture) draw the Chord $Az (=z)$ intersecting the Arch Pp in p ; so is $Ap = p = 4$, and the Line $p z = z = p$ or $z = 4$. From z I draw ZS perpendicular to CS , and intersecting it in S , and then the Line AS intersecting MC in r . So is $Mr = y - 4$, or $y - p$, (the other Multiplier in the Equation) which being greater than the Line $p z$ (to which it should be equal, it shews that z was taken too little.

After the same manner I try another z , which the view of the Scheme will now direct me to limit, till I find AZ , which Answers the demand. For making $AZ = z$, then is $PZ (=z - 4) = MR (=y - 4)$ consequently $Z = y = x$, z taking from the Scale, is equal to 6, the Root sought.

The same Conclusion would follow if I had inverted the Order of proceeding, and had begun with Mr , and thereby found Az (in a first tryal,) for in this Case I must have taken a Line for y (by guess) and made $mr = y - p$, and then having drawn AS intersecting mc in r , and CS in S . Also SZ parallel to BC , touching the Semicircle in z , I draw Az which will be equal to z ; so is the Line $p z = z - p$, which ought to be equal to mr ; but not being so, another Trial must be made.

EXAMPLE II.

Suppose I would find the Root of this Equation $xxx - 3xx + 2x = 24$. or $xxx - p2x + qqx = n$. I take for bb , 9. by which dividing 24, it gives $C = 2\frac{2}{3}$, and then I put the Equation into this Form $zz - pz + qq \times y - bb \times C$.

In the Semicircle ABD I draw the Chord $AB = b = 3$. BC perpendicular to AD . $mc = C = 2\frac{2}{3}$. CS parallel to AD .

Fig. 2.

I find $\sqrt{zz - pz + qq}$ by Fig. 3, where $AP = p = 3$, and is bisected in C . $PQ = q = \sqrt{2} = 1.4$. Pd is perpendicular to PA , Az , AZ ,

Fig. 3.

$\odot c$. are Lines taken by guess for z . zd , ZD , $\odot c$. are Arches of Circles drawn with Centre C and Radius Cz , CZ , &c. So are Pd , PD , &c. $\sqrt{zz}$

$\sqrt{zz - pz}$, and $dQ, DQ, \&c. = \sqrt{zz - pz + qq}$
 (For continuing the Arch ZD (for Instance) to C
 in the Diameter; $ZA (= PZ) = z$. $PZ = z$
 $- p$. Therefore $PD (= \sqrt{PZ \times PZ}) =$
 $\sqrt{z \times z - p} = \sqrt{zz - pz}$. And PQ being
 $= q$. $DQq. (= DPq + PQq) = zz - pz$
 $+ qq$. therefore $DQ = \sqrt{zz - pz + qq}$.)

Having found $dQ = \sqrt{zz - pz + qq}$; I
 draw Az (See Fig. 2.) $= dQ$, and then (as in
 the former Example) find $mr = y$, which being
 much less than z (or Az , Fig. 3.) I find that I have
 err'd in my Supposition of z . And considering that
 (See Fig. 3.) the bigger Az is, the bigger will dQ
 be also, and consequently mr the less; I try again
 with a lesser z , and at last find, that making AZ
 (Fig. 3.) $= z$, DQ will be $\sqrt{zz - pz + pq}$, to
 which I make AZ (Fig. 2.) equal, and thereby
 find $mr = y = z$, which is therefore the Root,
 and the Scale shews the Number to be $6 = x$.

For another Example, may be propos'd the
 doubling of the Cube; that is, having the Root
 or Side of a Cube given, to find another Line
 whose Cube shall be double the former Cube.
 In this Case, let AB (Fig. 1.) be the Side of the
 given Cube; $mc = 2AB$, $Az = z$, the sought
 Root taken by guess, by which finding mr (as
 above) if $mr = Az$, then is Az the Root of the
 double Cube sought; else another Trial must be
 made

$ABQ : Azq :: mr : nS = mc = 2AB$ theref.
 $2AB \times ABq = 2AB$, cub. $= Azq \times mr =$
 Az cub. (when $Az = mr$.)

Several things might be added conducing to a
 more ready determining of the Root sought;
 which any one who shall think fit to make trial,
 may himself observe and make use of.

By something alike Method may Biquadratick
 Equations be constructed also, and if the lowest
 Term be wanting, as easily as a Cubick. Of
 which I'll here give you an Instance. Suppose this
 Biquadratick Equation $x^4 + px^3 + qx^2 = n$.
 I divide n by a less Square Number, suppose b^2 the
 Quotient I call CC , $\frac{n}{b^2} = CC$, then $n = b^2 CC$.
 I divide also the other Side of the Equation in-

to two Multipliers, viz. $x^2 \times 2x^2 + px + qq =$
 $b^2 \times C^2$, whence $x \times \sqrt{x^2 + px + qq} = b \times C$.
 Or, Substituting y and z for x (as I do in Cubes)
 while x is unknown) $q \times \sqrt{zz + pz + qq} =$
 $b \times C$. I take z by guess, and therewith find
 $\sqrt{zz + pz + qq}$ (as is done in the Second Ex-
 ample of Cubick Equations.) In a convenient Se-
 micircle ABD , I apply the Chord $AB = b$, and
 producing it, make $AC = c$, [but if b be greater
 than c , I make $AB = c$ and $AC = b$.] Thorough
 C I draw ZCP perpendicular to AD , and apply-
 ing $AZ = \sqrt{zz + pz + qq}$, so is the inter-
 cepted Chord $AY = y$, and if $y = z$, then is ei-
 ther equal to x , the Root sought. Else Trial must
 be made with another x .

I might have taken the Biquadratick Root of n ,
 and then $b - c$, to which the Diameter AD must
 have been equal; the Demonstration depends on
 this, that $AY \times AZ = AB \times AC$, which I thus
 prove, (having drawn AK to the Intersection of

ZP with the Semicircle) $ABq : AKq :: (An : AP ::) AB : AC :: AB \times AC = AKq$. By
 a like Reason $AYq : AK :: (AM : AP ::) AT$
 $: AZ :: AY \times AZ = AKq = AB \times AC$.

The same Method will hold for compleat Biqua-
 draticks, but will be too operose.

See Mr. Halley's Construction of Cubicks and
 Biquadraticks, in *Phil. Trans.* N^o. 188, 190. As
 also Bernoulli's Animadversions on the Cartesian
 Geometry, in the *Act. Erud. Lip.* 1. for June 1688.
 And his *True Geometrical Construction of Solid,*
and more than Solid Problems by Right Lines and
Circles only, for the Month of Sept. 1689.

Dr. Gregory, in his Preface to his Excellent Ox-
 ford Euclid in G. L. shews that all Quadratick E-
 quations may be constructed from the 58 and 59
 of Euclides Data.

CONTRARY Flexion and Retrogression of
 Curves, when a Curve Line as AFK (Vid. Hay's
 Fluxions, pag. 153.)

CONTRARY Legg'd Hyperbola, is an Hyper-
 bola, so called by Sir Isaac Newton, because its
 Legs are convex towards contrary Parts, and run
 contrary ways. See Curves.

CONTRASTE, is a French Term used in Paint-
 ing and Sculpture, and signifies the due placing of
 the different Objects and Parts of the Figures;
 and produces that Variety which is so pleasing in
 the Attitudes, as if in a Groupe of three Figures,
 one stand out forward, the other backward, and
 the third appear to the middle between them, they
 say,

say 'tis well *Contrasted*: So they say also, that to render the Attitudes of Figures agreeable and just, they must be natural and active, varied in their Actions, and *Contrasted* in their Members: So that for Figures to be well *Contrasted*, is for them to be lively, and to express the Motion proper to the Design of the whole piece, or of any particular *Groupe*.

CONVERGING Hyperbola, is one whose Concave Legs bend in towards one another, and run both the same way. See *Curves*.

Converging Series, is a Method of Approximation still nearer and nearer towards the true Root of any Number or Equation, even tho' it be impossible to find any such true Roots in Numbers. See *Approximation and Square Roots in Vol. I.*

COPPERAS. The way of making *Copperas* is as follows; *Copperas* Stones, which some call Gold Stones, are found on the Sea-shore in *Essex*, *Hampshire*, and so *Westward*. There are great Quantities in the Cliffs, but not so good as those on the Shore, where the *Tides* Ebb and Flow over them.

The best of them are of a bright shining Silver Colour; the next, such as are of a Rusty deep Yellow; the worst are such as have Gravel and Dirt in them, of a sadder Umber Colour.

In the midst of these Stones are sometimes found the shells of Cockles, and other small Shell-Fishes; small pieces of the Planks of Ships, and pieces of Sea-coal.

In order to the making of *Copperas*, they make Beds according as the Ground will permit; those at *Deptford* are about 100 Foot long, and 15 Foot broad at the Top, and 12 Foot deep, shelving all the way to the Bottom.

They ram the Bed very well, first with strong Clay, and then with the Rubbish of Chalk, whereby the Liquor which drains out of the Dissolution of the Stones, is convey'd into a Wooden Shallow Trough, laid in the middle of the Bed, and covered with a Board; being also boarded on all sides, and laid lower at one End than the other, whereby the Liquor is convey'd into a Cistern under the Boiling-House.

When the Beds are indifferently well dried, they lay on the Stones about two Foot thick.

These Stones will be five or six Years before they yield any considerable Quantity of Liquor; and before that, the Liquor which they yield is but weak.

They ripen by the Sun and Rain; yet Experience proves, that watering the Stones, although with Water prepared by lying in the Sun, and poured thro' very small holes of a Watering-pot, doth retard the Work.

In time, these Stones turn into a kind of Vitriolick Earth, which would swell and ferment like Leavened Dough.

When the Bed is come to Perfection, then once in four Years they refresh it, by laying new Stones on the Top.

When they make a new Bed, they take a good Quantity of the old fermented Earth, and mingle it with new Stones, whereby the Work is hastned. Thus the old Earth never becomes useless.

The Cistern before-mentioned, is made of strong Oaken Boards, well joined and calked. That at *Deptford* will contain 700 Tun of Liquor. Great care is taken, that the Liquor doth not drain thro' the Beds, or out of the Cistern. The best way to prevent the same, is to divide the Cistern

in the middle, by Oaken Boards calked as before; whereby one of them may be mended in case of a Defect.

The more Rain falls, the more but the weaker will be the Liquor: The goodness whereof is tried by Weights prepared for that purpose. Fourteen-penny Weight is rich; or an Egg being put into the Liquor, the higher it swims above the Liquor, the stronger it is. Sometimes the Egg will swim near half above the Liquor.

Within one Minute after an Egg is put in, the ambient Liquor will boil and froth; and in three Minutes the Shell will be quite worn off.

A drop of this Liquor falling on the Manufactures of Hemp, Flax, or Cotton Wooll, will presently burn a hole thro' it. As also in Woollen and Leather.

Out of the aforesaid Cistern, the Liquor is pumped into a Boiler of Lead, about 8 Foot Square, containing about 12 Tuns, which is thus ordered. First, they lay long Pieces of Cast Iron, 12 Inches Square, as long as the Breadth of the Boiler, about 12 Inches one from another, and 24 Inches above the Surface of the Fire. Then Cross-wise they lay ordinary flat Iron Bars as close as they can lie, the Sides being made up with Brick-work. In the middle of the Bottom of this Boiler is laid a Trough of Lead, wherein they put at first 100 Pound Weight of old Iron.

The Fuel for boiling is *New-Castle* Coals. By degrees, in the boiling, they put in more Iron, amounting in all to 1500 pound Weight in a boiling. As the Liquor wastes in boiling, they pump in fresh Liquor into the Boiler: Whereby, and by a Defect in ordering the Fire, they were wont to be above 20 Days before it was enough; when that is, they try, by taking up a small Quantity of Liquor into a shallow Earthen Pan, and observing how soon it will gather and crust about the Sides thereof. But now of late, by the Ingenious Contrivance of Sir *Nicholas Crisp*, the Work is much facilitated. For at his Work at *Deptford*, they boil off three Boilers of ordinary Liquor in one Week; which is done, first by ordering the Furnace so, as that the heat is convey'd to all Parts of the Bottom and Sides of the Furnace.

Then, whereas they were wont to pump cold Liquor into the Boiler to supply the waste in boiling, whereby the Boiler was checked sometimes 10 Hours. Sir *Nicholas* hath now a Vessel of Lead, which he calls a Heater, placed at the end of the Boiler, and a little higher, supported by Bars of Iron as before, and fill'd with Liquor, which, by a Conveyance of Heat from the Furnace, is kept near Boiling-hot; and so continually supplies the waste of the Boiler, without hindring the boiling. Thirdly, by putting due Proportions of Iron from time to time, in the Boiler; as soon as they perceive the Liquor to boil slowly, they put in more Iron, which will soon quicken it. Besides, if they do not continually supply the boiling Liquor with Iron, the *Copperas* will gather to the Bottom of the Boiler and melt it; and so it will do if the Liquor be not presently drawn off from the Boiler into a Cooler, so soon as it is enough.

The Cooler is oblong, 20 Foot long, 9 Foot over at the top, 5 Foot deep, taper'd towards the Bottom, made of Terras. Into this they let the Liquor run so soon as it is boil'd enough. The *Copperas* herein will be gathering or shooting 14 or 15 Days, and gathers as much on the sides

as in the Bottom; *sc.* above 5 Inches thick. Some put Bushes into the Cooler, about which the Copperas will gather: But at *Deptford* they make no use of any.

That which sticks to the Sides and to the Bushes, is of a bright Green; that in the Bottom, of a foul and dirty Colour.

In the end of 14 Days, they convey the Liquor into another Cooler, and reserve it to be boil'd again with new Liquor.

The Copperas they shovel on a Floor adjoining: So that the Liquor may drain from it into a Cooler.

The Steam, which comes from the boiling, is of an Acrimonious smell.

Copperas may be boiled without Iron, but with Difficulty; without it, the Boiler will be in danger of melting.

Sometimes in stirring the Earth upon the Beds, they find pieces of Copperas produc'd by lying in the Sun.

CORBETT, in Architecture, is a short piece of Timber placed in a Wall, with its end sticking out 6 or 8 Inches, as occasion serves. The under Part of the end thus sticking out, is sometimes cut into the Form of a *Boultin*, sometimes of an *O--G--*, and sometimes of a *Face*, &c. according to the Workman's Fancy; the upper Side being plain and flat. These *Corbets* are usually placed for Strength's Sake, immediately under the Semigirders of a Plat-form, and sometimes under the Ends of *Camber Beams*; in which latter Case they are commonly placed a Foot or two below the Beam, and have a piece of Timber standing upright, close to the Wall, from the *Corbet* to the Beam.

Corbets, also is a Term used by some Architects, for the hollow Nicks in Walls, which are left for Images or Figures, or Statues to stand in.

CORNAGE, in our Law signifies a kind of grand Sergeantry; the Service of which Tenure is to blow a Horn, when an Invasion of a *Northern* Enemy is perceived: And by this many hold Land in the *Northern* Parts about the Wall, *i. e.* the old *Picts* Wall.

CORNEA *Tunica*. The Figure of it is of a greater Convexity than the rest of the Globe of the Eye; and it consists of several Laminæ, which are nourished by so small Blood Vessels, as to obstruct very little of the Light; 'tis of a very exquisite Sense, that on any light touch, the Tears may be squeez'd out of the Lachrymal Glands, to wash it and clean it.

CORONA, in Anatomy, is that Edge of the Glans of the *Penis*, where the *Preputium* begins.

CORONARE *Filios*, The ancient Villains were forbidden *Coronare Filios*, that is, to let their Sons receive their first *Preparatory Tonsure*, or to begin to be ordained Priests; because after that they are Freemen, and can be by their Lords no longer claimed as Servants in Villenage.

CORPORA *Pyramidalia*, when the Blood hath discharg'd it self of the Seed into the Testicles, it returns by the Veins, which rising in several Branches from the *Testes*, tend towards the *Abdomen* in the Production of the *Peritoneum*, the same way the Arteries came down. In their Progress, their Branches frequently inosculate and divide again, till they come near the *Abdomen*, and then they all unite in one Trunk; and therefore because of their Shape are called *Corpora Pyramidalia*.

CORPORAL of a Ship, is an Officer that hath the Charge of setting the Watches and Centries, and relieving them; and who sees that all the Soldiers and Sailors keep their Arms neat and clean; he teaches them also how to use them, and hath a Mate under him.

CORPUSCLES. The admirable Sir *Isaac Newton* shews a way of guessing with great accuracy, at the Sizes of the component Corpuscles or Particles of which Bodies are constituted, in the second Book of his *Opticks*, pag. 3. See more of this under the Word *Colour* and *Particles*.

CORSNED, in the *Saxon*, is *Ordeal Bread*, *Panis Conjuratus*: For the *Saxons* had a Superstitious way of purging themselves of an Accusation, by taking a piece of Bread and eating it with solemn Oaths and Execrations, that it might prove their Poison, &c. if they were guilty; which way of speaking is retain'd in some Places to this Day, especially in *Kent*.

CORVUS, was a Machine invented by the *Romans*, in the time of their Conquests of *Sicily*, when they first engag'd the *Carthaginian* Fleet, and was framed (as *Polybius* describes it, *Lib. 1.*) after this manner.

On the *Prow* of their Ships they erected a round piece of Timber about 1½ Foot in Diameter, and 12 Feet in Length, on the top of which was a Block or Pulley; round this piece of Timber was a Plat-form of Boards 4 Feet in Length, and about 18 Foot long, well framed and fastned with Iron: The Entrance was long ways, and it was moveable round the aforesaid upright piece of Timber, and could also be hoisted up and down within 6 Foot of the top; about this Frame was a sort of Parapet Knee high, which was defended with upright Bars of Iron, sharp at the Ends, and towards the top there was a Ring, by the help of which and a Pulley or Tackle, it was hoisted and lowered at Pleasure: With this moveable Gallery they Boarded the Enemies Ships (when they did not lie Side by Side) sometimes on their Bow, and sometimes in the after Part of the Ship; the Soldiers keeping the Bos of their Bucklers level with the top of the Parapet, &c. and by the Means of this new Engine, got the Day of the *Carthaginians*, in their first Sea Fight with them, tho' the Enemy were long before well skill'd in Naval Affairs, and the *Romans* perfectly raw and unskill'd.

COTLAND, is Land held by a Cottager, whether in Soccage or Villenage.

COUCH, is a Term in Painting, signifying the ground Bed, or Basis on which any Colour lies; and is distinguish'd from the *Field*, which is always *Horizontal* and upon the *Flat*; whereas the *Couch* may be upright or vertical, and in any other Position.

COVING-Cornish, in Architecture, is such a Cornish that hath a great Casement or Hollow in it, which is commonly lathed and plaistred upon Compass Sprockets or Brackets; also when Houses are built projecting out over the Ground-Plot, and then turn'd with a Semi-arch of Timber, which is lathed and plaistred, they call that *Coving-Work*.

COURT-*Christian*, or Ecclesiastical, is so call'd in Opposition to the Civil Court, or Lay Court, or *Curia Domini Regis*: These Courts of Christianity were not only held by the Bishops in Synods, and the Arch-Deacons and Chancellors in Consistories: But they were also the Rural Chapters where the Rural

Rural Dean or Dean of Christianity presided, and the Clergy were Assessors and Assistants. Dr. Kennet's Glossary.

CRASIN-Mill; See *Craze-Mill*.

CRAYONS, are Pencils of several Colours made purposely to paint withal: They are chiefly used in Portraits; and Pictures done after this way of Painting, are said to be done with *Crayons*.

CRAZE-Mill, or *Crazing Mill*, is a Mill (in all respects like a Grist Mill to Grind Corn) and is so call'd by the Tin Miners, who use it to Grind their Tin, which is yet too great, after Trampling; and then 'tis Trampled only; See *Tin*.

CRIMEN Ambitus, is getting into Publick Offices by Bribing with Money or other Gifts, or by Canvassing with Intreaties; as the Civilians Define it.

Crimen Falsi, in the Civil Law, is a fraudulent Suppression or Imitation of Truth to the Prejudice of another; so that the Commission of this Crime consists in three points, *Corruption of Truth, Deceit, and Damage* to another.

Crimen fraudatæ ennona, is the abusing Markets by raising the Price of Victuals unreasonably, by Forestalling, Monopolizing, &c.

Crimen Peculatus, (a *Pecore*, Cattle, in which Riches consisted before the use of Money) in the Civil Law, is the Crime of Stealing the Publick Treasure, or Cheating in the publick Accounts. And much of the same Nature is what they call,

Crimen Residui, which is applying the publick Money to other Uses and Purposes than those the Government orders and appoints, or else not applying to any Use at all.

CROOTES, is a Substance found about the Oar in the Lead Mines in *Mendip*, being a mealy, white, soft Stone matted with Oar.

CROSS-Multiplication, is a Kind of Multiplication much used by Workmen in measuring their Work; and 'tis so call'd because they multiply across, Feet by Inches, &c.

As suppose it were required to multiply 5 Foot, 3 Inches and 6 Parts, or $\frac{3}{4}$ of an Inch, by 2 Foot, 4 Inches and 6 Parts. They set the Number down thus:

F. In. Pa.

5 : 3 : 6

2 : 4 : 6

Then say, twice 5 Feet is 10 Feet, which they write down first of all, as you see under Feet.

Twice 3 Inches is 6 Inches — : 6 : :

Twice 6 Parts is 1 whole Inch — : 1 : :

Then working with 4, 4 times 5 Feet is 20 Inches. } 1 : 8 : :

Four times 3 Inches give 12 Primes, or one Inch. } — : 1 : :

Four times 6 Parts or Primes give 24 Seconds or 12th of the 12th of an Inch, which makes two Twelfths. } — : : 2 :

Six times 5 Feet gives 30 Inches — : 2 : 6 :

Six times 3 Inches is 18 Parts — : : 1 : 6 Seco.

Six times 6 Parts produce 36 thirds or 12ths of a Second, which makes } — : : : 3 Seco.

12 : 6 : 9 : 9

Vol. II,

And this Method they are very fond of (tho' it be very absurd in Reality; for to multiply Inches by Feet, &c. i. e. a thing of one Name or Denomination by another, is Nonsense;) and I believe they generally use it because of its Dispatch.

CROSS-Staff. The Description and Use of this Instrument is as follows:

The *Staff* is usually above 3 Foot long, having 4 Sides square to one another about $\frac{1}{2}$ an Inch over; and each is graduated like a Line of Tangents, and to every Side belongs a peculiar Cross-piece. The *Staff* may be divided either by a Table of Natural Tangents, or Geometrically by the Divisions in the Quadrant of a Circle. Then the Half of the Cross-piece being supposed Radius, the Graduation on the *Staff* will be the Natural Co-Tangents of the half Arches.

The Uses of this Instrument are, to take the Altitude of the Sun, or of a Star; to take the Distance between two Stars, or of any Star from the Moon, &c. and 'tis us'd by some to take Distances by Land.

To observe the Altitude of the Sun or Stars.

There are four Crosses belonging to the *Staff*, one called the *Ten-cross*, which belongs to that Side where the Graduation begins 3 deg. and ends with 10 deg. another called the *Thirty-cross*, belonging to that Side of the *Staff* where the Divisions begin with 10, and end with 30 deg. The Third is the *Sixty-cross*, which belongs to that Side where the Degrees begin at 20, and end at 60 deg. And the last is called the *Ninety-cross*, belonging to that Side where the Graduations begin at 30, and end at 90 deg.

Now, according as you can guess the Sun's Altitude to be, you must use the proper Cross: If the Altitude be under 10 deg. use the *Ten-cross*; if under 30, use the *Thirty-cross*; if under 60, the *Sixty-cross*; but if above that, use the *Ninety-cross*.

And the Way of observing is thus: Having fitted on your proper Cross, place the flat End of the *Staff* to the Outside of your Eye, and as near to your Eye as you can: Then look at the Sun, or Star, with the upper End of the Cross, and at the Horizon with the lower End, moving or sliding the Cross to and fro till you can do this exactly; for then the Degrees and Minutes cut by the inner Edge of the Cross, on the proper Side of the *Staff* for that Cross, will give you the present Altitude of the Sun or Star.

Unless it be hazy and thick Weather, the Observation can hardly be made without Prejudice to the Eye: To prevent which, some put a coloured Glass on the Top of the Cross; and then they observe the upper Limb of the Sun, and subtract his Semidiameter from the Altitude.

There is a Way also of making a backward Observation of the Sun's Altitude with the *Cross-Staff*, as thus: Fix a Horizontal Vane on the Eye-End of the *Staff*, and a Shoe of Brass to the End of any of the Four Crosses; which will serve instead of a Sight Vane. Having done this, and fitted the Cross on upon the *Staff*, turn your Back to the Sun, and looking through the Slit in the Brass Shoe, lift up or down the End of the *Staff*, till the Shadow made by the upper End of the Cross fall on the Slit in the Horizon Vane, and that likewise at the same time you can see the Horizon through

the Horizontal Vane at the End of the Staff; then will the Degrees cut on the proper Side of the Staff, be the Sun's Altitude required.

To observe the Distance between Two Stars, or the Moon's Distance from a Star.

Place the flat End of the Staff to the Edge, as in the First Observation, and looking to both Ends of the Cross, draw it to and fro, till the Ends will cut the Two Stars, or one the Moon, and the other the Star; then will the Cross cut the Distance between those Objects on the proper Side of the Staff.

Because there may be a Mistake in placing the Staff to the Eye, take this Rule to know when it is right: Put the Sixty-cross on 30 Degrees on its proper Side of the Staff, and likewise the Ninety-cross on 30 Degrees on its outside; and then when, by moving the Staff higher or lower, you have placed it so, that you can see the upper End of the Two Crosses in one and the same right Line, and the Two lower Ends in another, the Staff is placed right.

CROWNS of Colours, are certain coloured Rings which like *Halo's* appear, but of the Colours of the Rainbow, and at a less Distance than the common *Halo's*, about the Body of the Sun or Moon. These Sir *Isaac Newton*, in his *Opt. Book 2: p. 4.* shews to be made by the Suns shining in a fair Day, or the Moon in a clear Night, through a thin Cloud of Globules of Water or Hail, all of the same bigness: And according as the Globules are bigger or lesser, the Diameters of these Crowns, or Rings, will be larger or smaller; and the more equal these Globules are to one another, the more Crowns of Colours will appear, and the Colours will be the more lively.

CROWN-Post, is a Post which in some Buildings stands upright in the middle, between two principal Rafters; and from it there go *Strutts* or *Braces* to the middle of each Rafter. This is also by some called the *King-piece*, and the *Foggle-piece*.

CRUCIFORM Hyperbola, is a Curve by that Name; which is so called by Sir *Isaac Newton*, because it cuts its *Conjugate* cross-wise.

CRYPTOGRAPHY, called also *Steganography*, is the Art of secret Writing: On which Subject many Books have been publish'd; as, by the Abbot *Trithemius*, in his *Steganographia*, *Francf. 1608. 4to.* by *Gustavus Selenus*, in 9 Books in *Fol.* printed at *Luneburgh*, 1624. *cum Fig.* by *Schottus*, in his *Schola Steganographica*. Bishop *Wilkin's Secret and Swift Messenger*.

CUBICAL Paraboloid. See *Paraboloid* and *Curves*.

CUL-PRIT, are Words used by the Clerk of the Arraignments, when a Person is indicted for a Criminal Matter. For after the Indictment is read in Court (which is the Crown's Charge) against the Prisoner at the Bar, he is put upon his Plea, or asked, *Art thou Guilty, or not Guilty?* If he pleads or answers, *not Guilty*, there is next a Replication from the Crown, by continuing the Charge of Guilt upon him, according to the Tenour of the Indictment; which is express'd by pronouncing the Words *Cul-Prit*: *Cul* being an Abbreviation of the Latin Word *Culpabilis*, *Guilty*; and *Prit*, or *Prit*, (now *Pret*) is the old French Word for *Ready*. From these two Assertions therefore of the Clerk of the Arraignment, that

the Prisoner is *Culp*, or *guilty* of the Crime charged on him, and that the Crown is *Prit* or *ready* to prove it upon him; this Word *Cul-Prit* is derived.

And that this is the true Explanation of the Terms *Cul-Prit*, is evident from the Form of the Entry of the Record of the Trial when drawn up at large; which, as to the Replication pronounced by the Clerk, as aforesaid, in the Words *Cul* and *Prit*, run thus: *Et Prædictus A. (the Clerk) pro Domina Regina dicit, Quod Prædict. B. (the Prisoner) est Culpabilis, &c. Et hoc paratus est verificare, &c.*

CULVERTAIL, the same with *Dovetail*; which see.

CUNEUS. The *Wedge*, one of the five Mechanical Powers, is in the Form of a *Prism*, whose Top and Sides are Parallelograms, but its Ends *Isoceles Triangles*; whose Altitude is called the *Altitude of the Wedge*, as the Base of each said Triangle is the *Thicknes of the Wedge*. The right Line connecting the *Vertices* of the Two Triangles, is called the *Edge*; as the Parallelogram which joins their Bases, is called its *Dorsum*, or *Back*.

The Power of this Engine is easily estimated; and is (when directly applied to the *Top* or *Dorsum* of the Wedge) to the Resistance to be overcome, as the Thickness of the Wedge is to its Altitude. In the Figure, *BA* is the way of Power, and *CD* the way of the Impediment or Resistance: So that while the Wedge is driven down into the Wood, &c. by its whole Altitude, the Wood is divided by the entire Thickness of the Wedge, and this every where proportionably, as follows from the Nature of a Triangular Figure. Wherefore a Wedge, whose Thickness is to its Altitude or Length in a little greater Proportion, than as the Power applied is to the Resistance or Tenacity of the Wood, will cleave or divide it.

CUNETTE, See *Cuvette*.

CUPULO, in Architecture is an Arched Room or Turret standing on the very Top of a *Dome* or great Building, in Form either Circular or Polygonal; some call it a *Lantern*.

CURATOR, in the Civil Law, is a Person regularly appointed to take care of another; as suppose of a Minor, by his Consent from 24 Years of Age, to 35; on the Determination of a Trial at Law, where the Magistrate may appoint a *Curator* for the Minor. The Magistrate also might appoint a *Curator* for a Madman, a Prodigal, Deaf or Dumb Person, as also for the Estates of Debtors, and of Persons dying without Heirs.

CURIA, a Word used formerly in different Senses. Sometimes it signified the Persons or Feudatory Tenants, who did their Suit and Service at the Court of the Lord.

Some-

Sometimes it signified a House, as *Curia Canonicorum*, the Convent or Conventional House. *Curia Persona Ecclesie*, the Parsonage House. And sometimes it was used for the Service it self, of coming to the Court of the Lord; *Curia adventus*. Dr. Kennet.

CURRENTS, are certain Progressive Motions of the Water of the Sea in several Places, either quite down to the Bottom, or to a certain determinate Depth; by which a Ship may happen to be carried forward more swiftly, or retarded in her Course, according to the *Direction* or *Setting* of the Current in, with, or against the Course or Way of the Ship.

The first thing therefore to be known, is, *which way* the Current sets; and if its Motion be swift, great and strong, this will be best discovered by keeping an exact Account of the Ship's Way both outward and homeward, according to the best Method of what the Seamen call their *Dead Reckoning*, being very curious in observing the way the Ship makes by the Log-line; for 'tis not the correct Account, but the *Dead Reckoning*, that must here assist you. Therefore you must be very careful to observe how the Ship goes by it, when you Sail near the *Meridian*; how she is drawn from her Course: As also, when she is steered directly *East* and *West*, take good Notice whether she alter her Latitude.

As for those *Guesses*, by the *Ripplings* of the Water, and by the driving of Froth, &c. along Shore, when you are in sight of it, they will be of little use. But the most usual and the most useful way of observing the setting of a Current is thus:

When there is a smooth Sea, and not much Wind, heave out the Boat, with three or four Hands in her, together with a Compass, a Log-line, and Half-minute Glas, with also a Line or small *Warp* of about an Hundred Fathoms long; to the End of which Line fasten a Triangular Piece of Board, as *a b c*, and to one of the Angles fasten

a good heavy Piece of Lead to sink it. Some use instead of this Board a Kettle tied by the Bail, (which may do tolerably well).

When you are off from the Ship, cast over your Board or Kettle, letting it sink at least 60 Fathom; and if you have Line enough, let it down 100 or 120 Fathom: Then belaying the Line fast about her Stern, it will bring her up, and make her ride as if she

were at an Anchor. Then cast over your Log, turn up the Glas, and as you veer out the Log-line, set the Drift of the Log with your Compass: So shall you know whether there be any Current or no; and if any, how it sets; as also the Rate of its driving. Only remember to add always to the Drift, if the Line she ride be of 60 Fathom, $\frac{1}{4}$ Part; if of 80 Fathom, $\frac{1}{5}$; if of 100 Fathom, the $\frac{1}{6}$ Part, &c. of the Drift more, for the Drift of the Boat; for though the Boat may seem to ride or lie still, yet she is found by Experience to drive at the same Time.

N. B. Whether these Allowances be the *very Truth*, or not, I cannot say: They are said to agree with Experience, and therefore may be us'd till Better Observations of these things may be made.

Only this is certain, That the bigger the Board and Weight is that the Boat is to ride by, the less will be her Drift. Sir J. Moor's *Navig.*

If a Current set exactly with the same Direction, as is the Course of the Ship, then it must augment her Motion forward in Proportion to the Velocity of the Drift.

As if a Ship sail N. N. E. 20 Miles, in a Current setting the same way, and in the same time 8 Miles, her true Course will be N. N. E. 28 Miles in the same time.

But if the Current set directly against the Ship's Course, it will abate of her Motion forward in Proportion to the Velocity of the Drift.

As if a Ship sail N. E. 49 Miles in a Current, setting S. W. 10 Miles in the same time; the Ship's Course or Distance run in that time will be but 39 Miles. So if a Ship sail N. E. 49 Miles in a certain time, in a Current that sets S. W. 59 Miles in the same time; her true Course will be S. W. 10 Miles; that is, she will fall astern 10 Miles in that time.

But if a Ship sail a-cross any Current, her Motion will be compounded with that of the Current; and her Velocity augmented, or retarded proportionably to the Angle of her Direction, with that of the Direction of the Current; according as she goes in Part with it or against it.

As suppose the Ship's Course were from *a* to *c*, and the setting of the Current from *a* to *b*; the Ship will, by the Composition of those two Moti-

ons be carried from *a* to *d* in the Diagonal *a d*. See *Composition of Motion*.

Wherefore if a Ship sails N. E. 110 Miles, in a Current which sets S. W. 30 Miles in the same time, and her true Course and Distance sailed be requir'd, you may proceed thus:

1st. Geometrically.

1. Set off 4 Points from N. towards E. and draw A C equal to 110 Miles.

2. From C draw C B, parallel to the Line N. N. E. and equal to 30 Miles.

3. Draw A B, which will be the Ship's true Course; to find which

Trigonometrically,

In the Triangle A B C, there is

Given $\begin{cases} A C 110 \\ 7 \text{ at } C 22 30 \\ B C 30 \end{cases}$

and it will be by *Ca'e* 4. Sect. 4.

$A + CBC : AC - BC :: t, \frac{1}{2} \angle A + B : t, \frac{1}{2} \angle B - A, i. e.$
 As the Sum of $A C$ and $B C$ 140 2.1461280

To their Difference 80 4.9030900
 So is the Tangent of $78^{\circ} 45'$ 10.7013382

To the Tangent of $70^{\circ} 49'$ 10.4583002

Now $78^{\circ} 45' - 70^{\circ} 49' = 7^{\circ} 56' = \angle C A B$.
 Hence it appears that her true Course is N E
 $7^{\circ} 56'$ Easterly.

But for her Distance it will be by Case 1. Sect. 4.
 $s, \angle A : B C :: s, \angle C : A B. i. e.$

As the Sine of the Angle at $A 7^{\circ}, 56'$ 9.1399445

To the Drift of the Current $B C$ 30 1.4771212

So is the Sine of the Angle at $C 22^{\circ} 30'$ 9.5828397

To the Distance run 83, 2 Miles 1.9200164

Ex. 2. If a Ship from the Latitude $36^{\circ} 30' S$
 Sails N E b N 40 Miles, then N E b E 36 Miles,
 in a Current that sets S S E 20 Miles in the time
 that the Ship sails 38 Miles, and it be required to
 find the direct Course and Distance between the
 Ship and her first Place, as also the Latitude the
 Ship is in.

1st. Having constructed it, as in the former.

In the Triangle $A C B$, are

Given $\begin{cases} AC 40 \\ \angle at C 56^{\circ}, 15' \\ BC 21, 05 \end{cases}$ To find $A B$, and the
 Angles at A and B .

It will be, by Case the 4th of Sect. the 4th.
 $AC + BC : AC - BC :: t, \frac{1}{2} \angle A + \angle B : t, \frac{1}{2} \angle B$
 $= \angle A; i. e.$

As the Sum of $A C$ and $B C$ 61, 05 1.7856857

To their Difference 18, 95 1.2776092

So is the Tangent of $61^{\circ}, 52'$ 10.2720432

To the Tangent of $30^{\circ}, 08'$ 9.7639667

Now, $61^{\circ}, 52' - 30^{\circ}, 08' = 31^{\circ}, 44' =$
 $\angle C A B$; therefore the Ship's first Course is N. E.
 by E. $9^{\circ}, 14'$, Eastwardly.

For the Distance, it will be, by Case the 1st of
 Sect. the 4th,

$s, \angle C A B : C B :: s, \angle A C B : A B$; that is,
 As the Sine of the $\angle C A B 31^{\circ}, 44'$ 9.7209581

To $C B$ the Drift of the Current 21, 05 1.3232521

So is the Sine of the $\angle$ at $C 56^{\circ}, 15'$ 9.9198464

To the Distance run, 33, 28. 1.5221404

2. In the Triangle $B D G$, are given

$\begin{cases} B D 36 \\ \angle at D 78^{\circ}, 45' \\ D G 18, 95 \end{cases}$ To find $B D$ and the $\angle s D B G$
 and $D G B$.

Wherefore,
 As the Sum of $B D$ and $D G$ 54, 95 1.7399677

To their Difference 17, 05 1.2317244
 So is the Tangent of $50^{\circ}, 37'$ 10.0856980

To the Tangent of $20^{\circ}, 42'$ 9.5774547

Hence the Angle $D B G$, will be found $29^{\circ},$
 $55'$; wherefore the Ship's second Course is E. by
 N. $7^{\circ}, 25'$. Eastwardly, and consequently the An-
 gle $A B G = 159^{\circ}, 19'$.

But for $B G$, the Distance run, it will be
 As the Sine of the Ang. $B D G 29^{\circ}, 55'$ 9.6978747

To $D G$ the Drift of the Current, 18, 95 1.2776092

So is the Sine of the Angle $B D G 29^{\circ}, 55'$ 9.9915739

To $B G$ the Distance run, 37, 27 1.5713090

3. In the Triangle $A B G$, are

$\begin{cases} A B 33, 28 \\ \angle A B G 159^{\circ}, 19' \\ B G 37, 27 \end{cases}$ Whence must be
 found $\angle B A G$ and
 $A G$, and it will be,

As the Sum of $A B$ and $B G$ 70, 55 10.8484970

To their Difference 3, 99 0.6009729

So is the Tangent of $10^{\circ}, 20'$ 9.2612203

To the Tangent of $00^{\circ}, 36'$ 8.0136962

Hence the Angle $B A G$ is $10^{\circ}, 56'$, and conse-
 quently the bearing of the Ship from her first Port
 is E. by N. $2^{\circ}, 20'$. Northerly; and for the Di-
 stance it will be,

As the Sine of the Angle $B A G 10^{\circ}, 56'$ 9.2789911

To the Distance run $B G$ 37, 27 1.5713090

So is the Sine of the $\angle A B G 159^{\circ}, 19'$ 9.5480240

To the Distance between the Ship and } 1.8403419
 her Port 69, 24

Now for the Difference of Latitude, it will be
 as the Radius 10.0000000

To the Distance sail'd, 69, 24 1.2403571

So is the Co-Sine of the Course, $76^{\circ}, 25'$ 9.3708079

To the Difference of Latitude 16, 26 1.2111650

Hence, because she sail'd from a } Nly
 South Latitude

From the Latitude she sail'd from $36^{\circ}, 30'$ Sly

Take the Difference of Lat. made $16^{\circ}, 26'$ Nly

Remains the Lat. the Ship is in $36^{\circ}, 13\frac{1}{2}'$ Sly

Admit a Ship, from a certain Head-line, in the
 Latitude of $34^{\circ}, 00'$. North, sails S. E. by S. 24
 Miles in 6 Hours, in a Current that sets between
 the North and the East; and then the Cape is
 found to bear W. N. W. and the Ship to be in the
 Lat. of $33^{\circ}, 45'$. North. I demand the Setting
 and Drift of the Current?

Geometrically.

1. Set off 3 Points from *S* towards *E*, and draw the Line *AB* equal to 24 Miles.

2. Set off two Points from *E* towards *S*, and draw the Line *AC*.
 3. At the Distance of 15 Miles, equal to the Difference of Latitude, draw a parallel to *AE*, till it intersect *AC* as in *C*.
 4. From the Intersection *C*, draw *CD* parallel to *AS*; also the Line *BC* the Drift and Setting of the Current.

To find which *Arithmetically*.

In the Triangle *ADC*, Right-angled at *D*, are

Given $\begin{cases} DC \ 15 \\ \angle A \ 22^\circ, 30' \end{cases}$ to find *AC*

Wherefore $S \angle A : DC :: R : AC$; that is,

As the Sine of the Angle at *A* $22^\circ, 30'$ 9.5828397

To the Difference of Latitude 15 1.1760912
 So is the Radius 10.0000000

To the Distance run 39, 2 1.5932515

Again, In the Triangle *ABC*, are

Given $\begin{cases} AB \ 24 \\ \angle A \ 33^\circ, 45' \\ AC \ 39, 2 \end{cases}$ to find $\begin{cases} \angle C \\ BC \\ \angle B \end{cases}$

Wherefore,

$$\overline{AB + AC} : \overline{AC - AB} :: t_{\frac{1}{2}} \angle B + \angle C : t_{\frac{1}{2}} \angle B - \angle C$$

As the Sum of the Sides $\begin{cases} AB \text{ and } AC \end{cases}$ 1.8007171
 $63^\circ, 2'$

To their Difference $15^\circ, 2'$ 1.1818436
 So is the Tangent of $73^\circ, 07\frac{1}{2}'$ 10.5180608

To the Tangent of $38^\circ, 24\frac{1}{2}'$ 9.8991873

Which added to $73^\circ, 07\frac{1}{2}'$, gives $111^\circ, 32'$. the Angle at *B*. And hence the Current will be found to set *E*. by *N. 00^\circ*; $58'$ Northerly.

For *BC*, the Drift of the Current, it will be,

$$s, \angle B : AC :: s, \angle A : BC; \text{ that is,}$$

As the Sine of the Ang. at *B* $111^\circ, 32'$ 9.9685783

To *AC* the Distance run $39^\circ, 2'$ 1.5932515

So is the Sine of the Ang. at *A* $33^\circ, 45'$ 9.7447390

To *BC* the Drift of the Current in 6 } 13694122
 Hours, $23^\circ, 41'$

And consequently it sets at the Rate of $3^\circ, 9'$ Miles an Hour.

Several other Questions might be propos'd relating to Currents, but these being thoroughly understood, are sufficient for the Purpose.

CURSOR, is a Piece or little Ruler or Label of Brass being divided like a Line of Sines, and sliding in a Groove or Notch along the middle of another Label or Ruler, representing the Horizon, and always at Right Angles to it: 'Tis used in the *Analemma*, which see.

CURVATURE of a Line, is the peculiar manner of its bending or Flexure, whereby it becomes a Curve of such peculiar Properties. Thus the Curvature of the Circle is such, that all Points of the Periphery are equally distant from one Point within, call'd the Centre. The Curvatures of different Circles are to one another reciprocally as their Radii.

CURVE, generating the Solid of least Resistance, See *Solid*.

CURVES. The incomparable Sir Isaac Newton gives this following Enumeration of Geometrical Lines of the Third or Cubick Order; in which you have an admirable account of many Species of Curves which exceed the Conick-Sections, for they go no higher than the Quadratick or Second Order.

The Orders of Geometrick Lines.

1. **GEOMETRICK-LINES**, are best distinguish'd into *Classes*, *Genders* or *Orders*, according to the Number of the Dimensions of an Equation, expressing the relation between the *Ordinates* and the *Abscisse*; or which is much at one, according to the Number of Points in which they may be cut to a Right Line. Wherefore, a Line of the First Order will be only a Right Line: Those of the Second or Quadratick Order, will be the Circle and the Conick-Sections; and those of the Third or Cubick Order, will be the Cubical and *Nelian Parabola's*, the *Cissoïd* of the Antients, and the rest as below enumerated. But a Curve of the First Gender (because a Right Line can't be reckoned among the Curves) is the same with a Line of the Second Order; and a Curve of the Second Gender, the same with a Line of the Third Order; and a Line of an Infinitesimal Order, is that which a Right Line may cut in infinite Points, as the *Spiral*, *Cycloid*, the *Quadratrix*, and every Line generated by the infinite Revolutions of a Radius or Rota.

2. The chief Properties of the *Conick-Sections* are every where treated of by Geometers; and of the same Nature are the Properties of the Curves of the Second Gender, and of the rest, as from the following Enumeration of their Principal Properties will appear.

3. For if any right and parallel Lines be drawn and terminated on both Sides by one and the same Conick Section; and a Right Line bisecting any two

two of them shall bisect all the rest; and therefore such a Line is called the Diameter of the Figure; and all the Right Lines so bisected, are called *Ordinate Applicates* to that Diameter, and the Point of Concourse to all the Diameters is called the *Centre* of the Figure; as the Intersection of the Curve and of the Diameter, is called the *Vertex*, and that Diameter the *Axis* to which the Ordinates are *Normally* applied. And so in Curves of the *Second Gender*, if any two right and parallel Lines are drawn occurring to the Curves in three Points; a right Line which shall so cut those Parallels, that the Sum of two Parts terminated at the Curve on one Side of the intersecting Line, shall be equal to the third Part terminated at the Curve on the other Side; this Line shall cut, after the same manner, all others parallel to these, and occurring to the Curve in three Points; that is, shall so cut them, that the Sum of the two Parts on one Side of it, shall be equal to the third Part on the other.

And therefore these three Parts, one of which is thus every where equal to the Sum of the other two, may be called *Ordinate Applicates* also: And the intersecting Line to which the Ordinates are applied, may be called the *Diameter*; the Intersection of the Diameter and the Curve, may be called the *Vertex*, and the Point of Concourse of any two Diameters, the *Centre*.

And if the Diameter be Normal to the Ordinates, it may be called the *Axis*; and that Point where all the Diameters terminate, the *General Centre*.

Asymptotes and their Properties.

4. The Hyperbola of the first Gender has two *Asymptotes*, that of the second, three; that of the third, four; and it can have no more, and so of the rest. And as the Parts of any Right Line lying between the *Conical Hyperbola* and its two *Asymptotes* are every where equal; so in the Hyperbola of the Second Gender, if any Right Line be drawn, cutting both the Curve and its three *Asymptotes* in three Points, the Sum of the two Parts of that Right Line being drawn the same way from any two *Asymptotes* to two Points of the Curve, will be equal to the third Part drawn a contrary way from the third *Asymptote*, to a third Point of the Curve.

Latera Transversa & Recta.

5. And as in *Non Parabolick Conick Sections*, the Square of the Ordinate Applicate, that is, the Rectangle under the Ordinates, drawn at contrary Sides of the Diameter, is to the Rectangle of the Parts of the Diameter, which are terminated at the Vertex's of the *Ellipsis* or *Hyperbola*, as a certain given Line, which is called the *Latus Rectum*, is to that Part of the Diameter which lies between the Vertex's, and is called the *Latus Transversum*: So in *Non Parabolick Curves* of the second Gender, a Parallelopiped under the three Ordinate Applicates, is to a Parallelopiped, under the Parts of the Diameter terminated at the Ordinates, and the three Vertex's of the Figure in a certain given Ratio; in which Ratio, if you take three Right Lines to the three Parts of a Diameter situated between the Vertex's of the Figure, one answering to another; then these three Right Lines may be called the *Latera Recta* of the Figure, and the Parts of the Diameter between the *Vertices*, the *Latera Transversa*. And as in the Conick

Parabola, having to one and the same Diameter but one only Vertex, the Rectangle under the Ordinates is equal to that under the Part of the Diameter cut off between the Ordinates and the Vertex, and a certain Line called the *Latus Rectum*: So in the Curves of the second Gender, which have but two Vertex's to the same Diameter; the Parallelopiped under three Ordinates, is equal to the Parallelopiped under the two Parts of the Diameter cut off between the Ordinates and those two Vertexes, and a given Right Line, which therefore may be called the *Latus Rectum*.

The Ratio of the Rectangles under the Segments of Parallels.

Lastly, As in the Conick Sections when two Parallels terminated on each side at the Curve, are cut by two other Parallels terminated on each side by the Curve, the first being cut by the third, and the second by the fourth; as here the Rectangle under the Parts of the first, is to the Rectangle under the Parts of the third; as the Rectangle under the Parts of the second, is to that under the Parts of the Fourth: So when four such Right Lines occur to a Curve of the second Gender, each one in three Points; then shall the Parallelopiped under the Parts of the first Right Line, be to that under the Parts of the third; and as the Parallelopiped under the Parts of the second Line, unto that under the Parts of the Fourth.

Hyperbolick and Parabolick Legs.

All the Legs of Curves of the second and higher Genders, as well as of the first, infinitely drawn out, will be of the *Hyperbolick* or *Parabolick* Gender; and I call that an *Hyperbolick Leg*, which infinitely approaches to some *Asymptote*; and that a *Parabolick* one, which hath no *Asymptote*. And these Legs are best known from the Tangents: For if the Point of Contact be at an infinite Distance, the Tangent of an *Hyperbolick Leg* will coincide with the *Asymptote*, and the Tangent of a *Parabolick Leg* will recede *in infinitum*, will vanish and no where be found. Wherefore the *Asymptote* of any Leg is found, by seeking the Tangent to that Leg at a Point infinitely distant: And the *Course*, *Place* or *Way* of an infinite Leg, is found by seeking the Position of any Right Line, which is parallel to the Tangent where the Point of Contact goes off *in infinitum*: For this Right Line is directed towards the same way with the infinite Leg.

The Reduction of all Curves of the second Gender, to four Cases of Equations.

CASE I.

All Lines of the first, third, fifth and seventh Order, and so of any one, proceeding in the Order of the odd Numbers, have at least two Legs or Sides proceeding on *ad infinitum*, and towards contrary ways. And all Lines of the third Order have two such Legs or Sides running out contrary ways, and towards which no other of their infinite Legs (except in the *Cartesian Parabola*) do tend. If the Legs are of the *Hyperbolick* Gender, let *GAS* be their *Asymptote*; and to it let the parallel *CBc* be drawn, terminated (if possible) at both Ends at the Curve. Let this parallel be bisected

sected in X ; and then will the Place of that Point

Fig. 1.

X be the *Conical Hyperbola* $X\phi$, one of whose Asymptotes is AS : Let its other Asymptote be AB ; then the Equation by which the Relation between the Ordinate BC and the Abscissa AB is determined, if AB be put $=x$ and $BC=y$, will always be in this Form, $xyy + ey = ax^3 + bxx + cx + d$, where the Terms e, a, b, c , and d , denote given Quantities, affected with their Signs $+$ and $-$; of which any one may be wanting, so the Figure, through their Defect, don't turn into a Conick Section. And this Conical Hyperbola may coincide with its Asymptotes, that is, the Point X may come to be in the Line AB , and then the Term $+ey$ will be wanting.

CASE II.

9. But if the Right Line CBc cannot be terminated both ways at the Curve, but will occur to the Curve only in one Point, then draw any Line in a given Position, which shall cut the Asymptote AS in A ; as also any other Right Line, as BC , parallel to the Asymptote, and meeting the Curve in the Point C : And then the Equation by which the Relation between the Ordinate BC and the Abscissa AB is determined, will always put on this Form, $xy = ax^3 + bxx + cx + d$.

CASE III.

10. But if the opposite Legs are of the Parabolick Gender, draw the Right Line CBc , terminated at both Ends, if it's possible, at the Curve; and running according to the Course of the Legs, which bisect in B : Then shall the Place of B be a Right Line. Let that Right Line be AB , terminated at any given Point, as A ; and then the Equation by which the Relation between the Ordinate BC and the Abscissa AB is determined, will always be in this Form, $yy = ax^3 + bxx + cx + d$.

CASE IV.

11. But if the Right Line CBc meet the Curve but in one Point, and therefore can't be terminated at the Curve at both Ends; let the Point where it occurs to the Curve be C ; and let that Right Line at the Point B , fall on any other Right Line given in Position, as AB , and terminated at any given Point, as A : Then will the Equation, by which

Vol. II.

2

the Relation between the Ordinate BC and the Abscissa AB is determined, always be in this Form, $yy = ax^3 + bxx + cx + d$.

The Names of the Forms.

12. In the Enumeration of Curves of these Cases, we call that an *Inscribed Hyperbola*, which lies entirely within the Angle of the Asymptotes, like the *Conical Hyperbola*; and that a *Circumscribed* one, which cuts the Asymptotes, and contains the Parts cut off within its own proper Space; and that an *Ambigenial* one, which hath one of its infinite Legs inscribing it, and the other circumscribing it. I call that a *Converging* one, whose concave Legs bend inwards towards one another, and turn both the same way; but that I call a *Diverging* one, whose Legs turn their Convexities towards each other, and tend towards quite contrary ways. I call that *Hyperbola contrary leg'd*, whose Legs are Convex towards contrary Parts, and run infinitely on towards contrary ways; and that a *Conchoidal* one, which is applied to its Asymptote with its Concave Vertex and diverging Legs; and that an *Anguineal or Eel-like* one, which cuts its Asymptote with contrary Flexions, and is produced both ways into contrary Legs. I call that a *Cruciform or Cross-like* one, which cuts its Conjugate crosswise; and that *Nodate*, which by returning round into, decussates it self. I call that *Cuspidate*, whose two Parts meet and terminate in the Angle of Contact; and that *Punctate*, whose Oval Conjugate is infinitely small, or a Point: And that Hyperbola I call *Pure*, which, by the Impossibility of its two Roots, is without any Oval Node, Spike or Conjugate Point. And in the same Sense I denominate a Parabola also, to be *Converging*, *Diverging*, *contrary leg'd*, *Cruciform*, *Nodate*, *Cuspidate*, *Punctate* and *Pure*.

Of the redundant Hyperbola and its Asymptotes.

13. In the first Case, if the Term ax^3 be Affirmative, then the Figure will be a tripple Hyperbola with six Hyperbolical Legs, which will run on infinitely by the three Asymptotes, of which none are parallel, two Legs towards each Asymptote, and towards contrary Parts; and these Asymptotes, if the Term bxx be not wanting in the Equation, will mutually intersect each other in three Points, forming thereby the Triangle $Dd\delta$. But if the Term bxx (see Fig. 1.) be wanting, they will all converge to the same Point. In the former Case take $AD = \frac{b}{2a}$, and $Ad = A\delta = \frac{b}{2\sqrt{d}}$, and

Fig. 4^c.

A 2

join

join Dd , $D\delta$; so shall AD , Dd , and $D\delta$, be the three Assymptotes. In the latter Case, draw any Ordinate, as BC , in which, both ways produced, take, on each Side, BF and Bf equal to one another, and in the same Ratio with AB that $\sqrt{a}$ hath to 1 ; and then joining AF , Af ; AB , AF , and Af , shall be three Assymptotes. And this kind of Hyperbola I call *redundant*, because it exceeds the Conick Sections in the Number of its Hyperbolick Legs.

Of the Diameter of this Hyperbola, and the Position of its infinite Legs.

14. In every redundant Hyperbola, if neither the Term ey be wanting, nor $bb - 4ac$ equal to $+ae\sqrt{a}$, the Curve will have no Diameter; but if either of those happen, it will have *one only* Diameter, and *three* if they both happen. And the Diameter will always pass through the Intersection of two of the Assymptotes, and bisect all Right Lines which are terminated each way by those Assymptotes, and which are parallel to the third Assymptote: And the Abscissa AB will be the Diameter of the Figure, as often as the Term ey is wanting. I take the Word *Diameter* here, and in the following Pages, *Absolutely*; and in the common Acceptation of it, *viz.* for an Abscissa which hath every where two equal Ordinates, one on each Side, insisting at the same Point.

Nine redundant Hyperbola's, having no Diameter, but three Assymptotes, which form a Triangle.

15. If the redundant Hyperbola have no Diameter, let the four Roots or Values of x in this Equation $ax^4 + bx^3 + cxx + dx + \frac{1}{4}ee = 0$, be sought: And suppose them to be AP , $A\pi$, $A\tau$, and Ap . Let the Ordinates PT , $\pi\tau$, $\tau\tau$, and pt , be erected, and those shall touch the Curve in the Points T , τ , τ , and t , and by that Contact shall give the Limits of the Curve, by which its Species will be discovered.

For if all the Roots AP , $A\pi$, $A\tau$, Ap , (see Fig. 1.) are real, having the same Sign, and are unequal; the Curve consists of three Hyperbola's,

Fig. 2.

(an *Inscribed*, a *Circumscribed*, and an *Ambigenial* one) with an *Oval*: And one of the Hyperbola's will lie towards D , another towards d , and the third towards δ ; and the Oval will always lie within the Triangle $Dd\delta$, and also within the

middle Limits τ and τ , where it will be touch'd by the Ordinates $\pi\tau$ and $\pi\tau$. And this is the *First Species*.

But if either the two greatest Roots, $A\pi$, Ap ; or the two least, AP , $A\pi$, are equal to one ano-

Fig. 3.

Fig. 4.

ther, and have the same Sign with the other two; then the *Oval* and *Circumscribed Hyperbola* will join with one another, the Points of Contact τ and t , or T and τ , co-inciding; and the Legs of the Hyperbola decussating one another, will be continued, in the *Oval*, and make the *Nodate Figure*. The *Second Species*;

If the three greatest of the Roots, Ap , $A\pi$, $A\tau$; or the three least, AP , $A\pi$, AP , are equal

Fig. 5.

Fig.

Fig. 6.

to one another, the *Nodus* will be turned into a very sharp *Cuspis*; for the two Legs of the circumscribed Hyperbola's will then concur in the Angle of Contact, and not be produced further. And this is the *Third Species*.

If the two middle Roots $A\pi$ and $A\tau$ are equal, the Points of Contact τ and γ will be coincident;

Fig. 7.

wherefore the *Oval* will vanish into a Point, and the Figure will consist of three Hyperbola's, an *Inscribed*, a *Circumscribed*, and an *Ambigenial* one, with a *Conjugate Point*: Which makes a *Fourth Species*.

If two of the Roots are impossible, and the other two unequal, and of the same Sign, (for they

(See Fig. 7.)

Fig. 8.

Fig. 13.

Fig. 14.

can't have contrary Signs); there will be three pure Hyperbola's, without any *Oval*, *Node*, *Cusp*, or *Point Conjugate*; and these Hyperbola's will either lie at the Sides or the Angles of the Triangle made by the Asymptotes: Which makes a *Fifth* or *Sixth Species*.

If two of the Roots are equal, and the other two either impossible or real, with Signs contra-

Fig. 9.

Fig. 10.

Fig. 15.

Fig. 16.

ry to those of the equal Roots; the *Cruciform* Figure will be produced: For two of the Hyperboal's will decussate one another; and that either at the Vertex of the Triangle made by the Assymptotes, or at its Base; and these two are the *Seventh* and *Eighth Species*.

Lastly, If all the Roots are impossible, or if they are all real and unequal, and two of them are Affirmative and two Negative; then there will be two Hyperbola's at the opposite Angles of the two Assymptotes, with an *Anguineal* or *Serpentine Hyperbola* about the third Assymptote. Which is the *Ninth Species*.

Fig. 11.

Fig. 12.

And these are all the possible Cases of the Roots; for if any two Roots are equal to one another, and the other two are equal also, the Figure will become a *Conick Section* with a *Right Line*.

Twelve redundant Hyperbola's with one only Diameter.

16. If the redundant Hyperbola have one only Diameter, let it be the Abscissa *AB*; and in the Equation $ax^3 + bxx + cx + d = 0$, seek the three Values of x , or the three Roots. Then,

If those Roots are all real, and have the same Sign, the Figure shall consist of an *Oval* lying

Fig. 17.

within

within the Triangle $D d \delta$, and of three Hyperbola's as its Angles, viz. one circumscribed at the Angle D , and the other two inscribed at d and δ ; and this makes a *Tenth Species*.

If the two great Roots are equal, and the third of the same Sign with them, the Legs of

Fig. 18.

the Hyperbola lying towards D , will decussate one another in the Form of a *Node*, by reason of the Contact of the *Oval*. Which is the *Eleventh Species*.

If the three Roots are equal, the Hyperbola be-

Fig. 19.

comes *Cuspidate*, without any *Oval*. Which is the *Twelfth Species*.

If the two least Roots are equal, and the third of the same Sign with them, then the *Oval* va-

Fig. 20.

nishes into a Point. Which makes a *Thirteenth Species*.

In the four last *Species*, the Hyperbola lying towards D contains its *Asymptote* within it; but the other two are themselves contained within the *Asymptotes*.

If two of the Roots are impossible, then there will be three pure Hyperbola's, without any *Oval*, (See Fig. 20.)

Fig. 21.

Fig. 22.

Fig. 23.

Decussation, or *Cuspis*. And there are four Cases of this *Species*, viz. a *Fourteenth*, if the circumscribed Hyperbola lie towards D , and a *Fifteenth*, if the inscribed Hyperbola lie towards D , a *Sixteenth*, if the circumscribed Hyperbola lie under the Base $D \delta$ of the Triangle $D d \delta$, and a *Seventeenth*, when the inscribed Hyperbola lies under the same Base.

If two Roots are equal, and the third of a different Sign from them, the Figure will be *Cruciform*; for two of the three Hyperbola's will decussate one another, either at the Vertex, or at the Base of the Triangle made by the *Asymptotes*.

Which two Species are the Eighteenth and Nineteenth.

Fig. 24.

Fig. 25.

If two Roots are unequal, and of the same Sign, and the Third be of a different one, there will be two Hyperbola's in the opposite Angles of

Fig. 26.

...of the Triangle D A τ, and a second branch when the intended Hyperbola lies under the same base. If two Roots are equal, and the third of a different Sign from them, the Figure will be Conchoidal; for two of the three Hyperbola's will decay into one another, either at the Vertex, or at the Base of the Triangle made by the Asymptotes. Which

Fig. 27.

the two Asymptotes, with an intermediate Conchoidal one. And this Conchoidal Hyperbola will either lie on the same Side of its Asymptote that the Asymptotick Triangle doth, or contrarily: And these two Cases constitute two other Species, which are the Twentieth and Twenty first.

Two redundant Hyperbola's with three Diameters.

17. The redundant Hyperbola which hath three Diameters, consists of three Hyperbola's lying within the Asymptotes, and that either at the Sides,

Fig. 28.

Fig. 29.

or at the Angle of the Asymptotick Triangle. The former Case makes the Twenty Second, this Latter the Twenty Third Species.

Nine redundant Hyperbola's with three Assymptotes, converging towards one common Point.

18. If the three Assymptotes do intersect one another in one common Point, the 5th and 6th Species will be changed into a *Twenty Fourth*, the Seventh

Fig. 30.

Fig. 31.

Fig. 32.

Fig. 33.

and Eighth into a *Twenty Fifth*, and the Ninth into a *Twenty Sixth* Species, where the *Anguinal* doth not pass through the Concourse of the Assymptote, and into a *Twenty Seventh*, where it doth so; in which Case the Terms *b* and *d* are wanting, and the Concourse of the Assymptotes is the Centre of the Figure, equally distant from all its opposite Parts. And these four Species have no Diameter.

The Fourteenth and Sixteenth Species may be changed also into a *Twenty Eighth* Species, and the Fifteenth and Seventeenth into a *Twenty Ninth*.

Fig. 34.

Fig. 35.

Fig.

Fig. 36.

Fig. 37.

The Eighteenth and Nineteenth into a *Thirtieth*, and the Twentieth and Twenty First into a *Thirty First*. And all these Species have but one only Diameter. And finally, the Twenty Second and Twenty Third Species, may be changed into a *Thirty Second*, which hath three Diameters passing through the Point of Concourse of the Assymptotes.

Fig. 38.

All which Changes will be easily understood, if you suppose the Assymptotick Triangle to be diminished till it vanish into a Point.

Six deficient Hyperbola's, having no Diameter.

19. If, in the first Case of the Equations, the Term ax^3 be Negative, the Figure will be a deficient Hyperbola, having one only Assymptote, and only two Hyperbolick Legs running out infinitely towards the Side of the Assymptote, but quite contrary ways; and this Assymptote is the first and principal Ordinate AG . If the Term ey be not wanting, the Figure will have no Diameter; but if it be wanting, it will have but one: In the former Case the Species are thus enumerated:

If all the Roots $A\pi$, AP , Ap , $A\varpi$, of this Equation $ax^4 = bx^3 + cx^2 + dx + \frac{1}{4}ee$, be real and unequal, the Figure will be an *Angui-*

Fig. 39.

neal Hyperbola approaching towards the common Assymptote by a contrary Flexion, and with a Conjugate Oval. Which makes the *Thirty Third Species*.

If the two middle Roots AP and Ap be equal one to another, then the *Oval* and the *Anguineal*

Fig. 40.

will be joined, decussating one another in the Form of a *Node*. And this is the *Thirty Fourth Species*.

If three of the Roots are equal, the *Node* will be changed into a most *Acute Cuspis* in the Ver-

Fig. 41.

tex of the *Anguineal*. And this constitutes a *Thirty Fifth Species*.

If of the three Roots, having the same Sign, the two greatest, $A p$ and $A \tau$, are equal to one another; then the *Oval* vanishes into a Point. Which makes a *Thirty sixth Species*. (See Fig. 43.)

If any two Roots are imaginary, there will remain the *Anguineal* alone, and this *Pure*, without any *Oval*, *Decussation*, *Cuspis*, or *Conjugate Point*.

Fig. 42.

Fig. 43.

If the *Anguineal* don't pass through the Point A , it makes the *Thirty seventh Species*; but if it doth pass through A , (as it will do when the Terms b and d are wanting) then that Point will be the Centre of the Figure, bisecting all Right Lines drawn through it, and terminated both ways by the Curve. And this is a *Thirty eighth Species*.

Seven defective Hyperbola's, having a Diameter.

20. In the other Case, where the Term $e y$ is wanting, and consequently the Figure hath a Diameter, if all the Roots $A T$, $A t$, $A \tau$, of the

Fig. 45.

Equation $a x^3 + b x x + c x + d$, are real, unequal, and of the same Sign; then the Figure will be a *Conchoidal Hyperbola*, with an *Oval* on its convex Side. And this is a *Thirty ninth Species*.

If two of the Roots are equal, and of the same Sign, but the Third with a contrary Sign, the *Oval*

Fig. 44.

will lie on the Concave Side of the *Conchoidal Hyperbola*. And this makes a *Fortieth Species*.

If the two lesser Roots $A T$, $A t$, are equal, and the third $A \tau$, be of the same Sign with them,

Fig. 46.

then the *Oval* and the *Conchoidal* will be joined, decussating one another like a *Node*. Which is a *Forty first Species*.

If the three Roots are equal, the *Nodus* will be changed into a *Cuspis*, and the Figure will be the

Fig. 47.

Cifford of the Ancients. And this makes a *Forty second Species*.

If the two greater Roots are equal, and the Third of the same Sign with them, then the Con-

Fig. 49.

choidal Hyperbola, will have a *Conjugate Point* at its Convexity. Which is a *Forty third Species*.

If two of the Roots are equal, and the Third have a contrary Sign; the Conchoidal Hyperbola will then have a *Conjugate Point* at its Concavity. Which makes a *Forty fourth Species*.

If two of the Roots are impossible, there will be a pure Conchoidal without either Oval, Node,

Fig. 48.

Cusp, or *Conjugate Point*. And this is a *Forty fifth Species*. (See Fig. 49.)

Seven Parabolick Hyperbola's, having no Diameter.

21. If in the first Case of the Equations, the Term ax^3 be wanting, but the bbx be not wanting; then the Figure will be a *Parabolick Hyperbola*, having two *Hyperbolick Legs* to one *Asymptote* SAG , converging towards one and the same Sign. If the Term ey be not wanting, the Figure will have no *Diameter*; but if it be wanting, it will have one only: In the former Case the *Species* will be these.

If the three Roots AP , $A\pi$, $A\pi$, of this Equation $bx^3 + cx^2 + dx + \frac{ee}{4} = 0$, be unequal, and have the same Sign, the Figure will consist of an *Oval*, and of two other Curves, which

are partly *Hyperbolical*, and partly *Parabolical*; that is, the *Parabolick Legs*, by being continually

Fig. 50.

drawn out, are joined with the *Hyperbolical Legs* which are next to them. And this is the *Forty sixth Species*.

If the two lesser Roots are equal, and the Third of the same Sign with them; then will the *Oval*,

Fig. 51.

and one of those *Hyperbola Parabolick Curves* be joined, and intersect one another in the Form of a *Node*. Which is the *Forty seventh Species*.

If the three Roots are equal, the *Node* will turn

Fig. 52.

into a *Cusp*. Which makes a *Forty eighth Species*.

If

If the two greatest Roots are equal, and the Third hath the same Sign with them, the *Oval*

Fig. 53.

will vanish into a *Conjugate Point*. Which is the *Forty ninth Species*.

If two of the Roots are impossible, the two Hyperbola Parabolick Curves will remain pure, (See Fig. 53.)

Fig. 54.

without any *Oval*, *Decussation*, *Cusp*, or *Conjugate Point*. And this will make a *Fiftieth Species*.

If two of the Roots be equal, and the Third have a contrary Sign to them, then the Hyperbola

Fig. 55.

Parabolick Curves will be joined, decussating one another in the Form of a *Cross*. And this is the *Fifty first Species*.

If the two Roots are unequal, and of the same Sign, and the Third have a contrary Sign, the Figure will become an *Angineal Hyperbola* about the

Fig. 56.

Asymptote *AG*, together with a *Conjugate Parabola*. And this will be a *Fifty second Species*.

Four Parabolick Hyperbola's which have a *Diameter*.

22. In the other Case, where the Term *ey* is wanting, and the Figure hath a *Diameter*, if the two Roots of this Equation $bx^2 + cx + d = 0$

Fig. 57.

are impossible, there will be two Hyperbola Parabolick Figures equally distant from the *Diameter AB*, and one on one Side, and the other on the other, which will constitute a *Fifty third Species*.

If the two Roots of this Equation be impossible, the Hyperbola Parabolick Figures will join, and

Fig. 58.

intersect one another in the Form of a Cro's. And this will be a *Fifty fourth Species*.

If the Roots are equal, and have the same Sign, there will be a Conchoidal Hyperbola with a Para-

Fig. 59.

bola on the same Side of the Assymptote. And this makes a *Fifty fifth Species*.

If the Roots have contrary Signs, there will be a Conchoidal Hyperbola on one Side of the Assymp-

Fig. 60.

tote, and a Parabola on the other. And this makes a *Fifty sixth Species*.

Four Hyperbolisms of the Hyperbola.

23. Whenever in the first Case of the Equations, the Term ax^3 and bx^2 are both wanting, the Figure will be a *Hyperbolism* of some Conick Section.

I call that the *Hyperbolism* of a Figure, when the Ordinate comes out by dividing the Rectangle under the Ordinate of that Figure and a given Right Line, by the common *Abscissa*. By this means a Right Line is changed into a Conick Section, and every Conick Section into some one of those Figures which I here call the Hyperbolisms of the Conick Sections. For the Equation for the Figure, of which we now speak, viz. $xyy + ey = cx + d$, gives the Ordinate $y = \frac{e + \sqrt{ee + 4dx + 4cxx}}{2x}$; which is gene-

rated by dividing the Rectangle under the Ord. of the Conick Section, $\frac{e \times \sqrt{ee + dx + 4cxx}}{2m}$

and a given Right Line m , by the common *Abscissa* x . Whence it is plain, that the Figure pro-

duced will be the Hyperbolism of an Hyperbola, Ellipsis or Parabola, according as the Term cx is Affirmative or Negative, or quite wanting.

The Hyperbolism of an Hyperbola hath three Assymptotes, of which one is the first and principal Ordinate Ad , the other two are Parallels to the *Abscissa* AB , and equidistant from it on each Side of it.

In the principal Ordinate Ad , take Ad , As equal both ways to the Quantity $\sqrt{c}$; and thro' the Point d and s , draw dg , sy as Assymptotes, parallel to the *Abscissa* AB .

When the Term ey is not wanting, the Figure hath no Diameter. In this Case, if AP and Ap , the two Roots of the Equation $cxx + dx + \frac{ee}{4} = 0$, are real and unequal (for equal they cannot be, unless the Figure be a Conick Section;) then will the Figure consist of three Hyperbola's opposite to one another; of which, one lies be-

Fig. 61.

tween the parallel Assymptotes, and the other two without them. And this is a *Fifty seventh Species*.

If the two Roots are impossible, there will be two opposite Hyperbola's without the parallel Assymptotes, and an Hyperbolical Anguineal within them. This Figure is of two Species; for it hath

Fig. 62.

Fig. 63.

no Centre when the Term d is not wanting, but if d be wanting, the Point A is its Centre. The former of these makes a *Fifty eighth*, the latter a *Fifty ninth Species*.

But if the Term ey is wanting, the Figure will consist of three opposite Hyperbola's, of which one will lie between the parallel Affymptotes, and

Fig. 64.

the other two without, as in the 54th Species: And besides this, it will have a Diameter, which is the Abscissa AB . And this constitutes a *Sixtieth Species*.

Three Hyperbolisms of the Ellipse.

24. The Hyperbolism of an Ellipsis is determined by this Equation $xyy + ey = cx + d$; and hath only one Affymptote, which is the principal Ordinate Ad . If the Term ey be not wanting, the Figure will be an Anguineal Hyperbola without any Diameter, and even without any Centre, if the Term d be not wanting. Which makes the *Sixty first Species*.

Fig. 65.

But if the Term d be wanting, the Figure will have a Centre without any Diameter, which will

Fig. 66.

be the Point A . And this makes a *Sixty second Species*.

And if the Term ey be wanting, and not d , the Figure will be a Conchoidal Hyperbola to the

Fig. 67.

Affymptote AG , and will have a Diameter without any Centre, that is, the Abscissa AB . Which makes a *Sixty third Species*.

Two Hyperbolisms of the Parabola.

25. The Hyperbolism of a Parabola is determined by this Equation $xyy + ey = d$; and hath two Affymptotes, the Abscissa AB , and the first and principal Ordinate AG . But the Hyperbola's in this Figure are two, not lying in the opposite Angles

gles of the Assymptote, but in the contiguous or adjoining ones, and that on each Side the Abscissa

Fig. 68.

Fig. 69.

AB ; and even without any Diameter, if the Term xy be there, but with one if that be wanting. Which two Species are the Sixty fourth and Sixty fifth.

A Trident.

26 In the second Case of the Equation there is $xy = ax^3 + bx^2 + cx + d$: And the Figure in this Case will have four infinite Legs, of which

Fig. 76.

two are Hyperbola's about the Assymptote AG tending towards contrary Parts, and two converging Parabola's, and, with the former, making as

it were the Figure of a *Trident*. And this Figure is that Parabola by which *Des Cartes* constructed Equations of six Dimensions. This therefore is the Sixty sixth Species.

Five Diverging Parabola's.

27. In the third Case the Equation was $yy = ax^3 + bx^2 + cx + d$; and designs a Parabola, whose Legs diverge from one another, and run out infinitely contrary ways. The Abscissa AB is its Diameter, and its five Species are these:

If, of the Equation $ax^3 + bx^2 + cx + d = 0$, all the Roots AT , AT , At , are real and unequal; then the Figure is a diverging Parabola

Fig. 70.

Fig. 71.

of the Form of a Bell, with an Oval as its Vertex. And this makes a Sixty seventh Species.

If two of the Roots are equal, a Parabola will be formed, either *Nodated* by touching an Oval,

Fig. 72.

Fig. 73.

or *Punctate*, by having the Oval infinitely small. Which two *Species* are the *Sixty eighth* and *Sixty ninth*.

If three of the Roots are equal, the Parabola will be *Cuspidate* at the Vertex. And this is the

Fig. 75.

Neilian Parabola, commonly called *Semi-cubical*. Which makes the *Seventieth Species*.

If two of the Roots are impossible, there will

(See Fig. 73.)

Fig. 76.

be a pure Parabola of a Bell-like Form. And this makes the *Seventy first Species*.

The Cubical Parabola.

28. In the fourth Case, let the Equation be $y = ax + bxx + cx + d$; then will it denote

Fig. 77.

the *Cubical Parabola* with contrary turn'd Legs. And this makes up, or compleats the Number of the *Species* of these Curves, to be in all *Seventy two*.

Of the Genesis of Curves by Shadows.

29. If the Shadows of Figures are projected on an infinite Plane illuminated from a lucid Point, the Shadows of the Conick Sections will always be Conick Sections; those of the Curves of the Second Gender, will always be Curves of the Second Gender; and the Shadows of Curves of the Third Gender, will themselves be of the same Gender, and so on in *infinitum*. And as a Circle, by the Projection of its Shade, generates all the Conick Sections; so will the five diverging Parabola's spoken of in *ch.* 28. by their Shadows generate and exhibit all Curves of the Second Gender; and so some more simple Curves of other Genders may be found, which, by the Projection of their Shadows from a lucid Point upon a Plane, shall form all other Curves of the same Kinds.

Of the double Points of Curves.

30. I said above, that Curves of the Second Gender might be cut by a Right Line in three Points; but two of those Points are sometimes coincident. As when the Right Line passes by an Oval infinitely small, or by the Concourse of two Parts of a Curve mutually intersecting each other, or running together into a *Cuspis*. And if at any time all the Right Lines tending the same way with the infinite Leg of any Curve, do cut it in one only Point, (as happens in the Ordinate of the *Cartesian*, and in the *Cubical Parabola*, and in the Right Lines which are parallel to the Abscissa of the Hyperbolisms of Hyperbola's and Parabola's;) then you are to conceive that those Right Lines pass through two other Points of the Curve (as I may say) placed at an infinite Distance; and these two co-incident Intersections, whether they be at a finite or an infinite Distance, I call the *double Point*. And such Curves as have this *double Point*, may be described by the following Theorems.

Theorems for the Organical Description of Curves.

31. *Theor. I.* If two Angles, as PAD and PBD , whose Magnitude is given, be turned round the Poles A and B , given also in Position; and their Legs AP , BP , by their Point of Concourse

Fig. 78.

P , describe a Conick Section passing thro' their Poles A and B ; except when that Right Line happens to pass through either of the Poles A or B ; or when the Angles BAD and ABD vanish together into nothing; for in such Cases the Point will describe a Right Line.

II. If the first Legs AP , BP , by their Point of Concourse P , do describe a Conick Section passing through the Pole A ; then will the two other Legs AD , BD , by their Point of Concourse D , describe a Curve of the Second Gender, passing through the other Pole B , and having a *double Point* in the first Pole A , through which the Conick Sections, except when the Angles BAD , ABD , vanish both away together; for then the Point D will describe another Conick Section passing through the Pole A .

III. But if the Conick Section which the Point P describes, pass through neither the Pole A , nor B ; then the Point D will describe a Curve of the Second or Third Gender, having a *double Point*;

and that *double Point* will be in the Concourse of the describent Legs AD and BD , when the Angles BAP , ABP vanish together: And the Curve described, will be one of the Second Gender, if the Angles BAD , ABD vanish together, otherwise 'twill be one of the Third Kind, and then it will have two other *double Points* in the Poles A and B .

The Description of the Conick Section by five given Points.

32. A Conick Section is determined by having five of its Points given; and may be thus described by them: Let the five Points be A , B , C , D , and E ; join any three of them together, as suppose A , B and C , and form the Triangle ABC , and suppose any two of its Angles, as CAB and CBA , to revolve round their Vertices A and B ; and when C , the Intersection of the Legs AC , BC , is successively applied to the other two Points D , E , let the Intersection of the other Legs AB and BA , fall in the Point P and Q . Let also the Line PQ be drawn, and infinitely produced; and let the moveable Angles be so turned round, that the Intersection of the Legs AP and BP , may describe the Right Line PQ : And then will the Intersection of the two other Legs, C , describe the proposed Conick Section, by *Theor. I.*

The Description of Curves of the Second Gender having a double Point, by seven given Points.

33. All Curves of the Second Gender which have a *double Point*, are determined from their seven given Points, of which one is that *double Point*. And by means of those Points they may be thus described: Let there be given any seven Points of the Curve to be described, as A , B , C , D , E , F , and G , of which A is the *double Point*. Join A with any two other Points, as suppose B and C ; and then let both the Angles CAB , and also either of the other two Angles of the Triangle ABC (as the Angle ABC) revolve round the two Vertices A and B . And when the Point of Concourse C , of the Legs AC , BC , is successively applied to the four remaining Points D , E , F , and G ; let the Concourse of the two other Legs AB and BA , fall in the four Points P , Q , R , S . Through these four Points, and the fifth Point A , describe a Conick Section; and let the aforesaid Angles CAB and CBA , so revolve, that the Point of Concourse of the Legs AP , PB , may describe that Conick Section: Then shall the Point of Concourse of the other Legs AC , BC , describe the Curve proposed, by *Theor. the Second*.

If instead of the Point C , the Right Line BC be given in Position, and which shall touch the Curve to be described in B ; then the Lines AD , AP , will be coincident; and instead of the Angle DAP , there will be a Right Line revolving round the Pole A .

If the *double Point* A be infinitely distant, the Right Line will perpetually tend with a Direction towards that Point, and will be carried with a parallel Motion, while the Angle ABC revolves about the Pole B .

These Curves may also be described after another manner, by the Third Theorem; but 'tis enough to shew you the most simple way of their Description.

After

After the same Method may Curves of the Third, Fourth, and yet higher Genders, be describ'd; not at all indeed, but such as by some commodious Ratio may be describ'd by local Motion: For how commodiously, to describe some Curves of the Second or higher Genders, when they have no Common Point, is a Problem that must be reckoned amongst the more difficult ones.

The Construction of Equations by the Description of Curves.

The Use of Curves in Geometry is, that by their Intersections Problems may be solved. Let an Equation be proposed to be constructed having Nine Dimensions, as $x^9 + a x^8 + b x^7 + c x^6 + d x^5 + e x^4 + f x^3 + g x^2 + h x + k = 0$; where $b, c, d, &c.$ signify any given or known Co-efficients, affected with the Signs $+$ and $-$. Let an Equation to a Cubical Parabola $x^3 = y$ be assumed: Then will the former Equation, putting y for x^3 , stand thus, $y^3 + b x y y + c y y + d x x y + e x y + m y + f x^2 + g x x + h x + k = 0$, be an Equation to another Curve of the Second Gender, where m or f may either be wanting or assum'd at pleasure. And by the Descriptions of these Curves and their Intersections, there will be found the Roots of the Equation at first given to be constructed.

Note, 'Tis enough to describe the Cubical Parabola once.

If the Equation to be constructed, by reason of the two last Terms $h x$ and k being wanting, is depressed to seven Dimensions; the other Curve, by expunging m , will have a Double Point in the Beginning of the Abscissa, and therefore may easily be describ'd as above.

If the Equation to be constructed hath the three last Terms $g x x + h x + k$ wanting, and therefore is but of six Dimensions, the other Curve, expunging f , will become a Conick-Section.

And if the six last Terms being wanting, the Curve be reduced to three Dimensions, its Construction will fall in with Dr. Wallis's, by the Cubical Parabola and a Right Line.

Equations may also be constructed by the Hyperbolism of a Parabola with a Diameter. Suppose this Equation of nine Dimensions, and wanting its last Term save one, were to be constructed, $a + c x x + d x^3 + e x^4 + f x^5 + g x^6 + h x^7 + k x^2 + l x^9 = 0$. Let there be an Equation assumed to that Hyperbolism; thus, $x x y = 1$;

and substituting y for $\frac{1}{x x}$, the Equation to be constructed will be changed into this Form, $a y^3 + c y y + d x y y + e y + f x y + m x x y + g + h x + k x x + l x^2 = 0$, which denotes a Curve of the second Gender, by whose Description the Problem may be solved, and of the Quantities m and g , either may be wanting or assumed at pleasure.

By the Cubical Parabola and Curves of the Third Genders, all Equations may be constructed not exceeding twelve Dimensions; and by the same Parabola, and a Curve of the Fourth Gender, all Equations not exceeding fifteen Dimensions, and so on infinitely. And these Curves of the third, fourth, and superior Genders, may al-

ways be describ'd by finding their Points by plain Geometry.

As if this Equation were to be constructed, $x^{12} + a x^{10} + b x^9 + c x^8 + d x^7 + e x^6 + f x^5 + g x^4 + h x^3 + i x x + k x + l = 0$, and the Cubical Parabola be supposed to be described; let the Equation for that Cubical Parabola be $x = y^3$: Wherefore substituting y for x^3 , the Equation will put on this Form,

$$y^4 + a y y^3 + c x x y + f x x y + i x x = 0$$

$$+ b \quad + d x \quad + g x \quad + k x$$

$$+ e \quad + h \quad + l$$

Which is an Equation to a Curve of the Third Gender, by whose Description the Problem may be solved. And this Curve may be describ'd by finding its Points by plain Geometry, because the indeterminate Quantities relate not to above Two Dimensions.

In the Memoires of the French Academy of Sciences for the Year 1699, there is a Method for finding the Curves, which Bodies rising towards, or ascending from the Horizon, will describe, let the Ratio of the Time of the Descent or the Ascent, and the Acceleration or Retardation be what it will. Communicated by Mr. Varignon.

CUSPIDATED Hyperbola, is a kind of Hyperbola whose Two Parts concur and terminate in the Angle of Contact.

CUSTOMARIUS, was an inferior Tenant in Socage or Villenage, who, by Custom, is obliged to pay such and such Service of Work and Labour for his Lord. Dr. Kennet.

CUTTER of the Tallies, is an Officer in the Exchequer, that provideth Wood for the Tallies, and cuts the Sum paid upon them, and then casteth the same into the Court to be written upon.

CYCLOID. Besides the Segment of the Semi-cycloidal Space, first found quadrable by Sir Christopher Wren, and afterwards by Mr. Huygens, and also the Trilinear Part of it, which is plainly so; Dr. Wallis, in Phil. Transf. N. 217. P. 111. produces, from his Tracts de Cycloide and de Motu, some other Portions of the Cycloid which are capable of being squared. And the same Excellent Author, in N. 229. P. 561. shews, That this Figure of the Cycloid was considered long before the Time of Mersennus and Galileo, tho' not thoroughly understood 'till this present Age: For in the Math. Works of Bovillus, publish'd at several times between 1501. and 1510. the Curve which we now call the Cycloid, was then consider'd; and yet not first by Bovillus neither, for Cardinal Cusanus, as appears by an Antient Manuscript of his Works, translated by J. Scoblant in the Year 1451. had taken it into Consideration before. Indeed the Figure, both in the Manuscript, and in the Basil Edition of his Works, is ill drawn; but being corrected by the Cardinal's own Words, it plainly represents the Modern Cycloid.

In Philos. Transf. N. 94. you have a Demonstration of the Synchronism of the Vibrations made in a Cycloid; that is, of a Pendulum of a due Length, vibrating between Two Cycloids: For such a Pendulum will move in a Cycloid, and consequently its Vibrations will be Synchronal.

To investigate the Area's of Cycloidal Spaces.

Let AMC be a Vulgar Semi-cycloid, and the Generating Circle APB from any Point in the Ordinate, v. g. Q . Draw QM parallel to the Base BC , cutting the Periphery of the Circle in

P ; make the Parallelogram $AFMQ$, and draw fm infinitely near FM , cutting QM produc'd in μ , and the Curve in m . Put $AB = 2r$, $AQ = FM = x$, $\mu m = x$, $QP = y$; then (by the Property of the Circle) $2rx - xx = yy$.

Whence $rx - xx = yy$, and $y = \frac{rx - xx}{y}$:

And because the Triangles DPQ , pPO are similar, therefore $PQ(y) : Dp(r) :: PO(x)$

$Pp = \frac{rx}{y}$. Now it is the Nature of the Vulgar

Cycloid, that the Arch AP + the Right Sine of that Arch PQ are equal to QM : Therefore it is manifest, that the Fluxion of the Ordinate of the Cycloid QM , viz. MS , is equal to the Aggregate of the Fluxions of the Arch AP , and the Right Sine PQ ; that is, $ms = Pp + po$

$$po = \frac{rx - xx}{y} + \frac{rx}{y} = \frac{2rx - xx}{\sqrt{2rx - xx}}, \text{ and}$$

consequently the Rectangle $F\mu$ is equal to $FM \times$

$$M\mu = x \times \frac{2rx - xx}{\sqrt{2rx - xx}} = \frac{2rxx - xxx}{\sqrt{2rx - xx}} =$$

$\dot{x}\sqrt{2rx - xx} =$ to the Fluxion of the Area

AMF . But the Fluxion of the Portion of the Circle $APQ = \dot{x}\sqrt{2rx - xx}$; therefore the Area AMF and the corresponding Portion of the Circle APQ are always equal.

CONSECTARY I.

The Parallelogram AC is equal to the Semi-periphery $APB \times AB =$ Four times the Semi-circle $APBA$, and the Complement of the Cycloidal Space $AMCB$ to the Parallelogram, viz. $AMCX$ is equal to the Semi-circle $APBA$; therefore the Area of the Semi-cycloidal Space $AMCB$, is equal to three times the Area of the Semi-circle $APBA$.

CONSECTARY II.

The Cycloidal Space $AMCB$, is to the Circumscrib'd Parallelogram AC , as 3 is to 4.

CONSECTARY III.

The Space comprehended between the Chord AC , and the Curve AMC , is equal to the Area of the Semi-circle APB . For $AMCB$ is equal to $\frac{3}{4}$ Parallelogram AC , and the Triangle ACB is equal to $\frac{1}{4}$ Parallelogram AC ; therefore the Space $AMCA$ is equal to $\frac{3}{4}$ Parallelogram AC , which is equal to the Area of the Semi-circle APB , and the Space $AMCA$ is equal to the Space $AMCX = \frac{3}{2}$ the inscrib'd Triangle ACB .

CONSECTARY IV.

Though the Quadrature of the whole Cycloidal Space, or any indefinite Portion thereof, depends on the Quadrature of the Circle; yet an infinite Number of Segments of the Vulgar Cycloid, may be squar'd without supposing the same.

Let EAG be a Vulgar Cycloid, the Base EG , and AB the Axis, and the generating Circle APB . I say, if the Point Q be taken at pleasure in the Axis AB , and if CD be taken equal to AQ and the Ordinates DM , QN , and the Line MN connecting their Extremities be drawn, the Segment of the Cycloid $MeNM$ = Rectangle Triangle PBD + Rectangle Triangle RBQ .

Draw QAX parallel to the Base, and NQ , MK parallel to the Axis AB , and draw the Radij CP , CR .

First, If the Ordinates DM , QN be on the contrary Sides of the Axis AB , then the Segment $MeNM$ is equal to the Trapezium $MKON$ — Trilineal Figures AKM and AON . Now

the Trapezium $MKON$ is $= \frac{1}{2} MK + \frac{1}{2} NO \times KO =$ (because NO is $= AQ = CD$, and $KM = AD$) $\frac{1}{2} CA \times KO = \frac{1}{2} CA \times AK + \frac{1}{2} CA \times AO$. And by the Property of the Cycloid, $\frac{1}{2} AC \times AK$ is $= \frac{1}{2} CA \times$ Arch $AP + PD =$ Sector $ACP +$ Triangle $BCP =$ Sector ABP . In like manner it may be demonstrated, that $\frac{1}{2} CA \times AO$ is $=$ Sector ABR ; therefore the Trapezium $MKON$ is equal to Two Sectors $PBA = RBA$. But, by the known Property of the Cycloid, the Trilineal Figure AKM is equal to the Segment of the Circle ADP , and the Trilineal Figure AON is equal to the Segment AQR ; therefore if from the Trapezium $MKON$ the Trilineal Figures AKM , AON be subtracted, and if from the Sectors PBA , RBA , the Segments ADP , AQR be subtracted, there will remain the Segment of the Cycloid $MeNM$ equal to the Triangles $PDB + BRQ$.

Secondly,

Secondly, But if the Ordinates QN, DM be on the same Side of the Axis AB , then the Segment of the Cycloid $MeNM = \text{Trapezium } MKON + \text{Trilineal Figure } AON - \text{Trilineal Figure } AKM$. Now the Trapezium $MKON = \frac{1}{2} MK + \frac{1}{2} ON \times OK = \frac{1}{2} CA \times AK - \frac{1}{2} CA \times AO = \text{Sector } PBA - \text{Sector } RBA$

therefore if we substitute the Circular Segments ADP, AQR in the place of the Trilineal Spaces AKM, AON , we shall have the Cycloidal Segment $MeNM = \text{Sector } PBA - \text{Sector } RBA + \text{Segment } AQR - \text{Segment } ADP = \text{Rectangle Triangle } PDB - \text{Rectangle Triangle } R B Q$.

5. If the Points D and Q coincide, then it is manifest that BD or $BQ = \frac{1}{2} BC$, and the Chord MN is perpendicular to the Axis AB , and the Segment $MeANM$ will be equal to

an Equilateral Triangle inscrib'd in the Generating Circle, and Space $MPBAM$ will be equal to three times the Area of the Triangle CPB . Which was first discover'd by the Excellent Mr. *Hugens*.

6. But if the Point D fall in the Center, then Q will be in A , and the Segment $MeNM$ will degenerate into that which the Celebrated Mr. *Leibnitz* first squar'd, without having Recourse to the Area of the Circle. And the said Segment $MeNM$ will be equal to the Rectangular Triangle $PBD = \frac{1}{2}$ the Square of the Radius.

7. And to square an infinite Number of Sectors of the Cycloid: Assume any Point, Q , in the Axis AB ; and draw the Ordinate MQN , and take $CD = AQ$; and draw the Lines DM, DN : Then, I say, the Sector of the Cycloid $DMAND$ is equal to the Isosceles Triangle PBR . For the Sector of the Cycloid $DMAD$ is equal to the Trapezium $DMKAD - \text{Trilineal Figure } AKM$. But the Trapezium $DMKA$ is $= \frac{1}{2} DQ + \frac{1}{2} AQ \times AK = \frac{1}{2} AC \times AK = \frac{1}{2} AC \times \text{Arch } AP + PQ = \text{to the Sector } PBA$, and the Trilineal Figure AKM is equal to the

Segment APQ ; therefore the Sector of the Cycloid $DMAD$ is equal to the Triangle

PBQ ; and consequently the Sector of the Cycloid $DMAND$ is equal to the Isosceles Triangle PBR .

8. And as we have thus squar'd an infinite Number of Cycloidal Segments and Sectors, so an infinite Number of Cycloidal Zones, (*viz.* Spaces comprehended between the Portion of the Curve MN , the Portion of the Axis QD , and the Ordinates QN, DM) may be squar'd from the same Principles: For if we consider that the External Space AKM is equal to the Segment of the Circle APD , and that $AP = MP$, we may find the Value of any Cycloidal Space in Rectilineal Figures and Circular Segments; and therefore if it be requir'd that the said Cycloidal Space shou'd be squarable, it is plain that those Terms which consist of circular Segments, must destroy one another, and consequently be put $= 0$; from which Supposition the Quantities which were assum'd at first may easily be determin'd. *Ex. gr.* Let it be requir'd to determine the Right Lines CQ, CD in the Axis AC , so that the Cycloidal Zone $DMNQ$ be squarable. Suppose $AC = a, CQ = x, CD = z, QR = p, DP = q, AR$ or $NR = u, AP$ or $MP = e$; then the Sector $ACR = \frac{1}{2} au$, and the Sector ACP ,

$= \frac{1}{2} ac$, and consequently the Segment AQR , or the Figure AON , is $= ACR - CQR = \frac{1}{2} au - \frac{1}{2} px$; and the Segment ADP , or the Figure AKM , is $= ACP - CPD = \frac{1}{2} ac - \frac{1}{2} qz$. But the Cycloidal Segment AQN is $= QO - AON = QO - AQR = AQ \times QR + RN - AQR = AQ \times QR + AR - AQR = a - x \times p + u - \frac{1}{2} au + \frac{1}{2} px = ap - \frac{1}{2} px + \frac{1}{2} au - xu$.

And in like manner the other Segment ADM is $= aq - \frac{1}{2} qz + \frac{1}{2} ac - zc$.

And consequently the Zone $DMNQ = ADM - AQR$ is $= aq - \frac{1}{2} qz - ap + \frac{1}{2} px + \frac{1}{2} ac - zc - \frac{1}{2} au + xu$.

Whence it appears, that the Four first Members consist of Rectilineal Figures only, and that the other Terms affected with u and c , hinder the

Zone from being squarable. Whence it is evident, that if we suppose the Terms affected with u and c mutually to destroy one another, then the Cycloidal Zone $DMNQ$ will be $= aq - \frac{1}{2} qz - ap + \frac{1}{2} px$. And the remaining Terms must be $= 0$, that is, $\frac{1}{2} ac - zc - \frac{1}{2} au + xu = 0$; and if we suppose the Ratio of c to u be given (that is, as one Number is to another, that so one Arch being given, the other may be constructed Geometrically) we may destroy the Quantities c and u , and find the Relation between z and x . *V. gr.* If it be $u : c :: 1 : 2$, then the Equation $\frac{1}{2} ac - zc - \frac{1}{2} au + xu = 0$, becomes $a - 2z - \frac{1}{2} a + x = 0$; and consequently $z = \frac{a + 2x}{4}$. And if $u : c :: 1 : 3$, then $z = \frac{2a + 2x}{6}$; or if it be $u : c :: 1 : 4$, then $z = \frac{3a + 2x}{8}$, &c. in the same Progression.

And to find the Value of z in other Terms; if we suppose CQ the Sine Complement of the Arch AR to be given, then CD the Sine Complement of Double, Triple, Quadruple, &c. that Arch may be found by common Algebra. Therefore if c be $= 2u$, then $z = \frac{2xx - aa}{a}$; if $c = 3u$, then $z = \frac{4x^3 - 3aaa}{aa}$; or if $c = 4u$, then $z = \frac{8x^4 - 8aaa + a^4}{a^3}$, &c. and comparing these Values of z with those formerly found, we may find the Value of x in any Supposition. *V. g.* If c be $= 2u$, then $z = \frac{a + 2x}{4}$

$= \frac{2xx - aa}{a}$; and consequently $8xx + 2ax = 5aa$. Whence x is $= \frac{1}{8}a + \sqrt{\frac{5}{8}aa + \frac{1}{64}a^2}$

$= \frac{1}{8}a + \sqrt{\frac{5}{8}aa + \frac{1}{64}a^2} = \frac{1}{8}a + \frac{1}{8}a\sqrt{41}$. Hence it is manifest, that if CQ be taken $= \frac{1}{8}a + \frac{1}{8}a\sqrt{41}$. And if the Ordinate QN be applied to the Axis in the Point Q , and if the Arch RP be taken $= AR$, and the Ordinate MPD be drawn; then the Cycloidal Zone $DMNQ$ will be $= aq - \frac{1}{2}qz - ap + \frac{1}{2}px =$ the Rectilineal Triangles $CAP + DAP - CAR - AQR$.

And thus an infinite Numbers of Cycloidal Zones may be determin'd, which admit of a Quadrature, when the Proportion between the Arches AR, RP is express'd in given Numbers.

If the Curve Line AMD be a simple Semi-cycloid, whose Base BD is equal to the Semi-periphery of the Generating Circle BEA . 'Tis required to find the Value of the Ray of the Evoluta MC .

Suppose $AP = x$, $PM = y$, the Arch $AE = n$, and the Diameter $AB = 2a$; then, by the Property of the Circle, PE is $= \sqrt{2ax - xx}$ and by the Property of the Cycl. $y = u + \sqrt{2ax - xx}$; therefore $y = u + \frac{ax - xx}{\sqrt{2ax - xx}}$: But u equal

$$\frac{ax}{\sqrt{2ax - xx}}, \text{ therefore } y = \frac{2ax - xx}{\sqrt{2ax - xx}} = x \times \frac{2a - x}{\sqrt{2ax - xx}} = x \times \frac{2a - x}{\sqrt{x} \times \sqrt{2a - x}} =$$

(dividing by $\sqrt{2a - x} \times \frac{\sqrt{2a - x}}{x}$; whence $y =$ (supposing x invariable) $\frac{-ax^2 \sqrt{x}}{xx \sqrt{2a - x}} = \frac{-ax^2}{x \sqrt{2a - x}}$; and substituting this Value in

the General Theorem $\frac{x^2 + y^2 \sqrt{x^2 + y^2}}{-xy}$, or

$\frac{x^2 + y^2 \sqrt{x^2 + y^2}}{-xy}$ we shall have (because $y = x \sqrt{2a - x}$)

$$\frac{\frac{2ax^2}{x} \sqrt{\frac{2ax^2}{x^2}}}{-xy} = \frac{\sqrt{8a^3x^6}}{x^3} = \frac{\sqrt{8a^3x^6} \times x \sqrt{2ax - xx}}{a^3x^3}$$

$$\frac{\sqrt{8a^3} \times x \sqrt{2ax - xx}}{a} = \frac{\sqrt{16a^4x^3 - 8a^3x^4}}{a}$$

$2\sqrt{4aa - 2ax} = MC = (2\sqrt{EPg + PBq} = 2EB) = 2MG$, because MC perpendicular to the Curve in the Point M is parallel to the Chord BE .

CONSECTARY I.

If x be supposed $= 0$, then is $AN = 2\sqrt{4aa} = 4a$ = to the Ray of the Evoluta in the Vertex A ; and if we suppose $x = 2a$, then $MC = 2\sqrt{4aa - 4aa} = 0$; that is, the Ray of the Evoluta in D , is equal to nothing; and in A it

it is equal to twice the Diameter of the generating Circle; and hence 'tis evident, that the Evoluta begins in D and ends in N , so that BN is $= BA$.

CONSECTARY II.

The Evoluta DCN is a Semi-cycloid equal to the given Semi-cycloid DMA : Compleat the Parallelogram BS , and on the Diameter DS describe the Semi-circle DIS , and draw DI parallel to MC parallel to EB ; then is the Angle $BDI = EBD$, and consequently the Arches DI , BE are equal; but $EB = MG = GC$; therefore $GC = DI$, and if IC be drawn, it will be equal and parallel to DG . Now by the Nature of the Cycloid $DG = \text{Arch } EB = \text{Arch } DI$; therefore IC is $= \text{Arch } DI$, and consequently the Evoluta DCN is a Semi-cycloid, whose Base is $SN = \frac{1}{2}$ the Periphery of the Generating Circle DIS ; that is, the Evoluta is equal to the given Cycloid, and the same with it, only placed in a contrary Position.

CONSECTARY III.

The Length of the Curve of the Cycloid DCN is $= 2AB$ ($=$ twice the Diameter of the Generating Circle) and any Portion of the Cycloid, as DC , is $= 2CG = 2DI =$ twice the corresponding Chord in the Generating Circle.

Another Solution.

The Length of the Ray of the Evoluta MC may be determined without any Calculation,

thus: Draw another Perpendicular, mC , infinitely near the former, and another Ordinate me parallel to ME , and another Chord Be ; and on the Centers C and B describe the little Arches GH , EF ; then the Rectangular Triangles GHg , EFe will be similar and equal; for Gg is $= Ee$ (because BG or ME is $= \text{Arch } AE$, and Bg or me is $= \text{Arch } Ae$) and Hg or $mg = MG = Fe$ or $Be - BE$, and (47 Elem. 1.) $GH = EF$. Now the Angle MCm is $= EBe$ (because the Perpendiculars MC , mC are parallel to the Chords EB , eB , and GH , EF : The Arches that measure those equal Angles are equal; therefore the Radii CG , EB are also equal, and consequently MG is $= GC$; whence 'tis evident, that the Ray of the Evoluta MC is $=$ twice the Chord $BE = 2MG$.

CONSECTARY.

We have proved before, that the Area of the Cycloid is triple the Area of the Generating Circle: This Truth may be proved from other Principles, as thus; the Space $MGgm$, or the Trapezium $MGHm$ (the Difference being incomparably little) is $= \frac{1}{2} Mm + \frac{1}{2} GH \times MG = \frac{1}{2} GH \times MG = \frac{1}{2} EF \times BE$; that is, the Trapezium $MGgm$ is $=$ three times the Sector EBF or EBe ; therefore the Sum of all the Trapezia, viz. the Cycloidal Space $MGBA$ is equal to three times the Sum of all the Triangles, viz. the Circular Space $BEZA$; and the whole Cycloidal Space $AMDBA$ is $=$ thrice the Area of the Semi-circle $AEB A$.

If

If the Curve AMD be a Semi-cyloid describ'd by the Revolution of the Semi-circle AEB , on the Periphery of another immovable Circle BDG . 'Tis requir'd to describe the Evoluta of the said Curve,

The Movable or Generating Circle may be supposed to move either on the Convex or Concave Side of the Periphery of the immovable Circle; and when the Semi-circle AEB comes into the Position $MG B$, in which Position it touches the Base BD in G , and the describing Point

Point A , is in M , in the Curve of the Cycloid ; then, from the Genesis of the Curve, I infer,

1. The Arch GM is $\equiv$ Arch GD , and the Arch GD of the movable Circle is equal to the Arch GB of the immovable Circle.

2. MG is perpendicular to the Curve AMD ; for if we consider the Semi-circumference $MG B$, or AEB , and the Base BGD , as being compos'd of an infinite Number of little streight Lines, and every one in one, equal to the corresponding one in the other, 'twill be manifest, that the Semi-cycloid AMD is compos'd of an infinite Number of Circular Arches, which have for their Centers all the Points of Contact G successively, and are all describ'd by the same Point M .

3. If on O , the Center of the immovable Circle, the Concentrick Arch ME be describ'd, then the Arches of the movable Circle, viz. MG , and EB will be equal, and also the Chords MG and EB , and the Angles OGM , OBE will be equal between themselves; for in the Triangles OKM , OKE , the three Sides of the one are equal to the three Sides of the other respectively; therefore the Angles MKO is $\equiv EKO$, and the Arch MG is $\equiv$ Arch EB , and the Chord MG is $\equiv$ Chord EB , and KGM is $\equiv KBE$, and consequently OGM is $\equiv OBE$.

These things being premis'd, let mC be drawn perpendicular to the Curve AMD , and infinitely near MC ; draw also another Concentrick Arch me , and another Chord Be ; and on the Centers C and B describe the Arches GH , EFe : Then the Rectangular Triangles GHg , EFe are equal and similar; for Gg , or $Dg - DG = Ee$, or the Arch $Be -$ Arch BE ; and Hg or $mg - MG$ is $\equiv Fe$ or $Be - BE$, and consequently the little Arch GH is $\equiv$ Arch EFe ; whence it follows, that the Angle GCH is to the Angle EBF , as CE is to CG . It remains therefore to find the Proportion between those Angles, which we may do in this manner:

Having drawn the Radii OG , Og , KE , Ke , suppose OG or $OB = b$, $KE = a$, 'tis evident that the Angle EBE is $\equiv OBe - OBE$ (or $OBE - OBe$) $\equiv OGM - OGM$ (or $OGM - OGM$) $\equiv$ (having drawn GL , GV parallel to Cm , Og) $LGM + OGV = GCH + GOg$; therefore the Angle GCH is $\equiv$ Angle $EBE + GOg$. Now the Arches Gg , Ee being equal, it is, $GOg : EKe$ or $2EBF :: KE(a) : OG(b)$; and consequently the Angle GOg is $\equiv \frac{2a}{b} EBF$, and GCH is $\equiv (EBF + GOg) = \frac{b + 2a}{b} EBF$; therefore $GCH : EBF :: AE : CG :: \frac{b + 2a}{b} : 1$, and consequently the unknown Quantity CG is $\equiv \frac{b}{b + 2a} BE$: Which gives this

CONSTRUCTION.

Say, As $OA(b + 2a) : OA(b) :: BE$ or $MG : GC$; then the Point C will be in the Evoluta requir'd.

CONSECTARY I.

The Evoluta begins in the Point D , and touches the Base BGD in D ; for the Chord GM (the Third Term in the Analogy) vanishes in that Point.

CONSECTARY II.

The Evoluta DCN terminates in the Point N , so that then $OA : OB :: AB : BN :: OA + AB (\equiv OB) : OB + BN (\equiv ON)$; that is, OA , OB , ON are continually proportional.

CONSECTARY III.

If the Arch of the Circle NSQ be described on the Center O , I say the Evoluta DCN may be describ'd by the Revolution of the movable Circle GCS (whose Diameter is $GS \equiv BN$) about the immovable Circle NSQ ; that is, the Evoluta DCN is a Semi-cycloid, similar to the given Semi-cycloid AMD (because the Diamo-

ters AB , BN of the movable Circles, are proportional to the Radii of the immovable Circles OB , ON ; for $AB : OB :: BN : ON$ and in an inverted Position, having its Vertex in D ; for suppose the Diameters of the movable Circles to be in OT (drawn at pleasure from the Center O) it will pass through the Points of Contact S and G ; then if we say, AB or $TG : BN$ or $GS :: MG : GC$, the Point C will be in the Evoluta, (by Construction) and in the Circumference of the Circle GCS (Prop. 31. Elem. 3. Prop. 6. Elem. 6.) because the Angle GMT being a Right Angle, the Angle GCS is also; and because $MGT = CGS$, therefore the Arch $TM (\equiv GB) CS :: GT : GS :: OG : OS :: GB : NS$; therefore the Arch CS is $\equiv$ Arch NS ; ergo, &c.

CONSECTARY IV.

Hence 'tis evident, that the Portion of the Curve of the Cycloid DC is $\equiv$ Right Line CM , and consequently that $DC : Tang. GC :: AB + BN : BN :: OB + ON : ON$; that is, the Sum (or Difference) of both Diameters (of the movable and immovable Circles) is to the Semi-diameter of the immovable Circle, as DC is

is to the Tangent CG ; for the Triangles CMm , CGH are similar, therefore $Mm : GH$ or $EF :: MC : GC ::$ (by Construct.) $OA + OB (2b \pm 2a) : (See Fig. 2. in Page the last but one)$ $OB (b)$ and consequently the Sum of all the Mm , or the Portion of the Cycloid AM , is to the Sum of all the EF or Chord AE , or Tangent TM , as $OA + OB$ is to OB ; whence 'tis evident, that $OB : OA + OB (= 2OK) :: AB : AMD$, and $OB : 2OK :: AB - AE : DM ::$ twice the Versed Sine of $\frac{1}{2}$ the Angle MKG or EKB : the Portion of the Curve DM .

And because it is $AM : Tang. TM :: OA + OB : OB$; therefore in the Vulgar Cycloid, $AM : Tang. TM :: 2 : 1$.

CONSECTARY V.

The Trapezium $MGHm$ is $= \frac{1}{2}GH + \frac{1}{2}Mm \times MG$; but $CG (= \frac{b}{b \pm 2a} MG : CM (= \frac{2b \pm 2a}{b \pm 2a} MG) :: GH : Mm = \frac{2b \pm 2a}{b} GH$; therefore (because) GH is $= EF$, and $MG = EB$) $MGHm$ is $= 3 \frac{b \pm 2a}{2b} \times EF \times EB$;

that is, the Trapezium $MGHm$: corresponding Triang. $EBF :: 3b \pm 2a : b$. And because the Proportion universally obtains, 'tis evident, that the Cycloidal Space $MGBAM$ (See Fig. 2. in Page the last but one) (comprehended under the Right Lines MG , AB , the Base GB , and the Portion of the Curve AM) is to the corresponding Segment of the moveable Circle BEZ AB , as $3b \pm 2a$ is to b ; and the whole Cycloidal Space $AMDBA$ is to the Area of the Semi-circle $AEB A$, as $3b \pm 2a$ is to b .

CONSECTARY VI.

If we imagine OB , the Radius of the immovable Circle, to become infinite, the Arch AGD will become a straight Line, and the Curve AMD will be the Vulgar Cycloid; and in this Case AB , the Diameter of the moveable Circle, is $= 0$, in respect of that of the immoveable Circle: Whence, 1. because $b \pm 2a$ is $= b$, it is $MG : GC :: b : b$; that is, MG is $= GC$, and consequently if BN be taken $= AB$, and NS be drawn parallel to BD , the Evoluta DCN will be generated by the Revolution of a Circle (on the Base NS) whose Diameter is $= AN$. 2. The Portion of the Cycloid AM , is to the corresponding Chord of the Circle $AE :: 2b : b$; this is evident from §. 4. of *Hayes's Fluxions*. 3. The Space $MGBA$ is to the Segment $BEZ A$ AB , as $3b : b$; which is also evident from §. 5. of the same Book.

CONSECTARY VII.

The Length of the Semi-cycloidal Curve is proportional to the Rectangle BKO , if the Semi-diameter of the immovable Circle be the same. Let BA be the Diameter of one, and Ba the Diameter of another moveable Circle; and let OB be the Radius of the immoveable Circle common to both: Then, by §. 4.

$$OB : OA + OB :: AB : AMD;$$

2

$$\text{And } OB : OA + OB :: aB : amd;$$

And by Proportion of $OA + OB : OA + OB ::$ Equality and Div. $aB \times AMD : AB \times amd$ That is, $2OK : 2ok :: aB \times AMD : AB \times amd$ Whence $OK \times AB : ok \times aB :: AMD : amd$; And dividing by 2, $BKO : Bko :: AMD : amd$. Q. E. D.

CONSECTARY VIII.

Because the Arches GD , GM are always equal between themselves, it follows that the Angle $DOG : Ang. GKM :: GK : OG$; therefore if the Point D (where the Cycloid begins) the Radii OG , GK , and the Point of Contact G be given, the Position of the Point M , which describes the Cycloid, is found by drawing the Ray KM ; so that $GK : GO :: DOG : GKM$; and all the Points of the Curve AMD may be determin'd Geometrically, when the Proportion between the Radii OG , GK can be express'd in Numbers; and consequently, in that Case, this Cycloid is a Geometrical Curve, and the said Cycloid is a Transcendent (or Mechanick) Curve, when the Relation of OG to OC cannot be express'd by any finite Number of Terms.

CONSECTARY IX.

If in Concentrick Spheres similar Cycloids be describ'd, their Perimeters will be proportional to the Semi-diameters of the said Spheres.

CONSECTARY X.

And because the Length of the Curve of the Cycloid AMD is proportional to the Rectangle BKO , 'tis plain, that in Vulgar Cycloids the Curve is proportional to the Diameter of the Generating Circle.

SCHOLIUM.

By help of such Principles as these, the Great Sir Isaac Newton has advanced several wonderful Conclusions concerning the more exact measuring of Time by Pendulums: As for Instance,

1. If within the Globe BGD the Cycloid DAQ be describ'd, being bisected in A , and terminating in the Surface of the Globe in D and Q , and if OA be produc'd (bisecting DQ in B) unto N , so that OA , OB , ON $==$ and the Globe NS be describ'd on the Center O , and the Semi-cycloids ND , NQ be describ'd within the said Globe; then a Pendulum suspended to the Point N , and equal to NA , will vibrate in the Cycloid DAQ , the same being described by the Evoluti-on of the Cycloidal Cheeks ND , NQ . And thus a Pendulum may be made to vibrate in any such given Cycloid.

2. If the said Pendulum vibrate in the Cycloid DAQ by the sole Force of its own Gravity, and if the Force of Gravity in every Point of the Curve DAQ be as its Distance from the Center O , then the Vibrations (equal or unequal) of the Pendulum, will be performed in equal times.

Let MT touch the Cycloid in M , and draw OX perpendicular to MX ; then, because the Force

$GKg + GOg$ or gGg or $MGm = \frac{a+b}{b}$
 GKg . 2. $Ig : MI :: GMg : MGI$, and by
 Composition $Ig + MI$ or $MG(r) : Ig(q) ::$
 $GMg + MGI$ or $GIG :: \frac{1}{2} GKg : GMg$ or
 $Gmg = \frac{q}{2r} GKg$. 3. MCm or MGm, MGm
 $= Gmg \left(\frac{2ar + 2br - bq}{2br} GKg \right) : Gmg$

$$\left(\frac{q}{2r} GKg \right) :: Gm(r) : GC = \frac{bqr}{2ar + 2br - bq}$$

and consequently the Ray of the Evoluta MC is

$$= \frac{2arr + 2brr}{2ar + 2br - bq}$$

And if we suppose $OG(b)$ the Radius of the immovable Circle, to become infinite, the Circumference BGN will become a straight Line, and the Terms $2arr$ and $2ar$ will vanish in respect of the others, and the Value of the Ray

$$\text{of the Evoluta } MC \text{ will be } = \frac{2brr}{2b - bq} = \frac{2rr}{2r - q}$$

CONSECTARY.

Hence to find the Area of the Cycloidal Space MCB , the Quadrature of the Circle being supposed, because Sectors of Circles are in a Ratio compounded of the Duplicate Ratio of the Radii and the simple Ratio of their included Angles;

it is, Angle $GMg \left(\frac{q}{2r} GKg \right) : \text{Angle } MGm$

$$\left(\frac{a+b}{b} GKg \right) :: \text{the little Triangle (or Sector)}$$

MGg (whose Base is Ggm the movable Circle) : to the little Triangle or Sector GMm . Whence

$$\text{the Sector } GMm \text{ is } = \frac{2r}{q} \times \frac{a+b}{b} MGg =$$

$$\left(\text{supposing } MI = s, \text{ and consequently } r = s + n \right) = \frac{2a+2b}{b} MGg + \frac{2as+2bs}{bq} MGg.$$

Now the little Triangle or Sector KGg is to the little Triangle MGg , in a Ratio compounded of the Square of KG to the Square of MG , and

the Ratio of the Angle GKg to the Angle GMg , that is, as $aa \times GKg$ to $rr \times \frac{q}{2r} GKg$; and

consequently the little Triangle MGg is $= \frac{rq}{2aa}$

KGg , and substituting this Value in place of the

Triangle MGg in $\frac{2as+2bs}{bq} \times MGg$, we

shall have the Sector $GMm = \frac{2a+2b}{b} MGg$

+ $\frac{a+b \times sr}{aab} KGg$; but by the Property of

the Circle, $GM \times MI(sr) = BM \times MN =$

(supposing $KN = c$) $cc - aa$, which is an invariable Quantity, and is always the same in whatsoever Point of the Curve the describing Point M

be found; whence $GMm + MGg$ or mGg ,

that is, the Trapezium $GMmg = \frac{2a+3b}{b}$

$MGg + \frac{a+b \times cc - aa}{aab} KGg$. Now because

$GMmg$ is the Fluxion of the Cycloidal Space $MGBA$ and MGg , that of the Circular Space MGB (comprehended between the Right Lines

MB, MG , and the Arch BG), and KGg , that of the Sector KGB ; it is manifest that the Cy-

cloidal Space $MGBA$ is $= \frac{2a+3b}{b} MGB$

$$+ \frac{a+b \times cc - aa}{aab} \times KGB. \text{ Q.E.I.}$$

LEMMA II.

The same things being supposed, if on the Center K , with the Radius KA , the Semi-circle AEV be described; and if on the Center O , with any Radius between OV and OA , the Arch EM be describ'd, and the Radius KSE be drawn; I say, the Arch $EM : \text{Arch } SN :: OE : OB$.

Suppose the movable Circle BSN to come into the Position BGN , then the Point A which describes the Curve will be in M . Connect the Centers of the Generating Circles with the Line OK , which will pass through the Point of Contact G ; then 'tis evident that the Triangle MOK and EOK are equal and similar, because the Sides of one are equal to the respective Sides of the other; therefore the Angles MKO, EOK are equal, and the Arches that measure those Angles, viz. GN, BS , and their Complements to two Right Angles BG, SN , are also equal. And because the Angles MOK and EOK are equal, therefore the Angle MOE is $=$ Angle GOB , and Arch $EM : \text{Arch } GB :: OE$, the Radius of that $: OB$ the Radius of this. But it has been demonstrated that the inferior Arch $GB =$ superior Arch GB is $= SN$; therefore the Arch $EM : \text{Arch } SN :: OE : BB. \text{ Q.E.D.}$

CONSECTARY.

If the Radius OB be supposed infinite, then 'tis evident that the Right Lines OB and OE will be Parallels, and the Concentrick Arches VD, BN , and EM , will degenerate into Right Lines VT, BX , and EH , perpendicular to the Axis VA , and consequently the Right Line EH will be $= SN$, because OB and OE being infinite, are

are equal. Whence the Arch $EM : EH :: OE : OB$.

SCHOLIUM.

The Semi-cycloid AHT , into which the other Semi-cycloid AMD degenerates, when the Radius OB is infinite, is the same with that generated by the Revolution of the Semi-circle BSN on the Right Line BX , the describing Point A being in the Diameter BN produc'd.

PROP. XIV.

The same things being suppos'd, let it be requir'd to investigate the Area of the Cycloidal Space AEM , comprehended under the Arches AE , EM , and the Portion of the Cycloid AM .

Imagine another Concentrick Arch ME infinitely near to the Arch EM , and eb parallel and infinitely near to EH , and the Lines EF and EP perpendicular to the Arch ME and the Right Line EH (produced if need be); then are the Angles FEe , OEK equal, because each added to the Angle KEF makes a Right Angle, and the Angle PEe is = Complement of OEK to Two Right Angles, because $PEe + eEK + KER$ is = to Two Right Angles = $KEK + EK + EK$; therefore the Sine of the Angle FEe is to the Sine of the Angle PEe , as the Sine of the Angle OEK is to the Sine of the Angle OEK : That is,

$$Fe : Pe :: OK : OE;$$

And by the Corol. $\left. \begin{array}{l} \text{of the preceding Lem.} \end{array} \right\} EM : EH :: OE : OB$.

Therefore $Fe \times EM : Pe \times EH :: OK : OB$.

And because the infinitely little Spaces $EMme$, $EHbe$ are equal to the Products or Rectangles $Fe \times EM$, $Pe \times EH$ respectively, and the said Rectangles are always in the same Proportion to

one another, that is, the Space $EMme$ is always to the corresponding Space $EHbe$, as OK is to OB ; 'tis plain that the Sum of all the $EMme$ is to the Sum of all the $EHbe$, that is, the Space AEM is to the Space AEH , as OK is to OB .

I shall only add further, as to this Figure of the Cycloid; That, if a Caustick Curve, as AFK , were to be drawn to a Semi-circle, as AMD , whose Diameter is AD , and its Centre C : And when the Rays of Incidence, as PM , are supposed to be perpendicular to the Diameter AD :

Then the Caustick AFK will be a Semi-Cycloid; which will be described by the Revolution of the Little Circle MFH on the Periphery, or the Base KHG . For the Circle MFH is described on half MC , as on a Diameter; and the Angle CMF is equal to CMP , which is equal to HCK : And consequently the Angle HNF is equal to twice HCK . Therefore the Arch HF is equal to the Arch HK ; and the Curve KFA must be a Semi-cycloid, whose Beginning is in K , and its Vertex in A .

Let the Vulgar Semi-cycloid AMD be given, and described by the Revolution of the Semi-circle NGM on the Right Line BD : And let the Rays of Incidence PM , be parallel to the Axis AB : 'Tis required to draw a Caustick by Reflexion to the said Semi-cycloid AMD .

Because MG is $= \frac{1}{2}$ the Ray of the Evoluta, and GP perpendicular to PM : Therefore $MF = \frac{1}{2}a = PM$. Whence if GF be drawn perpendicular to the reflected Ray MF , the Point F will be in the Curve required.

If the Rays HM , HG , be drawn from H , the Center of the generating Circle, to the describing Point M , and the Point of Contact G ; 'tis evident that HG will be perpendicular to BD ; and that the Angle $GMH = MGH = GMP$; whence it appears, that the reflected

Ray MF passes through the Centre H . Now the Circle whose Diameter is GH passes also through the Point F ; because GFH is a Right-Angle: And therefore the Arches GN , and half GF , which measure the Angle GHN , are proportionable to the Diameters MN , GH , of their respective Circles: And consequently the Arch $GF = \text{Arch } GN = GB$. Whence it is manifest, that the Caustick DFB is a Cycloid, and describ'd by the Revolution of the Circle GFH on the Right Line BD . Q. E. D.

COROLLARY.

The Space $DABFD$ is equal to thrice the Area of the Circle GFH : For the Semi-circle MGN is equal to twice the Area of the Circle GFH : Wherefore the Cycloidal Space

$AMDB$ is equal to 6 times the Area of the Circle GFH ; and the Cycloidal Space BFD is equal to thrice the Area of the Circle GFH ; and consequently the Space $DABFD$ is equal to thrice the Area of the Circle GFH ; and the Curve DFB divides the Space $AMBD$ into two equal parts.

DAN

D A N

DAKIR, by the Statute of 23 H. 3. *de compositione Ponderum, &c.* was a Number of Ten Hides, as a *Last* was of 20 *Dakirs*: But since, by 1 Jac. 33. a *Last* of Hides is 12 Dozen.

DAMNUM, did formerly signifie the Bounds or Limits of a Man's private Property or Jurisdiction; as is plain by *Bracton, lib. 2. de Coron. c. 37.* And perhaps our Word *Dam*, for a Boundary or Confinement came from hence.

DAMPS, in Mines, are noxious Exhalations, which in some Mines have proved very suffocating, and otherwise fatal to the Workmen. They reckon four Sorts of Damps.

The *First* is the most ordinary; they know when 'tis coming, by the Flame of their Candles becoming orbicular, and by the Flames lessening by degrees, 'till at last it quite go out; as also by their Shortness and Difficulty of Breathing. Those that escape Swooning, seldom suffer any great Harm by it; but such as swoon away, tho' they miss of downright Suffocation, are on their first Recovery tormented with very violent Convulsions. Their Way of Cure is to lay the Person down on the Earth in a prone Posture, with a Hole dug in the Ground under his Mouth; if this fail, they fill him full of good Ale; and if that won't do, they conclude him desperate.

2. The *Pease-Bloom Damp*, which is so called from its Smell; this *Damp* they say always comes in the Summer Time, and it hath not been known to be Mortal. The Miners in the *Peake* of *Derby* fancy it arises there from the Multitude of *Red Trefoil Flowers*, called by them *Hony-suckles*, with which the Lime-stone Meadows of the *Peake* do much abound. Perhaps the Smell of this gives timely Notice to get out of the Way.

3. The *Third* is the most Pestilential and the most Strange of all, if what they say of it be true: They which pretend to have seen it, (for 'tis visible they say) do thus describe it: In the highest Part of the Roof of those Passages in a Mine which branch out from the main Grove, they see a round Thing hanging about as big as a Foot-ball, covered with a Skin of the Thickness and Colour of a Cobweb: If this Bag by a Splinter, or any other Accident, become broken, the *Damp* immediately flies out and suffocates all the Company: The Workmen, by Help of a Stick and a long Rope, have a Way of breaking this at a Distance; and when they have done this, they purifie the Place well with Fire: And they will have it, that it gathers from the Steam of their Bodies and Candles, ascends up into the highest Part of the Vault, and there condenses, and in Time hath a Film grows over it, and then corrupts and becomes Pestilential.

4. The *Fourth* is the *Fulminating* or *Fire-Damp*, whose Vapour being touch'd by the Flame of the Candles, presently takes fire, and hath all the Effects of Lightning or fired Gunpowder. These are found frequently in the Coal-Mines, and sometimes, tho' rarely, in the Lead ones.

DANEGET, or *Geld*, was a Tribute which the *Danes*, on their frequent Incurfions imposed upon the *English* as the Arbitrary Terms of Peace and Departure. It was first imposed as a continual yearly Tax upon the whole Nation under

D E A

K. Ethelred, A. D. 991. *Ælfred* and *Ingulph* report, that King *Edward* the Confessor remitted and abrogated this Tax: But *William* the Conqueror, tho' he would not re-induce the Annual Payment, yet he ordered the raising of it, as often as the Necessities of Invasion or Expedition did require: And it was severely exacted and augmented by *William Rufus*. In the Reign of *Hen. I.* it was computed amongst the King's standing Revenues: But *K. Stephen*, upon his Coronation-Day, promised that *Danegelt* should be for ever remitted; from which Time some date the Expiration of this Tax. But it seems rather to have continued upon extraordinary Occasions, 'till it was abrogated by Time; or swallowed in Tillage and Parliamentary Impositions. The Laws of *Edward* the Confessor, c. 11. rate this Tax at 12 *d.* on every Hide: *Henry Hunt* computes it at 2 *s.* on each Hide; and *John Brampton* at 3 *d.* on a *Bovate* or *Oxgangs*. And no doubt it varied according to the different Exigencies on which it was levied. *Dr. Kennet's Glossary.*

DANGER, *Dangerium*, in some Places called *Lief-Silver* and *Lef-Silver*, was formerly a Payment of Money made by the Forest Tenants to their Lords, that they might have Leave to plow and sow in Time of *Pannage* or Mast-feeding.

DARREINE, in the Common Law, seems to be a Corruption from the French *Dernier*, i. e. *Last*; for 'tis now used in that Sense, in

DARREINE, *Continuance*: And

DARREINE, *Presentment*.

DATIRE Tutelage, is a Term in the Civil Law, for such a Tutelage of a Minor as is appointed by the Magistrate either *Ex Officio*, or by Petition, when a Guardian by *Will*, or by *Law*, is not already provided.

DAY, in our Common Law, is sometimes used for the Day of Appearance in Court, either Originally or on Assignation; and sometimes for the Return of Writs. Thus

DAYS in Bank, are Days set down by Statute or Order of Court, when Writs shall be return'd, or when the Party shall appear on the Service of the Writ. They say also, That if a Person be dismissed without *Day*, he is finally discharged the Court.

DAYWERC of Land, was anciently as much as could be plowed up in one Day's Work or Journey, as the Farmers in some Places still call it.

DAZE, is one of the *Weeds*, as they call them, which are found in our Tin Mines; 'tis a kind of glittering Stone enduring the Fire; and is of different Colours, as White, Black and Yellow. It seems to be a Spar.

DEAN. Originally the *Decanus*, was so called, because he was an Ecclesiastical Magistrate, which had Jurisdiction and Power over Ten Canons at least. He is next under the Bishop, and ordinarily Chief of the Chapter in a Cathedral Church.

As there are Two Foundations of Cathedral Churches, the *Old* and the *New*, (the *New* being those which *Henry* the Eighth founded on the Suppression of the Abbots and Priors, and turned their Convents into Dean and Chapter;) so there are Two Ways of Creating these Deans.

For

For those of the *Old Foundation*, are brought to their Dignity much like a Bishop: The Prince first sending out his *Conge d'Esire* to the Chapter; the Chapter there chusing, the King yielding his Royal Assent, and the Bishop confirming him, and giving his Mandate to install him.

Those of the *New Foundation* are installed by a shorter Course; only by the King's Letters Patent, without either Election or Confirmation.

The Word *Dean* is also apply'd to divers that are the Chief of some peculiar Churches or Chapels; as Dean of the King's Chapel, of *Paul's*, of *Westminster*, of the *Arches*, of *Battel*, of *Boking*, &c.

DEAN *Rural*, or *Urban*, call'd *Decanus Christianitatis*, was formerly an Ecclesiastical Person, who had the District of ten Churches either in the Country or City, within which he exercised a useful Jurisdiction. These *Rural Deans* were sometimes call'd *Archipresbyteri*, and at first were both in Order and Authority above the Archdeacons. They were elected by the Clergy, and by their Votes again deposed; but afterwards they were appointed and remov'd at the Discretion of the Bishop: And hence they were call'd *Decani Temporarii*, to distinguish them from the Cathedral Deans, who were call'd *Decani perpetui*.

DEADS, in the Tin-Miners Language, are such Parcels of common loose Mould or Earth lying above the *Shelf*, as usually contain the *Shoad*, which they find when they are training a *Load*. They call also that part of the *Shelf* which contains no *Oar* or Metal, but encloseth the *Load* as a Wall between two Rocks, by this Name. See *Tin*.

In the *Mendip Lead-Mines*; when a Vein of *Oar* breaks off abruptly in an Earth, they call it a *Deading-Bed*; and Earth without an *Oar* they call *Dead Earth*.

DEAD Ropes in a Ship, are such as are not running, i. e. which do not run in any Block.

DECIMAL Scales, (*Vide Leybourne's Cursus*, p. 174.) are in the General any Scales that are divided Decimally. But for the expediting of Decimal Arithmetick, there are in use some Scales of Money, Weights, Measures, which are made from Tables bearing those Names, and serve readily, by Inspection only, to shew you the Decimal Fraction which properly belongs to any part of Money, Weight, or Measure, &c. These Scales are usually placed on a square Ruler, and are about Nine in Number:

1. One of *English Coin*, 2 Shillings being the Integer.
2. *Troy Weight*, 2 Penny-weight being the Integer.
3. *Averdupois Great Weight*, 28 lb. being the Integer.
4. *Averdupois Little Weight*, 16 oz or 1 lb. being the Integer.
5. *Liquid Measure*, 36 Gallons being the Integer.
6. *Dry Measure*, 8 Bushels being the Integer.
7. *Long Measure*, one Ell or Yard being the Integer.
8. *Foot Measure*, where 12 Inches is the Integer. And,
9. *Time and Motion*, where one Hour, Minute, &c. may be the Integer.

To every one of these there is joined another Decimal Scale, divided into 100 or 1000 equal Parts; so that if you look on any Division in any of the Nine Scales, you may easily see what Division, or part of a Division, answers to it in

the adjacent Decimal Scale: And consequently it will very readily shew you what Decimal Fraction answers to any Part of Money, Weight, Time, Measure, &c. as well as it will give the Value of any Decimal Fraction in the Corresponding Parts of any Integer. Thus if in the *Money Scale* you take out any Part of 2 Shillings, as suppose 8 Pence 3 Farthings, you will find the Corresponding Decimal to be .364. Or if in the Decimal Scale contiguous to it, you would know what Part of 2 Shillings answers to this Decimal Fraction .771, you will find the Corresponding Point in the *Money Scale* to be 18 Pence 2 Farthings. And so for the rest.

DECINERS, or *Decenniers*, or *Desiners*. *Decennarii*, in our Old Law, where such as had the Jurisdiction over 10 *Friburghs* for keeping the King's Peace; and the Limits or Compass of their Jurisdiction was call'd a *Decenna*, saith *Bracton*, *Lib. 3. Tract. 2. Cap. 15*. In the *Saxons* Times, these seems to have had large Authority, taking Cognisance of Causes within their Circuit, and redressing Wrongs by way of Judgment. In latter Times, the Word came to signifie such an one, as by Oath of Loyalty to his Prince was settled in the Combination or Society of such a *Dozein*; and a *Dozein* seems then to be extended as far as a *Leet*, because in *Leets* only this Oath is administred by the Steward, and taken by all from 12 Years old and upward that dwell within the *Leet*. Now there are no *Decenniers*, but *Leets*.

DECK Nails, are such as are used for fastening Decks of Ships, doubling of Shipping, and for Floors laid with Planks: They are of two Sorts, *Dye-headed* and *Clasp-headed*. Their Sizes are from 4 to 9 Inches.

DECLINATION of the Sun. To find it readily by Projection of Part of the *Analemma*; having his Place in the *Ecliptic*, and his greatest

Declination: Draw *EC* for the Equinoctial, and *PC* for the Azimuth of East and West, and with 60 Deg. of the Chords sweep the Ark *EP*. Set 23 Deg. 30 Min. the Sun's greatest Declination, from *E* to *S*, and draw *SC* for one Quadrant of the *Ecliptic*. Set the Sine of the Sun's Longitude, or Distance from the next Equinoctial Point from *C* to *O* in the *Ecliptic* *CS*, being, suppose, 42 Deg. then will the nearest Distance from *O* to *EC*, be the Sine of the Sun's present Declination = to *PC* = to the Ark *FE*, measured on the Chords.

DECRE-

DECREE, in the Civil Law, is a Determination that the Emperor pronounces, upon hearing a particular Cause between Plaintiff and Defendant.

DECRETALS, are a Volume of the Canon Law, containing the Decree of sundry Popes; or else a Digest of the Canons of all the Councils pertaining to one Matter and under one Head.

DEDI, is a Warranty in Law to the Feoffee and his Heirs; as if it be said in a Feoffment, *A. B.* has given and granted, &c. they call it a *Warranty*.

DEEMSTERS, are a kind of Judges in the *Isle of Man*, chosen from among and by themselves, who without Process, Writing, or Charge, decide all Controversies there.

DEFAULT, is a Neglect or Omission of Appearance before a Court of Justice, for which Judgment may be given against the *Defaulter*.

DEFEND, in our Ancient Laws and Statutes, signified to prohibit and forbid: *Leg. Edw. Confess. c. 37.* and *5 R. 2. c. 7.* And in this Sense *Chaucer* also uses it.

DEFERENTIA Vasa. See *Vasa Deferentia*.

DEFICIENT Hyperbola, is a Curve of that Name, having but one Asymptote, and only two Hyperbolick Legs running out infinitely towards the Side of the Asymptote, but contrary Ways. See *Curves*.

DEFLECTION of the *Rays of Light*, is a Property which *Dr. Hook* observed 1674, and read an Account of it before the Royal Society, March 18. the same Year. He saith, he found it different both from Reflection and Refraction, and that it was made towards the Surface of the opacous Body perpendicularly. This is the same Property which *Sir Isaac Newton* calls *Inflexion*; of which, see an Account under that Word.

DEFORCEMENT, in the Law Sense, is with-holding Lands or Tenements by force from the Right Owner. Wherefore a

DEFORCEOR, is he that overcometh and casteth a Person out by Force.

DEFORCIATIO, is a Distrain or Seizure of Goods for Satisfaction of a Lawful Debt. In Assizes and Trials formerly, the *Claimer* or *Plaintiff* was called *Querens*, and the *Possessor* or *Defendant* was called *Deforcians*: Tho' indeed the Original Sense of the Verb *Deforciare* is to keep Possession ones self, or to turn another out of his by Violence and Force.

DEGRADING, or, as it has sometimes been writter, *Disgrading*, is the Punishment of a Clerk, that being deliver'd to his Ordinary, can't purge himself of the Offence whereof he was convicted by the Jury; and it is the Privation of him from those Holy Orders which he had, as of *Deacon*, *Priest*, &c.

Formerly also Knights have been degraded. See 18 E. 2.

In the Common Law also there are two Sorts of *Degrading*; one *Summary*, by Word only; the other *Solemn*, by divesting the Party degraded of those Ornaments and Rites, which are the Ensigns of his Order and Degree. See 13 Car. 2. c. 15.

DEGREE of a great Circle, on the Surface of the Earth (supposing it be of a Spherical Figure) is 69 English Miles and 288 Yards; as appears by the Concurrent Mensurations, nearly, of *Mr. Norwood* and the *French Mathematicians*. The *French* make a Degree 365184 Feet English,

and *Mr. Norwood* 367196, the Difference being only 597 Yards, or 1791 Feet: And from hence, the Circumference of the Earth will be 24899 English Miles.

DELEGATION, in the Civil Law is a kind of *Novation*, whereby a Debtor appoints one that is Debtor to him, to answer a Creditor in his Place.

DEMANDANT, is the Plaintiff in a real Action, and so called because he demandeth Lands, &c.

DEMICROSS, is an Instrument, used by the *Dutch* to take the Sun's Altitude, or that of a Star at Sea; but 'tis not used by us, but the Cross-staff or Fore-staff supplies its Place. The *Demicross* is of this Figure;

The Staff *AG* is graduated easily, being only a Line of whole Tangents, whose Radius is *EB*, the Length of the Cross-piece or *Transum*: It hath three Vanes; a Horizon-Vane, as *A*; a Sight-Vane, as *H*; and the Shade-Vane, as *E*.

When the Vanes are on the Staff and Cross-piece, to take the Sun's Altitude, hold the Instrument with the *Transum* as upright as you can, and looking through the Sight-Vane, as *H*, look for the Horizon through the Slit in the Horizon-Vane, and then slide the Cross-piece or *Transum* to and fro, 'till you cause the Shade of the Vane at *E* to fall at the same Time upon the Slit of the Horizon-Vane also at *A*; then are the Degrees cut on the Staff by the Edge of the Cross-piece, the Sun's Altitude required. But to take the Height of a Star; you must remove the Horizon-Vane *A*, and put it on the End *G*, and transfer the Sight-Vane *H* to *A*; then holding up the Instrument upright, as before, looking through the Sight-Vane, see for the Horizon through the Horizon-Vane, and for the Star by the Shade-Vane, sliding the *Transum* to and fro, 'till the Horizon and Star are both seen by their respective Vanes, and then the *Transum* will cut the Degrees of the Star's Altitude on the Staff, allowing about 8 or 10 Minutes for your Height above the Level of the Water, as must be done in all such Cases.

DENARII de Caritate, were the *Pentecostals* or *Whitsun-Farthings*, being anciently customary Oblations made to the Cathedral Church at the Time of *Pentecost*, when the Parish Priests and their People used to go visit the Mother Church. In process of Time this voluntary Oblation came to be claimed as a settled Due, and was charged on the Parish Priest, and it is now annually paid to the Bishop in some Dioceses.

DENARIUS. See *Penny*.

DE deoneranda pro Rata Portionis, is a Writ that lieth where one is distrained for a Rent that ought to be paid by others *proportionably* with him.

DEPARTURE, in Navigation, is the Easting or Westing of a Ship with respect to the Meridian it *departed* or sail'd from. Or 'tis the difference of Longitude (either East or West) between the present Meridian the Ship is under, and that where the last Reckoning or Observation was made: This *Departure*, any where but under the *Æquator*, must be accounted according to the Number of Miles in a Degree proper to the Parallel the Ship is under. See *Mercator's Sailing*.

DEPOSITUM, in the Civil Law, is a Contract of the Law of Nations, by which a Thing is committed to the Custody of one to be kept, without any Reward, on Condition to be returned truly again on Demand.

DERELICKS, in the Civil Law, are such as are *wilfully* thrown away and abandoned by the Owners.

DESIGN, in Painting or Sculpture, is the Expression of the Images or Ideas that the Painter hath conceiv'd in his Mind on the Picture, &c. and it is Good, when the Author has a good *Gusto* and correct Judgment: This is the Basis and Foundation of all other Parts, and may be compared to the *Stile* of a correct Writer. But the Painters call *Designs* chiefly such Draughts as they usually express on Paper, in order to the Performance of some considerable Piece of Work: A feint imperfect Design is usually call'd a *Sketch*.

DIACAUSTICK Curve, or the *Caustick* by *Refraction*. If you imagine an infinite Number of Rayes, *BA*, *BM*, *BD*, &c. issuing from the

Ratio; then the Curve Line *HFN*, which touches all the refracted Rayes, is called the *Dia-caustick*, or *Caustick* by *Refraction*. How to find these *Causticks* by *Refraction* to all Sorts of Curves, see *Hayes's Fluxions*, p. 243, &c. where also the Doctrine of the *Foci* of Spherical Glasses of all Sorts, exposed either to diverging, converging, or Parallel Rayes, is deduced from the Principles of the *Caustick* Curves. *Vid.* p. 249. Of the Relation of this *Dia-caustick* Curve to the *Evoluta*, see a Discourse of Mr. *James Barnoulli* in the *Leipsick Acts* of May, 1693.

DIACENTROS, is a Word used by *Kepler*, to signify the shortest Diameter of the Elliptical Orbit of any Planet.

DIAGLYPHICE, is the Art of Cutting, or otherwise making hollow or concave Figures in Metals; such as Seals and *Intaglias*.

DIALLING. Some Authors on this Subject are, *J. Bapt. Benedicti, de Re Gnomonica.*

Kercheri, Ars magna Lucis & Umbræ. Rom. 1646.

Marignani Perspectiva Horaria.

Leybourn's Dialling.

Colling's Geometrical Dialling.

Cir. Clavii Gnomonices, Libri 8. Fol.

Voellus de Sciotericis Horologiis.

Cæsii Horologiographia Plana.

Hollwell's Dialling. 4to.

Fr. Comondini de Horologio Descriptione. 4to.

Sargue's Universal Way of Dialling.

Foster's Elliptical Horologiography.

Fale's Art of Dialling.

Wells's Art of Shadows. 8vo.

DIALLING in a Mine, which they call also *plumming*, is using a *Compass* (which they call a *Dial*) and a long Line, to know which Way the Load or Vein of Ore inclines, or where to sink an *Airshafe*, or to bring an Adit to a desired Place. See the Manner of it under the Word *Tin*.

DIALLING Lines or Scales, are such graduated Lines as being placed on Rulers or the Edges of Quadrants, and other such like Instruments, are designed to expedite the Constitution of all Kind of Dials.

These Lines are,

1. *A Scale of six Hours*; which is only a double Tangent, or 2 Lines of Tangents, each of 45 Deg. set together in the Middle, and equal to the whole Line of Sines, with the Declinations set against the Meridian Altitudes, in the Latitude of London, suppose, or whatever Place else it is made for. The Radius of which Line of Sines, is equal to the Dialling Scale of six Hours.

2. *A Line of Latitudes*; which is fitted to the Hour Scale, and is made by this Canon: *As Rad. : to the Chord of 90 Deg. :: So are the Tangents of each respective Degree of the Line of Latitudes. to the Tangents of other Arks.* And then the natural Sines of those Arks are the Numbers, which taken from a Diagonal Scale of equal Parts, shall graduate the Divisions of the Line of Latitudes to any Radius.

The Line of Hours and Latitudes is general for pricking down all Dials with Centres: As suppose. 1. an Horizontal Dial for the Latitude of London, 51 Deg. 30 Min. Draw *CE* for the Hour Line of 12, and cross it at Right Angles with *AB*. Then out of the Scales of Latitudes set off *CB* and *CA* each equal to 51 Deg. 30 Min. or the *Stile's* Height. Then take the whole Scale of six Hours, and set it from *A* to *E*, and from *B* to *E*, dividing those two Lines *AE* and *BE* with the

Compass.

same Luminary Point *B*, to be refracted from or to the Perpendicular *MC*, at the Curve *AMD*; and so that *CE*, the Sines of the Angles of Incidence *CME*, be always to *CG*, the Sines of the refracted Angles *CMG*, in a given

Compasses accordingly ; as you see in the Figure :

Then Lines drawn from C, the Center of the Dial, through those Points 1, 2, 3, 4, 5, and 11, 10, 9, 8, 7, &c. shall be the true Hour Lines. And this is a very ready and easy way to describe the Hour Lines on any Plane.

See Collin's Sector on a Quadrant.

The other Scales are particular, and give the several Requisites for all upright declining Dials by Inspection.

They are these :

3. A Line of Chords.
4. A Line for the Substile's Distance from the Meridian.
5. A Line for the Stile's Height.
6. A Line of the Angle of 12 and 6.
7. A Line of Inclination of Meridians.

When these are placed all together on a Ruler in order as they should be ;

Count the Plane's Declination in the Line of Chords, and then a Square laid over it will intersect all the other Lines in their proper Points : Or you may open the Compasses to the Plane's Declination in the Chords, and then that Distance will find all the rest in the other Scales. Thus, suppose a Plane decline 35 Deg. from the Meridian, then all the Requisites by these Scales will be found thus :

	Deg.	Min.
The Substile's Distance from the Meridian	24	30
The Stile's Height	30	38
The Inclination of Meridians	41	49
The Angle of 12 and 6	84	10

All which previous Requisites being found, the Dial may be drawn easily and readily by applying in the Hour Scale by the Help of the Line of Latitudes and the Substilar Line, as Collins shews how to do in his Sector on a Quadrant, p. 268. or by any other Method of describing Hour Lines on a given Plane.

DIAMETER of Gravity, in any Surface, Body, or Solid, is that Right Line in which the Center of Gravity is placed.

DIHELIOS, in the Elliptical Astronomy, is that Ordinate of the Ellipsis which passes through that Focus in which the Sun is supposed to be placed. Kepler.

DILAPIDATION, is a wasteful destroying, or letting of Buildings run to Ruin and Decay for want of Reparation, 13 Eliz. c. 13. And the Money recover'd for Dilapidations, by 14 Eliz. 11.

Vol. II.

shall be employ'd in the Repair of the same Houses.

DILVING, is a Word used in the dressing of Tin Oar ; and means, taking the Forehead of what is in the 2d Buddle after the 2d Trampling, and putting it into a Canvas Sieve, to shake it lustily about in a large Tub of Water, so that the Filth goes over the Rim of the Sieve, leaving the Black Tin behind. See Tin, Buddle, and Trampling.

DIAZEUTICK Tone, in the Antient Greek Musick, was that which disjoin'd two Fourths, one on each Side of it, and which being join'd to either, made a Fifth. This was in their Musick that from Mese to Paramese ; that is, in our Musick, from A to B, supposing Mi to stand in Bfabmi, which is accounted its natural Position. They allowed to this Diazeutick Tone, which is our La, Mi, the Proportion of 9, to 8, as being the unalterable Difference of Diapente and Diatesseron, or of the Fifth and Fourth.

DICASTRICK Muscles, sometimes called Bi-ventres, are such as have a double Belly.

DIMISSORY Letters. When a Candidate for Holy Orders hath a Title in one Diocese, and is to be ordain'd in another, the proper Diocesan gives his Letters Dimissory directed to some other Bishop, giving Leave that the Bearer may be ordain'd to such a Cure within his District.

DIRECT Motion of a Planet. To any Eye placed at the Earth's Surface, Venus and Mercury, which move round the Sun in lesser Orbits than it doth, will sometimes appear direct, and sometimes Stationary and Retrograde.

For let the Earth be at T, moving round the Sun in the Orbit T & from West to East. Let ACDF be the Orbit of ♀ revolving the same Way, but performing its Revolution in a shorter Time. It will then be plain, that when Venus is in that Part of her Orbit expressed in the Figure by DEF, and which is most remote from the Earth, supposed to be in T, I say, Venus will then appear to move forward directly, according to the Order of Signs, or in Consequentia, as the Astronomers speak, and so is said to be Direct. And when she comes to such a Position, in respect of the Sun and Earth, as to be in G ; then while she moves from G to H, she will seem to move with equal Celerity with the Sun, for then she tends directly towards the Earth : Nor can she appear to have any other Motion, than as if her Orbit were carry'd by the Sun moving towards the East. Therefore now she will appear to move slower than before, but still she

E e

will

will be direct. But when she gets beyond *H* towards *A*, and then to *B*, she in reality moving swifter than the Earth, (because nearer to the Sun) she will pass by between the Earth and the Sun; and therefore to an Eye placed at the Earth must appear to change her Place among the fix'd Stars, but yet contrary to the usual Order of the Signs: That is, she will appear to move in *Antecedentia*, and so is said to be *Retrograde*; tho', if viewed from the Sun, she would always appear to move *Direct*. And in the Part of the Orbit about *H*, she will appear *Stationary*, as they call it, because then Right Lines drawn from the Sun to the Earth and Her, will appear to be parallel to one another for a considerable Time. Also after her *Retrogradation*, and before she begins to *Direct* again, we will be again *Stationary*, as about *B*; and then she is said to be *Stationary* towards her *Direction*, as before she was so towards her *Retrogradation*.

And 'tis the same Case, with respect to the Earth consider'd, as moving on in her Orbit; for the *Directions, Stations, and Retrogradations*, above describ'd, and referred to *Venus*, will after the same manner appear to belong to the Earth; in the several Parts of her Orbit, to an Eye placed in *Venus*, or on the Surface of some Superior Planet.

And from what has been here said, it appears, that *Venus* will appear *Retrograde* when she is nearest to the Earth, and consequently then also appears bigger; and on the other hand, will be *Direct*, and appear least, when she is remotest from the Earth.

After much the same manner will the Phænomena of the Directions of the Stations and Retrogradations of the superior Planets be accounted for by the following Figure :

Let M ☿ be the Orbit of one of the Superiors, suppose of *Mars*; let AC ☿ G be the Orbit of the Earth, and nearer to the Sun than that of *Mars*; let that Planet be supposed at M , and the Earth in that Part of her Orbit design'd by the Letter A : Then will *Mars* appear *Stationary*, and that towards his Direction; because the Right Lines drawn from *Mars*, and from the Earth to the Sun, will for a while appear to be Parallel, altho' if *Mars* were seen from the Sun, his Motion would then appear to be *Progressive*, as at other Times. And while the Earth moves from A towards B, C, D, E , and F , to G , *Mars* will appear to move forward directly among the fixed Stars, for a double Reason; both because it is in reality carry'd about the Sun *in Consequentia*; and also because the Earth is carry'd the same

way in the opposite Simicircle, and about the same Centre. *Mars* therefore being now most remote from the Earth, will appear to be direct. But the Earth coming at length to *G*, and *Mars* being supposed to be in *M*, (which in process of Time will come to pass) then he will appear *Stationary* again, and now towards his Retrogradation, for he will appear Retrograde in his Motion from *G* to *A*.

And the very same Phenomena must happen to *Jupiter* and *Saturn*; only the Retrogradations of *Saturn* will be more frequent than those of *Jupiter*, and his than those of *Mars*: Because the Earth will oftner follow, overtake, and get between *Saturn* and the *Sun*, than he will between *Jupiter* and him; and oftner also between *Jupiter* and the *Sun*, than between *Mars* and him.

DISCONTINUANCE, in the Common Law, signifies the same as an Interruption or Breaking off; and is of two Kinds, either

DISCONTINUANCE of Possession; the Effect of which is, that Man may not enter on his own Lands or Tenements alienated, whatsoever his Right be to them, of his own self, or by his own Authority; but must bring his Writ, and seek to recover Possession by Law. Or it is

DISCONTINUANCE of Plea or Process; the Effect of which is, that the Instant is lost, and may not be regain'd, but by a new Writ to begin the Suit afresh; for to be *discontinued*, and to be put *sine die*, signifies to be dismissed the Court finally.

DISGRADING. See *Degrading*.

DISPARAGEMENT, in the Law Sense is used especially for matching an Heir in Marriage under his or her Degree, or against *Decency*.

DISPAUPERED. When any Person, by reason of his Poverty, attested by his own Oath of not being worth 5*l.* (his Debts being paid) is admitted to *sue in Forma Pauperis* ; if afterwards, before the Suit be ended, the same Party have any Lands or Personal Estate fallen to him ; or that the Court, where the Suit depends, think fit for that or any other Reason to take away that Privilege from him, he is then said to be *Dispaupered*, *i. e.* put out of the Capacity of suing any longer in *Forma Pauperis*.

DISPENSATION of a Law, is a Thing distinct from the Equity of it, or from an equitable Construction of it : For *Equity* is only the Correction of a Law that is too *Universal* or *General*; but a *Dispensation* suspends the Obligation of the Law itself. A *Dispensation* therefore must be from the *Legislative Power*, and should be but very rarely and sparingly used.

DISTANCE of *Places* on the Earth, are easily found by the Analemma. Thus:

Having the Longitudes and Latitudes of any two Places on the Earth; to find their Distance.

Let *London* be one Place at *Z*, and let the other be in 20 Deg. Latitude North, and whose Difference of Longitude from *London* is 82 Deg. 30 Min. East. Take from the Chords $Z E = 51 \text{ Deg. } 30 \text{ Min.}$ and draw $E C$ $\textcircled{2}$ for the *Æquator*; and to it, at 20 Deg. Distance draw $a b$ for the Parallel of the other Place: Then from b , where the Meridian of *London* intersects that Parallel, set $b * = 82 \text{ Deg. } 30 \text{ Min.}$ the Difference of Longitude, and that will find the Point $*$ in the Parallel representing the Place. Thro' $*$ at Right Angles to $Z c$, draw $e d$, crossing the Vertical Circle in d ; measure $c d$ on the Sines, it will be about

bout 20 Deg. whose Complement 70 Deg. is the Places Distance from London, or Z. Multiply 70 by 70, you have 4900 Miles, the Distance required.

DISTANCE of the Eye, in Perspective, is a Line drawn from the Foot of the Line of Altitude of the Eye, to the Point where a Line drawn at Right Angles to it will intersect the Object.

DISTRIBUTIVE Justice. See *Justice*.

DIVERGING Hyperbola, is one whose Legs turn their Convexities towards one another, and run towards quite contrary Ways. See *Curves*.

DIURNAL Parallax of the Sun. See *Parallax*, and *Sun*.

DOCKET, in the Law Sense, is a *Brief in Writing*. It hath been formerly written *Dogget*; and seems then to have been some small Piece of Paper or Parchment, containing the Effect of a larger Writing.

DOG-DRAW, is one of the four Kinds of an Apparent Deprehension of an Offender against Venison in the Forest: And it is, when a Man hath stricken or wounded a Deer, &c. by shooting at him with a Cross-Bow or Long-Bow, or otherwise, and is found with a Hound or other Dog drawing after him to receive the same. See *Manwood's Forest-Laws*, c. 18. N. 9.

DOGGER, is a small Ship built after the Dutch Fashion with a narrow Stern, and commonly but one Mast. See 31 Ed. 3. Stat. 3. c. 1.

DOG-NAILS, are such as are used for fastening Hinges.

DOM-BOC. See *Domes-day Book*.

DOMES-DAY Book. When King *Alfred* divided his Kingdom into Counties, Hundreds, and Tithings, he had an Inquisition taken of the several Districts, which were digested into a Register, which was called *Dom-Boc*; i.e. the Judicial or Judgment Book, reposit in the Church of *Winchester*, and thence call'd the *Winchester-Book*, to which King *Edward, Sen.* seems to refer in the first Chapter of his Laws. The General Survey taken afterwards by *William the Conqueror* was after this Precedent of King *Alfred*, and seems but a Corruption of, or rather an Addition to, the same Name, *Dom-Boc* into *Domes-day Book*: And it implying no more than *Doom-Book*, or a Register from which Sentence might be given in the Tenure of Estates; (whence by Latin Writers 'tis called *Liber Judicialis*) 'tis a trifling Etymology to derive the Word from either *Domus Dei*, or *Domes-day*, that is, the final Day of Judgment. And it is not improper to observe (because no Notice hath yet been taken of so small a Matter) that the Addition of *Dey*, or *Day*, in forming *Dooms-day Book* from *Dom-Boc*, doth not augment the Sense of the Word, but only doubles and confirms it. For the Word *Day*, in all Idioms, signifies Judgment: And in the North, to this Day,

Vol. II.

a *Daysman* is an Arbitrator, Umpire, or Judge; and so 'tis translated in our English Bible, in *Job. ix. 33*. *Domes-day Book* therefore is no more than the Book of *Judicial Verdict*, *Decretory Sentence*, or *Dooming of Judgment*. *Kennet's Paroch. Antiq. in Gloss.*

DORMANT Tree, is a Word used in Architecture, by some Workmen, for a great Beam lying a-cross the House; which is usually called a *Summer*.

DORMER, in Architecture, is a Window made in the Roof of an House, and it stands upon the Rafters.

DONATIVES. See *Benefices*.

DOUBLE Quarrel, is a Complaint made by any Clerk or other to the Archbishop of the Province against an inferior Ordinary, for his delaying of Justice in some Cause Ecclesiastical; as to give Sentence, to institute a Clerk presented, &c. The Effect whereof is, That the Archbishop taking Knowledge of the Delay, directs his Letters, under his Authentick Seal, to all and singular Clerks in his Province, thereby Commanding and Authorizing them, and every of them, to admonish the said Ordinary, within a certain Number of Days (*viz. 9.*) to do the Justice required; or otherwise to cite him to appear before him or his Official, at a Day in the said Letters prefixed, and there to alledge the Cause of his said Delay. And lastly, to intimate to the Ordinary, That if he neither perform the Thing enjoined, nor appear at the Day assign'd, he himself will, without further Delay, proceed to perform the Justice required. And this seems to take its Name of *Duplex Querela*, from its being most times made both against the Judge and him at whose Petition Justice is delayed. *Cowel's Interpreter*.

DOUBLE Aspect, a Term in Painting. See *Aspect Double*.

DOUBLE Point. When all the Right Lines tending the same Way, with the Infinite Leg of any Curve, do cut it in one only Point (as happens in the Ordinates of the *Cartesian*, and in the *Cubical Parabola*, and in the Right Lines, which are parallel to the Abscissæ of Hyperbolism-Hyperbola's and Parabola's) then you are to conceive, that those Right Lines pass thro' two other Points of the Curve (as I may say) placed at an Infinite Distance. And those Coincident Intersections, whether they be at a Finite or at an Infinite Distance, Sir *Isaac Newton* calls the *Double Point*: And how such Curves as have a Double Point are describ'd, see under *Curves*.

DOUBLING the Cape or a Point of Land, in Navigation, signifies to come up with it, pass by it, and so to leave it behind the Ship.

DOVETAILING, in Architecture, is a Way of fastening Boards or Timber together, by letting one Piece into another indentedly, with a *Dovetail Joint*, or with a Joynt in the Form of a Dove's Tail.

DRAGON Beams, in Architecture, are two strong Braces, or Struts, which stand under a Breast Summer, and meet in an Angle on the Shoulder of the King-piece.

DRAGGS, in a Ship, are by the Seamen accounted whatever hangs over the Ship in the Sea, or is towed after the Ship in the Water, &c. Such as *Clothes*, a *Boat*, &c.

DRAUGHT-Hooks, are large Iron Hooks fixt on the Checks of a Cannon Carriage, two on

E c 2

each

each Side, one near the Trunion Hole, and the other at the Train. Large Guns have *Draught-books* near the middle *Transum*, to which are fix'd the Chains which serve to ease the Shafts of the *Limbers* on a March.

DRAW-Bridges, are made after several Fashions, but the most common are made with *Plyers* twice the Length of the Gate, and a Foot in Diameter: The inner Square is travers'd with a *St. Andrew's Cross*, which serves for a Counterpoise, and the Chains which hang from the other Extremities of the *Plyers*, to lift up or let down the Bridge, are of Iron or Brass.

DRENCHES, or *Drenges* (*Lat. Drengi*) some ancient *MS.* say, were Tenants *in Capite*: Such as at the Conquest being put out of their Estates, were afterwards restor'd by King *William*, because they being Owners thereof, were neither against him by their Persons or Councils. *Co. on Lit. Fo. 6.* says, these *Drenches* are Free Tenants of a Manor.

DRENGAGE, was the Tenure by which the *Drenches* held their Lands.

DRIFTWAY of a Ship, the same with *Lee-way*.

DUCTILITY. Captain *Halley*, in *Philosoph. Transf. N. 194*, gives this further Account of the extreme Ductility, and exceeding Minuteness of the Parts of Gold. 'Tis evident, that Gravity is in all Bodies proportional to the Quantity of Matter in each; this is known by undoubted Experiment, so that there is no such Thing as a Propension of some more, others less, towards the Earth's Centre, since the Impediment of the Air being remov'd, all Bodies descend, be they never so loose or compact in Texture, with equal Velocity. It follows therefore, that there is 7 times as much Matter in a Piece of Gold, as in one of Glass of the same Magnitude, (their specifick Gravities being as 7 to 1 nearly) and consequently, that at least 6 Parts in 7 of the Bulk of the Glass must be Pore or Vacuity. This some Favourers of the Atomical Philosophy have endeavour'd to solve, by supposing the Primary or Constituent Atoms of Gold to be much larger than those of other Bodies, and consequently the Pores fewer. In order to examine this, he inform'd himself by the

Wire-drawers, that every best *Double-gilt Wire* was made out of Cylindrick Ingots of Silver, four Inches in Circumference, and 28 Inches long, weighing 16 lb. Troy. To gild these, they bestow 4 oz. of Gold; that is, to every 48 oz. of Silver, one of Gold. They inform'd him also, that two Yards of superfine Wire weighs just one Grain. Hence at first Sight it appear'd, that the Length of 98 Yards of Wire is in Weight 49 Grains, and that a single Grain of Gold covers the said 98 Yards; and further, that the 10000th Part of a Grain is above one 3d of an Inch in Length, (or longer than a Barley Corn) which Length may actually be divided into 10 Parts, and consequently the 100000th Part of a Grain of Gold be visible without a Microscope. And by reason of the Specifick Gravities of the Metals, viz. Silver $10\frac{1}{2}$ and Gold $18\frac{1}{2}$; he found the Diameter of such Wire to be $\frac{1}{1120}$ th Part of an Inch, and its Circumference $\frac{1}{112}$ th Part of an Inch; but the Gold did not exceed in Thickness $\frac{1}{1120}$ th Part of an Inch. Whence it may be concluded, that the Cube of an hundredth Part of an Inch would contain above 2433000000 (or the Cube of 1345) such Atoms. And yet tho' the Gold be stretch'd to such a prodigious Degree as is here demonstrated, it still shews itself of so even and united a Texture, as not to let the white Colour of the Silver that lies under it appear (even by a Microscope) thro' any the least Pores. Which argues, that even in this exceeding Thinness, very many of those Atoms may still lie one over the other.

DULEGE, in Gunnery, is a Peg of Wood, which joyns the Ends of the 6 *Fellows*, which form the Round of the Wheel of a Gun-Carriage; and the Joint is strengthen'd on the Out-side of the Wheel by a strong Plate of Iron call'd the *Duledge Plate*.

DUPLEX Querela. See *Double Quarrel*.

DUPLICATE, is used by *Crompton* for Second Letters Patents granted by the Lord Chancellor in a Case wherein he had formerly done the same, and was therefore thought void. But any Transcript or Copy of a Writing may be call'd a Duplicate.

E A R

EALDERMAN, was a Title among the Saxons, of the same Import as *Earl* among the Danes, and signified an *Elder* or *Statesman*; such an one as the Romans call'd *Senator*: And to this Day we use the Word *Alderman* in the same Sense for an Associate to the Chief Officer in the Common Council of any Town or City, and sometimes for the Chief Officer himself.

EAR. The former Account (in Vol. I.) of this Curious Organ not being so satisfactory as I could wish it, I have here inserted Dr. Keill's Anatomy of the Ear.

The Ear is divided into the External and Internal. The External Ear (whose Parts have already been describ'd) is composed of the Skin, a Cartilage, and a little Fat. The Skin of this Part is thin and smooth, it sticks close to the Cartilage by means of a fine Membrane. The Cartilage is in that Part of the External Ear call'd the *Pinna*; and the Fat in that Part call'd the *Lobe*. The Vessels of the External Ear, are Arteries from the *Carotidale Veins*, which go to the *Jugulares*, and the Nerves from the *Portio Dura*, and second Pair of the Neck.

The External Ear is tied to the *Os Petrosum* by a strong Ligament, which comes from the Back-side of the *Pinna*. Though the Ear has but a very obscure Motion, yet it has two Muscles: The first arises from the Outside of the Frontal Muscle, where it joins the *Crotaphite*, and is inserted into the Upper and Back-part of the *Pinna*. The second arises from the upper and foremost Part of the *Processus Mamillaris*, and is inserted into the middle and back Part of the *Concha*. The first should draw the Ear upwards, and the second downwards and backwards; but the continual binding of our Ears when young, deprives us of their Use. The Use of the External Ear is to gather the Sounds, and to carry them to the Internal. Its Inequalities and Circles do moderate the Violence of the Air.

The Internal Ear begins at the Conduit which goes from the Middle of the *Concha* to the *Tympanum*: it is call'd *Meatus Auditorius*. It is cartilaginous from the *Concha* till within a little of the *Tympanum*, where it is bony; yet this Cartilage goes not compleatly round, for towards the Temple its Edges do not meet by above a Line. The Passage is crooked, running first upwards and then downwards to the *Tympanum*. It is covered within by a pretty thick Membrane. Betwixt this Membrane and the Cartilage, especially where it is slit, there are a great Number of little Glands, whose Excretory Channells piercing this Membrane, carry a yellow sort of Excrement into the *Meatus*, which hinders Insects or any other thing to enter the Ear.

At the further Extremity of this Conduit, there is a thin transparent Membrane stretch'd out like the Head of a Drum, upon a bony Circle, which wants about half a Line of being compleat. The Handle of the *Malleolus* is tied to this Membrane, which it draws somewhat inwards, making it a little Concave towards the *Meatus Auditorius*: And there runs a small Twig of a Nerve from the fifth Pair upon its Inside, call'd *Chorda Tympani*; for the Membrane it self is call'd *Tympanum*.

E A R

Behind this Membrane there is a pretty large Cavity call'd the *Barrel*; it is about three or four Lines deep, and five or six wide. It is lined with a fine Membrane, on which there are several Veins and Arteries. It is always full of a purulent Matter in Children. In this Cavity there are four small Bones, of which,

The first is the *Malleolus*, or Hammer, so call'd because of its Shape. Its Head has on its lower Side two Protuberances, and a Cavity whereby its joyned to the *Incus* by *Ginglymus*: Its Handle, which is pretty long and small, is fastened to the *Tympanum*. Near its Head it has two small Processes, and it is moved by three Muscles.

The first is call'd the *Externus*; it arises from the upper and external Side of the *Meatus Auditorius*, and is inserted into the upper and longer Process of the *Malleolus*, which it draws outwards. This is necessary when Sounds are too great, which might break the *Tympanum*.

The Second is the *Obliquus*; it lies in the External Part of the Conduit which goes to the Palate, and entering the *Barrel*, it is contained in a Sinuosity of the Bone by the upper Edge of the *Tympanum*, and is inserted into the slender Process of the Hammer, assisting the former Muscle in its Action.

The Third is the *Internus*, which arises from the Extremity of the bony Part of the Conduit which leads to the *Fauces*, and lies in a *Sinus* of the *Os Petrosum*, till it passes over a little Rising of the Bone at the *Fenestra Ovalis*, to be inserted into the posterior Part of the Handle of the *Malleolus*. This Muscle, by pulling the Hammer inwards, distends the *Tympanum*.

The Second small Bone is call'd *Incus*, the Anvil: It has a Head, and two Legs. Its Head has a Protuberance, and two Cavities, whereby it is articulated with the Hammer; the shorter of its Legs is tied to the Side of that Conduit which goes to the *Processus Mamillaris*, and its longer Leg to the Head of the Third Bone, call'd,

The *Stapes* or Stirrop, because of its Resemblance. 'Tis of a Triangular Figure, being made of two Branches set upon a flat Basis, which stands upon the *Foramen Ovale*. The Space between the two Branches is fill'd up by a fine transparent Membrane; the Union of the two Branches is call'd the Head of the Stirrop, in which there is a small Cavity, in which lies the Fourth Bone. There is a small Muscle which arises out of a small Canal in the bottom of the *Barrel*, and which is inserted into the Head of the Stirrop.

The *Os Orbiculare*, which is a very small Bone, being Convex on that Side which is received in the Cavity of the Head of the Stirrop, and hollow on the other Side, where it receives the long Leg of the Anvil, which is only joyned to the Stirrop by means of this Fourth Bone.

Besides these Bones, there are several Holes in the *Barrel*. The First is in its Fore-part nearest the *Tympanum*. It is the Entry to the *Sinus* in the Mammillary Process. The Second is the Orifice of a Conduit, which opens behind the Palate of the Mouth. The Beginning of this Conduit is bony; and its Extremity, which is near the

Vulva,

Utricle, is membranous. Part of the Air which we breath, enters by this Conduit into the Ear. The Third and Fourth are in the Internal Process of the *Os Petrosum*. The one is called *Fenestra Ovalis*; the Basis of the Stirrop stands upon it; it is the Entry to the *Vestibulum*. The other is called *Fenestra Rotunda*; it is covered by a fine Membrane, inclosed in a Rift of this Hole; it leads to the *Cochlea*.

The *Vestibulum* is a Cavity in the *Os Petrosum*, behind the *Fenestra Ovalis*; it is covered with a fine Membrane: In it open the Semi-circular Pipes of the Labyrinth. The upper Turning of the *Cochlea*, and the Auditory Nerve, pierces into it also.

The *Labyrinth* is made of three Semi-circular Pipes excavated in the *Os Petrosum*; they open by five Orifices into the *Vestibulum*. That which is called the Superior Pipe, joins one of its Extremities with one of the Extremities of that which is call'd the Inferior Pipe; and these two Extremities open by one Orifice, but the middle Pipe opens at each End by it self into the *Vestibulum*.

The last Cavity of the Ear is the *Cochlea*; it resembles a Snail's Shell. Its Canal, which winds in a Spiral Line, is divided in two, the Upper and Lower, by a thin *Lamina Spiralis*. The Edge of this *Lamina* is membranous, where there are several Holes, through which Twigs of the Auditory Nerve pass from the one Canal to the other. The Upper Canal opens into the *Vestibulum*, and the Lower into the Barrel, by the *Fenestra Rotunda*.

The Vessels of the Internal Ear are Arteries and Veins from the Internal Carotides and Jugulars. The *Nervus Auditorius* enters by the Hole in the Internal Process of the *Os Petrosum*. It consists of two Bundles, of which one is hard, the other soft. Its *Portio Mollis* is distributed through all the *Cochlea* and *Labyrinth*, and the *Portio Dura* is bestowed on the External Parts about the Ear.

Sounds being gather'd by the External Ear, pass through the *Meatus Auditorius*, and beat upon the *Tympanum*, which moves the four little Bones in the Barrel. In like Manner as it is beat by the External Air; these little Bones move the Internal Air which is in the Barrel and *Vestibulum*: which Internal Air makes an Impression upon the Auditory Nerve in the *Labyrinth* and *Cochlea*, accordingly as it is moved by the little Bones in the Barrel. So that, according to the various Refractions of the External Air, the Internal Air makes various Impressions upon the Auditory Nerve, the immediate Organ of Hearing: These different Impressions represent different Sounds.

See *Maria Valtalva de Aure Humana Tractatus*.

EARL, anciently was the Title given to such as were Associates to the King in his Councils or Martial Expeditions; as *Comes* was to those who followed the Magistrates of Rome, as their Deputies to execute their Offices for them; and this Title died always with the Man. The old Way of making Earls was only *Cincturam Gladii Comitatus*, without any formal Method of Creation. But William the Conqueror, saith Camden, gave this Dignity in Fee to his Nobles, annexing it to this or that County, and allotting them a Proportion of Money, arising from the Prince's Profits, for the Pleadings and Forfeitures of the Province: Now, and long since, Earls are made by the

Kings of England, by their Charters; but without any Authority over any County, and without any Profit arising from thence, but some Annual Stipend out of the Exchequer for Honour's Sake. The Solemnity of their Creation you may find at large in Stow's Annals. Their Place is next after a Marquis, and before a Viscount.

EARTH. There have been several Methods thought of to find the Magnitude of the Earth: As, 1. To find its Diameter, by having the Height of some very eminent Mountain, and the Length of a Visual Ray, that shall be a Tangent to the Earth's Surface at some considerable Distance from the Top of the Hill: For the Square of such a Tangent being (by 35 E. 3.) equal to the Rectangle, under the whole Line made by the Earth's Diameter, and the Height of the Mountain together, if you divide DCA by CB , i. e.

the Square of the Distance, from the Top of the Hill to the Earth's Surface, by the Hill's Height, the Quotient will be the Line CE , (viz.) the Aggregate of the Earth's Diameter and the Mountain's Height; the latter of which being given, the former is so.

2. Let a Spectator on the Top of a high Hill, as at C , with an Instrument, take the Angle DCB ; which may best be done by the Help of the Sun or Moon's being in the Horizon; for that Way the Horizon will be the most accurately determin'd. Then the Length of the Tangent CD , being some-how known, in the Right angled $\triangle DCA$, the Line DA = to the Earth's Semidiameter may easily be drawn, and its Length found by Calculation.

3. The Angle DCA being taken, and the Mountain's Height CB known; the Earth's Radius BA may be had without knowing the Distance CD : For in the $\triangle DCA$ all the Angles are known, and the Length BC is only the Excess of the Secant CA above the Radius BA or AD ; wherefore by the Tables of Sines, Tangents, and Secants, the Radius AD will be known.

There is also another way a-kin to these, of finding a Part of the Circumference of a great Circle on the Earth, by having the Altitude of two high Mountains, and their Distance from each other. But none of these Ways can be depended upon, tho' they are built upon Geometrical Principles, and are great Instances of the due Thought and Penetration of the Inventers; because there will be so many unavoidable Difficulties in the different Refraction of the Atmosphere, in taking the exact Height of the Mountains, or the Distance of their Tops from the Earth's Surface in D , that there can nothing certain be determin'd from hence. The

The best Method therefore to gain this Point, is that which Mr. Norwood here in England, and Mr. Picart in France, proceeded in; which was to measure the Distance, in Miles, or rather in Yards or Feet, between two Places situate under the same Meridian, and at least a Degree one from another; that so the Number of Miles contain'd in one Degree of a great Circle of the Earth, being exactly known, the Earth's Circumference will be easily had by only multiplying those Miles by 360. And this the French Mathematicians seem to have done so nicely, that hardly any thing more exact is to be expected. They make the Ambit of the Earth to be 123249600 Paris Feet; that is, nearly, 131630573 English Feet, or 24930 of our Statute Miles. Whence the Diameter must be 41899310 English Feet, and nearly 7935 Statute Miles.

EARTH. Dr. Hook, in *Op. Post.* p. 467. saith, that the Semidiameter of the Earth, from the most accurate Observations that ever were made, is $3962\frac{3}{4}$ Statute Miles; or more exactly $20923500\frac{3}{4}$ Statute Feet.

Since 'tis known that the Orbit of the Earth is Elliptical, and that its Motion round the Sun is slowest in the *Aphelion*, and swiftest in the *Perihelion*; the Consequence is, that the Places of the Earth's *Aphelion* and *Perihelion* may be found by Observation of her slowest or swiftest Motion. And the Places of these *Aspides*, as they are called, may be found also by the Sun's Apparent Diameter; which will be least when the Earth is in her *Aphelion*, and greatest in the *Perihelion*: But their being some Difficulty in measuring this accurately, the former Way of finding the Place of the Earth's *Aspides* is the best.

The Motion of the Earth's *Aphelion* is only Apparent, and not Real; but it answers to the Procession of the Equinoxes, which is annually about 50 Seconds.

EARTH. In the Year 1679, an Experiment being suggested to try, whether the Earth moved with a Diurnal Motion or not, by the Fall of a Body from a considerable Height, alledging it would fall to the East of a true Perpendicular: Dr. Hook read before the R. Society a Discourse on that Subject, wherein he endeavoured to explain what Curve the falling Body would describe; and in particular, he asserted, that the Fall of the Body would not be directly East, but to the South-East, and more to the South than the East. And on several Trials made, the Ball did always fall to the South-East. *Hook's Life*, in *Op. Post.* p. 22.

EARTH. If you suppose an heavy Body to descend 15 Feet in the first Second of Time, Mr. Keill saith, it follows by Calculation, (See *Exam. of Burnet's Theory*, p. 117, 118.) That the Force of Gravity, to the Centrifugal Force, in a Body placed at the Equator of our Earth :: is as 289 to 1. So that by the Centrifugal Force arising from the Earth's Rotation, any Body placed in the Equator will lose a 289th Part of its weight which it would have were the Earth at Rest.

And since there is no Centrifugal Force at the Poles, a Body there weighs 289 lb. which, at the Equator would weigh but 288 lb.

And p. 123. He shews;

That on our Earth, the Decrease of Gravity, in going from the Pole towards the Equator, is always as the Square of the Cosine of the Latitude.

EARTH. According to Sir Isaac Newton's Principles, Lib. 3. Prop. 21. The Axis of the Earth

doth, in every Annual Revolution of the Earth round the Sun, twice incline towards the Ecliptic, and twice return to its former Position; and on this Nutation of the Earth's Axis depends the Recession of the Equinoctial Points; and, as Mr. Flamsteed thinks, the Annual Parallel of the fixed Stars.

The Annual Regression of the Earth's Nodes, is about 50 Seconds, and the Nutation of her Axis, about 42 Thirds.

EARTH. Dr. Gregory, *Astron. Phys. & Geom.* p. 76. That by reason of the Figure of the Earth, the Equinoctial Points do recede; and that the Axis of the Earth, in every one of its Annual Revolutions round the Sun, doth twice change its Inclination to the Ecliptic, and as often return again to its former Inclination of 66 Deg. and half.

EASEL-Pieces, in Painting, are such small Pieces, either Portraits or Landscips, which are painted on the Easel; (the Frame on which the Painter places his strain'd Canvass) and are so called to distinguish them from larger Pictures, which are drawn on Cielings, Roofs, or the Walls of Rooms.

EASEMENT, (*Aisiumentum*) in the Law, is a Service which one Neighbour hath of another, by Charter or Prescription, without Profit; as a Way through his Ground, a Sink, &c. and this, in the Civil Law, is called *Servitus Predii*.

EAVESLATH, in Architecture, is a thick scather-edg'd Board, nail'd round the Eaves of a House, for the lowermost Tiles, Slate, or Shingles to rest upon.

EBDOMADARIUS, was formerly an Officer, so called in Cathedral Churches, appointed Weekly to supervise the Regular Performance of Divine Service, and other Duties of the Choir; and at the Beginning of each Week he drew up a Bill (which was called *Tabula*) of the Respective Persons attending the Service of the Choir, and of their Duties allotted them; and those Persons which were entered in this Bill were called *Intabulati*.

ECCENTRICITY of the Earth, in the new Astronomy, is the Distance between the Focus and the Centre of the Earth's Elliptick Orbit: How to find which, Mr. Whiston shews, p. 90. of his *Prelect. Astron.* from the Apparent Motion of the Sun, compared with the two Extrems of the *Aspides*. For since the True Velocity of the Earth in her *Aphelion* and *Perihelion* is in a Reciprocal Ratio of her Distances from the Sun; and that the Apparent and Angular Velocity is in a duplicate Ratio of her Distances reciprocally; from the Apparent Difference of these two Velocities, the Difference of the Distances, or the double Eccentricity, will easily be known. The Eccentricity of the whole Distance is, at a mean, about a 60th Part, or, more accurately, $\frac{3486}{10000}$.

ECHO. Dr. Plot, in his *Natural History of Oxfordshire*, Cap. 1. distinguishes Echoes into such as are, 1. Single, which return the Voice but once; and of these, some may be called *Tonical*; because they will not return the Voice but when modulated into some peculiar Musical Note: And others *Poly syllabical*; because they will return many Syllables, Words, and Sentences; and sometimes a whole Hexameter Verse.

2. *Manifold* or *Tautological*, which return Syllables and Words the same oftentimes repeated.

In the *Poly syllabical* and *Articulate* Echoes, the Place where the Speaker stands is called the *Centrum Phonicum*; and the Object or Place that returns

turns the Voice is called the *Centrum Phonocampiticum*. He saith, he experienced what *Blancanus* writes in his *Echometria*, Theor. 5. That no one Syllable can be distinctly and clearly returned under the Distance of 24 Geometrical Paces, or 120 Feet. But by some Experiments I have made, I judge that Distance to be too large, as well as that of *Mersenus*, of 69 Feet, to be too little: And perhaps some Places may return the Voice sooner, and some later, than others; which it would be worth while to try, where there is a Convenience of measuring perpendicularly from the *Centrum Phonocampiticum*. When I was about 16 Years of Age, having Dr. Plot's Book to direct me, I remember well, that I found an Echo, whose *Centrum Phonicum* was on the North Side of Shipley Church in the Wild of *Sussex*; and which would repeat distinctly these Words, in the Night;

*Os Homini sublime dedit, Cælumque tueri
Jussit & Erectos-----*

especially, if you spoke the first Syllable very strong, and all the rest pretty fast. I measured then also the Distance very accurately, but the Papers are lost, and I can pronounce nothing certainly about them; but only that it was much the finest and most distinct Echo that ever I tried; tho' I tried the famous one at *Woodstock* several Times, after I went to *Oxford*.

ECLIPSE of the Sun. In order to observe an Eclipse of the Sun accurately, Mr. *Flamsted* directs to cast the Species of the Sun through a good Telescope, of a tolerable Length, on an extended Paper behind the Eye-Glass; and so far as that the said Species may appear at least 6 Inches over. And then to divide both the Periphery of a Circle, equal to that, and drawn on the Paper, into 560 gr. for the better observing the Cusps of each Phasis; and also the Diameter into Digits, and their Parts, by Concentrick Circles, for measuring the Quantity of the obscured Parts. When you look at an Eclipse of the Sun, the best and readiest way to save the Eye, is to take a Piece of plain Looking-glass Plate, and black one side of it over the Flame of a Candle; and then look through it at the Sun. And if you use a Telescope, such a black'd Glass must be between your Eye and the Eye-glass.

To determine the Moment of the Immersion, Duration, and other Requisites of a Solar Eclipse: Vid. *Whiston's Praelect. Astron.* p. 160. and of a Lunar, p. 150.

ECLIPSES. 'Tis now discovered, that Lunar Eclipses do not arise from the Interposition of the Earth's Body between ☉ and her, but only from the Interposition of her Atmosphere.

Of which, and all the Phenomena of Eclipses, see *Whiston's Praelect. Astron.* p. 135.

EDICT, in the Civil Law, is any thing that the Emperor establishes of his own Accord, that it may be generally observed by every Subject. And this differs both from a Decree, or a Pragmatick Sanction.

ELASTICITY. The Cause of the Elasticity of Fluids, such as our Air, may easily be accounted for, from their Particles being all endowed with a Centrifugal Force, like what Sir *Isaac Newton* mentions in *Prop. 23. lib. 2.* of his Excellent *Principia*. And to solve the Springiness or Elasticity of solid and firm Bodies, we must have Recourse to another universal Law of Nature, *Attraction*; by which the Parts of solid and firm

Bodies are caused to cohere together. When therefore hard Bodies are either bent or struck, so that the Component Particles are a little moved from one another, but not quite disjoined and broken off, nor separated so far as to be out of the Power of that Attracting Force, by which they cohere together; they certainly will, on the Cessation of the external Violence, spring back with a very great Velocity to their former natural State: Supposing, as I said before, that the Particles are not separated by the Flexure, or the Shock, so far from one another, as that the Atoms of any foreign Fluid can get in between them, and hinder the Attractive Force; for then, as soon as ever the separating Force ceases, the Attractive will act, and bring them back to their former State.

ELECTION, in Numbers, with Regard to Combinations, is the several Ways of taking any Number of Quantities given, without having respect to their Places. Thus the Quantities *a, b, c*, may be taken 7 Ways; as *abc, ab, ac, bc*, and *a, b, c*.

See *Schooten* in his *Miscellanea*; and *Strode* of *Combinations*. See also the Word *Combination*.

ELECTRICITY. In *Phil. Tran.* N. 308. there is an Account of an Experiment made before the R. S. at *Gresham College*, touching the extraordinary Electricity of Glass, produceable by a smart Attrition of it, with some odd Phenomena thereon depending: As, that Moistness will at any Time hinder the Electrical Attraction: That the Interposition of the finest Lawn or Muslin between the Body heated by rubbing, and the Light Bodies to be attracted, will deprive it of all Electrical Force: That when the Electrified Body (which was a Tube of Glass of 1½ in Diameter, and 30 in Length) became hottest by the greatest Rubbing, it sent forth Effluvia that might sensibly be felt to strike against your Face, when the Tube was held near it: That exhausting the Tube of Air by the Pump, did almost totally deprive it of its Electrical Force, tho' rubb'd never so much, &c. All which Experiments I have often made myself, and find to be very truly related there. 'Tis observable, that on rubbing the Tube in the Dark, a Light would be produced; which was greater when the Tube was exhausted of Air, and then seem'd to be all within the Tube; and when another Hand, or ones Finger was held near the Tube in the dark, a Light was seen to break from it, with a snapping Noise like that of a green Leaf in the Fire, but not so smart and loud.

He got also a Cylindrical Glass, and caused it by the Contrivance of a Wheel to be briskly turned round in an Horizontal Position: When this Glass, being exhausted of Air, was turn'd round its Axis, a considerable Light would be produced, by the Attrition of ones Hand on the Outside; and when the Air was let in, it was surprising to see, that on the Application of ones Finger towards the Glass, a vigorous Light would be produced, which began at the Finger first, and seem'd to gravitate on it, and was sensibly to be felt there, at half an Inch distance from the revolving Glass. And this Purple Light was visible, even by Day, or in the Light. Mr. *Hawksbee* contrived also, that some loose Threads should be fasten'd at one End to a Circle of Wire, which was fasten'd at Right Angles to the Axis of the Glass, and within it; and then we observ'd several times, that when the Glass was swiftly moved round, and, by that means, strongly rubbed and heated, all those loose Threads would stand upright, and point

point directly towards the Axis of the revolving Glass.

He afterwards fix'd the Lower Ends of Threads into a Circle of Cork, which was placed at Right Angles to the Axis as before, but the upper Ends of the Thread hang loose; but as soon as the Glass was turn'd round as before, rubbed and warmed, the Threads would stand up an End in the same Plane with the Circle they were fastened to; and would point directly from the Axis towards the inward Surface of the Glass; unless when moved by the Application of ones Finger without; which would, surprisngly, make them bend and point towards it.

ELLIPSIS. To describe this Figure readily by means of the Sector, see *Analemma*, Vol. 1.

EMBER-WEEKS, are those Weeks in which the *Ember-Days* fall. In the Laws of K. *Alfred*, c. 39. and in those of *Canute*, c. 16. they are called *Ymbren*, i. e. *Circular Days*; from whence they are corrupted into *Ember-Days*: And by the Canonists they are called, *Quatuor Anni Tempora*, the Four Cardinal Seasons on which the Circle of the Year turns: They are the *Wednesday*, *Friday*, and *Saturday*, after *Quadragesima Sunday*; after *Whitsunday*; after *Holy-rood Day*, in *September*; and after *St. Lucy's Day*, in *December*: Which four Times answer well enough to the four Quarters of the Year, Spring, Summer, Autumn, and Winter. And Mr. *Somner* thinks, they were Fasts instituted to beg God's Blessing on the Fruits of the Earth. These *Ember-Weeks* are now chiefly taken notice of on the Account of the Ordinations of Priests and Deacons; because the Canon now appoints the Sundays next succeeding the *Ember-Week*, for the Solemn Times of Ordination. Tho' the Bishops, if they please, may ordain on any Sunday or Holyday.

EMBRACERY, is the Offence of an *Embracur*; to pre-instruct the Jury.

EMBRE, or *Embring-Days*, are those by the Antients call'd *Quatuor Tempora*, and are of great Antiquity in the Church; being observed on the *Wednesday*, *Friday*, and *Saturday* next after *Quadragesima Sunday*, *Whitsunday*, *Holy-Rood Day*, in *September*, and *St. Lucy's Day*, in *December*, 2 & 3 *Edward VI.* c. 19.

EMENDATIO, in the Law, is the Power of amending and correcting Abuses according to stated Rules and Measures: As.

EMENDATIO Panni, is the Power of *Aulnage*, or *Ulnage*, or looking to the Affize of Cloth, that it be of the just Ell, or due Measure.

EMENDATIO Panis & Cervisie, is the Affize of Bread and Beer; or the Power of supervising and correcting the Weights and Measures belonging to them.

EMETICKS. Dr. *Cheyne*, in his Book of Fevers, says, the Action of vomiting by a Medicine is produced thus: The Particles of the Vomitory, by wedging themselves into the Orifices of the *Emissaries* of the Glands which are placed adjacent to the Surface of the Stomach, do Dilate the same (which by some extrinsical Cause had been contracted) and after the same Manner do Dissolve (at least in some Degree) the Cohesion of the Stagnant *Morbifick* Matter, rendring it more fluid, and consequently, making its Resistance less. Now the natural and constant Action of the Glands being *Secretion*; and the Impediment (by the Dilatation of the Orifice, and the Attenuation of the Fluid) being taken away, or at least

Vol. II.

made less than the natural *Momentum* of the Glands, the Matter must necessarily flow into the Cavity of the Stomack, till it be heap'd up in such a Quantity (which not being to be done in an Instant, must require some Time) as is sufficient (by the united Loathsomeness, and the *Vis Stimulans* of the Emetick) to villicate and force the Fibres of the Stomach, *Abdomen*, and *Diaphragm* (by the Communication of the Nerves of the First with the two last) into a violent Contraction, and thereby, throw all out by the *Oesophagus*; and this makes all quiet for a while, till a new and sufficient Quantity be excerned from these Glands to reproduce the aforesaid Contraction. And thus there happens a Fit of Vomiting and Quiet alternately, till either all the *Morbifick* Matter be thrown out, or the Force of the Emetick is so dilated, that it is no longer able to elicit the *Morbifick* Matter from the Glands. And the Strong Contraction in so many Muscles and Muscular Canals as are at work in the Action of Vomiting, and the Violent Concussion which is produced over the whole Body, by a Power which, by just Computation, is not inferior to that of 26000 lb. Weight, may, and often does take away the Obstructions in many other Canals besides those which are adjacent to the Stomach and Gullet; as we may plainly see by those vast Sweats which plentiful Fits of Vomiting occasion. *Emeticks* and purgative Medicines differ only in this, that the Particles of the latter do not immediately villicate the Fibres of the Stomach, dilate the Orifices, and attenuate the Matter contain'd in the Glands of the Stomach, but act gently, and assist the natural Motion of Digestion, and so are carried down into the Intestines; and how they operate there, see under *Purgatives*.

EMINENTIAL Equation, is a Term used by the Algebraists in their Investigation of the Areas of Curvilinear Figures; and is so called, because 'tis an Artificial Equation, which contains another Equation eminently. See *Hayes's Fluxions*, p. 97, &c.

EMISSARY of a Gland, is the common Conduit, Canal, or Pelvis, in which all the little Secretory Canals of a Gland do terminate. See *Gland* and *Animal Secretion*.

EMPHYTEUSIS, in the Civil Law, is a Contract made by Consent, but created by the Roman Law, and not the Law of Nations; by which Houses or Lands are given, to be possess'd for ever, upon Condition that the Lands shall be improv'd, and that a small yearly Rent shall be paid to the Proprietor. The Tenant is call'd,

EMPHYTEATA, because of his being under an Obligation of planting and improving the Land.

EMPTIO-Venditio, in the Civil Law, is that Contract, by Consent only, which we call Buying and Selling, whereby the Seller is bound to deliver the Goods, and the Buyer to pay the Price for them, according to the Bargain.

EMPYREUMA, is that Taste and Smell of Fire, which some Things, too hastily distill'd, retain.

ENCAUSTICE, is the Art of Enameling.

ENCHESON, is a French Word often used in our Law-Books; and seems to signify, the Occasion, Reason, or Cause of any Thing's being done.

ENCOLAPTICE, is the Art of making Plates of Brass, and cutting in the Figures or Letters for Monumental Inscriptions and Laws.

F f

ENGINE

ENGINE for Rowing Ships : The Figure of this Engine being omitted in *Vol. I.* is here added.

Description.

- | | |
|---|--|
| <p>A. The Line the Ship makes.
 B. The Water Line.
 C. The Decks.
 D. The Capstand Barrs.
 E. The Capstand.
 F. A Wheel on the Drum-head of the Capstand.
 G. A Trundle-head on the Wheel.
 H. An Iron Bar going through the Trundle-head, and thorough the Sides of the Ship.
 I. Two Drum-heads like those on the Capstand.</p> | <p>K. Paddles, of which Six, or Eight on each Side the Ship, are with Ease Fixed and Unfixed into the said Drum-heads.
 L. A Piece of Iron, to which a Luff-Tackle may be Fix'd, to lift those that are too Heavy for Mens Strength, round each of which, by taking half Turns with a Cord, you make a Compleat Wheel on each Side the Vessel.</p> |
|---|--|

ENGLECRY, *Engleceria*, is an old Word signifying to be an *Englishman*: For in the Time of the *Danes*, if a Man were privily slain or murdered, it was accounted *Fracigena*, which Word then comprehended every Alien, until *Englecery* was prov'd, that is, 'till it was made manifest that he was an *Engliffman*. *Vid. Bracton, Lib. 3. Tract. 2. Cap. 15. Fol. 134.* But there being many Abuses and Troubles about this Engle-

cery, it was taken away by 14 E. III. cap. 4.

ENURE, in the Law Sense, signifies to take Place, or Effect, or to be Available. As a Release shall *Enure* by way of Extinguishment; and a Release made to a Tenant for Term of Life, they say, shall *Enure* to him in Reversion.

EPICYCLOID, is a Curve generated by the Revolution of the Periphery of a Circle along the Convex

Convex or Concave Part of another Circle; which Part of this other Circle is call'd the Base of the Epicycloid; as in this Figure, DB is the Base of

the Epicycloid; V its Vertex; VB its Axis; DPV half of the Exterior Epicycloid; made by the Revolution of the Semicircle VLB , (which is called the Generant) along the Convex Side of the Base DB : As DPV is the Interior Epicycloid, formed by the Generant's revolving along the Concave Side of the Base.

How a Portion of this Epicycloid is squarable, see *Phil. Trans.* N. 217. by Mr. Caswell, and in *Phil. Trans.* N. 218. you have a general Proposition for measuring the Areas of all Cycloids and Epicycloids. How to find the Evoluta to this kind of Curve, as also to find the Areas of Cycloidal and Epicycloidal Spaces. See *Hayes's Fluxions*, p. 210, &c.

EPISCOPALE Onus. See *Episcopalia*.

EPISCOPALIA, are Synodials, Pentecostals, and other Customary Payments, from the Clergy to their Diocesan Bishop; which Dues were formerly collected by the Rural Deans, by them transmitted to the Bishop.

These Customary Impositions were called *Onus Episcopale*, and were by special Privilege remitted to those free Chapels as were built on the Demesne of the King, and exempt from Episcopal Jurisdiction.

EQUATED Bodies. On Gunter's Sector there are sometimes placed two Lines, answering one another, and called, *The Lines of Equated Bodies*: They lie between the Lines of Solids and Superficies, and are noted with the Letters D, I, C, S, O, T , for Dodecahedron, Icosihedron, Cube, Sphere, Octahedron, and Tetrahedron.

Their Uses may be these;

1. The Diameter of a Sphere being given, to find the Sides of the 5 Regular Bodies, severally, equal to that Sphere.

2. The Side of any of the Bodies being given, to find the Diameter of the Sphere, and the Sides of the other Bodies, which shall be severally to the first Body given.

If the Sphere be first given, take its Diameter, and apply it over in the Sector in the Points S, S : If any of the other Bodies be first given, apply the Side of it over in its proper Points: So Parallels taken from between the Points of the other Bodies, shall be the Sides of those Bodies, equal severally to the first Body given.

EQUATIONS. Captain Halley in *Philosoph. Trans.* N. 190. p. 38. gives an Account of the Number of Roots in Cubick and Biquadratick Equations, together with their Signs and Limits. And in N. 210. he gives a Method for the Ex-

traction of all Roots out of them without any previous Reduction.

In N. 309. there is an Analytical, Geometrical, Mechanical, and Universal Method for the Resolution of Cubick and Biquadratick Equations, by Mr. J. Colson. And an Analytical Resolution of some Equations of the 3, 4, 5, 7, 9, and Superior Powers; and so on Infinitely, in Finite Terms, and in such a Method as Cardan used for Cubicks.

Dr. Gregory, in the Preface to his excellent *Oxford Euclide*, in G. L. shews, that from the 86th and 87th Proposition of *Euclides Data*, even Biquadratick Equations, where the 2d and 4th Terms are wanting, may be resolv'd. As all Quadratick Equations may be, by the 84th and 85th Propositions of the same *Data*.

EQUES Auratus, is used to signify a Knight, which is called *Auratus*, because antiently none but Knights might guild or beautify their Armour, or other Habiliments of War, with Gold. However, in Law, this Term is not used; but instead of it *Miles*, and sometimes *Chevalier*.

EQUILATERAL Hyperbola. If the Transverse Diameter of any Hyperbola be equal to its Parameter, then all the other Diameters will also be equal to their Parameters: And such an Hyperbola as is this, is called an *Equilateral*, whose Asymptotes do always intersect each other at Right Angles in the Center.

EQUITY, is of two Sorts, and those of contrary Effects; for the one doth abridge and take from the Letter of the Law; and the other doth enlarge and add thereto.

The first is thus defined; 'Tis the Correction of the Law made generally in that Part wherein it fails; which is a Correction much used in our Law: As suppose an Act made, That whosoever does such a Thing, shall be a Felon, and suffer Death: Yet if a Madman, or an Infant, who hath no Discretion, do the same, he shall neither be a Felon, nor suffer Death.

The other Equity is defined, to be an Extension of the Words of the Law to Causes unexpress'd, yet having the same Reason; so that when one Thing is enacted, all other Things are so too, that are of the like Degree: As the Statute, which ordains, that in Action of Debt against Executors, he that doth appear by Distress shall answer, doth extend by Equity to Administrators; for such of them as shall appear first by Distress, shall answer by Equity of the said Act: *Quia sunt in Equali genere.* Cow. Interpret.

EQUIVOCAL Generation. There is scarce any thing seems more to countenance Equivocal Generation, than the Production of Worms, &c. in the Bodies of Animals; and yet Mr. Andey, in his *Discourse de la Generation de Vers dans le Corps de l'Homme Paris*, in 8vo. 1700. shews, that they breed there by a Seed which finds Entrance some how into our Bodies; and in particular, he shews, that the *Ciron*, or Hand-Worm, issues perfectly from its Egg, and after that grows insensibly. He judges that the Eggs of small Insects enter our Bodies by the Air we breathe, and in our Food; and that they are hatch'd there, only when they find an agreeable Heat and Disposition of the Humours and Parts.

Dr. George Garden hath observ'd; See *Phil. Tran.* N. 237. that the Bearers, or Bearing Buds of Fruit-Trees, are full of Asperities, and not so smooth in their Bark as the other Parts of the

Tree; and that if after Harvest you look on these with a common Microscope, you will find the Cavities there full of Eggs of an oblong Figure, and of a Citron Colour; especially, in such Years, and in those Trees, where the Caterpillers have been numerous. From whence he concludes, that we should not say Insects are bred out of Corruption equivocally, and not *ex Ovis*, only because we cannot discern the particular Manner of their Propagation. See *Insects*.

Mr. Ray saith, it seems to him to be most probable, that there is no such Thing as *Spontaneous* or *Equivocal* Generation; but that all Insects are the Natural Issue of Parents of the same Species with themselves. Fr. Redi, in his Book *de Gener. de g'l Insetti*, hath, I think, cleared up this Point, and shew'd there is no Generation of Animals *ex Materia Putrida*. And Dr. Lister hath given an Account of the Insects bred in the By-Fruits and Excrecencies of Vegetables, in *Phil. Tran.* N. 71, 72, 75.

Mr. Willoughby accounts for the *Ichneumon Wasps*, and the Manner of their laying their Eggs in the Bodies of other Insects; as of Caterpillers, &c. *Phil. Transf.* N. 76.

Dr. Lister, in *Phil. Transf.* N. 83. hath refuted the vulgar Notion, that Horse-hairs thrown into Water will become animated Bodies; and shews, that the Appearances of that Kind are *Hair-Worms* actually bred in the Bodies of other Insects, as of the Common Black Beetle, &c.

ERRANT, in our Law, is the same as *Itinerant*, being attributed to Judges that go the Circuit; and to Bailiffs at large.

ESCAMBIO, is a Licence granted to one, for the making over a Bill of Exchange to another, at Sea, *Reg. Orig. Fol.* 194. For by the Statute of 3 R. 2. c. 2. no Merchant ought to exchange or return Money beyond Sea, without the King's License.

ESCAPE, signifies, in the Civil Law, a violent or Privy Evasion out of some lawful Restraint.

ESNECY, *Æsnecia*, in the Law, is a Prerogative given to the eldest Co-partner, to chuse first, after the Inheritance is divided.

ESPICURNANTIA, is the Office of *Spigurnel*, or Sealer of the King's Writs.

ESQUIRE, in *French* *Escuier*, i. e. *Scutiger*, was originally such an one, as attending a Knight in Time of War, did carry his Shield. But now it signifies a Gentleman, or one that beareth Arms as a Testimony of his Nobility or Gentry; and is a meer Title of Dignity, next to and below a Knight. They who claim this Title now are, all the younger Sons of Noblemen; the Four Esquires of the King's Body; the eldest Sons of all Barons, Knights of the Bath, and Knights Batchelors; those that serve the King in any worshipful Calling; such as created Esquires by the King with a Collar of SS's of Silver: The Chief of some Families are also Esquires by Prescription: Those that bear any superior Office in the Common-wealth, as a Justice of Peace, while in Commission, and Utter Barristers, &c.

ESSAY Hatch, is the Miners Term for a little Trench or Hole, which they dig to search for *Shoad*, or *Oar*. See *Tin*.

ESSENTIAL Oils of Vegetables, are, according to the Chymists, such are drawn from the Plant in a Limbeck, by the Help of Water.

ESTERLING. The same with *Sterling*.

ESTORERS. The same with *Hase Bote*, or *House Bote*: Which see.

ESTRANGERS, in the Law, are sometimes taken for such as are not Privies or Parties to the levying of a Fine, or making of a Deed; and sometimes for those that are born beyond the Sea.

ESTRAY, signifies any Tame Beast found within any Lordship, and not own'd by any Man; in which Case, being cried, according to Law, in the Market adjoining, if it be not claimed by the Owner in a Year and a Day, it is the Lord's of the Soil.

EVENINGS, was formerly the Delivery, at Night or *Even*, of a certain Portion of Grass or Corn to a Customary Tenant, who performs his wonted Service of Mowing or Reaping for his Lord, and at the End of his Day's Work, did use to receive such a Quantity of Grass or Corn to carry Home with him, as a Gratuity or Encouragement for his bounden Service. *Kennet's Paroch. Antiq.*

EVICITION, in the Civil Law, is a Recovery of the Title to any thing sold by a Stranger.

EVOLUTA. See in *Involute* and *Evolute* Figures, in *Vol. I.*

EVOLUTION. The Equable Evolution of the Periphery of a Circle, or any other Curve, is such a gradual Approach of the Circumference to Rectitude, as that all its Parts do meet together, and equally *evolve* or unbend; so that the same Line becomes successively a less Ark of a reciprocally greater Circle, till at last they turn into a strait Line.

In *Philos. Transf.* N. 260. p. 445. you have a new *Quadratrix* to the Circle, found by this Means, being the Curve described by the Equable Evolution of its Periphery.

EUSTACHIAN Tube. The same with the *Aqueductus Tallopii*. See *Tuba Eustachiana*.

EXACTION *Secular*, was any Sort of Tax or Imposition formerly paid by servile and feudatory Tenants.

EXCEPTION, in the Law, is a Stop or Stay to an Action; being used in the Civil and Common Law both alike, and in both divided into *Dilatory* and *Peremptory*.

EXCLUSIONS. The Method of Exclusions is a Way of coming at the Solution of Problems (in numerical Cases) by previously ejecting or excluding out of our Consideration, such Numbers as are of no Use in solving the Question; and whereby consequently the Process may be regularly and judiciously abbreviated.

An Account of which Method, Mr. Frenicle gives, in the *Ouvrages de Mathematique*, &c. in *Fol. Paris*, 1693.

EXHIBITION, was anciently an Allowance for Meat and Drink, such as the Religious Appropriators made to the poor depending Vicar. And this Word is still retained in the Colleges of Oxford and Cambridge, in nearly the same Sense.

EX OFFICIO. By a Branch of a Statute of 1 Eliz. 1. The Queen, by her Letters Patents, might authorise any Persons, &c. to administer an Oath *Ex Officio*; whereby the supposed Offender was forced to confess, accuse, or clear himself of any Criminal Matter, &c. But this Branch, relating to the said Oath, is repeal'd by *Stat. 17 Car. 1. c. 11.*

EXPLE-

EXPLETORY *Justice.* See *Justice*.

EXPONENTIAL *Curves*, are such as partake both of the Nature of *Algebraick* and *Transcendent* ones. They partake of the former, because they consist of a *Finite* Number of Terms, tho' those Terms themselves are *Indeterminate*: And they are in some measure *Transcendental*, because they cannot be *Algebraically* constructed.

EXPONENTIAL *Equations*, are such as Sir *Isaac Newton* calls *Geometrice Irrationals*; they are sometimes also call'd *Transcendental*.

EXPONENTIAL *Quantities*, are such whose Exponents are indeterminate, variable, or flowing Quantities; and the Quantities are of several Degrees and Orders. When the Exponent is a simple indeterminate Quantity, 'tis called an *Exponential* of the first or lowest Degree.

When the Exponent it self is an *Exponential* of the first Degree, then the Quantity is an *Exponential* of the second Degree, &c.

Thus x^y is an *Exponential* of the first Degree; because the Quantity y is a simple flowing Quantity.

But x^{y^2} is an *Exponential* Quantity of the second Degree; because y^2 is an *Exponential* of

the first Degree. So also x^{y^3} is an *Exponential* of the Third Degree; the Exponent y^3 being one of the second.

See *D. Bernoulli's Tractatus de principiis Calculi Exponentialis*: And *Craig's* Correction also of a Mistake in it; in *Phil. Trans.* N. 245. p. 374.

Hayes Fluxions, p. 306. Where are Rules to find the Fluxions of *Logarithms* and of *Powers*, when the Exponents are Flowing Quantities. As also how to construct *Exponential Curves*, and to determine their Tangents.

EXPROMISSOR, in the Civil Law, is one that discharges the first Debtor, and takes the Burden upon himself.

EXTEND. To extend, in a Legal Sense, signifies the valuing of Lands and Tenements of one bound by Statute, &c. and hath forfeited his Bond to such an indifferent Rate, as that, by

the yearly Rent, the Obligator may in time be fully paid his Debt.

EXTREMITIES of the Figures in Painting, are the Head, Hands, and Feet; and these should be drawn with more Nicety and Exactness, or more terminated than other Parts; and must help, by that Means, to render the Action more expressive.

EYE. Dr. *Hook*, in his *Posthumous Works*, p. 12. saith, That the discerning Power of the Eye, is not capable of making Distinction of Parts, when they are smaller than the small Pores of Wood; which he found by this Experiment: By a convenient Lens, he brought the Object so near the Eye, that the crossing of the Rays in the Eye was about the middle Space between the visible Side of the Object and the Bottom of his Eye; from whence it followed, that the Picture of the visible Part of the Object was as big as the Thing represented; and the Eye being then at most but capable of seeing or distinguishing those Pores; it follows, that if the Cause of that Distinction be from the Ends of the Filaments of the Optic Nerve, as *Descartes* ingeniously supposes, the Filaments can't be smaller than the Microscopical Pores of Wood; and that the Eye is incapable of distinguishing the Parts of any Object that are smaller than those: So that any Object being so far remov'd from the Eye, as that its Picture on the Retina shall be less than a Microscopical Pore, will become invisible; at least if it be but of a dull Radiation; for if it be of a bright one, (as the Stars are) the whole Filament is moved by having one Part of it powerfully acted on; and so we have a Sensation of the Object the same as if it were much bigger. And this seems to be the Reason, why the Stars appear to our naked Eye many thousand Times bigger than they really are, and even as big as thro' a long Telescope. And p. 13. he saith, that if by the Help of Glasses, the Eye can be made capable of collecting a much greater Quantity of Rays from a Point, and make them meet in the Retina, 'tis not improbable, but that a much greater Number of Bodies may be discovered to be *Radiant*, which are now not supposed to be such.

F A R

F By Statute 5 & 6 E. 6. cap. 4. 'tis enacted, That whoever shall maliciously strike any Person with a Weapon in the Church or Church-yard, or draw it there, with an Intent to strike, shall have one of his Ears cut off; or if he have no Ears, shall be burnt on the Cheek with an F; that he may be known for a common Fighter or Fray-maker.

FABRICK Lands, are Lands given to the Rebuilding, Repair, or Maintenance of Cathedrals, and other Churches, and mentioned in the Act of Oblivion, 12 Car. 2. c. 8. Formerly every one almost gave by his Will something, more or less, to the Fabrick of the Cathedral, or his Parish Church, and these were called *Fabrick Lands*; and by the Saxons, *Timber Lands*.

FACE *prolong'd*, in Fortification, is that Part of the Line of Defence Razant which lies between the Angle of the Shoulder and the Curtain; or 'tis the Line of Defence Razant diminished by the Length of a Face.

FACIA's, in Architecture, as the Workmen call it, (for it should be spelt *Fascia*.) are nothing but broad Lifts or Fillers, and are commonly made in Architraves, and in the Corners of Pedestals. In Brick Buildings, they call the Juttings-out of the Bricks over the Windows in all Stories but the highest, by this Name; these are sometimes plain, and sometimes moulded; and this moulding is only a *Scima Reversa*, or an O . . . G . . . at the Bottom, and above this are two plain Courses of Bricks, then an Astragal, and last of all, a *Boultime*; which the Workmen call a *Boultree* and a *Boltell*.

FACK, in a Ship, is any one round of a Cable when it is quoiled up out of the Way.

FAGGOT, in Times of Popery here was a Badge worn on the Sleeve of the Upper Garment of such Persons as had recanted and abjured what the Powers that then were, did call Heresy; which was put on after the poor Wretches had carried a Faggot, by way of Penance, to some appointed Place of Solemnity. And sometimes they interpreted the leaving off this Badge of the Faggot to be a Sign of Apostacy.

FALDAGE, *Faldagium*, is a Privilege which antiently several Lords reserved to themselves of setting up Folds for Sheep in any Fields within their Manors, the better to manure them; and this not only with their own, but their Tenants Sheep, which they called *Seſta Falda*. This Faldage in some Places they call a *Fold Course*, or *Free-fold*; and in some old Charters 'tis called *Fold-foca*, i. e. *Libertas Falda* or *Faldagii*.

FALDFEY, or *Faldfee*, was a Composition paid some Customary Tenants antiently, that they might have Liberty to fold their Sheep upon their own Ground.

FARDEL of Land, according to some Writers, is the 4th Part of a Yard Land; but Noy, in his *Complete Lawyer*, p. 57. saith, two Fardels of Land make a Nook, and four Nooks a Yard Land.

FARDING, or *Farthing* of Gold, seems to have been a Coin used in antient Times, containing in value the 4th Part of a Noble, viz. Twenty-pence in Silver: In Weight, the 6th Part of an Ounce of Gold, that is, of five

F I E

Shillings in Silver. This Word is used 9 H. 5. c. 7. and there appears to have been a Coin as well as the Noble and Half Noble.

FARDING-deal, or *Farundel of Land*, was the 4th Part of an Acre.

FAST-Country. A Term used by the Tin-Miners, and signifies the same with *Shelf*; which see.

FASTING Men, *Homines habentes*. An old Term which some will have to signify Men of Repute and Substance: But 'tis more probable, that by it was meant rather Pledges, Sureties, or Bondsmen; which, according to the Saxon Custom, were fast bound to answer for one another's peaceable Behaviour.

FAUSBRAYE. See *Falſe Braye*.

FEATHER Edg'd, is a Term used by Workmen for such Boards as are thicker on one Edge or Side than on the other.

FELLOWS, in Fortification, are six Pieces of Wood, each of which form an Arch of a Circle; and these, joined all together by *Duledges*, make an entire Circle; and these, with 12 Spokes, make the Wheel of a Gun Carriage. Their Thickness is usually the Diameter of the Ball of the Gun they serve for, and their Breadth something more.

FEODARY, *Feodatorious*, was formerly the Title for the *Seneschal* or Prime Steward, who received *Aids*, *Reliefs*, *Herriots*, &c. and such Customary Fees due to any Lord.

FIBRES. There are other Divisions and Distinctions of *Fibres*, besides those two mentioned in Vol. I. For, according to some Authors, there are in an Animal Body, *Carnous*, *Membranous*, *Cartaliginous*, *Tendinous*, *Osseous*, and *Nervous* Fibres, according to the Matter of which they consist. The *Carnous* Fibres, of which the Flesh is composed, are vascular and hollow, being full of little Cells: They are called *Fibræ motices*, because they are the chief Organs of Muscular Motion.

There is a Difference also among *Fibres*, as to their Situation and Course. For those that run lengthwise in Right Lines, are called *Strait Fibres*: Those that run about some Part, as those do that form *Sphinter Muscles*, are call'd *Circular*. Those Fibres which cross *Strait ones* at Right Angles are called *Transverse*; but those which intersect them at any other Angles, *Oblique Fibres*.

FIDE Jussor, in the Civil Law, is the same with *Repromissor*, *Adpromissor*, *Sponsor*, *Prades*, and *Vades*; That is, a *Surety*, or one that obliges himself in the same Contract with a Principal, for the greater Security of the Creditor or Stipulator.

FIELD-Colours, are small Flags about a Foot and half Square, which are carried along with the Quarter-master-General, for marking out the Ground for the several Squadrons and Battalions of an Army.

FIELD-Pieces, are small Cannon which are usually carried along with an Army in the Field; such as 3 Pounders, Minions, Sakers, 6 Pounders, Demi-Culverins, and 12 Pounders; and these being small and light, are easily carried.

FIELD-Staff, is a Staff carried by the Gunners; 'tis about the Length of an Halbert, with a Speer at the End, which, on each Side, hath Ears

scrued

screw'd on like the Cock of a Match-lock; and in these, the Gunners screw in Lighted Matches when they are on Command. And this is call'd Arming the *Field-Staffs*.

FIFE Rails, in a Ship, are those that are plac'd on Banisters on each Side of the Top of the Poop, and so along with *Hances* or Falls they reach down to the Quarter-Deck, and to the Stair of the Gangway.

FIGURE. The Rectangle under any Diameter and its proper Parameter, is, in the Ellipsis and Hyperbola, called the Figure of that Diameter. *De la Hire, Lat. Con. p. 47, 48.*

FINERY, is the Name of one of the Fires in Forges in an Iron-work. See *Iron*. At the *Finery*, by the Working of the Hammer, they bring the Iron into what they call *Blooms* and *Anconies*.

FIRE. See *Light*. There is an Account of the Generation of Fire, by Mr. *Malbranche*, in the *Fr. Memoirs* for the Year 1699, which is ingenious enough; but it seems to depend entirely on the Hypothesis of *Descartes*. In the same Book, Mr. *Amontons* shews a Method of making the Force of Fire supply that of Men or Horses in Engines, p. 112.

FIRE-Master, in our Train of Artillery, is an Officer that gives the Directions and the Proportions of the Ingredients for all the Compositions of Fire-Works, whether for Service in War, or for Rejoycings and Recreations. His Orders are given to the Fire-Workers and Bombardeers, who are obliged to execute them.

FIRE-Workers, are subordinate Officers to the Fire-Masters, but they command the Bombardeers: They receive the Orders from the Fire-Masters, and see that the Bombardeers execute them.

FIRME, the same with a Farm, or Land and Tenements hired at a certain Rate. But it antiently signified the Reception and Entertainment of the King, or any other Lord and his Retinue; and frequently in the Doomsday Book, a Condition of Tenure was *pro firma per unum diem*, or *pro firma per unum noctem*: And so, because in the Saxon, and part of the Norman, Times, the Rent of Lands was paid in Provisions, *Firma* signified the Profits and Rent of an Estate: But Henry II. for better Convenience, alter'd this Custom into an Equivalent of Money; which Pecuniary Rent was still call'd *Firma Regis*.

FIRST-Fruits, Primitie, are the Profits of every Benefice for one Year, given before the Reformation to the Pope; but by 26 H. VIII. c. 3. translated to the Crown: And by that Act, he which enters on any Spiritual Living before he pays or compounds for it, on Conviction, forfeits the double Value thereof. Every Clerk therefore, before his Induction, (or soon after,) should go himself with one Friend of the City of London, Inns of Courts, or Parts adjacent, or send two such Friends for him, to the First Fruits Office, and there enter into Bond to pay the First Fruits of his Benefice within two Years next ensuing, at four equal Half-yearly Payments. Only one Tenth of the whole Yearly Sum mention'd in the Queen's Books to be deducted; because that must be paid by itself the first Year. Formerly four Bonds were given for the four several Payments; but by Statute 2 and 3 of Her present Majesty, but one Bond only is appointed to be given; and the Rates of all Benefices, according to the Queen's Books, are declared unalte-

rable. The Successor is chargeable with Arrears of Tenths due from his Predecessor; and consequently, by 27 H. VIII. c. 8. is impower'd to distrain his Predecessor's Goods, being upon the Benefice, and hath likewise a good Action at Law, against him, or his Executors.

FISH-Block, in a Ship, is the Block which is hung in a Notch at the End of the *David*, and serves to hawle up the Fluke of the Anchor to the Ship's Bow.

FISHES. *Rondeletius* distinguishes Fishes, from the Places where they are found, into *Sea Fish*, *River Fish*, and *Lake or Pond Fish*; and of these he makes some other Subdivisions. But Mr. *Willoughby* saith rightly, That *Fishes* are much better divided by *Aristotle* into these three Kinds, *Cetaceous*, *Cartilaginous*, and *Spinous*.

The *Cetaceous* Kind (which are sometimes therefore call'd the *Belle Marine*) have Lungs and Breath like Quadrupeds, they copulate also like them, conceive and bring forth their Young alive, whom they suckle with their Milk.

The *Cartilaginous* Sort, are produc'd from large Eggs like Birds, which are excluded the Womb also like those of Birds.

The *Spinous* Kind, are also *Oviparous*, but their Eggs are smaller, and they have *Spine* up and down in their Flesh to strengthen it.

But he thinks it would be yet more proper to divide Fishes into the *Cetaceous* Kind, or such as *breath with Lungs*, and into such as *breath with Gills*. And then, to subdivide those that *breath with Gills*, not into *Cartilaginous* and *Spinous*, but into *Viviparous* and *Oviparous*.

The *Viviparous* Kind, that *breath with Gills*, he subdivides into *Long*, such as the *Galei*, and *Canes* or *Sharks*, and *Dog-Fish*: And the *Broad Kind*; such as the *Pastinace*, *Raja*, *Squatina*, &c. all whose Subdivisions he gives in his Chapter of *Cartilaginous Fishes* in general.

The *Oviparous* Kind, that *breath with Gills*, are the most numerous; and these he subdivides into such as are what we usually call *Flat Fish*; and such as swim with their Backs upright, or at Right Angles to the Horizon.

The *Plain* or *Flat Fish Kind*, called usually *Plani Spinosi*, are either *Quadrati*, as the *Rhombi* and *Passeres*; or *Longiusculi*, as the *Soleæ*.

Such as swim with their Backs erect; are either *Long* and *Smooth*, and without Scales, as the *Eel Kind*; or *Shorter* and less *Smooth*: And these have either but one Pair of Fins at their Gills, which are call'd *Orbes* and *Congeneres*; or else another Pair of Fins also on their Bellies. And this latter Kind he divides into two others; 1. Such as have no Prickly Fins on their Backs, but Soft and Flexile ones. 2. Such as have Prickly Fins upon their Backs.

Those Fishes which have only Soft and Flexile Fins on their Backs, may be divided into such as have Three, Two, or but One single Fin there. No Fish but the *Aselli* have Three Fins on their Backs.

Fishes with Two Fins on their Backs, are either the *Truttaceous* or *Trout Kind*, or the *Gobionite*, or *Loch* or *Gudgeon Kind*.

Fishes with but one soft Back Fin, are of three Sorts; the first Kind have one long continued Fin from Head to Tail, as the *Hipparus* of *Rondeletius*, &c. the second have this Fin, but short, and placed just in the Middle of their Back; and these are either *Marine*, as the *Herring Kind*; or *Fluviatile*, as those we call *Lether-mouthed Fishes*; such as *Carp*, *Tench*, &c.

Such

Such Fishes as have Prickly Fins on their Backs, are of two Kinds :

1. Such as have Two prickly Fins on their Backs ; and in these the Anterior Radii of their Fins are always prickly : Or,

2. Such as have but one prickly Fin there.

Mr. Willoughby gives us this Catalogue of our English Fishes.

1. Of the Long Cartilaginous Kind ; are the
 1. *Canis Carcharius*, or *Lamia*, the White Shark.
 2. *Galeus Glaucus Rondeletii*, the Blue Shark.
 3. *Canis Galeus Rondeletii* ; called a Tope in Cornwall.
 4. *Galeas acanthias sive Spinax*, the prickled Dog or Hound Fish.
 5. *Galeus seu Mustela levis*, the smooth or unprickled Hound Fish.
 6. *Catulus major*, vulg. *Canicula Aristotelis*, the Rough Hound ; in Cornwall, the Bounce.
 7. *Catulus minor*, the lesser Hound Fish or Mor-gay.
2. Of the Plain Cartilaginous Kind ; are the
 1. *Raja levis undulata*, the Skate or Flare.
 2. *Raja Clavata*, the Thornback.
 3. *Raja Aspera Nostras*, the White-horse.
 4. *Squatina*, the Angel or Monk-Fish.
 5. *Rana Piscatrix*, the Toad Fish or Sea-Devil.
3. Of the plane Spinous Kind ; are the
 1. *Rhombus Maximus Aspero Squammosus*, the Turbot or Brett.
 2. *Rhombus non acculeatus squammosus* ; in Cornwall call'd the Lug-alese.
 3. *Passer Bellonii*, the Place.
 4. *Passer Asper sive Squammosus*, the Dab.
 5. *Passer Fluviatilis sive Amphibius*, the Flounder, Fluke, or Butt.
 6. *Hippoglossus Rondeletii*, the Holy-Butt ; call'd in the North the Turbot.
 7. *Buglossus* or *Solea*, the Sole.
4. Of the Eel Kind ; we have,
 1. *Lampetra major*, the Lamprey, or Lamprey Eel.
 2. *Lampetra parva* and *Fluviatilis*, the Lampern.
 3. *Anguilla*, the Common Eel.
 4. *Conger*, the Conger or Sea Eel.
 5. *Ammodytes Gesneri*, the Sand Eel or Launce.
 6. *Gunnellus Cornubiensis*, the Butter Fish.
 7. *Mustela vulgaris Rondel*, the Sea Loach or Whistle-Fish.
 8. *Mustela Fluviatilis*, the Eel Pout, or Turbou.
 9. *Lupus Marinus*, the Wolf Fish, or Sea Wolf.
 10. *Alauda non cristata*, the Sea Lark ; called in Cornwall *Mulgranoc* and *Bulcard*.
 11. *Alauda Cristata*, the Crested Sea Lark.
 12. *Liparis Rondeletii*.
 13. *Gobio Fluviatilis*, the Bull-head or Millers-thumb.
 14. *Scorpana Bellonii Similis*, the Dutch-Pots-Hog ; the Cornish Boys call it *Father-Lasher*.
5. Of the Kind of Fishes wanting the Belly Pair of Fins ; we have,
 1. *Mola Salviani*, the Sun Fish.
 2. *Acus Aristotelis*, Species major.
 3. *Acui Aristotelis congener*, the Sea Adder.
 4. *Xiphias*, seu *Gladius piscis*, the Sword Fish.
6. Of the non Spinous Kind of Fishes, with 3 unprickly soft Fins on their Backs ; we have,
 1. *Asellus vulgaris major*, the Cod-fish, or Kaling.
 2. The Whiting Pollack.
 3. *Asellus Niger*, the Colefish, or Rawling Pollack.

4. *Asellus Lucus*, the Bib or Blinds.
5. *Asinus Antiquorum* (Turn.) the Haddock.
6. *Asellus mollis major*, the Whiting.
7. Of the non Spinous Kind, with only 2 soft Fins on their Backs ; are found with us,
 1. *Merlucius*, the Hake.
 2. *Asellus longus*, the Ling.
 3. *Thynnus*, see *Thunnus* ; the Tunny, or Spanish Mackerel.
 4. *Scomber*, the Mackerel.
 5. *Thymallus*, the Gragling, or Umber.
 6. *Albula Salmoni Similis*, the Guinnard.
 7. *Albula Harengi formis*, the Schelley.
 8. *Salmo*, the Salmon.
 9. *Salmulus*, the Samlett, or Branlin.
 10. *Salmo Griseus*, the Gray.
 11. *Trutta Salmonata*, the Salmon Trout.
 12. *Trutta Lacustris*, the Scurf, or Bull Trout.
 13. *Trutta Fluviatilis duum generum*, the Trout.
 14. *Umbia Minor Gesn*, the Red Charr, or Welsh Torgoch.
 15. *Carpio Lacus Benaci*, the Guilt or Guilt Charr.
 16. *Eperlanus seu Viola*, the Smelt.
 17. *Golius Niger*, the Rock Fish or Sea Gudgeon.
 18. *Lumpus Anglorum*, the Lump or Sea Owl.
 19. *Cataphractus Schonfeldii*, in the West of England, a Dog.
8. Of the non Spinous Kind, with only 1 Fin on the Back ; we have,
 1. *Harengus*, the Herring.
 2. *Harengus minor*, the Pilchard, called also *Calchis*.
 3. *Encrassicholus*, the Anchoris.
 4. *Alosa seu Clupea*, the Shad or Mother of Herrings.
 5. *Sardina*, the Sprat or Sparling ; which is nothing else but the Fetus of a Herring.
 6. *Acus Vulgaris*, the Garr-Fish, or Horm-Fish.
 7. *Sturio*, the Sturgeon.
 8. *Lucius*, the Pike or Pickrel.
 9. *Cyprinus*, the Carp.
 10. *Cyprinus Latus*, the Bream, or Bruma.
 11. *Tinca*, the Tench.
 12. *Orfus Germanorum*, the Rudd, Oerve, or Nerfling.
 13. *Capito*, seu *Cephalus*, the Chub or Chevin.
 14. *Barbus*, the Barbel.
 15. *Leuciscus*, the Dace or Dare.
 16. *Rutilus*, seu *Rubellus*, the Roach.
 17. *Alburnus*, the Bleak or Bley.
 18. *Gobius Fluviatilis*, the Gudgeon.
 19. *Bobites Fluviatilis barbatula*, the Loche.
 20. *Varias*, seu *Phoxinus levis*, the Pink or Minnow.

The last Twelve of these are called by us (*Mala-costomi*) Leather-mouthed Fishes ; because they have no Teeth in their Jaws, but only deep down in their Mouths.

9. Of the Spinous Kind with 2 Fins on their Back, of which the Foremost is aculeate ; we have,
 1. *Lupus*, the Basse.
 2. *Mugil*, the Mullet.
 3. *Gurcardus Piscis*, the Gray Garnard.
 4. *Hirundo Aldrovandi*, the Tub-Fish.
 5. *Cuculus Aldrovandi*, the Red Garnard, or Rotchet.
 6. *Lyra prior Rondel*, the Piper.
 7. *Mullus major*, the Sur-Mullet.
 8. *Draco*, seu *Araneus Plinii*, the Spider.
 9. *Erachurus*, the Scud.
 10. *Perca Fluviatilis*, the Perch.
 11. *Faber Piscis*, the Dorge.

10. Of the *Aculeat Kind*, with only one Fin on the Back, whose *Radii* are some prickly, and some soft; we have,

1. *Aurata*, the Gilt-head, or Gilt-poll.
2. *Pagrus*, the Bream.
3. *Turdus vulg.* the Old Wife or Wras.
4. *Perca Fluviatilis minor*, seu *auratu*, the Ruff.
5. *Piscis Aculeatus vulgaris*, seu *pungitius Alberti*, the Common Prickle-Back, or Sharp-ling, or Banstickle.
6. *Piscis aculeatus minor*, the lesser Prickle-Back.

11. Of the *Cetaceous Kind*, we account only,

1. *Balena Britannica Antiquorum*; which now seems to be gone from our Seas, and we scarce know what kind of Fish it was.
2. *Balena vulg. Rondel*, the Whale, which is sometimes found stranded on our Coasts; or rambles up our Rivers.
3. *Delphinus Antiquorum*, the Dolphin, very rarely, but sometimes seen here.
4. *Phocæna*, the Porpuss, call'd by *Schonfeld*, the Northern Dolphin.

FITS of easy Reflection of the Rays of Light; so Sir Isaac Newton, in his *Opticks*, calls the Disposition of the Rays to be reflected at any Time; and their Disposition to be transmitted, he calls,

FITS of easy Transmission: And the Space it passes between every Return and the next Return, he calls the *Interval of its Fits*. *Opt. Book II. p. 3. See Light.*

FIXED Stars. The Phenomena's that have been observ'd by Astronomers about the Fix'd Stars are these:

1. That they all, together also with the Planets, or Erratick Stars, and all the Celestial Bodies, do appear every Day to rise and set; and to move with a Circular Motion from East to West; the Plains also of these Diurnal Circular Revolutions being at Right Angles to the Earth's Axis, or Parallel to the Equator.

All which is fairly and easily accounted for, by supposing our Earth to revolve round its own Axis in 24 Hours, from West to East. But the Eye of the Spectator moving together with the Earth, that must appear to him immovable; as a Ship doth to those that are in it, till by Observation and Judgment they come to find it otherwise.

Provehimur Portu, Celique ac Astra recedunt.

2. It hath been observ'd of the Fix'd Stars, that besides the former apparent Motion round the Earth in 24 Hours, they also seem to have another which is quite contrary to that; for they appear to change their Longitude, or Distance from the Beginning of *Aries*, forward according to the Order of the Signs, or to move in *Consequentia* by a slow Motion of about a Degree in 70 Years. So that those Stars which in *Hipparchus*, nay even in *Ptolemy's* Time, were in *Aries*, are now found to be in *Taurus*; and so on all round the Zodiack.

As to which, we must consider that the *Terminus à quo*, or Point from whence this slow Motion is propagated, being the Vernal Equinoctial Point, or the Eastern Intersection of the Equinoctial and Ecliptick; till it can be determin'd whether this Point be fix'd or moveable, it cannot be

Vol. II.

known whether the Stars move from that, or that Point from them: And indeed the latter is much more probable, when we compare with this what certainly happens in other Instances in the Heavens. For 'tis well known now, that the *Nodes* of the Orbits of the secondary Planets, or the Points of their Intersection with the Ecliptick, do shift and change, and go a little backward, or move in *Antecedentia*; as is very evident in the *Nodes* of the Lunar Orbit: Why may it not be so then with the *Nodes* of the Earth's Orbit? The *Precession* therefore of the Terrestrial Equinoxes may serve to account for this Motion of the Fix'd Stars, since the Quantity will be found the same in both. For from the *Newtonian* Principles, it appears, the Terrestrial *Nodes* should go backward, after the Rate of about 50 Seconds every Year; and just so much the Fix'd Stars have been observ'd to move forward every Year.

3. It hath never been observ'd, that the Fix'd Stars have changed their Latitude, though, as before, they annually do their Longitude.

Which is a difficult Thing to account for without the New Astronomy. For allowing the former Motion of the Fix'd Stars, how can they all, and always, keep the same Distance from the Ecliptick? 'Tis true, the Celestial Orbits are all found to be in immovable Plains, but those Plains are different, and do intersect each other with different Angles; nor is there any two of the Primary Planets, whose Orbits are in the same Plain. If therefore these Stars had any such Motion, as that seeming one of Longitude, 'tis very likely that their Orbits would be posited with respect to some one great and peculiar Plain, and which should be inclin'd in a peculiar Manner to the Plains of the other Orbits, so as that their Orbits would intersect the Ecliptick, and the Orbits of the Planets; but since there is no such Thing observ'd, 'tis likely, that Motion of Longitude belongs not to the Stars, but to the *Nodes* of the Earth's Orbit, as has before been shewn. But allowing that *Recession* of the Earth's *Nodes*, 'tis evident why the Stars should have (or appear to have) a Motion in Longitude, but none in Latitude; because that *Recession* of the Terrestrial *Nodes* happens without any Change of the Earth's Annual Motion as to the Plain of the Ecliptick; for if the Stars themselves are immovable, and the Earth's Orbit (or the Ecliptick) be always an immovable Plain, there can be no such Thing as any Change in the Latitude of the Stars.

4. The Diameters of the Fix'd Stars are very small, scarcely sensible even in the largest Telescopes, seen through which, they appear but like Lucid Points, and without any of those adscitious Rays which strike the naked Eye.

5. The Fix'd Stars have no *Diurnal Parallax*, but, as hath lately been discover'd by Dr. Hook and Mr. Flamsteed, a small Annual one; and consequently their Distance must be immensely great. In order to guess at which, Mr. Hugen's supposes the Dog-Star, *Syrius*, to be about the Bigness of our Sun; and then considers how remote our Sun must be placed, before his Diameter would appear as little as that of *Syrius*: And on the whole, he concludes, that *Syrius* and the nearest Fix'd Stars, cannot be less distant than 150000000000 of our Miles from the Earth, which is 27000 times as far off as our Sun is from us.

G g

And

f And by that Annual Parallax which hath been found to belong to the fix'd Stars, and is about 47 Seconds, they conclude, that they are distant from us about 9000 times the Radius of the *Magnus Orbis*, i. e. 9000 times as far off as the Sun; or about 50000000000 Miles.

6. The *Milky Way* is a circular Tract in the Heavens, extending over a very considerable Part of them; and is so call'd, because it looks white and brighter than any other Part of the Sky. And this, by the Telescope is discover'd to be a Congeries of very small Stars, which are singly inconspicuous to the naked Eye.

7. There are above 1000 Stars which are visible to the naked Eye; but the Telescope hath discover'd about 20 times as many more: And the larger and better those Glasses are, the more are still discover'd.

8. The Light of the Fix'd Stars is much more strong and vivid than that of the Planets, tho' their apparent Diameters are much less; because the Stars, like the Sun, shine by their own Native Light, but the Planets only by Reflection from the Sun.

9. The Fix'd Stars are observ'd to twinkle much more than the Planets: because their apparent Diameters being very insensibly small, the least Atom or Particle of Matter floating in our Atmosphere will hinder (for a Moment) the Stars being entirely visible. As the gross Smoak of a Chimney will do by the Planets themselves, which in such a Case will twinkle.

That there are Changes and Alterations among the Fix'd Stars, hath appear'd by the Observations of our Modern Astronomers.

In *Phil. Trans.* N. 73. there is an Account that *S. Montanari* found two Stars of the 2d Magnitude wanting in the *Navis*, in the Year 1668, April 10. which were certainly visible before. And that he had made many such Observations of Stars of less Note.

Cassini hath discover'd also many new Stars: One of the 4th, and two of the 5th Light, in *Cassiopeia*; two others in *Eridanus*; and four towards the *Arctick* Pole, which he is sure were not visible formerly. He takes Notice also of several in *Bayer's Catalogue*, which do now disappear. *Hevelius*, in 1666, found a new Star in *Pectore Cygni*. And *Don. Anthelme*, a Carthusian at *Dyon*, another in the Head of that Constellation. And this both he and *Mr. Cassini* observ'd to be twice in great Splendor, and as often diminishing.

Bullialdus observ'd the new Star in the Neck of the *Whale*, to be very different in his Magnitudes at different Times. And *Hevelius* observes the same Thing of another Star in the same Constellation.

From all which Observations, and many others might be produc'd, 'tis plain, there are very great Changes and Alterations amongst even the Fixed Stars themselves.

And if that noble Conjecture of our Modern Astronomers be true, that each Fix'd Star is a Sun to some System of Planets moving round him, as we do round the Sun, there must needs be terrible Changes in those Planetary Worlds; and those probably both Conflagrations and Deluges. Of this, see more in *Whiston's Astronomy*, p. 46.

Dr. Hook, *Op. Posthum.* p. 109. gives very probable Reasons why the Fix'd Stars should be of the same Nature with the Sun; which are drawn

from their vast Distance, and their affecting our Eyes with so strong and vivid a Light; which they could not do, if they were not actually blazing Fires: And that they are so, the Disappearance of some Stars, which have formerly been visible, and the Appearance of new ones, doth much confirm.

And the incomparable *Sir Is. Newton*, in the Latin Edition of his *Opticks* by *Mr. Clark*, hath, to p. 83. added this Note; by which we may conclude the Fixed Stars to be at an immense Distance from us.

" That the Fixed Stars, by reason of their immense Distance, are to be look'd upon as Points, (unless so far as their Light is dilated by Refraction) is plain from hence: That when by the Moon's Appulses to them they are eclipsed or cover'd by her Body, their Light doth not, like that of the Planets in the like Case, vanish or disappear gradually, but at once and all together; and when they emerge again out of the Eclipse, they don't become visible by degrees, but, as it were, instantaneously, or at least in the Space of 1 or 2 Seconds.

Besides what hath been said in the former Vol. and above, *Dr. Cheyne* adds this further Guess at the Immensity of the Distance of the Fix'd Stars.

Tho' we on this Globe approach nearer to some of them about 24000 Diameters of the Earth, i. e. about 188304000 Miles (of 5000 Foot in a Mile) at one time of the Year than we do at another; yet their Parallax, if any at all, is scarcely then sensible, which it must be, if they were at an estimable Distance from us.

Mr. Huygens computes, that the Distance of the Sun, to that of the nearest Fix'd Star, is as 1 to 27664. That is, (allowing the Distance of the Sun to be 12000 Diameters of the Earth, and a Diameter to be 7846 Miles, according to the best Calculations) the Distance of the nearest Fix'd Star from us, is at least 2404520928000 Miles; which is so great, that if a Cannon Ball (going all the Way with the same Velocity it hath when it parts from the Mouth of the Gun) would scarce arrive there in 700000 Years.

In *Philos. Trans.* N. 202. there is a Method of finding the Parallax of the Fix'd Stars, which *Dr. Wallis* acquaints *Mr. Molyneux* with; but both those Persons are since dead.

FIXITY. To the Production of this Property of Fixity, there is necessary chiefly a Supposition of the Particles attracting one another, within a certain Distance, with a very violent Force; or else they could never keep together, when press'd by a violent Heat; which yet we find the Particles of some fix'd Bodies will do. See *Cohesion*.

FLAME-heat. The same with a *White-heat*; which see.

FLAT-pointed Nails, are of two Sorts, the longer are used in Shipping, and are very proper to hold where you cannot clench; the shorter are fortified with Points to drive into Oak, and are used to draw Sheathing-Boards to, &c.

FLAW, at Sea, signifies a sudden Gust of Wind; which sometimes also the Seamen call a *Squale*.

FLEXION and *Retrogression of Curves.* See *Contrary Flexion*.

FLIGHT. In melting the Lead-Oar in the Works in *Mendip*, there is a Substance flies away in the Smoak, which they call therefore the *Flight*. They find it sweetish upon their Lips, if their Faces happen to be in the Way of the Smoak; which they

they avoid all they can. This falling on the Grass, kills Cattle that feed there; and being gather'd and carried Home, kills Rats and Mice in their Houses. That which falls on the Sand, they gather and melt (upon a *Flag-hearth*) into Shot and Sheet Lead.

FLORENS, were Gold Coins in the 18th of our *Edw. III.* of the Value of 6 Shillings. *Cambden* saith, they were so called, because made by *Florentines*: And *Fabian* saith, they were not of so fine Gold as the Nobles and half Nobles of that Prince.

But what is most observable, is, that *Fabian* calls the *Floren* a Penny, val. 6 s. 8 d. the half *Floren* an Halfpenny, val. 3 s. 4 d. the Quarter *Floren* a Farthing, val. 1 s. 8 d. And these Words you will often meet with in old Histories and Accounts, applied to several Coins, as Rials and Angels, &c. where you are to understand, by *Denarius* the whole, by *Obolus* the half, and by *Quadrans* the 4th Part or Farthing. *Chr. Preciosum*, p. 22.

By Indenture of the Mint, in 18 *Edw. III.* every Pound Weight of old Standard Gold was to be coined into 50 *Florences*, to be current at 6 Shillings a-piece; all which made, in Tale, fifteen Pounds: Or into a proportionable Number of half or quarter *Florences*. *Cowel's Interpreter*.

FLUIDITY. Besides what hath been said of this Quality in the former *Vol.* I must add here, That the Corpuscular Philosophy, before Sir *Is. Newton's* wonderful Improvement of it, did not go to the Bottom of this Matter; for it gave no Account of the Cause of the chief Condition requisite to constitute a Fluid Body, viz. the various Motions and Agitations of its Particles. But this may be in a good Measure accounted for, if you suppose it to be one of the Primary Laws of Nature, that as all Particles of Matter do attract one another when they come within a certain Distance, so, at all greater Distances from one another, they do fly away from, and avoid one another. For then, though their common Gravity may keep them together in a Mass, together (it may be sometimes) with the Pressure of other Bodies upon them; yet their continual Endeavour to avoid one another singly, and the adventitious Impulses of Light, Heat, or other external Causes, may make the Particles of Fluids continually move round about one another, and so produce this Quality. It is, indeed, a Difficulty I cannot yet get over, to account for the Particles of Fluids always keeping at such a Distance from one another, as not to come within the Sphere of one another's Attraction. The Fabrick and Constitution of that fluid Body of Water is wonderful and amazing, that a Body so very rare as that is, and which has such a vast Over-proportion of Pore, or interspersed Vacuity, to solid Matter, should yet be perfectly incompressible by the greatest Force. And yet this Fluid is easily reducible into that firm, transparent, friable Body, which we call Ice; by being only exposed to a certain Degree of Cold. One would think here, that though the Particles of Water cannot come near enough to attract each other, yet the intervening Frigorifick Matter doth, by being mingled *per minima* with them, strongly attract them, and is itself also strongly attracted by them, and sowedges or fixes all the Mass into a firm solid Body: Which solid Body loses its Solidity again, when by Heat the Vinculum is solv'd, and

Vol. II.

these Frigorifick Particles are disjoin'd from those of the Water, and are forc'd to fly out of it. And perhaps just thus doth the Fumes of Lead fix Quicksilver.

When a firm solid Body, such as a Metal, is by Heat reduc'd into a Fluid; doth not the Fire disjoin and separate its constituent Particles, which mutual Attraction caused to cohere before, and keep them at such a Distance from each other, as that they are without the Sphere of one another's Attraction as long as that violent Motion lasts? And don't they, when that is over, and the Heat is flown out, come nearer to, attract one another, and coalesce again?

As therefore the Cause of Cohesion of the Parts of solid Bodies appears plainly to be their mutual Attraction; so the chief Cause of Fluidity seems to be a contrary Motion impressed on the Particles of Fluids, by which they avoid and fly one another as soon as they come at, and as long as they keep at such a Distance from each other.

'Tis observ'd also in all Fluids, that the Direction of their Pressure against the Vessels that contain them, is in Lines perpendicular to the Sides of such Vessels; which Property being the necessary Result of the Particles of any Fluids being spherical, it shews that the Parts of all Fluids are so, or of a Figure very nearly approaching thereunto. For Fluids in an Animal Body, see Glands in *Vol. II.*

FLUTES, in Architecture, are the Hollows made in the Body of a Column or Pillar, and which then is said to be *Fluted*. The Dorick, Ionick, Corinthian and Composite Columns, are usually fluted all along the Body of the Pillar, from the Base to the Capital. Each Column hath 24 Flutes, and each Flute is hallowed in exactly a quarter of a Circle. In the Dorick Column the Flutes join together without any Interspace; but in the Ionick, Corinthian and Composite Orders, there runs a List between every two Flutes.

FLUXIONS. This general Method of finding the Fluxions of all Powers and Roots, I had from the Honourable *Fr. Robartes*, Esquire.

If a Quantity gradually increases or decreases, its immediate Increment or Decrement is called its *Fluxion*.

Or the Fluxion of a Quantity is its Increase or Decrease indefinitely small.

Let a Quantity x be put into Fluxion, whereby it becomes $xx \pm x$ (x representing an Increment or Decrement indefinitely little, being called the Fluxion of x).

Now the Fluxion of all the Powers, and of all the Roots of x , may be found by this general Rule:

As $x + x$ contains the simple Quantity and its Fluxion; so the Square, Cube, &c. and the Square Root, Cube Root, &c. of $x + x$ must contain the respective Powers or Roots of x with its Fluxion respectively.

And consequently, if the *Flowing Quantity* be respectively subtracted, the *Fluxion* only must remain.

Thus the Fluxion of xx , is $x \mp x \times$
 $x \mp x = xx = 2xx \mp x \times$: And the

Fluxion of $x x x$ is $x + \dot{x} \times 2 x \dot{x} + \ddot{x} x + x \ddot{x}$
 $- x x x = 3 x x \dot{x} + 3 \dot{x} x \dot{x} + \ddot{x} x x$.

But since $x x$, Part of the Fluxion of $x x$, is infinitely smaller than $2 x \dot{x}$, whereby it can make no sensible Change in that Quantity, it may be laid aside as of no Value.

And for the same Reason, $3 x \dot{x} \dot{x} + \ddot{x} x x$ may be left out of the Fluxion of $x x x$; so that their remains only

$2 x \dot{x}$ } for the Fluxion of $\begin{cases} x x \\ x x x \end{cases}$
 $3 x x \dot{x}$

Thus also the Fluxion of $\sqrt{x}$ is $\sqrt{x} + \frac{\dot{x}}{2\sqrt{x}}$
 $- \sqrt{x} = 2 \sqrt{x}$; which will be evident, by only extracting the Square Root of $x + \frac{\dot{x}}{2\sqrt{x}}$ according to the common Method, thus;

$$\begin{array}{r} x + \dot{x} \left(\sqrt{x} + \frac{\dot{x}}{2\sqrt{x}} \right) \\ 2 \sqrt{x} \left) \frac{x}{0} + \frac{\dot{x}}{0} \right. \end{array} \quad \frac{\ddot{x} x}{4x}$$

The Fluxion of

$$\begin{array}{l} \sqrt[3]{x} \\ \sqrt[3]{x} \\ \sqrt{x x x} \end{array} \left\{ \begin{array}{l} \frac{\dot{x}}{3\sqrt[3]{x x}} \\ \frac{2 \ddot{x} x}{3\sqrt[3]{x x x x}} \\ \frac{3 x x \dot{x}}{2\sqrt{x x x}} \end{array} \right.$$

So that $\sqrt{x + \frac{\dot{x}}{2\sqrt{x}}}$ is equal to $\sqrt{x} + \frac{\dot{x}}{2\sqrt{x}}$
 which is equal to $\frac{x}{2\sqrt{x}}$ the Fluxion of $\sqrt{x}$, as above.

Indeed $\sqrt{x} + \frac{\dot{x}}{2\sqrt{x}}$ is the true Root of $x + \dot{x} + \frac{\ddot{x} x}{4x}$ as the Operation shews, and consequently somewhat bigger than the Root of $x + \dot{x}$. But $\frac{\ddot{x} x}{4x}$ being indefinitely less than what is annex'd to the Difference between $x + \dot{x} + \frac{\ddot{x} x}{4x}$ and $x + \dot{x}$, may be consider'd as of no Value. Wherefore $\sqrt{x} + \frac{\dot{x}}{2\sqrt{x}}$ may be taken for the true Root of $x + \dot{x}$.

Authors Names who have written of Fluxions:
D. Bernoulli Tractatus de Principiis Calculi Exponentialis.

Nieuwentijt's Analysis Infinitorum. Amster. 1695.
Dr. Cheyne's Fluxions, with Moivre's Animadversions on them; and the Doctor's Reply.

Mr. Humphrey Ditton's Institution of Fluxions.

FLYBOAT, is a large Vessel with a broad Bow; used by Merchants in the Coasting Trade. Some of these will carry 800 Tun of Goods.

FLYERS, is the Workmens Term in Architecture for Stairs that go strait, and don't wind round; nor are the Steps tapering, but the fore and back Part of each Stair and the Ends are respectively parallel to one another. So that if one Flight don't carry you to your design'd Height, there is a broad half Space; and then you fly again with Steps every where of the same Breadth and Length, as before.

FLYING Bridges, in Fortification, are made of two small Bridges laid one upon the other, so that the uppermost, by the means of Ropes and Pullies, is forc'd forwards 'till the End of it join to the Place design'd.

FOCUS. *Dr. Hook, Op. Posthum. p. 122*, very well accounts for the Reason of the great Effect of Burning Glasses, thus: Suppose there be one, either Concave or Convex, of a Foot in Diameter; this will constipate or crowd together all the Rays of the Sun, which fell before on the Area of a Circle 12 Inches in Diameter, into the Compass of $\frac{1}{8}$ of an Inch. The Area's then of the two Circles will be as 9216 to 1; and consequently, the Heat of the Lesser, to the Heat of the Greater, will be reciprocally as 9216 to 1: That is, the Heat in the Focus will exceed the Sun's common Heat at that time 9216 Times. And this will have an Effect, as great as the direct Rays of the Sun would have on a Body plac'd at one 96th Part of the Distance of the Earth from the Sun, or on a Planet that should move round the Sun, at but a very little more than a Diameter of the Sun's Distance from him, or that would never appear further from him than about 36 Minutes.

FODDER, or *Fother* of Lead, is a Weight containing eight Piggs; every Pigg three Stone and an half. In the Book of Rates, a Fodder of Lead is said to be 2000 lb. Weight; at the Mines, it is 22½ Hundred; and among the Plumbers, at London, it is but 19½ Hundred.

FOETUS. The *Fetus* is almost of an Oval Figure, whilst it lies in the Womb: For its Head hangs down with its Chin on its Breast; its Back is round; with its Arms it embraceth its Knees, which are drawn up to its Belly; and its Heels are close to its Buttocks; its Head is upwards, and its Face is towards the Mother's Belly. But about the 9th Month, in the Humane Foetus, the Head, which was specifically lighter than any other Part, becomes specifically heavier; its Bulk bearing a much smaller Proportion to its Substance than it did before; and consequently it must now tumble and sink down in that Liquor in which it swam, as it were, before: So its Head falls down, its Feet get up, and its Face turns towards the Mother's Back. But because 'tis then in an irksom, tho' proper, Posture for its Exit, the Motion it makes for Relief gives frequent and great Pains to the Mother; which cause a Contraction of the Womb, for the Expulsion of the *Fetus*. When it happens to present it self in any other Posture, it should be care-

carefully put back again; and, if possible, turn'd the right Way by the Midwife: But if that can't be done, it should be drawn out by the Feet.

FOLIATE. In *Phil. Trans.* N. 245. there is a Way, communicated by Sir Rob. Southwell, of foliating the Globe Looking-glasses. The Mixture is of Quicksilver and Marchasite of Silver, of each 3 Ounces; Tin and Lead, of each half an Ounce. These two first thrown on the Marchasite, and last of all the Quicksilver. Stir them well together over the Fire; but they must be taken off it, and be towards cooling, before the Quicksilver is put to them. When you use it, the Glass should be well heated, and very dry: But it will do also when 'tis cold, but best when the Glass is heated.

This is a little oddly express'd: But I suppose 'tis meant, that the Marchasite should be powder'd, the Lead and Tin melted and poured upon it, and then all well stirred and mixed together while in Fusion; and afterwards, when 'tis almost cold, the 3 Ounces of Mercury put to it to make the Amalgam.

FOLK-Land, was the *Terra vulgi*; the Land of the Common People who had no Estate therein; but held the same under such Rents and Services as were accustomed or agreed, at the Will only of their Lord the Thane; and therefore their Bargain was not put in Writing, as that about the Boc-Land was, but was accounted *Prædium Rusticum & Ignobile*.

FOLKMOTE, was the general Word for a Popular Convention of all the Inhabitants of any Place; which if it were of those of a City or Town, it was called a *Burgh-mote*; but if of all the Free Tenants of a County, 'twas called a *Schire-mote*. In Towns and Burghs, this solemn Assembly was made by the Sound of a Bell call'd the *Motbell*. In the County *Folk-mote*, all Knights and Free Tenants did their Fealty to the King, and elected their annual Sheriff formerly, (on the 1st of October) before the King nominated. But after that, (about the Time of Edward II.) the City *Folk-mote* was changed into the Common-Council, and the County *Folk-mote* into the *Sheriff's Turn* and *Affises*. The Word *Folk-mote* had also sometimes a less Extent, signifying only the Assembly of the Tenants to a Court Leet or Baron of their Lord.

FOOT-Bank, or a *Banquette*, in Fortification, is a small Step of Earth on which the Soldiers stand to fire over the Parapet.

FOOT-gelde, was an antient Amerciament for not cutting out the Balls of the Feet of great Dogs in the Forest; which was done for preventing their running after the King's Deer; and was called *Expediation*.

FORAMEN Arteriae Durae Matris, is a Hole in the Cranium, which allows a Passage for the Artery belonging to the *Dura Mater*.

FORAMEN Lacerum, in the 3d Hole in the Os *Pharoides*, by which the 3d Pair of Nerves pass out of the Cranium.

FORE-Staff, is an Instrument used at Sea to take the Sun's Altitude, or the Height of the Moon, or any Star in the Night; and 'tis so call'd, because when 'tis used, your Face is to the Object: Whereas in the Use of the *Back-staff*, or *David's Quadrant*, the Back of the Observer is towards the Sun. The *Fore-staff* is the same with the *Cross-staff*: Which you will find fully describ'd in this *Vol.* under that Word.

FORMELLA, was a Weight of Lead, which in 51 H. 3. A. D. 1267. is said to contain six *Petrae*, except 2 lb. Each *Petra* contain'd 12 lb. and each Pound contain'd the Weight of 25 Shillings.

FORNICATION, is sometimes used in Architecture, to signify Arching or Vaulting.

FORTIFICATION. Writers on this Subject.

Sir Jonas Moor's *Modern Fortification.* London, 1673. 8vo.

Nouvelle Maniere de Fortifier les Places, par M. Blondel. Hague, 1684.

La Grand Art d' Artillerie, par Casimir Symyewicks. Frankfurt, 1676.

FORTINGLES, the same with *Farthingdell*; i. e. the 5th Part of an Acre, Penny, &c.

FORTITUDE, is that Virtue which enables us to persevere in doing well, notwithstanding any Dangers, Obstacles or Difficulties we may meet with in the Performance of what we know to be our Duty.

FOSSA, is, according to some Anatomists, the Term for the Middle Part of the *Corvix*, or Hinder Part of an Humane Neck. The Upper Part being called *Lophia*, and the Lower *Epimis*.

FOSSATORUM Operatio, was antiently the Service of Work and Labour done by Inhabitants and adjoining Tenants for Repair and Maintenance of the Ditches round the City or Town, for which some compounded, paying a Duty called *Fossagium*.

FOTMEL, in Old Times, was a Weight of Lead containing Ten Stone, or, at that time, Seventy Pounds; as appears from the *Cartul. St. Albani*, MS. in the Cotton Library.

FOUCADE, the same with *Fougade*.

FOUNDAY, is a Word used in the Iron Works, for the Space of six Days; in which time they usually make about 8 Tun of Iron.

FOURNEAU, is the *Powder Chamber*, or the *Chamber of a Mine*, which holds the Powder in Barrels or Sacks, (usually about 1000 lb. Weight) which by means of the *Saucidge* is fired, and so the Mine is sprung.

FRACTIONS, Besides the common one, given in *Vol. I.* there is also another Notion of a Fraction; which is very necessary to be understood, because it will be of use to shew the Reason of many of the vulgar Rules and Operations in Fractions. Thus suppose $\frac{3}{4}$ of 20 s. or of a Pound Sterling, were the Fraction; this Fraction, instead of three quarters of one Pound, may be consider'd as a fourth Part of three Pounds: That is, by taking as many of the Integers as the Numerator expresses, (*viz.* 3.) and dividing them by 4, the Denominator; for then a Quotient of the same Value will arise, (for 4) 60 s. (15 s.) And this shews you the Reason of that manner

manner of Expression which is used by Geometers and Algebraists about Fractions; who read

$\frac{a}{b}$, thus, a divided by b .

FRACTIONS *Decimal*. See *Decimal*.

FRACTIONS *Sexagesimal*. See *Sexagesimal*.

FRACTIONS *in Algebra*. A Fraction is a broken Number or Quantity, expressing the Parts of some Integer. It consists of two Parts, with a Line of Separation placed between them. Of which, that above the Line is called the Numerator, because it *Enumerates* or tells you how many of the Parts of the Integer the Fraction contains: And that below the Line is call'd the Denominator; because it *Denominates* or expresses the Nature of the Parts the Integer is supposed to be divided into. Thus,

Suppose $a = 3$ and $b = 4$, then will $\frac{a}{b}$ or $\frac{3}{4}$ be a Fraction, expressing, that some Integer being divided into 4 Parts or *Quarters*, there is taken 3 of them, or 3 Quarters.

A Fraction is either *Proper*, when the Numerator is less than the Denominator, as $\frac{3}{4}$: Or *Improper*, when the Numerator is equal to it, or greater: As $\frac{4}{4}$ or $\frac{4}{3}$ are Improper Fractions; because one expresses the whole Integer, and the other more than the Integer; however 'tis often of good Use to express Quantities after this Way.

The Operations about Algebraick Fractions, or Fractions express'd by Letters, are much of the same Nature with those in common Arithmetick.

I. All Fractions ought first to be reduc'd to their lowest Terms; which is done by dividing both Numerator and Denominator, by their greatest common Divisor; that is, the greatest Quantity which can divide both. For then the Quotient will be a Fraction of the same Value as the former, but in the smallest Terms that can be. Thus,

$\frac{3aa}{6a}$, by dividing both Parts by $3a$, will be brought

down to $\frac{a}{2}$ or $\frac{1}{2}a$. And $\frac{4a^3}{6a^4}$ being divided by its greatest Common Divisor $2a^4$, will be reduc'd

to $\frac{2aa}{3}$

$$\begin{array}{r} 4x \) \ 36xx \\ 4x \) \ 4bx + 16dx \end{array} \quad \left(\frac{9x}{b+4d} \right)$$

And this may most times be done by Inspection, by casting out of both Numerator and Denominator such Letters as are multiplied into both of them; as in these Examples.

But such greatest Common Divisor may be found in all Cases where the Eye cannot readily discover it, by dividing the Denominator by the Numerator, and the last Divisor by the Remainder, if any be; and so on, till there come to remain nothing: And then that last Divisor is the greatest Common Measure. But if Unity, or 1, remain at last, then the Fraction was in its lowest Terms at first, and cannot be reduc'd to any smaller Terms. This Practice is the same as in Vulgar Fractions; and you have an Example of it in *Species in Ward's Algebra, Chap. 4.*

II. To reduce any Integer, as b or $a + c$, to the Form of an Improper Fraction, draw the Line of Separation, and under it write 1, then it will stand $\frac{b}{1}$ or $\frac{a+c}{1}$, which, tho' in the Form of Fractions, are not alter'd, because 1 neither Multiplies nor Divides.

If a Denominator, as d , were given: First Multiply the given Integer by such Denominator, and then write the Denominator under the Product. Thus,

$$\frac{db}{d} = b, \text{ and } \frac{da + dc}{d} = a + c.$$

III. To reduce Fractions of different Denominators, to others of the same Value that shall have a Common Denominator; (which Operation must always precede Addition and Subtraction in Fractions.) You must first bring the Fractions down as low as you can; (by Rule 1.) then Multiply a-cross the Numerator of the first into the Denominator of the second, for a new Numerator of the first Fraction; then the Numerator of the second into the Denominator of the first, for a new Numerator for the second Fraction; and lastly, Multiply the Denominators one into another, for a Common

Denominator. Thus, let $\frac{a}{d}$ and $\frac{bb}{f}$ be given,

and they will by this Rule be reduced to $\frac{fa + fb}{df}$,

and $\frac{dbb}{df}$; Fractions in Value equal to the former.

The Reason of which is plain; for each Fraction is Multiplied and Divided by the same Quantity or Letter, and therefore must retain the same Value as before, tho' reduc'd to another Form:

$$\begin{array}{cc} \frac{4}{6} & \frac{3}{4} \\ \frac{16}{24} & \frac{18}{24} \end{array}$$

For every Fraction being Multiplied by Multiplying its Numerator, but Divided by Dividing it; and being also Multiplied by Dividing the Denominator, and divided by Multiplying it:

It follows, That each Fraction will gain as much by the Multiplication of its Numerator, as it loses by the Multiplication of its Denominator. And, *Vice versa*, in case of Division, by one and the same Quantity.

If there are more than two Fractions, every Numerator must be Multiplied continually into all the Denominators but its own; and the Denominators one into another continually for a

new Denominator. E. gr. $\frac{a}{x}, \frac{b}{y}, \frac{c}{z}$, will be

reduc'd to this Form $\frac{ayz}{xyz}, \frac{bxz}{yzx}, \frac{cxy}{zyx}$, which are

Fractions of the same Value as the former (as is apparent by ejecting the Common Letters) but reduc'd to a Common Denominator.

IV. And when this is once understood, Addition and Subtraction in Fractions are perform'd by only Adding or Subtracting the Numerators, and

and Subscribing the *Common Denominator* before found. Thus,

If the Fractions $\frac{a+b}{d} \frac{bb}{f}$, were to be *Added* or *Subtracted*; they will stand, when reduc'd (by Rule 3.) in this form, $\frac{fa+fb+fb}{df}$, or $\frac{fa+fb-fbb}{df}$: The former of which is the *Sum*, the latter the *Difference*, of the two given Fractions.

V. *Multiplication in Fractions*, is perform'd by Multiplying the Numerators into one another for a new Numerator, and the Denominators for a new Denominator, the Fractions having been first reduced to their lowest Terms. Thus,

$$\frac{a}{b} \times \frac{d}{c} = \frac{da}{bc}, \text{ and } \frac{a+b}{c} \times \frac{a-b}{d} = \frac{aa-bb}{cd}.$$

Hence, if any Fraction be Multiplied by the Denominator, or by some Integer the same with it, the Numerator is the Product. As $\frac{aa}{b}$

$\times b = aa$, for $\frac{aa}{b} \times \frac{b}{1} = \frac{aab}{b}$; which, casting off the Common Letters in both Parts, leaves aa .

Also, if any Fraction be to be Multiplied by some Letter or Letters that are found in every Member of the Denominator, the Multiplication may be made only by ejecting such Letters out of the Denominator: As $\frac{ab}{cd}$ Multiplied by $d = \text{to } \frac{ab}{c}$.

VI. *Division in Fractions*, is perform'd (after Reduction, according to Rule 3.) by Multiplying the Numerator of the Dividend by the Denominator of the Divisor, for a Numerator; and the Denominator of the Dividend by the Numerator of the Divisor, for a new Denominator: As in *Vulgar Fractions*. Thus,

$$\frac{a}{b} \div \frac{d}{c} = \frac{ac}{bd}$$

The Reason of which is plain, from what was said above, That a Fraction is Divided by Multiplying its Denominator. Thus,

$$\frac{3}{4} \div \frac{12}{16} = \frac{48}{48} = 1.$$

For to divide $\frac{3}{4}$ by $\frac{12}{16}$, is to seek how often 3, the Numerator of the Divisor, is in $\frac{3}{4}$; which is done by Multiplying 16 by 3, and the Answer is $\frac{48}{4}$: But then again, because $\frac{3}{4}$ is but $\frac{3}{4}$ of 3, it will be contain'd in $\frac{48}{4}$ 4 times oftner than 3 is; and therefore, in order to bring it to a *Par*, Divide the Value of that Fraction by Multiplying its Denominator by 12, and the Product 48 will be the Numerator of the Quotient.

But if it happen that the Fractions have a Common Denominator, then cast off that, and divide one Numerator by the other. Thus,

$$\frac{a}{b} \div \frac{c}{b} = \frac{a}{c}, \text{ and } \frac{b}{a} \div \frac{b}{a} = 1.$$

For Fractions having a Common Denominator, are as their Numerators.

VII. A Mixt Quantity or Number, is that which is part Integer, and part Fraction. As $aa + \frac{b}{c}$: Such Quantities are reduc'd to the form of improper Fractions, by first Multiplying the Integral Part by the Denominator of the Fractional Part; then adding the Numerator to it, and subscribing the Denominator under all. Thus, the former Quantity $aa + \frac{b}{c}$ is Reduc'd

to this improper Fraction $\frac{caa+b}{c}$.

Every improper Fraction is Reduc'd back again into its equivalent Mixt Number or Integer, by dividing the Numerator by the Denominator.

Thus, $\frac{caa+b}{c}$ divided by c , quotes $aa + \frac{b}{c}$; and $\frac{aa}{1}$ divided by 1, makes aa .

FRAISING of a *Batallion*, is to line the Musketers all round with Pikes, in case of their being charg'd by a Body of Horse.

FRANKPLEDGE, *Franciplegium visus Franciplegii*, was the Antient Custom for the Freemen of England, at 14 Years of Age, to find Surety for their Truth and Fidelity to the King, and good Behaviour to their Fellow Subjects. This Surety, among the Saxons, was taken in their *Friborg*, *Lath*, or *Tithing-Court*; and after the Norman Conquest, it was call'd *Frankpledge*, and was continu'd in the *Court-Leet* of Royal Jurisdiction to be held annually on the Feast of St. Michael by *Magna Charta*.

So that to have *Visum Franciplegii*, View of *Frankpledge*, was no more than to have the Privilege of holding a *Court Leet*; and this Power was determin'd by Stat. 8 of *Edw. II.* and 1 of *Edw. III.* The Place of holding such Courts was, if it were fair Weather, on some open Green; but if it was bad Weather, they adjourn'd to the *Mannor House*, or to that of some adjoining Tenant. *Kennet P. Antiq.*

FREEZING. The true Cause of the Congelation of Water into Ice, seems plainly to be the Introduction of the *Frigorifick Particles* into the Pores or Interstices between the Particles of the Water; and by that means, getting so near to them, as to be just within the Sphere of one another's *Attracting Force*, (see *Attraction*) and then they must cohere into one solid or firm Body. But Heat afterwards separating them, and putting them into various Motions, breaks this Union, and separates the Particles so far from one another, that they get out of the Distance of the *Attracting Force*, and into the Verge of the *Repelling Force*, and then the Water reassumes its Fluid Form.

Now that Cold and Freezing do arise from some Substance of a *Saline Nature* floating in the Air, it seems probable from hence, That all *Salts*, and more eminently some particular ones, when mix'd with Snow or Ice, do prodigiously encrease the Force and Effects of Cold: We see also, that all *Saline Bodies* do produce a Stiffness and Rigidity in the Parts of those Bodies into which they enter. Microscopical Observations upon *Salts* inform us, That the Figures of some *Salts*, before they shoot into Masses, are thin double-wedg'd like Particles, which have abundance of Surface in Respect to their Solidity, (which is the Reason why

why they swim in Water when once raised in it, tho' specifically heavier). These small Points or the Salt getting into the Pores of the Water, whereby also they are in some measure suspended in the Winter Time (when the Heat of the Sun is not ordinarily strong enough to dissolve the Salts into a Fluid, to break their Points, and to keep them in perpetual Motion) being less disturb'd, are more at Liberty to approach one another, and by shooting into Chrystals of the Form above-mentioned, do, by both their Extremities, insinuate themselves into the Pores of Water, and by that Means freeze it into a solid Form. And we see, that the Dimensions of Water are increas'd by Freezing, its Particles being kept at some Distance one from another by the Intervention of the Frigorific Matter.

But besides this, there are many little *Volumes*, or small Parcels of Air, included at several Distances, both in the Pores of the Watry Particles, and in the Interstices formed by their Spherical Figures. Now by the Insinuation of these Chrystals, the *Volumes* of Air are driven out of the Watry Particles, and many of them uniting, form larger *Volumes*, which thereby have a greater Force to expand themselves than when dispers'd, and so both enlarge the Dimensions, and lessen the specific Gravity, of Water thus congeal'd into Ice. And hence, saith Dr. Cheyne, (from whom this last Account) we may guess at the Manner, how Water, impregnated with Salts, Sulphurs, or Earths, which are not easily dissolvable, may form itself into Metals, Minerals, Gums, and other Fossils; the Parts of these Mixtures becoming a Cement to the Particles, of Water, or getting into their Pores, change them into these different Substances. *Phil. Prin. of Nat. Rel. p. 66.*

FRESCO. Painting in *Fresco* is thus perform'd: The Colours are ground with Lime-Water, Milk, or Whey, and temper'd or mix'd together in Pots, as in Size Colouring. The Plaister is made of the Powder of old rubbish Stones mixt with burnt Flints or Lime, and Water; but the Salt of the Lime must be wash'd out, by often pouring on fresh Water; and to make the Plaister stick the better, they drive in Stumps of Horse-nails, about 6 Inches asunder. With this Plaister the Wall is to be laid thick, and then it must be let dry; and afterwards a new Layer of Plaister is put of the Thickness of an Half-Crown; and the Colours must be wrought with a quick free Hand whilst it is wet, for there is no altering of it after it is dry. This Way of Painting was in most antient Use among the Greeks, and from them came to the Romans, with whom it was famous. *Raphael Urbin*, and *Julio Romano*, were eminent this Way: There being three Chambers in the Vatican of their doing, yet in being.

FRICTION, is a Word used often among Mechanicians, or the Writers on Mechanicks, for the Resistance which arises to the Motion of the Parts of any Engine from the Matter of the Wheels, &c. rubbing against one another, or against any other Body.

Of the Resistance arising from Friction of the Parts of an Engine one against another, Mr. *Amontons* hath a large Discourse, which is printed in the *Memoires de l'Academ. Royale des Sciences*, for the Year 1699. where he makes several Experiments, gives Rules to find and calculate Tables of this Resistance arising from

Friction, and of that which is the Result of the Rigidity of Chords used in Pulleys, &c.

FRIGAT, is a Ship of War, usually of two Decks, light built, and design'd for swift Sailing. When it hath but one Deck, and consequently is of a smaller Size, they call her a *Light Frigate*.

FRIGATOON, is a *Venetian Vessel*, commonly used in the *Adriatick*: She is built with a square Stern, without any Fore-mast; having only a Main-mast, Miffen-mast, and Bow-sprit.

FRUGIVOROUS Birds, according to Mr. *Willoughby*, are the *Parrot-Kind*, which tho' they have a crooked Beak and Talons, and therefore do belong in general to the *Birds of Prey*, being Rapacious and *Carnivorous*; yet because they eat Fruit too, I suppose, he distinguishes them from the rest by this Title. See *Birds*.

FRUMGYLD, was the old *Saxon* Term for the first Payment made to the Kindred of a slain Person, in Recompence of his Murder.

FURNACE Almond. In the smelting of Silver Oar, and clearing it from the Lead, they use a Furnace which they call an *Almond Furnace*; in which they melt the Slaggs or Refuse of the Licharge, without pounding or stamping it, and with Charcoal only.

FURNACE of Assay, is used in the Smelting-Houses of Silver Oar; and is to try the Value of the Silver, or what Proportion it bears to the Lead: Which they know by weighing the Pieces cut off from every Bar, and then melting them anew, and after the Lead is separated, weighing the remaining Silver. See *Silver*, in this Vol.

FURNITURE of Dials. As on all Sorts of Dial Plains, *Strait Lines* may be describ'd, which by the Shadow of a *Stile*, or a Line parallel to the Earth's Axis, will shew the true Hour of the Day: So by the Shadow of an *Apex*, *Nodus*, or one determinate Point in that Axis or Stile, on the Plane of the Dial, may many useful and curious Astronomical Conclusions be describ'd or shewn: And all these taken together, are call'd the *Furniture of Dials*.

Such as,

1. *The Parallels of the Sun's Diurnal Motion*; shewing every Day what Degree of the Ecliptic the Sun is in; or, if less Accuracy be thought enough, what Sight of the Zodiac.

2. *The Length of the Day and Night*; or, *The Proportion of the Sun's Diurnal to his Nocturnal Arch, throughout the Year*.

3. *The Time of the Year*; shewing, by the Shadow of the Axis, both the Month and Day.

4. *The Sun's Almacanters*, or, *Parallels of Altitude*; shewing the Sun's Altitude above the Horizon, and the Proportion of Shadows.

5. *The Azimuths*, or *Vertical Circles*; shewing what Azimuth or Point of the Compass the Sun is upon it all Times of the Day.

6. *The Babylonish, Italian, Jewish* (or *Unequal*) *Hours*; together with the Meridians or Horizons of any Particular and Remote Places; and many other Things, &c. I purposely omit to mention the Planetary Hours, the Circles of Position, &c. in order to Astrological Fooleries; because, I hope, at this Time of Day, they are of no Esteem with any Persons of Mathematical Skill, or indeed of common Sense and Understanding.

Now of these Circles of the Sphere, whose Projection constitutes this Furniture; some are *Great*,

as the Azimuths or Vertical Circles, the Meridians or Hour Circles, and the Circles of Longitude of the Sun or Stars; and these on all Sorts of Dial-Planes will be strait Lines: And if the Planes on which such great Circles are describ'd, are parallel to such great Circles in the Heavens as they are design'd to represent, then will those straight Lines be all parallel to one another.

But if the Dial-Plane be perpendicular to any of those corresponding great Circles in the Heavens, then the straight Lines so projected on the Plane, will meet in the Centre at *Equal Angles*.

But if the Plane lie oblique to any of those great Circles in the Heavens, the projected straight Lines will still meet in one Centre upon the Plane, but at *Unequal Angles*.

All lesser Circles of the Sphere, (such as are, the *Parallels of the Sun's Declination or Course*, and all *Almacanters*, or *Parallels of Altitude*) being projected on a Plane, become *Conick Sections*, i. e. either *Ellipses*, *Parabola's*, or *Hyperbola's*; except when these lesser Circles are projected on such Planes as do lie parallel to those lesser Circles in the Heavens; as *Parallels of Declination*, when they happen to be drawn on a Plane, lying parallel to the Equinoctial, for then they will be perfect Circles, which are Sections of a Cone parallel to its Base. So also, if the *Almacanters*, or *Parallels of Altitude*, be describ'd on a Plane parallel to the Horizon, they will become perfect Circles.

It may be of Use to remark also, That all Dial-Planes in any Latitude, and however posited in that Latitude, whether Direct, Declining, Inclining, or Reclining, or both Declining and Inclining, or Declining together, are, in some Part or other of the Earth, *Horizontal Planes*: and the *Height of the Stile* is equal to the *Latitude* of the Place wherein it is an *Horizontal Plane*; and the *Substile* of the Dial is the *Meridian* of that Place; and the *Difference of Longitude* of that Plane, shews

how much to the *East* or *West* the Place lies from that wherein it is an *Horizontal Plane*.

Whence it must follow, that if you draw, for any Declining-Reclining Plane, or any other Dial-Plane, a good Dial with Hours and Quarters; and much more if you draw it to Minutes, &c. and then, on the same Plane, with Red Ink, &c. draw an Horizontal Dial for the Latitude of that Place, which is equal to the Stile's Height in the former Declining-Reclining, &c. Plane; and letting the Substile be the Hour-Line of 12 to it, draw all the other Hours, Quarters, &c. from thence; and then on that Horizontal Dial draw also the proper Furniture: When you have done this, I say, if you can expunge the Hour-Lines of the Horizontal Dial, the Furniture of that Horizontal Dial will be the true Furniture for the Declining-Reclining, &c. be it never so irregular, supposing it have but a Centre.

As to the Description of this Furniture on all Kinds of Dial-Planes, you will find large and full Directions in *Wells's Art of Shadows*, *Hollwell's* and *Leybourn's Dialling*, &c. And the full Demonstration of the whole Matter, *Christopher Clavius* gives us in his *Gnomonicks*. See also *Gaspar Schottus's Cursus Mathematicus*, Book 14. of *Horography*.

FURRING, in Architecture, is making good the Rafters-Foot in the Cornish: That is, when Rafters are cut with a Knee, these *Furrings*, or *Furrs*, are Pieces that go straight along with the Rafter from the Top of the Knee to the Cornish. Also when Rafters are rotten, or sunk hollow in the Middle, there are Pieces cut thickest in the middle, and tapering towards each End, which are nailed upon them to make them straight; and such Pieces are call'd *Furrs*, and the putting them on, *Furring* the Rafters.

FUST, is a Term in Architecture for the Shaft of a Column, from the *Astragal* to the *Capital*.

GABELL, *Gabella*, *Gabellum*, the same with *Vectigal* in old Writers, hath the same Signification as *Gabelle* in French: And for the better understanding of Antient Records, Statutes, Charters &c. you should know, that *Gabel*, or *Gavel*, *Gablum*, *Gabellum*, *Gabellettum*, *Galbellettum*, and *Gavillettum*, do all signify a Rent, Custom, Duty, or Service, yielded or done to the King, or some other Lord: and Dr. Cowell seems to have judg'd right, that *Gablum* is to be distinguish'd from a Rent or Payment made, or a Contract or Bargain; and hath only Relation to such a Payment or Service as was imposed by the Power and will of the Lord.

GABEL-End of a House, is the Upright Triangular End, from the Cornish or Eaves, to the Top of its Roof.

GAGE, in Joinery, is an Instrument made to strike a Line truly parallel to the straight Side of any Board or Piece of Stuff. Its chief Use is for gaging of Tenents true to fit into Mortises, and for gaging Stuff of an equal Thickness. It is made of an oval piece of Wood, fitted on upon a square Strick, to slide up and down stiffly thereon, and with a Tooth in the End of a Staff, to score or strike a Line upon the Stuff at any Distance, according to the Distance of the Oval from it.

GAGE-Point. See *Gauge-Point*.

GAGER Deliverance. See *Wage*.

GAIN, in Architecture, is the Workmen's Term for the Bevilling Shoulder of the Joist or other Timber. 'Tis used also for the lapping off the End of the Joist, &c. upon a Trimmer or Girder; when the Thickness of the Shoulder is cut into the Trimmer also, and bevilling upwards that it may just receive the *Gain*; and so the Joist and Trimmer lie even and level with their Surface. This way of working is used in Floors and Hearths.

GAINAGIUM, or *Wainagium*, signifies all manner of Plough-Tackle, or Instruments used in Husbandry, without any Respect to *Gain*, or *Profit*. For as *Magna Charta* provides, That the Knight and Freeholder shall be amerced *Salvo Contenemento suo*, and the Merchant *Salvo Mercandisâ suâ*; so the Villain Countryman, or Plowman, was to be fined or amerced for his Offences, but still *Salvo Guinagio suo*, i. e. *Saving all his Plow-Geers, and necessary Implements of Husbandry*: For he was not to be fined so as to be ruined and undone, by taking from him the necessary Means of Life.

GALEASSE, is a large low-built heavy Vessel, using Sails and Oars: It hath three Masts, and those not to be lowered, as they are in a Galley. They have three Tire of Guns in the Head, and usually two Tire in the Stern. In two Dutch Prints that I have of a Galeasse, there are 25 Oars of a Side; and I'm told, there is about 6 or 7 Men to an Oar.

GALEONS, were formerly the French Ships of War; but now the Word is only used amongst the Spaniards and Italians. And the Spaniards do now call only those Ships *Galeons*, which are sent annually to *La Vera Cruse*, or other Places, in the *West-Indies*, to fetch home Bullion.

GALL. Dr. Keil shews, *An. Secret. p. 36*. That the Gall or Bile, being to be mixed with the

Chyle, as it comes out of the Stomach into the Duodenum, could be no where so conveniently secreted from the Blood, as where the Liver is placed, had also all the Branches of the Celiac Arteries, carry'd all the Blood to the Liver, from which the Gall was to be separated: It is evident, considering the Nearness of the Liver to the Heart, and the Intestine Motion of the Blood, that so viscid a Secretion, as the Gall is, could never have been separated by any Gland in that Place. In this Case therefore, Nature is forced to alter her constant Method of sending the Blood to all Parts of the Body by the Arteries; and here she forms a Vein, (which is no Branch of the *Cava*, as all other Veins are) and by it she sends the Blood from the Branches of the Mesenterick and Celiac Arteries, (after having passed through all the Intestines, Stomach, Spleen, Caul, and Pancreas) to the Liver. By which extraordinary Contrivance, the Blood is brought a great way about, before it arrive at the Liver; and its Celerity is extremely diminish'd: So that all the Corpuscles which are to form the Gall, may have sufficient Time to attract one another, and to unite, before they come to their secreting Vessel. And thus the Use of the *Vena Porta* is found out.

And moreover he computes, that since a Branch of the Mesenterick Artery is to its corresponding Branch of the *Porta*, as 9 to 25; therefore the Blood in the Branches of the *Porta* moves above 177 times slower than it does in the Trunk of the Mesenterick Artery; and this only on the Account of the Increase of the Diameters of the Vessels.

Thus Nature provides for the forming of the Gall, in that Blood which passes through the Mesenterick Artery. Next he enquires what Care is taken about that which is convey'd by the Celiac Artery to the Liver. For it seems it was necessary to send a larger Quantity of Blood thither, than could be disposed of through the Intestines. Part of the Blood of the Celiac Artery is spread upon the Stomach and Caul, and its Velocity diminished, as we have seen in the Intestines: But still all the Blood which those Parts could receive, was not sufficient for the Liver; and there was no room for the Division and Expiating of the Vessels through such a large Space as the Mesentery, and the long Tract of the Guts. And therefore here Nature hath a new Contrivance to abate the Velocity of the Blood, (to which the Intestine Motion is always proportional); which is, by emptying the Blood entirely out of the Vessels, into a large spongy Bowel, the Spleen; which seems to be a Cistern produced for that very Intent and Purpose. And the Circumference of the Celiac Artery being half an Inch, or .5 its Square is .25: And therefore the Square of the Splenic, which is a Branch of it, cannot be above .18. Now the Dimensions of the Spleen are six Inches long, 3 or 4 in Breadth, and 2 in Thickness. He makes therefore this easy Supposition, That it is a Cylinder of 2 Inches Diameter. Wherefore the Square of its Circumference being 36, the Blood must move above 200 Times slower in it, than in the Beginning of the Splenic Artery; and is longer before it gets to the Liver, than that which passes through all the Intestines.

From

From all this Art and Contrivance, it is an evident Demonstration, that the Intent of Nature was to diminish the Velocity of the Blood; and that such a slow Motion is absolutely necessary for the secerning of the Bile in the Liver.

The Particles which compose the Gall, he shews, bear a very small Proportion to the rest of the Blood; as is evident from that great Quantity of Blood which is carry'd to the Liver, and the small Quantity of Bile which is separated from it. In a large Dog, whose *Ductus Chole-doctius* was near as big as a Man's, I could never gather above two Drams in an Hour. Now there is thrown into the *Aorta* every Hour about 4000 Ounces of Blood; and it appears by the Proportions of the Arteries, that the Mesenterick and Celiac are to the rest, as 1 to 8. And therefore 500 Ounces of Blood are carry'd every Hour to the Liver. And since only two Drams of Gall are separated from it, the Blood must be to the Blood, at least as 2000 is to 1.

'Tis by Reason of this small Proportion of the Bile to the Blood, that it was so necessary to allow so much Time for the Attraction of the Particles which form the Bile.

From this Contrivance also of the *Aorta*, the Bile receives another Advantage, not less considerable than the Diminution of the Velocity of the Blood: And that is, the Blood passing thro' so many different Parts before it comes to the Liver, parts with the greatest Share of its *Lympha*. By which means, the Particles composing the Bile approaching nearer towards one another, are by their mutual Attraction sooner united.

And the Consideration of these two Contrivances does highly (he thinks) confirm the Truth of his Theory of *Animal Secretion*. For the Diminution of the Velocity of the Blood, and the Substraction of the *Lympha*, can agree in no other End, than the uniting the Particles of the Bile.

GALLEHALPENS, were formerly a *Genoa* Coin, brought into *England* by the Merchants of that City; who trading hither in Gallies, lived commonly in a Lane near *Tower-street*, call'd from them *Galley-Lane*; and they landed their Goods at a Place in *Thames-street*, call'd *Galley-Key*; and they traded with their own small Silver Coin, which our People call'd *Gallehalpence*. But these, together with two kinds of Coin, call'd *Suskins* and *Dotkins*, were forbidden by the Statute of 3 H. V. 1. See *Stow's Survey of London*. p. 137.

GALLERY of a Mine, is any Branch of it carried on towards any Place. For the Besiegers, and the Besieged, do carry each of them Galleries or Branches under Ground, in search of one another's Mines, which often meet and destroy one another.

GALLEY, is a low-built Ship, using both Sails and Oars. Usually they have only a Main-mast and a Fore-mast, which may be struck or lowered at pleasure. 'Tis said, their Length is usually about 130 Feet, and their middle Breadth about 18, and the Length of the Oar is about 36 Feet, and about 4 or 5 Men to an Oar. They are of Service only in the Mediterranean, and such still quiet Seas. These were like the *Roman Liburnice*. See my *Introduction to the Bibliotheca Navigantium & Itinerantium*, about the *Antient Shipping*.

Vol. II.

GALLIOT, is a small Galley, or a Sort of *Brigantine*, built very slight, and design'd for Chase. She hath but one Mast, and can both sail and row. She usually carries two or three *Pedrero's*, and hath 16 or 20 Oars: Some call the Bomb-Ketches *Galliot's*.

GAMING. For the Laws of Chance in Games. See *Play*.

GARBLER of Spices, is an Officer of great Antiquity in the City of *London*, who may enter into any Shop, Warehouse, &c. to view and search Drugs, Spices, &c. and to Garble the same, that is, to make them clean from any Garbles or Dust. See 21 Jac. I. c. 19.

GARSUMME, (*Gersuma*, a *Spelm. Gloss.*) a Fine or Amerciament often used in *Doomsday Book*.

GARTER. The most Noble Order of the Garter, is an Order of Knighthood first instituted by our famous King *Edward III.* 1350. and inferior to none in the World; consisting of 26 Nobles, or Persons of even yet higher Degree; i. e. Sovereign Princes, Kings, and Emperors; whereof the King or Queen of *England* is the Sovereign; and the rest are stiled, The Companions of the Order. See *Cambden*, *Ashmole*, &c.

GARTER, is also the Title of the Principal King at Arms among our *English* Heralds. The Office was created by *Hen. V.* See *Stow*, p. 581. and *Stat. 14. Car. II. c. 33.*

GAVELL-BREAD, Corn-Rent, or Provision of Bread, referred from the Tenant to be paid in Kind.

GAVELCESTER, *Sextarius Vectigalis*, was a certain Measure of Ale, to be paid by way of Rent: It appears to be the same with *Tokester*, which hath sometimes been corruptly written *Colcester*; as perhaps in *Selden's Dissertation*, annexed to *Fleta*, c. 8.

GAVELLERTH, *Gavelhert*. The Duty of Work of plowing so much Earth or Ground, done by the Customary Tenant for his Lord: As,

GAVEL-MEDE, was the Duty of mowing Grass, or cutting Meadow Land, required by the Lord from his Customary Tenant: So,

GAVEL-REP, or *Bedreap*, was the Duty of Reaping at the Bid or Command of the Lord.

GAVELLING-Men. Tenants which paid a reserved Rent, besides some Customary Duties to be done by them.

GAUGE-Point of a solid Measure, is the Diameter of a Circle, whose Area is equal to the solid Content of the same Measure. Thus the Solidity of a Wine Gallon being 231 Cubick Inches, (according to *Winchester* Measure;) If you conceive a Circle to contain so many Inches, the Diameter of it will be 17.15; and that will be the Gauge-Point of Wine-Measure. And an Ale-Gallon containing 288 Cubick Inches; by the same Rule, the Gauge-Point of Ale Measure will be found to be 19.15.

And after the same manner may the Gauge-Point of any Foreign Measure be discover'd.

And from hence may be deduced, by way of Consequence, that when the Diameter of a Cylinder in Inches is equal to the Gauge-Point of any Measure (given likewise in Inches;) every Inch, in Length thereof, will contain an Integer of the same Measure, *V. gr.* In a Cylinder whose Diameter is 17.15 Inches, every Inch in Height contains one entire Gallon in Wine Measure;

H h 2

and

and in another, whose Diameter is 19.15, every Inch in Length contains one Ale Gallon.

GAUGER, is an Officer of the King's Excise, whose Business it is to examine all Casks of Beer, Wine, Oil, Honey, Butter, &c. and to give them a Mark of Allowance, (which is a Circle burnt with an Iron) before they be sold in any Place of this Office. See 27 E. III. c. 8. 4 R. II. c. 1. 18 H. VI. 17. 23 H. VI. 10. 1 R. III. 13. 28 H. VIII. 14. and last of all, 12 Car. II. c. 4.

GAUGING. On this Subject, the following Authors may be consulted :

Stereometrical Propositions, variously applicable, but particularly intended for Gauging : By Robert Anderson. Lond. 1668. 8vo.

Gauging Promoted; being an Appendix to the former Book. Lond. 1669.

Kepleri Stereometria Nova.

Mayne's Practical Gauger.

Hunt's Practical Gauging.

Newton's Gauging.

Everard's Gauging.

GELD, the same with *Gild*, or *Guild*.

GEMOTE, is an old Saxon Term for what we now call a Court : 'Tis often used in the Laws of Edward the Confessor.

GENERAL. When an Army is preparing to march, the Drums beat a peculiar Sound, in order to acquaint the whole Army, that they should all get ready to march: And this Notice by the Drum, they call *Beating the General*.

GENERALE, the Single Commons, or Ordinary Provision, of the Religious in Convents, was formerly call'd by this Term *Generale*, as being their *General Allowance*; and so distinguish'd from their *Piſcantia*, or *Pittances*, which, on extraordinary Occasions, were added as *Over Commons*.

GENERAL Issue. See *Issue*.

GENERATION. As to what the Moderns, from their Discoveries by Microscopes, have advanc'd on this Subject, you will find by comparing the Observations and Discoveries of Dr. Harvey, S. Malpighii, Dr. de Graaf, and M. Leeuwenhoek, with one another: And these Three Things seem to me very probable. 1. That *Animals* are *ex Animalculo*. 2. That the *Animalcules* are originally in *Semine Marium*, & non in *Fœminis*. 3. That they can never come Forward, nor be Formed into *Animals* of the respective Kind, without the *Ova* in *Fœminis*.

The First of these seems probable from these 3 Observations; 1. That some such Thing has been so often observ'd by Malpighius in the *Cicatricula* of an Egg before Incubation, as the Rudiments of an *Animal* in the Shape of a Tadpole; as may be seen in his First, and in his repeated Observations *de Formatione Pulli in Ovo*. 2. The sudden Appearance and Displaying of all the Parts, after Incubation, makes it probable, that they are not then actually formed out of a Fluid, but that the *Stamina* of them have been formerly there Existent, and are now expanded. The first Part of the Chick which is discover'd with the Naked Eye is, you know, the *Punctum Saliens*, and that not till Three Days and Nights of Incubation be past: And then on the Fifth Day the Rudiments of the Head and Body do appear. This

made Dr. Harvey conclude, that the Blood had a Being before any other Part of the Body, and that from it all the Organs of the Fœtus were both formed and nourished; but by Malpighius's Observations, we find that the Parts are then only so far extended, as to be made visible to the Naked Eye, and that they were actually Existent before, and discernable by Glasses. After an Incubation of 30 Hours, are to be seen the Head, the Eyes, and the Carina, with the Vertebra, distinct, and the Heart. After 40 Hours its Pulse is visible, and all the other Parts more distinct, which cannot be discern'd by the Naked Eye before the Beginning of the Fifth Day; from whence it seems very probable that even the so early Discovery of those Parts of the Fœtus by the Microscope, is not the discerning of Parts newly form'd, but only more dilated and extended by receiving of Nutriment from the *Colliquamentum*; so that they seem all to have been actually existent before the Incubation of the Hen. And what Swammardam has discover'd in the Transmutation of Insects, gives no small Light to this, whilst he makes appear in the Explanation of the 13th Table of the General History of Insects, that in those large *Eruca's* which feed upon Cabbage, if they be taken about the Time they retire to be transform'd into *Aurelia's*, and plunged often in warm Water to make a Rupture of the Outer Skin, you will discern, through the Transparency of their Second Membrane, all the Parts of the Butterfly, the Trunk, Wings, Feelers, &c. folded up: But, that after the *Eruca* is changed into an *Aurelia*, none of these Parts can be discern'd, they are so drench'd with Moisture, though they be there actually formed.

Another Consideration is from the Analogy, which we may suppose between Plants and Animals. All Vegetables, we see, do proceed *ex Plantula*, the Seeds of Vegetables being nothing else but little Plants of the same kind folded up in Coats and Membranes; and from hence we may probably conjecture, that so curiously an organized Creature, as an Animal, is not the sudden Product of a Fluid, or *Colliquamentum*, but does much rather proceed from an *Animalcule* of the same kind, and has all its little Members folded up according to their several Joints and Plicatures, which are afterwards enlarg'd and distended, as we see in Plants. Now though this Consideration alone may seem not to bear much Weight, yet being join'd to the two former, they do mutually strengthen each other. And indeed all the Laws of Motion which are as yet discover'd, can give but a very lame Account of the forming of a Plant or Animal. We see how wretchedly DesCartes came off, when he began to apply them to this Subject. They are formed by Laws yet unknown to Mankind; and it seems most probable, that the *Stamina* of all the Plants and Animals that have been, or ever shall be in the World, have been formed *ab Origine Mundi*, by the Almighty Creator within the First of each respective Kind. And he who considers the Nature of Vision, that it does not give us the true Magnitude, but the Proportion of Things, and that what seems to our Naked Eye but a Point, may truly be made up of as many Parts as seem to us be in the whole visible World, will not think this an absurd or impossible Thing.

But the Second Thing which later Discoveries have made probable is, that these *Animalcules* are originally

originally in *Semine Marium*, & non in *Fœminis* : And this I collect from these Considerations :

1. That there are innumerable *Animalcula* in *Semine Masculino Omnium Animalium*. M. Leeuwenhoek has made this so evident by so many Observations, that I do not in the least question the Truth of the Thing.

2. The Observing of the Rudiments of the *Fœtus* in Eggs, which have been *Fœcundated* by the Male, and the seeing no such Thing in those which are not *Fœcundated*, as appears from *Malpighius* his Observations, makes it very probable, that these Rudiments proceeded originally from the Male, and not from the Female.

3. The Resemblance between the Rudiments of the *Fœtus* in Ova, both Before and After Incubation, and the *Animalcule*, makes it very probable, that they are One and the Same. The same Shape and Figure which M. Leeuwenhoek gives us of the *Animalcule*, *Malpighius* likewise gives us of the Rudiments of the *Fœtus*, both before and after Incubation; yea, and even the *Fœtus*'s of Animals do appear so at first to the Naked Eye; so that Dr. Harvey does acknowledge, that all Animals, even the most Perfect, are Begotten of a Worm.

4. This gives a Rational Account of Many *Fœtus*'s at One Birth, especially that of the Countess of Holland; and how, at least, a Whole Cluster of Eggs in a Hen are *Fœcundated* by One Coition of the Male.

5. This gives a New Light, as it were, to the First Prophecy concerning the Messiah, that the Seed of the Woman shall bruise the Head of the Serpent: All the rest of Mankind being thus most properly and truly the Seed of the Man.

6. The Analogy I have already mention'd, which we may rationally suppose between the Manner of the Propagation of Plants and Animals, does likewise make this probable. Every Herb and Tree bears its Seed after its Kind; which Seed is nothing else but a Little Plant of the same Kind, which being thrown into the Earth, as into its Uterus, spreads forth its Roots, and receives its Nourishment, but has its Form within it self; and we may rationally conjecture some such Analogy in the Propagation of Animals.

The Third Particular, which later Discoveries make probable, is, That Animals cannot be Formed of these *Animalcula* without the Ova in *Fœminis*, which are necessary for supplying them with proper Nutriment; and this, these Considerations seem to evince. 1. It is probable that an *Animalcule* cannot come forward if it do not fall into a proper Nidus. This we see in the *Cicatricula* in Eggs, and tho' a Million of them should fall into One Egg, none of them would come forward, but what were in the Centre of the *Cicatricula*; and perhaps the Nidus, necessary for their Formation, is so proportioned to their Bulk, that it can hardly contain more than One *Animalcule*; and this may be the Reason why there are so few Monsters. This we see is absolutely necessary in *Oviparis*; and the only Difference which seems to be between them and the *Vivipara* in this Matter, is in this, That in the latter the Ova are properly nothing more but the *Cicatricula*, with its *Colliquamentum*, so that the *Fœtus* must spread forth its Roots into the Uterus to receive its Nourishment; but the Eggs in *Oviparis* may be properly termed

an Uterus in relation to the *Fœtus*; for they contain not only the *Cicatricula* with its *Amnion* and *Colliquamentum*, which is the immediate Nourishment of the *Fœtus*, but also the Materials which are to be converted into that *Colliquamentum*; so that the *Fœtus* spreads forth its Roots no farther than into the White and Yolk of the Egg, from whence it derives all its Nourishment. Now that an *Animalcule* cannot come forward without some such proper Nidus, M. Leeuwenhoek will not readily deny; for if there were nothing needful but their being thrown into the Uterus, I do not see why many Hundreds of them should not come forward at once, at least whilst scatter'd in so large a Field.

Now, 2. That this *Cicatricula* is not originally in Utero, seems evident from the frequent Conceptions which have been found extra Uterum: Such as the Child which continued 26 Years in the Woman of Tholouse's Belly; and the Little *Fœtus* found in the Abdomen of Mad. de S. Mere, together with the Testicle torn, and full of Clotted Blood; such also seem to be the *Fœtus* in the Abdomen of the Woman of Copenhagen, mentioned in the *Nouvelles des Lettres*, for Sept. 85. all the Members of which were easily to be felt thro' the Skin of the Belly, and which she had carried in her Belly for four Years: And the seven Years Gravitation related by Dr. Cole. Now granting once the Necessity of a Proper Nidus, for the Formation of an *Animalcule* into the Animal of its respective Kind, these Observations make it probable, that the Testes are the Ovaria appropriated for this Use; for though the *Animalcules* coming thither in such Cases, may seem to be extraordinary, and that usually the Impregnation is in Utero, yet it may be collected from hence, that the *Cicatricula* or Ova to be Impregnated, are in *Testibus Fœmineis*; for if it were not so, the accidental coming of *Animalcules* thither, could not make them come forward more than in any other Part of the Body, since they cannot be Formed and Nourished without a Proper Nidus.

But, 3. It is acknowledg'd by all, that the *Fœtus* in Utero, for some considerable Time after Conception, has no Connexion with the Womb; that it sits wholly loose to it, and is perfectly a Little Round Egg with the *Fœtus* in the Midst, which sends forth its Umbilical Vessels by Degrees, and at last lays hold on the Uterus. Now from hence it seems evident, that the *Cicatricula*, which is the Fountain of the *Animalcule*'s Nourishment, does not sprout from the Uterus, but has its Origine elsewhere, and falls in thither as into a fit Soil, from whence it may draw Nutriment for the Growth of the *Fœtus*; else it cannot be easily imagined how it should not have an Immediate Connexion with the Uterus from the Time of Conception.

If you joyn all these Three Considerations together, viz. that an *Animalcule* cannot come forward without a Proper Nidus, or *Cicatricula*; that there have been frequent *Fœtus*'s extra Uterum; and that they have no Adhesion to the Uterus for a considerable Time after Conception; they seem to make it evident, that Animals cannot be Formed ex *Animalculis* without the Ova in *Fœminis*. To all these I shall subjoyn the Proposal of an Experimentum Crucis, which may seem to determine whether the Testes Fœmineæ be truly the Ovaria: viz. Open the Abdomen of the Females of some Kinds, and cut out these Testicles, and

this

this will determine whether they be absolutely necessary for the Formation of Animals.

It is indeed difficult to conceive, how these Eggs should be Impregnated per Semen Maris, both because there is no Connexion between the Tube and the Ovary for its Transmission; and for that Dr. Harvey could never discover any thing of it in Utero. But as to the last, M. Leeuwenhoek has cleared that Difficulty, by the Discovery of innumerable *Animalcula Seminis Maris* in Cornutus Uteri, and those living a considerable time after Coition. And as to the former, we may either suppose that there is such an Inflation of the Tube, or Cornua Uteri, tempore Coitionis, as makes them Embrace the Ovaria, and such an Approach of the Uterus and its Cornua, as that it may easily transmit the Seed into the Ovary: Or else, that the Ova are Impregnated by the Animalcules after they descend into the Uterus, and not in the Ovary. The former seems probable for this Reason, that at least a whole Cluster of Eggs in a Hen will be Fecundated by One Tread of the Cock; now this Fecundation seems to be in the Vitellary, and not in the Uterus, as the Eggs pass along from Day to Day: For it can hardly be supposed that the Animalcules should subsist so long, being scatter'd loosely in the Uterus, as to wait there, for many Days, for the Fecundation of the Eggs as they pass along. The latter Conjecture has this to strengthen it; That the Animalcules are found to live a considerable Time in the Uterus, and that if they should Impregnate the Ova in the Ovary it self, the Fetus would encrease so fast, that the Ova could not pass through the Tube Uteri, but would either burst the Ovary, or fall down into the Abdomen from the Orifices of the Tube; and that from hence proceed those extraordinary Conceptions, in Abdomine extra Uterum.

But M. Leeuwenhoek, to weaken this Consideration about the Conception's being like unto an Ovum in the Womb, proposes a Parallel between these Animalcules and Insects, and insinuates, that as the Latter cast their Skins, and appear of another Shape, so the Other, which at first seem like Tadpoles, may cast their Outer Skin, and then be Round; and that this may be the Occasion of the Round Figure of the Conception in the Womb. To this it may be replied, That according to M. Leeuwenhoek's own Sentiment, the Animalcules cannot come forward, if they do not find the Punctum or proper Place for their Nourishment, to which it seems they must have some Adhesion. Now the Conception in Viviparis is not fastened unto the Womb for many Days, nor does Adhere to any Point of it; so that it seems this Roundish Body is not the Animalcule thus changed after having cast an outer Skin, but is rather the Cicatrice, or little Egg, into which the Animalcule has enter'd as its Punctum, or Place of Nourishment; else I do not see why they should not be Adhering to the Womb from the First Conception; or why (as I have said) many Hundreds of them are not Conceived and Formed together.

GENITURA. See Seed.

GENTLEMAN, is derived from the French *Gentil*, i. e. *Honestus*, vel *Honesto loco natus*; and the Saxon Word *Man*: So that it signifies a Man well born. So the Italians call such Persons *Gentil Huomini*: And the Spaniards keep the Meaning, when they call a Gentleman *Hidalgo*, or *Hijo d'algo*; i. e. the Son of some Man, or of some Man of Note or Reckoning. Under this Name

with us are comprised all above Yeomen; so that Noblemen may truly be call'd Gentlemen. But by the Course and Custom of England, Nobility is either Greater or Less, Upper or Lower. The Greater contains all from Knights upwards; the Lesser all from Barons downwards: As Smith saith, Cap. 21. de Republ. Anglic.

GEORGE Noble, was a Piece of Gold, current in 1 Hen. VIII. at Six Shillings and Eightpence. At which Time, by Indenture with the Mint, one Pound of Gold (in Weight) was to be coined into Eighty one George Nobles.

GIRDERS, in Architecture, are the largest Pieces of Timber in a Floor: Their Ends are usually fastened into the *Summers* or *Brest-Summers*, and the Joists are framed in at one End to the *Girders*. No Girder should lie less than 10 Inches into the Wall, and their Ends should be laid in Lome, &c.

GLANDS. All Secretions in an Animal Body are made by Glands, and a Gland is nothing but the Convolution or various Folding of the small Arteries, whose last Branch must be Cylindrical. This Cylindrical Artery, in its Windings, sends out several little Ducts or Se-

cretory Vessels of equal Diameters, which sometimes unite in one common Pore, sometimes run into a common Bason. This Structure is evident in all the larger Glands, such as the *Intestines*, with their Secretory Ducts, the *Lacteals*, the *Testicles*, and some of the *Conglobate Glands*, and may be seen in all the rest, if they happen to be *Obstructed*, and so swell to become visible; and therefore the same may reasonably be concluded of all Glands in general. There are small Branchings of Nerves passing all over the Coats of the Arteries, and seem to be designed principally for their Spiral Contortion, that the Blood may be the more easily propagated through them.

A Conglobate Gland is a little smooth Body wrapt up in a fine Skin, by which it is separated from all other Parts, only admitting a Nerve and Artery to pass in, and giving way to a Vein and Excretory Canal to pass out: Of this Sort, are the Glands of the Brain, the Labial Glands, and the *Testes*.

A Conglomerate Gland is composed of many little Conglobate Glands all tied together, and wrapt up in one common Tunicle or Membrane. Sometimes all their Excretory Ducts unite and make up one common Pipe, thro' which the Liquor of all of them runs, as the *Pancreas* and the *Parotides* do. Sometimes the Ducts uniting, form several Pipes, which only communicate with one another by cross Channels; and such are the *Breasts*. Others again have several Pipes without any Communication with one another, of which Sort are the *Glandulae Lachrymales*, and the *Prostata*. And a fourth Sort is, when each little Gland hath its own Excretory Duct, thro' which it transmits its Liquor to a common Bason, as in the *Kidneys*.

As to the Manner how the several Fluids, after they are form'd in the Blood, are separated from it in the Glands; it depends (as Dr. Keil shews, *An. Secret.* p. 82.) entirely on the Figure and Structure of the Glands, which therefore must first be determined. As Truth, when plain and evident, doth of itself dispel all false Opinions; So the true Structure of the Glands being once demonstrated, there will be no Occasion to refute the Doctrine of Ferments, nor the Hypothesis of Tubes differing as to the Figures of their Orifices; both which have several Times been demonstrated to be false.

That the Glands are nothing but Convolutions of small Arteries, the greatest and most accurate Anatomists of this Age, *Malpighi*, *Bellini*, and *Nuch*, have discover'd. And indeed, that all the Vessels of the Body, in which the Liquors are continually moving, can have no other than a Cylindrical or Conical Form, is demonstrable from the Nature of Fluids, whose Pressure is always perpendicular to the Sides of the Vessel containing them, and equal at equal Heights of the Fluid. If therefore the Sides of the Vessels are soft, and equally yielding every where, (as are all the Tubes in the Body of a *Fœtus*) they must, by the Pressure of their contained Fluid, be equally every where distended; and consequently the Section of such a Vessel, perpendicular to its Axis, must be a Circle; and therefore the Vessel must be either a Concave Cone or Cylinder, or at least such a Figure whose Transverse Section, normal to the Axis, must be a Circle.

The Circular Orifices therefore of the Glands can only differ in Magnitude; and all Sorts of Particles, of a lesser Diameter than that of the

Orifice

Orifice of the Gland, may enter it: So that without some further Contrivance, that Fluid which contains the biggest Particles, must likewise consist of all the Particles of all the other Secretions; neither could any Fluid thicker than the Blood be separated from it, because of the great Proportion of the Aqueous Fluid, whose Particles being vastly smaller than any other, and invisible to the best Microscopes, must enter all the Glands, and be mix'd with the secreted Fluid.

Now how this Inconvenience may be prevented, and how the Particles of any Size may either be separated by themselves, or with any assigned Portion of the Aqueous Fluid, or of other lesser Particles, I shall endeavour to shew.

Suppose then *AB* to be a small evanescent Artery, and that the Particles of the least Size were to be separated from the rest.

From the Side of the Artery must arise the Gland or Tube *CK*, whose Orifice at *C* is such as is capable of admitting only Particles of the least Size, together with the Aqueous Fluid: These therefore will be separated from all the other Particles of the Blood, and the Tube *CK* being a Cylinder, they will pass to its further End *K*, which is supposed to be the Excretory Duct of the Gland.

If the Quantity of the Aqueous Fluid, separated with the least Particles, must be diminished, that such a Fluid as is requisite may pass through the Excretory Duct *K*, from the Tube *CK*; you must imagine, that several other smaller Canals go out, as at *D*, *E*, *F*, and *G*, whose Orifices are so small, that they admit no other Particles, besides those of the Aqueous Fluid, to pass through them; and therefore as the least Particles, together with the Aqueous Fluid, pass along the Tube *CK*, the Aqueous Fluid must constantly be diminished; and the Quantity of the least Particles still remaining, they can pass no where but through the Excretory Duct at *K*: And this Diminution of the Aqueous Fluid will always be according to the Number of the Canals, *D*, *E*, *F*, *G*, that is, in Proportion to the Length of the Tube *CK*. And therefore, according as the Gland is longer or shorter, so the more or less Aqueous Fluid will pass through the Orifice of the Excretory Duct at *K*; and consequently, the secreted Fluid, on this Account, be *Thicker* or *Thinner*.

If the Particles of a middle Size, between the biggest and the least, are to be drawn off from the rest of the Blood: Let the Orifice at the Gland *C* be just so big as to admit those Particles, and not any other of a larger Size. These Particles therefore, with the Aqueous Fluid, and all better Particles, will pass through the Orifice *C*; but if the Canals *D*, *E*, *F*, *G*, are big enough to receive all the other Particles, and too little to admit those that are to be separated, it is evident, that

those Particles must arrive at the Excretory Duct *K*, with what Proportion of *Lesser* Particles is required.

And thus we see how any Sort of Particles may be drawn off, either by themselves, or mixed with any others, in any Proportion: And this is done in the most simple manner, only by Arteries; for *CK* is only a smaller Artery, either Straight, Spiral, or otherwise contorted, and *D*, *E*, *F*, and *G*, are again Arteries smaller than it; and if any of these are so small as only to admit Particles of *Serum*, they will constitute *Lymphatick Vessels*. From whence it is, that we find *Lymphatick* arising in great Numbers from those Glands that separate thick Humours; as from the *Testicles*, *Liver*, &c.

GLANDULÆ Miliare. See *Miliare*, and *Skin*.

GLANDULÆ Myrtiformes, are the Contractions of the Fibres of the broken *Hymen*, upon the first *Coition*.

GLANDULÆ Sebaceæ, are a large Number of Glands which lie under the Skin of the *Auricle* of the Ear; and which, because they separate a greasy Matter, like *Tallow* or *Sebum*, their first Discoverer *Valsalva*, in his Book of the Ear, calls by this Name. This *Sebum* being carried to the Surface of the Skin, he saith, hardens there, and turns into a scaly greasy Substance, not unlike that of *Bran*. Perhaps they are such Glands as those that secrete the *Scurf* and *Dandruff* that arises from combing the Head.

GLASS Drops, or *Bubbles*, sometimes called *Prince Rupert's Drops*; are small Parcels of coarse green Glass, taken out of the Pot in Fusion at the End of an Iron Pipe; and being exceeding hot, are let fall or drop from thence into a Vessel of Cold Water, and so lie there 'till they are sensibly cold. These exhibit a very surprising Phenomenon, *viz.* as soon as you break off the least Bit from the Stem of it, or pecked End, the whole Bulk of the Drop flies to pieces with a brisk Noise, and some of the Pieces will be as small as Dust. Dr. *Hook*, in his *Micrographia*, hath a particular Dissertation upon this Subject.

GLOBULES, are such small Particles of Matter as are of a Globular or Spherical Figure: As the Red Particles of the Blood which swim in the transparent *Serum*, which are easily discoverable by the Microscope; and 'tis pleasant to see how these Blood-Globules, whenever they come within a due Distance, do attract one another, and unite like Spheres of Quicksilver; and by this Means the Blood separates into two Parts; one of which is the Coagulation this Way of the Red Parts of it, and the other is the *Serum*. Now the *Serum* consists of a great Number of Corpuscles or small Particles (but they are not all Spherical nor Globular, like the Red Globules of the Blood) and these of various Figures and Magnitudes, and swimming in a Limpid Fluid. And these *Serous* Particles don't unite with, nor attract one another as the former did, 'till some Part of the Fluid in which they swim hath been evaporated by Heat; but then they do (and form a Coagulum) as the Blood Globules did. So that the Power of Attraction is greater in the Red Globules, than in the Particles of the *Serum*.

GLYPHICE, is a Part of Sculpture, being the Art of Cutting, Carving, or Casting, the Images and Resemblances of natural Things in Metals.

GOLD Mines. In *Phil. Trans.* N. 58. Dr. Edw. Brown gives the following Account of the Gold Mines in Hungary. Among the 7 Mine Towns in Hungary, (which are not far from one another, viz. Chremnitz, Schemnitz, Newsol, Coningsberg, Bochantz, Libeten, and Tiln) Chremnitz is the richest in Gold. They have also at present, Gold Mines at Bochantz and Coningsberg; and they report in that Country, that there hath been formerly a rich Gold Mine at Glas-Hitten, but lost since that Bethlem Gabor over-ran those Parts, when the Undertakers stopped up the Mine and fled.

They have worked in the Gold Mine at Chremnitz 900 Years. This Mine is divers English Miles in Length, and about 160 Fathoms Deep. Many Veins of the Ore run to the North, and to the East. They work also towards One, Two, and Three of the Clock, as they speak; for the Miners direct themselves under Ground by a Compass, not of 32 Points (such as is used at Sea), but by one of 24; which they divide, as we do the Hours of the Day, into twice Twelve. Of the Gold Ore, some is White, and some Black, Red, or Yellow: That with Black Spots in White is esteem'd the best, as also the Ore which lieth next to the Black Veins. This Ore is not rich enough to suffer any Proof in small Parcels, like that in other Mines, whereby to know what Proportion of Metal is contain'd in it; but they pound a very great Quantity thereof, and wash it in a little River, which runs nigh the Town. The whole River being divided, and admitted into divers Cuts, runs over the Ore continually, and so washeth away the Earthy Parts from the Metalline: And from a clear River above the Town, by its running through so many Works, and over so much pounded Ore, it becomes below the Town a Dark-yellow Stream, of the Colour of the Earth of those Hills.

There have been Pieces of pure Gold found in the Mine; some of which I have seen in the Emperor's Treasury, and in the Elector of Saxony's Repository; one Piece as broad as the Palm of my Hand, and others less, and upon a White Stone many Pieces of pure Gold; but these are very rare.

The common Yellow Earth of the Country near Chremnitz, although it be not esteem'd Ore, affords some Gold: And in one Place I saw a great Part of an Hill digg'd away, which hath been cast into the Works, washed and wrought in the same Manner as pounded Ore with considerable Profit.

Some Passages in this Mine, cut through the Rock, and long disused, have grown up again; and I observ'd the Sides of some, which had been formerly wide enough to carry their Ore through, to approach each other, so as we passed with difficulty. This happens in moist Places. The Passages unite not from the Top to the Bottom, but from one Side to another.

There is Vitriol in this Mine, White, Red, Blue, and Green; and also Vitriol Waters. There is a Substance found which sticks to the Gold Ore, of small pointed Parts like Needles, called by them Antimony of Gold. There are Chrystals found here, and some tinged Yellow.

The Miners will not allow any Quicksilver or Brimstone to have been found here; yet in the lately mention'd Antimony of Gold, there is evidently Sulphur, as I perceiv'd by burning. The

Vol. II.

Quicksilver Mine, mentioned in the Answer to Kercher's Inquiries, *Mund. Subter.* is an Hungarian Mile, or 7 English Miles distant from Chremnitz, and is not wrought in at present.

There is a Vitriol Mine in these Hills near the Gold Mine; the Earth or Ore of it is Reddish, and sometimes Greenish. This Earth is infused in Water, and after 3 Days, the Water is poured off, and boiled 7 Days in a Leaden Vessel, till it comes to a thick granulated whitish Substance, which is afterwards reduced to a Calx in an Oven, and serveth in the making *Aquaefortis*, or the Separating Water used at Schemnitz.

They have divers Ways of taking the Gold out of its Ore; by burning the Ore; by melting; by adding Silver Ore, and other Minerals, Sand, and Lead, as they find the Ore fluid or fix'd.

But without Lead they proceed thus:

They break and pound the Ore in Water, very fine; they wash it often, and lay it in Powder upon Cloths, and by the gentle oblique descending of the Water over it, and their continual stirring it, the earthy, clayish, and lighter Parts, are washed away, while the heavier and metalline remain in the Cloths; these Cloths are afterwards washed clean in several Tubs, and the Water, after some settling, poured off from its Sediment; which Sediment is again wash'd, and stirred up in several Vessels and Troughs, till at length they sprinkle Quicksilver upon it, and knead it well together for an Hour, and then washing it again in a wooden Vessel, after the separating of much of it which the Quicksilver touches not; by striking this Vessel against their Leg, they bring the Gold and Quicksilver together, in an Amalgama, to one Corner of it. From this Amalgama they strain as much of the Quicksilver as they can through coarse Cloths first, and then through fine; then they put the Mass remaining upon a perforated Plate, which they set over a deep Pan placed in the Earth, in the Bottom of which Pan they also put Quicksilver: This Pan they cover, and lute the Cover well, and then making a Charcoal Fire upon it, they drive down the Quicksilver, yet remaining in the Gold, to the rest in the Bottom of the Pan; then taking out the Gold, they cast it into the Fire, that it may become purer.

Concerning Cranach-Gold, I cannot learn that there is any such Gold, or Place where Gold is digg'd in Hungary; but in Germany I think there is, for *Agricola* mentions such a Place as *Golde-Cranacum*, and another called *Golde-Crona*.

For the exceeding Minuteness of the Constituent Particles of Gold, see *Ductility*.

GOTHICK Manner of Building, was unhappily brought into Use, after the Irruption of those barbarous Nations, the Goths and Vandals, &c. from the North, and the Moors and Arabs, from the South and East, into the civiliz'd World. These rude People demolish'd what they could of the antient Greek and Roman Architecture, and instead of those admirable and regular Orders and Manner of Building, introduced a licentious and fantastical Manner, which, tho' sometimes adorn'd with expensive Carvings, and costly, tho' lamentable, Imagery, is without any of that august Beauty, and just Symmetry, which the Fabricks of the Antients entertain us with.

GRAMMAR, is thus very justly defined by Mr. Johnson, in his Grammatical Commentaries:

I i

That

That it is the Art of expressing the Relations of Things in Construction, with due Accent in Speaking, and Orthography in Writing, according to the Custom of those whose Language we learn.

GRAND Days, are those in every Term solemnly kept in the Inns of Court and Chancery; viz. In Easter Term, *Ascension Day*; in Trinity Term, *St. John Baptist's Day*; In Michaelmas Term, *All-Saints Day* (and of late, *All-Souls Day*); and in Hillary Term, the Feast of the Purification of our Lady, commonly called *Candlemas Day*. These are *Dies non Juridici*, no Court Days.

GRAND Gusto, is a Term used by Painters, to express, that in a Picture there is something very great and extraordinary, to surprise, please, and instruct. Where this is found, they say the Painter was a Man of the *Grand Gusto*, or *Gout*: And they use the Words *Sublime* and *Marvellous*, when they speak of a Picture, in much the same Sense.

GRAPPLINGS. The same with *Grapnels*. See that Word in *Vol. I*.

GRAS-Hearth, was formerly the Customary Service for all the inferior Tenants to bring their Plows, and do one Day's Work for the Lord, within four Days after *Michaelmas*.

GRAVITY. Dr. Gregory, in the Preface to his Excellent Astronomy, shews, that the ancient Astronomers knew that the Heavenly Bodies gravitated towards one another, and were kept in their Orbits by the Force of Gravity. And that when *Democritus*, *Metrodorus*, and *Diogenes*, and afterwards *Anaxagoras*, *Archelaus*, and *Eurypides*, maintain'd the Sun and Stars to be great Globes of Stone or Metal heated red hot; they meant by it, that they were heavy Bodies of such a Density, and heated to such a Degree, as to enable them to retain their Fire and Heat for the Purposes they were designed.

Anaximenes said, the Fix'd Stars were of a Fiery Nature, but had Bodies of an Earthy Nature moving round them, which we can't see as we can them. And this Opinion he had from *Anaximander*, and he from *Thales Milesius*; who was the first of the *Ionick Sect* of Philosophers; among whom this was a received Notion. It got also into the *Italian Philosophy*; for those of that Sect maintain'd each Star to be a World, and to have Earths or Planets moving round it, in the infinite Mundum Space; and in particular, that the Moon was an Earth like ours, and inhabited by some fine Sorts of living Creatures.

In the *Leipsick Acts* of May, 1690. there is a Discourse about the Cause of Gravity, by Mr. *Leibnitz*, together with a Defence of his Opinion of the true Laws of Nature against the *Cartesians*.

GRAVITY, its Center, is a Point in every heavy Body, through which any Plane whatever being drawn, will divide the Body into two Parts of equal Weight.

And the Plane so dividing the Body into two Parts, equal in Weight to each other, is call'd the *Plane of Gravity*.

And every Line in this Plane which passes thro' the Centre of Gravity, is call'd the *Diameter*, or *Line of Gravitation*, *Propension*, and (by some) *Inniction*.

The *Line of Direction of Gravity*, or *Line of Gravity*, is perpendicular from the Center of Gravity to the Horizon.

If a Body, being placed upon an Horizontal

Plane, have its *Line of Gravity* *C P* falling with-

out its Base *O E*; then that Body must fall down, and will fall on that Side where the Perpendicular *C P* falls.

But if that Line *C P* falls any where within *O E*, the Base or Foot on which the Body stands,

the Body will rest there without Danger of falling.

And if a Body be placed on an Inclined Plane, and *C P* the Line of Gravity, as in N. 1. falls

without the Base, it will tumble over; but when it falls within, as in N. 2. it will only slide down.

Of the Mathematical Way of finding Centers of Gravity. See *Centers of Gravity*, in *Vol. II*.

I shall here, from *Sturmius*, give you a good Mechanical or Practical Way for finding the Center of Gravity of Regular or Irregular Solids; by which also the Plane of Gravity, and the Diameter of Gravity, may be determined. Apply to the Solid suspended by a Rope, as *C D*, on both Sides of it, the Perpendiculars *E G*, and *F H*, so that they may touch in the Lines *I K*, *L M*, which should be mark'd out with Chalk, &c. and then be joined above and below by the Transverse Perpendiculars *I L*, *K M*, so that one of the Planes of Gravity, *I K*, *M L*, may be gained: Also having turned the Solid about,

find

find out, after the same Manner, another such Plane of Gravity, *li, km*, which will cut the former above in *D*, and below in *d*; and then the Diameter of Gravity *Dd* will be had. Then hang the Solid transversely, and the same Way find another Diameter of Gravity *NP*, which will cut the former in *O*, the Centre of Gravity sought.

And in some Cases, there may be yet used a more Compendious Way; *viz.* Lay the given Solid *AB* on the fine Edge *CD*, of any *Hypomochlion*, turning and moving it about 'till it will rest there in *Equilibria*; then will that Plane, in the Body or Solid which answers perpendicularly to the Edge of the *Hypomochlion*, be one of the Planes of Gravity: Then find out such another,

by poising the Solid another Way oblique to the former, so will their common Section be one of the Diameters of Gravity: Lastly, roll the Solid into another Position, and then repeat the former Way of finding another Plane and Diameter of Gravity; so shall the Intersection of this Diameter of Gravity with the former be the Centre of Gravity sought.

GREAT Circle-Sailing, is conducting a Ship (if it be possible) in the Arch of a great Circle, which passes thro' the Zenith of the two Places from whence and to which she is bound. But this from Method is not practicable at Sea, tho' the nearer a Ship can keep to it, the better. See *Sir Jonas Moor's Navigation*.

GREE, from the French Word *Gre*, signifies in our Law, Contentment or Satisfaction. Thus in 2 R. II. c. 15. to make *Gree* to the Parties, is to give them Contentment or Satisfaction for an Offence done to them. So in 25 E. III. c. 19. 'Tis appointed that Judgment shall be put in Dispense, 'till *Gree* be made to the King of his Debt. Hence *Agree*, *Agreement*, &c.

GREGARIOUS Birds, are such as do not live solitarily, but associate in Flights or Coveys, a great many together in Company.

GREUT, is the Miners Word for the Earthy Part of what they dig up, and which hath no Mine or Oar in it, but is peculiar to each particular Load, *i. e.* such a Load hath such a coloured *Greut*. The common Earth, which is the loose Mold above the Shelf, in which find the *Shoad*, they call *Deads*.

GROOVE, is the Shaft or Passage into the Lead Mines, and by which they draw up their Oar.

GROSSE. Formerly a Villain in *Gross*, was such a servile Person as was not appendant or annex'd to the Land or Mannor, and to go along with the Tenure as an Appurtenance of it; but was, like the other Personal Goods and Chattles of his Lord, at his Lord's free Pleasure and Dis-

posal. And thus *Advouson in Gross*, is distinguish'd from *Advouson Appendant*.

GROTESQUE, or *Grotesca* Work, is the same with what is sometimes call'd *Antick*; being a confus'd Composure of Figures of different Natures, Sexes, &c. and usually of such Fancies as are not any where really existing in *Rerum Natura*.

GROUND Plates, in Architecture, are the outermost Pieces of Timber lying on or near the Ground, and framed into one another with Mortesses and Tennonns: In these also are Mortesses made to receive the Tennonns of the Joists, the Summer, and Girders; and sometimes the Trimmers for the Stair-Case and Chimney-Way, and the Binding Joists.

GROUPE, in Painting or Sculpture, is a Knot or separate Collection of Figures, which appear to have some plain Connexion with, or Relation to one another, by the Design of the Piece.

GUARD, in the Military Art, signifies a Duty or Service paid by the Soldiers, to secure the Army or Place from the Surprizes and Efforts of the Enemy; and of this there are several Kinds: As, 1. *The Main Guard*; which is that from whence all other Guards are detach'd: Those who are to mount the Guard, meet at the respective Captains Quarters, and are carried from thence to the *Parade*; where, after the Whole Guard is drawn up, the Small Guards are detach'd for the *Posts* and *Magazines*; and then the Subaltern Officers throw Lots for their Guards; and are commanded by the Captain of the *Main Guard*. 2. *Advance Guard*, is that Party of Horse or Foot which march before a Body, to give Notice of approaching Danger. When an Army is upon their March, the *Grand Guards* which should mount that Day, serve as *Advance Guards* to the Army. That small Body also of 12 or 16 Horse, which are posted under a Corporal or Quarter-master before the *Grand Guard* of a Camp, are called the *Advance Guard*. 3. *Grand Guard*, are 3 or 4 Squadrons of Horse commanded by a Field Officer, and posted before the Camp, on the Right and Left Wing, towards the Enemy, for the Security of the Camp. 4. In a Camp also every Battalion posts a small Guard, commanded by a Subaltern Officer, about 100 Yards before its Front; and this is called the *Quarter Guard*. As, 5. That small Guard of Foot which a Regiment of Horse mounts in the Front of the Regiment, under a Corporal, is call'd the *Standard Guard*. There is also, 6. *The Picquet Guard*, which is a good Number of Horse and Foot, which keep themselves always in a Readiness in a case of an Alarm: The Horse are saddled, and the Riders booted, all the while; and the Foot draw up at the Head of the Battalion at the Beating of the *Tattoo*; but afterwards return to their Tents, where they are in a readiness to march upon any sudden Alarm. This Guard is to make Resistance, in case of an Attack, 'till the Army can get ready.

GUARDIAN of the Spiritualities, is he that collects the *Spiritualities* of any Bishoprick during the Vacancy of that See. The Dean and Chapter of *Canterbury* are *Guardians of the Spiritualities* for the whole Diocese and Province, during the Vacancy of that Archbishoprick.

GUERITE, in Fortification, is a small Tower of Wood or Stone, plac'd usually on the Point of a Bastion, or on the Angles of the Shoulder, to hold a Centinel, who is to take care of the Ditch, and to watch out against Surprizes.

GULE of August, is the Day of *St. Peter ad Vincules*, celebrated formerly and now on the first of August. See *Hospinion de Origine Festorum*, Fol. 85.

GUN-Powder. The wonderful Explosion of this mischievous Composition (when it is kindled) seems to arise from hence: That the Sulphur and Coal-dust being Bodies very quickly set on Fire, they do very swiftly accend the Nitre; whose Spirit being thereby rarified, breaks out with a violent Explosion, like the heated Vapour of Water out of an *Æolipile*. The Sulphur also being of a volatile Nature, is itself also converted into Vapour, and so encreases the Explosion; and that Part of it which is of an Acid Nature, (as that Spirit which they call Oil of Sulphur *per Campanam*) upon the Accention, breaks out, and entring into the fix'd Body of the Nitre, loosens and lets out its latent Spirit also, hereby producing a yet much greater Fermentation and Heat.

And if you mingle Salt of Tartar with Gun-Powder, and let that Mixture be gradually heated 'till it come to take Fire, the Explosion will become much more quick and violent; and this can arise from no other Cause than from the Action of the Vapour of the Gun-Powder on the Salt of Tartar. By what Means the small Particles of Bodies do act upon one another with this Immense Violence, you will find under the Word *Attraction*.

GUN-Room, in a Ship, is the Apartment under the Great Cabin; where the Master Gunner and his Crew rendezvous, get ready their Cartridges, &c. and do all Things belonging to their Business.

GUNTERS Line. Designing in this Volume, the Description and Use of the common Scales, Rules and other Mathematical Instruments; I shall now give you the Constitution and Use of this Famous Line. Provide a Ruler of any Metal, Wood, &c. that is proper, of any Length, (the larger the better) and according to the designed Length of your Line of Numbers, divide a Line of the same Length into 10000 equal Parts; and then having Recourse to a Table of Logarithms, take off from the said Scale the Artificial or Logarithmic Numbers answering to the Division of your intended Line, (omitting the Index or Characteristick) and these Distances will graduate your Line of Numbers, and divide it into its *Primes*, *Tenths*, *Centesms*, &c.

For the first eminent Nine unequal Parts, which have the Nine Digits annex'd, are call'd *Primes*; and the Subdivisions of those into Ten lesser Parts are called *Tenths*; each *Tenth* is divided, or supposed to be so, into *Centesms*; and those *Centesms* into *Millains*, as Mr. *Wingate* calls them. Numeration therefore, as they call it, on the Line will be very easy; and you may know readily how to find the Point expressing any Number of not above 4 Places on it. Suppose the Number were 4867; The Figure 4, on the Line, expresses the Place of 4000; thence accounting 8 *Tenths* further to the Right Hand, you will have the Place of 4800; and in the next Tenth, reckoning forward six Subdivisions, you

will have the proper Point for 4860; and then in the next *Centesm*, taking or guessing at 7, (and Practice will make this easy) you will find the Point (nearly) for 4867.

But if your Number had been but of 3 Places, as 486; then the Digit Figure 4 on the Line would only have represented 400. And if it had been but of two Places, or a single Figure, the Figure 4 on the Line would have been 40, or barely 4 Unites accordingly. 'Tis plain also, that any Decimal Fractions and Unfixt Numbers will be represented on the Line as easy as Whole Numbers, Regard being only had to the Point or Line of Separation.

PROBLEM I.

Two Numbers being given, to find a Third or Fourth Geometrical Proportion.

The Line being nothing but a Series of Logarithms or Artificial Numbers in an Arithmetical Proportion; 'tis plain, if the Compasses be extended from the first Term to the second, the same Distance will reach from the 3d to the 4th, from the 4th to the 5th, and so on continually; only you must turn the Leg forward when a greater Term is requir'd, and backward, or towards the Left Hand, when the proportional Term required is to be less; as common Sense will direct. Thus if the Two Numbers had been 10 and 12, the Third Proportional forward would be 14.4, and backward 8.3, &c. So that all Questions in any Practical Art, where such kind of Proportionals are requir'd, may, you see easily, be wrought by the *Gunters Line*.

PROBLEM II.

To multiply or divide one Number by another.

Since in all Multiplication, As 1 is to the One Factor :: So is the Other, to the Product. And since in all Division, as the Divisor is to Unity :: So is the Dividend to the Quotient. Either of these Rules may be easily wrought by the Line of Numbers, since 'tis only finding a 4th Proportional to Three Terms given. The Extent of the Compasses therefore, from 1 to the Multiplier, will reach forward in Whole Numbers from the Multiplicand to the Product: And the Extent from the Divisor to Unity, will reach from the Dividend to the Quotient. If either or both Numbers be Decimal Fractions, the Nature of the Product or Quotient must be determined by the Rules given about managing of such Fractions; but the same Figures will be found by the Line, let the Nature or Value of the Numbers be what it will. N. B. How many Places must be in the Product or in the Quotient, may be discovered easily by the Rules of Common Arithmetick, and consequently to what Exactness you must endeavour to go in the Line.

PROBLEM III.

Three Numbers being given, to find a Fourth in a Duplicate Ratio or Proportion.

This relates to the Proportion of Surfaces and Area's, which, when Similar Figures, are in a Duplicate

Duplicate Ratio of their Homologous Sides. Let the Diameter of a Circle be 14 Inches, and its Area 154; What is the Area of a Circle, whose Diameter is 28?

Extend the Compasses from 14 to 28; that Extent will reach from 154 to 308, and thence to 616, the Area requir'd.

PROBLEM IV.

To three Numbers given, to find a Fourth in a Triplicate Proportion.

This relates to Solids, and their Proportion to Lines.

Let the Diameter of an Iron Bullet be 4 Inches, and its Weight 9 lb. What will a Bullet weigh, whose Diameter is as much more; viz. 8 Inches?

The Extent of the Compasses from 4 to 8, applied to 9, and turn'd three Times, will at last fall on 72, the Weight sought.

PROBLEM V.

To find a Mean Proportional between any Two Numbers given: As suppose between 8 and 32.

Extend the Compasses from 8 in the Left Hand Part of the Line, to 32 in the Right, and then bisect that Distance; the half shall reach either from 8 to 16 forward, or from 32 to 16 backward.

PROBLEM VI.

To find Two or more Mean Proportionals between two Numbers given.

Divide the Distance between the two Numbers into a Number of equal Parts, which shall exceed the Means required by one; (as if 2 are required into 3, if 3 are required into 4, &c.) So shall the Feet of the Compasses, when turned from either of the Numbers towards the other, mark out the middle Proportionals required.

PROBLEM VII.

To Extract the Square Root of any Number.

Bisect the Distance between 1 on the Scale, and the Point which represents the Number; and the Half being set from 1, will give the Point representing the Root.

PROBLEM VIII.

For the Cubick Root, or that of any Higher Power.

You must Divide the Distance on the Line between 1 and the given Number, into as many equal Parts as the Index of the Power expresses; and one of those Parts set from 1, on the Line, will find the Point representing the Root requir'd. Thus if the Cubick Root of 1728 were requir'd: Divide the Distance between 1 and 1728 into three equal Parts, (3 being the Index of the Cube or Third Power) and one of those set from 1 forward, will find 12 the Root sought.

N. B. Only observe to Point the Number whose Root is to be Extracted (as in Extraction of Roots in Common Arithmetick) and then, if the last Point fall on the first Figure of the Number, the former Way of accounting on the Line will do: But if the last Point fall on the second Figure or Place in the Number (reckoning from the Left Hand towards the Right;) then account the whole Length of the first Line of Numbers in, and carry the Account on in the Second: As suppose the Root of 36 were requir'd; begin to take the 36 from the first 1 on the Left Hand in the Line, and account the 36 on in the second Line; and then half that Distance being sent from the first 1, will reach to 6, the Root in either the first or second Line. So also if the Square Root of 1440 had been sought: Account the whole first Line for your first 1000; and then the 440 on in the Tenths between the second 1 and 2: So will half the Distance between the first 1 and that Point, reach from 1 to near 38 in either Line.

PROBLEM IX.

For the Use of the Line in Trigonometry; See that Word.

The Use in Superficial Measure.

PROBLEM X.

Having the Diameter of a Circle, to find the Circumference.

Extend the Compasses from 1 to the Number expressing the Diameter; and then the same Extent will reach from 3.142 to the Circumference.

PROBLEM XI.

Having the Diameter, to find the Superficial Content.

The Extent, as before, from 1 to the Diameter being found, set it twice from the Point of .7854 on the Line, and then it will reach to the Number expressing the Area.

PROBLEM XII.

The Breadth of a Rectangle being given in Inch-Measure, and the Length in Foot-Measure, to find the Area in Feet.

Extend the Compasses from 12 on the Line to the Breadth in Inches; and that will reach from the Length in Feet, to the Area in Square Feet.

PROBLEM XIII.

The Length and Breadth being given in Foot-Measure, to find the Area in Yards.

The Extent from 9 to the Breadth, will reach from the Length to the Area in Yards.

PRO.

P R O B L E M XIV.

To find the Area in single Perches.

The Extent from 16.5, to the Breadth, will reach from the Length to the Content in Perches : And the Extent from 160 to the Breadth, will reach from the Length to the Content in Acres, &c.

The Use in Solid Measure.

P R O B L E M XV.

The Depth and Breadth of a Right-angled Parallelopiped being given in Inch-Measure, and the Length in Foot-Measure, to find the Content in Feet.

The Extent from 12 to the Breadth and Depth in Inches, being twice repeated from the Length in Feet, will reach to the Content in Feet. If the Parallelopiped be Oblique-angled, you must find a Mean Proportional between the Breadth and Depth : And then the Extent from 12 to the Mean Proportional being twice repeated from the Length in Feet, will reach to the Content in Feet.

P R O B L E M XVI.

To find the Solidity of a Cylinder, whose Base and Length is given.

The Extent from 1 to the Base, will reach from the Length to the Solid Content.

P R O B L E M XVII.

Having the Diameter of a Sphere, to find its Surface and Solidity.

The Extent from 1 to the Diameter, repeat twice from the Point of 3.142, and that will reach to the Number expressing the Surface : And if you repeat the Extent from 1 to the Diameter, three times from .5238 on the Line, that will reach to the Solid Content requir'd.

Its Use in Interest and Annuities.

P R O B L E M XVIII.

To find what any Sum will encrease at 6 per Cent. Interest upon Interest, if forborn a certain Time. Suppose 273 l. for 5 Years.

Extend the Compasses from 100 to 106, and then repeat that Distance five times from 273, so will the Point at last fall on 402.1, or 402 l. 2 s. which is the Principal and Interest requir'd.

P R O B L E M XIX.

A Sum of Money being due for a Time to come, to know what 'tis worth in ready Money.

This is the Reverse of the Last.

P R O B L E M XX.

A Yearly Rent or Annuity being forborn for a Terme of Years, to find what the Arrears will amount to, at the Rate proposed.

As suppose a Rent or Annuity of 12 l. per Ann. were forborn sixteen Years ; What will the Arrears amount to at the Rate of 8 l. per Cent. Interest ?

First find the Principal answering to 12 l. by saying, If 8 l. hath 100 l. for its Principal, what will 12 l. have ? Answer, 150 l. Then I find (by Probl. 18.) that 150 l. being forborn sixteen Years, amounts, at 8 l. per Cent. to 513.9, or 513 l. 18 s. Out of which deducting 150 l. the Principal answering to the Annuity given, there remains 363 l. 18 s. the Sum of all the Arrears requir'd.

P R O B L E M XXI.

To know what Annual Rent or Annuity is worth in Ready Money.

Find (by the Precedent) the Value of the Arrears at the End of the Term proposed ; and then (by Probl. 19.) what those Arrears are worth in Ready Money ; and that will be the requir'd Price or Value of the proposed Rent or Annuity ; v. gr. I find the Arrears of 12 l. per Ann. at sixteen Years end, and at 8 l. per Cent. amount to 363 l. 18 s. And I find (by the 19th Probl.) that the said Sum is worth in Ready Money 106 l. 4 s. and consequently I conclude, that the Lease or Annuity proposed is worth in ready Money (after 8 l. per Cent.) 106 l. 4 s.

If the Term of the Annuity don't commence presently, but suppose at five Years hence or to come, then you must find what the Arrears for all that Time are worth in ready Money ; that is, what they are worth, when forborn in this Instance for twenty one Years. The Answer is, 72 l. 6 s.

GUTS : See Intestines.

GUY Rope : See Guy, in Vol. I.

GWAIF, the same with Waif ; i. e. such Goods as Felons when pursued, cast down and leave in the High-Way ; which become a Forfeiture to the King or Lord of the Mannor, unless the Right Owner legally claim them within a Year and a Day.

H A B E N

H A L

HABENTES *Homines, Feasting-Men*; as they are call'd in a Charter of *Cenulph* King of the *Mercians*, Anno 821. *Du Fresne* will have these to be no more than *Divites*, Rich Men: But no doubt the Word implies a stricter Sence; and signified either the King's Guard or Retinue, which were at the King's Pleasure to be *Feasting-Men*, or plentifully entertained at the Houses of his Tenants: Or rather, those Old Servants which were commended to the Religious by the King; and so fastned on them for *Corrodies*, or Maintenance for Life. Some think that they were only *Pledges* and *Sureties*, or *Friburghs*; which under their Chief or Principal Tything Man, were to keep the King's Peace, and to be accountable for the Breach of it.

HABITATION, in the Civil Law, is the Term for one of the Personal Services, by which a Man hath a Right to live in the House of another without Prejudice to the Propriety.

HADBOTE, was a Recompence made for the Violation of Holy Orders, or Violence offer'd to Persons in them.

HAIL. Dr. *Wallis* in a Letter from *Oxon* to the Secretary of the Royal Society, and printed in the *Transactions*, observes that *Hail* is very often an Attendant on Thunder and Lightning; (of which, see *Thunder* in this Volume.) And 'tis well known, that in our artificial Congelations, a mixture of Snow and Nitre, or even common Salt, will cause a very sudden Congelation of Water. Now the same in the Clouds may cause *Hail-Stones*; and the rather, because not only in some prodigiously great, but also in common *Hail-Stones* there seems somewhat like Snow rather than Ice, in the midst of them. And as to those very large *Hail-Stones*, weighing $\frac{1}{2}$ or $\frac{3}{4}$ of a Pound; by the violence of their Fall 'tis manifest they must have descended from a great Height: And tho' perhaps in their first Concretion, or Congelation, their Bulk might be but of the moderate Size of common *Hail*, yet in their long Descent, if the *Medium*, through which they fell were alike inclined to Congelation, they might receive a great Accession to their Bulk, by, perhaps, many of them coalescing and incorporating into one; as in that strange Shower of *Hail* in *December* 1672. whereof their hung on the Trees a great deal in the form of Icicles, of a Foot or more in length.

HAIL WORKFOLK; *i. e.* Holy Work-folk, or People who hold Lands for the Service of Repairing or Defending some Church or Sepulchre: For which pious Labours they were excused formerly from Feudal and Military Services.

HALF-Bloom, is the Term for a round Mass of Metal, which comes out of the *Finery* in all Iron-work: See *Iron*.

HALF-Tangent-Lines: See *Scale*.

HALF-Tongue, or *Party-Fury*, is a Jury empanell'd in a Cause where a Stranger is a Party; whereof the one Part consists of Denizens, the other Half of Strangers: And the same is used in Pleas, where one Party is a Denizen, the other a Stranger. This way of Tryal was first Enacted by a Statute of *Edward III*.

H A N

HALLAGE, is a Fee due for Cloths brought for sale to *Blackwell-Hall* in *London*; and also the Toll that is due to the Lord of a Fair or Market, for such goods as are vended in the Common Hall of the Place.

HALO. Mr. *Huygens* (*vid. Philosoph. Transf. N. 60.*) endeavours to account for the Appearance of *Halo's*, or Circles round the Sun, thus: That they are formed by small round Grains of a kind of Hail made up of two parts; one of which is opake and inclosed in the other, which is transparent; and the same way he accounts for the *Parbelia*; only there he imagines that the Icy Grains are of an oblong Figure, and rounding at the Ends like Cylinders with round convex Tops. Where some of these Cylinders are in an erect Position, the Circle they form will be white, and is caused by the Reflexion of the Rays of the Sun on the Surface of these Cylinders. He proceeds afterwards to account for the colour'd *Halo's* and *Parbelia* from the same Hypothesis, and produces an Experiment of a Glass Cylinder of a Foot long, and having within an Opake Kernel (which was a Cylinder of Wood) and the ambient Space was filled with Water: Which Cylinder being exposed to the Sun, and the Eye disposed in proper places, the several successive Reflexions and Refractions necessary to produce such Effects did plainly appear.

HALY-MOTE (*alias Healge-mote*) a Word retain'd in *Herefordshire* to this Day for a Court-Warren. It may signifie a Convention of Citizens in their Court-Hall; or, a Holy or Ecclesiastical Court. *Cowel's Interpr.*

HAMBLING, or *Hamelling* of Dogs, is the same, in the Laws of the Forest, as *Expeditating*: And *Manwood* saith, *Canutus*, in *Can. 1.* calls the Lawing of Dogs, *Genuscissio*, *Ham-stringing*.

HAMMER. Besides the *Sledges*, or large *Hammers* used by Smiths, there is, 1. The *Hand-Hammer*, which is us'd by the Smith at the Forge with one Hand. Its edge is call'd the *Pen*; and the other part of the Head the *Face*; and the Hole for the Handle is call'd the *Eye*. 2. The *Rivetting-Hammer*, chiefly us'd for rivetting or setting straight cold Iron; or for crooking of small Work; but 'tis seldom us'd at the Forge. For the Smith's larger *Hammers*, see *Sledge*.

HAMPER: See *Hanaper*.

HAMSOKEN, *Haimsuken*, *Homesoken*, is the Term in *Scotland* for the Crime of him that violently Assaulteth a Man in his own House: And our antient Records call Burglary *Hamsocene*.

HANAPER: See *Clerk* of the *Hanaper*.

HANCES (in a Ship) are Falls or Descents of the Fife-Rails, which are placed on Banisters on the Poop, Quarter-Deck, &c. down to the Gangway.

HANCES in Architecture are the Ends of Elliptical Arches; and these are the Arks of smaller Circles than the *Scheme* or middle Part of the Arch.

HANDBOROW, is a Surety, a Manual Pledge; *i. e.* an *Inferior* Undertaker; as *Headborow* is a *Superior* or Chief Instrument. *Spelman*.

HAND-

HANDGRITH, was antiently the Word for Peace or Protection given by the King with his own Hand.

HAND-HABEND, is a Thief taken with the Goods in his Hand, or upon him, as we say.

HANGWITE, according to *Rastal*, was a Liberty granted to a Man whereby he was quit of a Felon or Thief, hang'd without Judgment, or escap'd out of Custody.

HANSE, is an old *Gotbick* Word, signifying a Society of Merchants combin'd together for the good Usage and safe Passage of Merchandize from Kingdom to Kingdom. This Society was, and in part is yet, endow'd with many large Privileges of Princes respectively within their Territories. It had four principal Seats or States, where the *Almain* or German Merchants, being the Erectors of this Society, had an especial House; One of which was here in *London*; and call'd *Gild-Hald a Teutonicorum*, or among us vulgarly the *Steel-Yard*, or *Still-Yard*.

HAPPE, from the *French* *Happer*, to Snatch or Catch, is a Term used in our Law. As to *Happe* the Possession of a Deed Pole. *Littleton*, Fol. 8. To *Happe* the Rents; as if Partition be made between two Parcenors, and more Land be allow'd to one than to the other: And she that hath most of the Land charges it to the other, and she *Happeth* a Rent, she shall remain an *Assize* without Specialty. *Cowel*.

HARMONY. Dr. *Holder* in his Discourse on this Subject, saith, That when the Sonorous Body is constituted of Parts solid or tense, regular and fit to receive and express the Tremulous Motion of Sound, equally and swiftly, it will then render a certain even *Harmonical Tone* or *Tune*.

The *Tune* of any Note is constituted by the Measure and Proportion of the Vibrations of the Sonorous Body; i. e. of the *Velocity* of those Vibrations in their Recourses.

For the more frequent the Vibrations are, the acuter will be the *Tune*; and the slower or fewer they are in the same Time, the graver is the *Tune*.

So that any given Note of a *Tune* is made by one certain Measure of *Velocity* of *Vibration*; viz. Such a certain Number of *Courses* and *Recourses* (i. e. forward or backward Vibrations) of any Chord or String in such a certain Space of Time, doth constitute such a determinate *Tune*: And all such Sounds as are *Unisons*, let them come from *Voice*, *Bell*, *Pipe*, or *String*, are made with Vibrations all equal to one another.

The Continuance also of the Sound in the same *Tune*, to the End, (as in Strings of Wire, which being once struck will hold their Sound long in the same Note) depends upon the Equality of Time of the Vibrations from the greatest Range till they come to cease: As is the known Property of *Pendulums*: And a Musical String struck, is like a Double *Pendulum*, moving upon two Centres, the *Nut* and the *Bridge*, and vibrating with its greatest Range in the middle of its Length, and the Vibrations equal, even to the last; which must make it keep the same *Tune* as long as it sounds. And because it doth plainly keep the same *Tune* to the last, the Vibrations are equal.

The Measures of *Swiftness* of Vibrations of the String or Chord, as hath been said above, constitutes and determines the *Tune*, as to the *Acuteness* and *Graveness* of the Note which it sounds:

and the lengthning or shortning of the String under the same Tension, determines the Measure of the Vibrations which it makes. And thus *Harmony* comes under Mathematical Calculations of Proportions; as to the Length of the Chords, the Measure of the Time in Vibrations, and of the Interval of tuned Sounds. As the Length of one String is to another (if of the same Matter, Thickness and Tension) so is the Measure of the Time of their Vibrations. As the Time of the Vibration of one String to another, so is the Interval or Space of Acuteness or Graveness of the Tune of that one, to the Tune of the other: And consequently, as the Length is, so is the determinate Time, *ceteris paribus*. These Vibrations impress a Motion of Undulation or Trembling in the Air, as far as the Motion extends, of the same Measure with the Vibrations.

And if the Motions made by different Chords are so commensurate that they mix and unite, and bear the same Course altogether, alternately or frequently: Then the Sounds of these different Chords, thus mixing, will calmly pass the Medium, and arrive at the Ear as one Sound, or nearly the same; and so do evenly, smoothly, and with pleasure strike the Ear; which produces what they call a *Consonancy*; and from the Want of such an agreeable Mixture, *Dissonances* do arise.

And as the more frequent Mixture or Coincidence of Vibrations render the *Concords* generally so much the more perfect; so the less there is of Mixture, the greater and more harsh will the *Discord* be.

From all which 'tis easie to see the Reason why *Concords* are agreeable and pleasing to the Ear; which is because they unite in their Motions often; at least in every sixth Course of Vibration; as is apparent from the Musical *Ratio's* by which they are constituted, which are all contain'd within that Number of 6.

Thus the Agreement between two or more *Unisons* or Chords of the same Length, &c. is because the Vibrations of such Sounds are equal to Time and Measure, and do joyn and unite in every Course and Recourse.

If the String *A* be double in length to *B* (I proceed according to the usual Division of the Monochord) i. e. as to 2 to 1. Then the Vibrations of *B* will be duple to those of *A*, or twice as swift: And consequently if these Strings are struck together, their Vibrations will unite alternately; viz. at every Course crossing at the Recourse, and give the Sound of the *Octave* to one another.

If the Length of *A* to that of *B*, be as 3 to 2: Then reciprocally their Vibrations will be as 2 to 3; and their Sounds will concord in a *Fifth*; their Motions uniting after every second Recourse; i. e. at every other, or third Course.

If *A* be to *B*, as 4 to 3, they sound a *Fourth* together, and their Vibrations unite after every third Recourse, or at every fourth Course.

If the Length of *A* be to that of *B*, as 5 to 4, they sound a *Ditone* or *Third Major*; and their Motions unite after every fourth Recourse, or at every fifth Course.

If *A* be to *B*, as 6 to 5, then they sound a *Trihemitone* or *Third Minor*; uniting their Vibrations after every fifth Recourse, and at every sixth Course, &c.

And

And thus by the frequency of their being mix'd and united, the *Harmony* of joyn'd Concords in Musick is found so very sweet and pleasing; the Remoter being also combined by their Relation to other Concords besides the *Unison*. The *sixth Major*, which is 5 to 3, is within the compass of *Ratio's* between 1 and 6. But the *lesser Sixth* (8 to 5) is beyond it; but is the Complement of 6 to 5, to an Octave; and makes a better Concord by its Combinations with the Octave and Fourth from the Unison; having the Relation of a *Third Minor* to one, and of a *Third Major* to the other, and their Vibrations uniting accordingly. The *Sixth Major* hath the same Advantage.

HARO, *Harron*, is an Outcry, or a Hue-and-Cry after Felons and Malefactors: See the Original of this Custom; *de Haro* among the Normans in *La Coustume de Normandie* par Mr. H. Basnage, Vol. 1. p. 104. Perhaps, hence our English Word to be *Har'd*, i. e. Frighted; and *Harass'd*, Tired, &c.

HATCH, a Term in Mining: See *Essay-Hatch*. *Hatch* is also us'd for a Cross-Board that lies a-thwart the *Past*, [to hinder the Ore from tumbling all at once into the Coffer of a *Stamping-Mill*.

HATCHING, is a Term us'd in the Art of Drawing or Designing in Black and White; and by it is understood a manner of Shadowing by a continual Series, or Succession of many Lines shorter, or longer; closer or more separate; oblique, or direct, according as the Work requires, to render it more or less enlighten'd.

HAW, is a small Quantity of Land, and usually such as lies near a House: As a *Hemp-Haw* or *Plat*, a *Bean-Haw*: And some old Manuscripts say that *Haw* is the same with *Mansio*, a Dwelling-House, as in *Doomsday-Book*, &c.

HEADS, is a Term us'd by Builders for those kind of Tiles which they use to lay at the Eaves of a House; being the full breadth of a Common Tile, and but half a Tile in length.

HEAD-BOROW, signifies him that is Chief of the *Frank-Pledge*, and him that had the principal Government of them within his own *Pledge*. And as he was call'd *Head-Borow*, so he was also call'd *Burrow-Head*, *Burholder* (now *Bosholder*.) *Third-Borow*, *Tything-Man*, *Chief-Pledge*, and *Borow-Elder*, according to the diversity of Speech in divers places. This Officer is now usually call'd a *Constable*.

HEAD-PENCE, or *Head-Silver*, was formerly an Exaction of 40 l. or more, collected by the Sheriff of *Northumberland* of the Inhabitants of that County every Third and Fourth Years; without any Account made to the King. But by 23 H. VI. c. 7. this was clearly abolish'd for ever.

HEART. Authors which have treated about this Muscle are chiefly *Lower de Corde*, *Bellini de Motu Cordis*, and *Borelli de Motu Animalium*; who accounts that the Force of the Compression of the Heart to squeeze out the Blood into the Arteries, is equal to that of 3000 Pound weight; and that 350 Pound weight of Blood passes thro' the Heart every Hour: See Dr. Keil's *Animal Secretion*, p. 88. where you have a good Attempt to estimate the Quantity of the Blood in an Human Body, its Velocity, &c.

Vol. II.

HEAT. Great Bodies are capable of preserving Heat for a long while; their Parts mutually increasing one another's Heat. And it may be, that a very great dense and fix'd Body, when heated beyond such a degree, may emit Light so copiously, that by such Emission, and by the Reaction of its Light, and by the Reflexions and Refraction of the Rays within its hidden *Meatus*, it may come to grow still hotter and hotter, as deriving more Degrees of Heat by those ways, than it can of Cold by any other: And by this means it may come to attain a Heat, like that of the Sun: For the Sun and the fix'd Stars seem only vast Globes of Earth vehemently heated; and whose Heat is preserved by their great Magnitude, and by the mutual Action and Reaction that there is between them and the Light which they emit.

And their Parts are preserved from evaporating in Flame and Fume, not only by the great Fixity of their Nature; but also by the mighty Weight and Density of the Atmosphere which environ them, which press them every way with a great *Nisus*, and condense their Vapours and Exhalations, whenever they are emitted.

For we see that Water, but moderately heated, will boil with violence when the Pressure of our Atmosphere is taken off in the Exhausted Receiver.

And a Mixture of Tin and Lead, being plac'd on a red-hot Iron in *vacuo*, will emit copious Fumes, and even some Flame, which yet in our Air will scarce visibly smoke. *Vid. Qu. 11. Newton. Opt. p. 296. Edit. Lat.*

Heat conduces very much to the Fluidity of Bodies, by lessening the Tenacity of their Parts; for it renders many Bodies fluid, which otherwise are not so; and increases the Fluidity of Tenacious Liquors, as of Oyl, Balsam, Honey, &c. and by the same reasons lessens their Resisting Force: And yet it doth not much lessen the Resisting Force of Water; which it must do, if that Force arise chiefly from the Attrition or Tenacity of its Parts; and consequently it doth not arise from thence, but from the *Vis Inertiae Materiae*.

HEBBER-THEF, was formerly the Privilege of having the Goods of a Thief, and the Tryal of him within such a Liberty.

HEBDOMADIUS, was formerly that Canon or Prebendary in a Cathedral Church, which had the peculiar Care of the Choir, and the Officers of it, for his own Week.

HEDAGIUM, from *Heda*, a *Hythe*, Port or Wharf; was formerly the Term for the Toll or Custom paid at the *Hythe* or Wharf, &c. for Landing Merchandize, Goods, &c. From which Toll or Customary Duties, Exemptions were sometimes granted by the Sovereign to some particular Persons and Societies.

HEIGHT, or *Altitude* of the Eye in Perspective, is its Height or Elevation above the Horizontal Plane; and it is measured by a Perpendicular let fall from the Eye to that Plane.

HELICOLD Parabola, or the *Parabolick Spiral*, is a Curve which arises from the Supposition of the Axis of the common *Apollonian Parabola's*, being bent round into the Periphery of a Circle, and is a Line then passing through the Extremities of the Ordinates, which do now con-

verge towards the Centre of the said Circle. The *Tangent*, *Area*, *Length*, and *Flexure* of this *Spiral Curve* is investigated by Mr. *J. Bernoulli*, according to the Method of the *Differential Calculus*, in a Discourse on that Method on the *Act. Lips.* for Jan. 1691. Thus,

Suppose the *Axis* of the common *Parabola* to be bent into the Periphery of the Circle *BDM* (in Fig. above;) Then the Curve *BFGNA*, which passes through the Extremities of the Ordinates *CF*, *DG* (which converge towards the Centre of the Circle *A*) is what is called the *Helicoid*, or *Spiral Parabola*, or the *Parabolick Spiral*. And in order to the Investigation of its *Tangent*, *Area*, *Length*, and *Flexure*; He supposes $AB = r$, $BDMB = c$. The Arch $BC = x$, $CF = y$.

Let also *CL*, *AH*, be drawn perpendicular to *AC*; and let *CD* be an infinitely small Arch on part of the Circumference, similar to, and concentrick with, the little Arch *GE*.

The Nature of the Curve is $lx = yy$ (where *l* stands for the Parameter of the Parabola.) Whence, in this Calculus, *dx* being the Fluxion of *x*, and *dy* the Fluxion of *y*, &c. (See the *Marquis l'Hospital's Analyt. des Infiniment petits*.) $l dx = 2y dy$; and $dy : dx :: l : 2y$.

$$AD : AG :: DC : GE$$

First then for the *Tangent*. It will be $r : r - y :: dx : \frac{r dx - y dx}{r}$;

$$FE : EG \quad FA \quad AH \quad FC \quad CL$$

$$\text{And } dy : \frac{r dx - y dx}{r} :: r - y : \frac{dx \times r - y^2}{r dy} :: y : \frac{ry dx - yy dx}{r dy}$$

To make a particular Application of the General Expression to the Curve proposed; instead of *dy* and *dx*, substitute their Proportionall and $2y$;

$$\text{Then will } AH = \frac{2y^3 - ryy + 2rry}{lr} = (\text{substituting } lx \text{ for } yy) \frac{2xy}{r} + \frac{2ry}{l} - 4x;$$

$$\text{and } CL = \frac{2ryy - 2y^3}{lr} = 2x - \frac{2xy}{r}. \text{ The}$$

greatest *AH* (*CL*) will be found, if its Differentials $\frac{6yy dy - 8ry dy + 2rr dy}{lr}$ (or

$$\frac{4ry dy - 6yy dy}{lr} \text{ the Differentials of } CL)$$

be put $= 0$: Whence arises $y = \frac{1}{2}r$ ($\frac{2}{3}r$;) and consequently the greatest *AH* (*CL*) $= \frac{8rr}{2yl}$

either of them.

COROLLARY.

If the Parameter $\frac{l = rr}{c}$, viz. that the Applycate answering to the whole Circumference be the Radius it self (as in the present Fig.) then the greatest *AH* or *CL* will $= \frac{8}{2y} c$.

The greatest Angle made by the Ordinate and Tangent, viz. *AFH*, or *CFL*, is found, by putting the Ratio $\frac{CL}{CF}$, or $\frac{2ry - 2yy}{lr}$ equal a

Maximum; that is, its Differential $\frac{2r dy - yy dy}{lr}$

$= 0$. Whence we have $y = \frac{1}{2}r$; and consequently $\frac{CL}{CF} = \frac{r}{2l}$. But more particularly in

the

the Hypothesis of $l = \frac{rr}{c}$, we have $x (= \frac{yy}{l}) =$

$$\frac{cyy}{rr} = \frac{3}{4}c, \text{ and } \frac{CL}{CF} = \frac{c}{2r}$$

COROLLARY.

If IK touches the Curve in the Point I (where it intersects the Radius AM) and cuts the Diameter BAK produced in K ; then shall $AK = \frac{3}{4}$ the Periphery.

Next, 2. For the Area: 'Tis $DC + GE \times \frac{1}{2} DG = CDGE$: Or $\frac{2r dx - y dx}{r} \times \frac{1}{2} y = \frac{2ry dx - yy dx}{2r} =$ (substituting $\frac{2y dy}{l}$ in-

stead of dx) $\frac{2yy dy}{l} - \frac{y^3 dy}{lr}$. The Integral

of which is $2 \frac{y^3}{3l} - \frac{y^4}{4lr}$, or $\frac{2}{3}xy - \frac{lxx}{4r}$;

which is equal to the Curvilinear Space $BFGDCB$. Wherefore putting $y=r$, we shall find the whole

Space $BANGFBCDMB = \frac{5r^3}{12l}$; that is,

in the Case of $l = \frac{rr}{c}$, 'tis $= \frac{5}{12}rc$. And since

the whole Circle $BDMB$ is $= \frac{1}{2}rc = \frac{6}{12}rc$; the aforesaid Space shall be to the Circle as $5:6$: And therefore the remaining Space $BANGBA$ will $= \frac{1}{6}$ of the Circle.

Again, Thirdly, For the Length of the Curve. $FG^2 = FE^2 + EG^2 = dy^2 + dx^2 \times \frac{rr - 2ry - yy}{rr} =$ (substituting $\frac{2y dy}{l}$,

instead of dx) $\frac{rrll + 4rryy - 8ry^2 + 4y^4}{rrll} dy^2$.

Hence $FG = dy \times \sqrt{\frac{rrll + 4rryy - 8ry^2 + 4y^4}{rrll}}$;

The Integral of which, could it be exhibited, would give the Length of the Curve BFG : Which Rectification may yet be thus express'd. On the Diameter AB describe the Semi-circle $ATXB$, and let Aa be cut off $= l$; then drawing any indefinite Perpendiculars WV, ZY , equidistant from A and B , and cutting the Periphery of the Semi-circle in T and X , let the Right Line XTS be drawn, and joining Sa , take $AK = AS$, and let KR be parallel to Sa , and the Right Line $R\beta$ be drawn to the Centre of the Semi-circle; equal to which cut off the Right Lines WV, ZY ; Then shall the Points V, Y , be at the Curve $YVT\delta$; which is of such a Nature, that the Abscissa $BZ = DG$, and the Space $BZY\delta B$ divided by $A\beta (= \frac{1}{2}AB)$ gives a Right Line $=$ the Curve BFG .

Demonstration.

$$AK = AS = WT = ZX = \sqrt{BZ \times ZA} = \sqrt{y \times r - y} = \sqrt{ry - yy}; \text{ and } Aa (= l)$$

$$: AS (= \sqrt{ry - yy}) :: AK (= \sqrt{ry - yy}) : AR = \frac{ry - yy}{l}$$

Wherefore,

$$ZY (= WV = R\beta = \sqrt{A\beta^2 + AR^2} = \sqrt{\frac{1}{4}rr + \frac{rryy - 2ry^2 + y^4}{ll}} : \text{ Whence}$$

$$\text{a Portion of the Space } ZY\delta B, \text{ of the Breadth } dy = dy \sqrt{\frac{rrll + 4rryy - 8ry^2 + 4y^4}{ll}}$$

$$\text{And this divided by } A\beta = \frac{1}{2}r, \text{ gives } dy \sqrt{\frac{rrll + 4rryy - 8ry^2 + 4y^4}{rrll}} = FG.$$

And consequently the whole Space $ZY\delta B$ divided by $\frac{1}{2}r$ is equal the Portion of the Curve-Line BFG . Q. E. D.

COROLLARY.

Taking BZ, AW , equal to one another; if on the Centre A , and with the Radii $AZ, A\beta, AW$, we describe Arches cutting the Curve in the Points G, I, N , (Note here, The middle Intersection I , in the Case of the present Figure, falls in the Radius AM) the Portions of the Curve BG and AN, GI and NI , as also BGI and ANI , are equal to one another. Whence 'tis plain, that even those Curves that don't admit of a Rectification, yet some times have Dissimilar Parts equal to one another.

When I had signified this to my Brother, he presently observ'd, That the Nature of almost any Spiral being express'd by an Algebraical Equation, another Geometrical Curve may be assign'd equal to it. For on the Centre A , with the Radii AF and AG ; describing the Arches $F\pi, G\pi$, if the Curve $M\downarrow$ be imagin'd such, that $v\downarrow$, the Difference of the Ordinates $\pi x, \pi\downarrow$, be equal to the Arch EG : Then, because of $v\kappa = \pi\rho = EF$, and $v\downarrow = EG$, and the Angles $\downarrow vx, FEG$, Right ones; also $\downarrow x$ shall be equal FG ; and compounding, the whole Portion of the Curve $M\downarrow =$ the whole Portion of the Spiral BG . Now to find the Nature of the Curve $M\downarrow$, we need on-

ly substitute (in the Quantity $\frac{r dx - y dx}{r}$, which always expresses EG or $v\downarrow$) the Value of dx , which in our Curve is $\frac{2y dy}{l}$; which produces

$$\frac{2y dy}{l} - \frac{2yy dy}{rl}, \text{ the Integral of which } \frac{yy}{l} - \frac{2y^3}{3rl}, \text{ gives the Length of the Ordinate } \pi\downarrow.$$

Then putting $\pi\downarrow = z$, we have no Equation between z and $\frac{yy}{l} - \frac{2y^3}{3rl}$, or $3rlz + 2y^3$,

or $3rlz + 2y^3 - 3ryy = 0$; which expresses the Relation between the Abscissa $M\pi = y$, and the Ordinate $\pi\downarrow = z$. But in General, A Parabolical Spiral, of any Degree, is by this means transmuted into another Geometrical Paraboloid, of one Degree higher. This also is to be observed; That if the Curve $ANIGB$ be the Archimedean Spiral, and a Common Parabola $A\mu$ be described

described at the Centre A , and upon the Axis AK ; whose Parameter is a Fourth Proportional to the Periphery, Diameter, and Radius of the Circle BDM , then shall both the Curve Lines, and the Spaces comprehended under them, be equal, viz. Taking any Point λ in the Right Line AM ; if to this be applied the Right Line $\lambda\mu$, cutting the Parabola in μ , and the Arch λN concentric to the Periphery of the Circle BM , be drawn cutting the Spiral in N ; then the Portion of the Spiral Line AN shall ever be equal the Portion of the Parabolick Line $A\mu$; and the Space AN comprehended between the Right Line AN and the Spiral, shall equal the Parabolick Space $A\lambda\mu A$. Which wonderful Agreement of the Spiral and Parabola we afterwards found Dr. Willis had observed before; who relates, that Roberval and Hobbs contended about the first Discovery of it; as if two Persons, at a distance both in point of Place and Time, might not be led by their own Genius's to one and the same Invention.

4. For the Flexure of the Curve. That the Curve must have a Point of contrary Flexion, is evident; for because the Periphery BC differs but insensibly from a Right Line, for some space beyond the Vertex B , it follows from the Nature of the Parabola, that the Curve must be concave towards the Circumference in the Parts next the Vertex, and concave towards the Centre in the rest. If G , *e. gr.* be the Point of contrary Flexion, then AO , the Segment of the Radius, intercepted between the Centre and the Tangent, shall be a Minimum, which put $= M$. Produce GE in P , and draw PQ parallel to EF ; and let the Secant of the Arch $BD = s$, and the Tangent $= t$: Then we have the following Proportions; Viz. $r : r - y (= AG) :: t : \frac{tr - ry}{r} (= GP) :: s : \frac{sr - sy}{r} (= AP)$.

Again, $GE : EF :: PG : PQ$
 $\frac{r dx - y dx}{r} : dy :: \frac{tr - ty}{r} : \frac{tdy}{dx}$.

Lastly; $AF : PQ :: AO : PO (= AO - AP)$
 $r - y : \frac{tdy}{dx} :: M : M - \frac{sr - sy}{r}$.

Whence we shall find

$$M = \frac{rrs dx - 2rsy dx + ssy dx}{rr dx - ry dx - rtdy}; \text{ and}$$

Substituting $\frac{tdx}{2y}$ for dy , and dividing by dx , we

$$\text{have } M = \frac{2rrsy - 4rsyy + 2sy^3}{2rry - 2ryy - rlt}. \text{ And}$$

therefore the Differential of this is to be equal to nothing; but the Differential of a Fraction is $= 0$, when its Terms, multiplied into the Alternate Differentials, are equal: For the Differential

of the Fraction $\frac{y}{x}$ is $\frac{+x dy \pm y dx}{xx}$; and consequently if it be $= 0$; then also shall $\pm x dy \pm y dx$

$= 0$; that is, $x dy = y dx$. By the help of which Rule we shall come to an Equation of sixteen Members; in order to the Reduction of which, let it be observed, viz. That the Differential of an Arch is in a given Ratio to the Differential of the Tangent and Secant; for It is to the Differential of the Tangent, As the Square of the Radius To the Square of the Secant: And It is to the Differential of the Secant, As the Square of the Radius to the Rectangle under the Tangent and Secant. For in the Quadrant ABD ,

ferential of the Tangent and Secant; for It is to the Differential of the Tangent, As the Square of the Radius To the Square of the Secant: And It is to the Differential of the Secant, As the Square of the Radius to the Rectangle under the Tangent and Secant. For in the Quadrant ABD ,

$$dx : dt :: DC : EF :: DC : GE + GF; \\ GE + GF : EF :: AD (= AB) : AG + AB; \\ AG + AB : AF :: AB^2 (= rr) : AF^2 (= ss). \\ \text{Wherefore, } dt = \frac{ss dx}{rr} \text{ (in the}$$

present Case) $\frac{2ssy dy}{lrr}$.

$$\text{Again, } dx : ds :: DC : GF :: DC : GE + EF; \\ GE + GF : GF :: AD (= AB) : AG + AB; \\ AG + AB : BF :: AB^2 (= rr) : AF \times FB (= st). \\ \text{Wherefore } ds = \frac{st dx}{rr}$$

$= \frac{2sty dy}{lrr}$: And substituting these Values in

the Equation instead of ds and dt , as also $ss - rr$ instead of tt , there will come forth another Equation, which may be divided by $st dy$; so that the Symbols s, t, dy , will be quite out, and only the Powers of the unknown y remain. The Equation then will be $y^6 - 3ry^5 + 3rry^4 - r^2y^3 + \frac{3}{4}rrlly - r^2lly + \frac{1}{4}r^4ll = 0$; which may be still further divided by $r - y$, and so the Equation be reduc'd to this, $y^5 - 2ry^4 + rry^3 + \frac{3}{4}rrlly - \frac{1}{4}r^3ll = 0$: The Root of which will shew the Point of Contrary Flexure;

which in the Case of $l = \frac{rr}{c}$, is very nearly ob-

tain'd by drawing the Ray AC , so that the Ap- plicate CF be $\frac{1}{2}r$, or the Arch $BC = \frac{1}{2}c = 10^\circ$.

This Method for finding the Points of Contrary Flexure in Curves, seeming very tedious, and not so natural, in that it makes use of Symbols that are superfluous, and do afterwards vanish out of the Equation; gave us occasion to find a shorter and easier Way for doing the same, and that thus: I conceive the Point of Contrary Flexion as falling in that Point of the Curve, where two contiguous infinitely small Particles are imagin'd to lie in directum with one another: As, *ex. gr.* FG, FI , the

rest being bent upwards on one hand, and downwards on the other. It follows from hence,

1. That in Curves whose Axes are perpendicular, and whose Ordinates are parallel to one another, the Acute Angles EGF , MFI , or DGL , CFL , are equal, and either the greatest or the least of all those that the Ordinates make with the Curve on the one side and the other, according as the Portion of the Curve (that is) at the Parts of these Angles, falls either with or without them. From whence the Ratio $\frac{DG}{DL} (= \frac{y}{t})$

is either a Maximum or Minimum; and consequently (by what was shewn above) $ytd = tdy$. But since every where $t dy = y dx$ (as is evident in all Curves) therefore shall $dt = dx$, viz. The Differential of the Part of the Axis between the Ordinate and the Tangent, equal to the Differential of the Abscissa: Which is also thus manifest: Because GF , FI , lie in directum, the Tangents GL , FL , shall cut the Axis in the same Point L ; and, consequently, the Differential of the Abscissa DC , will also be the Difference of DL and CL .

The Celebrated Author of the Differ. Calculus, has given another Theorem for this (in the *Acta*.) Viz. Since the Triangles EGF , MFI , (because of the equal Angles EGF , MFI .) are similar; it follows, That if EF , MI , that is the dx , are equal, also EG , MF , or the dy , shall be equal too; and, consequently, $ddy = 0$.

2. In the Curves whose Applicates tend to some common Point or Centre A . The Angle EGF

$= GAF + GFA = DAC + CFL$: Whence, since CL is the Tangent of the Angle CFL to the Radius CF , and DH the Tangent of the Angle DGH to the Radius DG , the Difference of the Right Lines, CL , DH , shall be equal to the Difference of the Tangents of the two Angles, that differ by the Angle DAC ; one of which is to the Radius CF , and the other to the Radius DG . For tho' the Difference of the Radii EG vanishes in comparison of the whole Radius or Tangent; yet 'tis not to be neglected, if compared with their Differences.

Let $AC = r$; $DC = dx$; $CF = y$; $CL = t$; and consequently, $FL = \sqrt{yy + tt}$. Also, Let it be $AC (=r) : DC (=dx) :: CF (=y) :$

$= \frac{y dx}{r}$ an Arch, that is the Measure of the Angle

DAC , with the Radius CF . This Arch (by Sect. 4.) Is to the Difference of the Tangents, in the Duplicate Ratio of the Radius to the Secant.

Wherefore $FC^2 (=yy) : FL^2 (=yy + tt)$

$::$ The Arch found $\frac{y dx}{r} : \frac{yy dx + tt dx}{r y} =$

the Difference of two Tangents, each to the Ra-

dius CF . To which if we add $EF = \frac{r dx - y dx}{r}$

(which Is to EG , As DH To DG , or CL to CF , or Tangent to Radius) the Aggregate will

be $\frac{yy dx + tt dx}{r y}$, or $dx + \frac{tt dx}{r y}$, the Dif-

ference of two Tangents, the one of which agrees

to the Radius DG , that is the Difference of the

Right Lines CL , $DH (=t)$; and therefore

$dt = dx + \frac{tt dx}{r y}$.

The same is more clearly shewn thus. On the Centre C , with the Radius CL , describe the Arch LK : For then the Angle $ACL + LCK = AMH = ADM + DAC = ACL + DAC$, and so $LCK = DAC$. (Note, That CM is neglected here, and the Points C and M esteem'd as co-incident; since CM is infinitely less than the Differentials DC , LK , EG , which are infinitely small themselves.) Whence, $AC (=r)$

$: CD (=dx) :: CL (=t) : \frac{t dx}{r} = LK$

Again, $GD (=y) : DH (=t) :: LK (=$

$\frac{t dx}{r} : \frac{tt dx}{r y} = KH$.) Wherefore $dt (=DH$

$- CL = DH - CK = DC + KH =$

$dx + \frac{tt dx}{r y}$.

COROLLARY.

If r be Infinite; that is, If CA , DA , be parallel, then $\frac{tt dx}{r y}$ will vanish, and $dt = dx$, as above.

My Brother, instead of the Ratio $\frac{GD}{DH}$ or $\frac{GA}{AP}$,

assumes $\frac{GE}{EF}$, putting $AF = y$, $AP = t$, EF

$= dz$; and so finds $dt = \frac{dzc}{dyq}$: Which Theo-

rems well deserve notice, upon the account of their Universality.

For a particular Application of this to the Parabolick Spiral: Because $CL (=t, \text{Fig. preced.})$ was

found before $= \frac{2rry - 2y^3}{lr}$, then shall $dt =$

$\frac{4ry dy - 6y dy}{lr}$; and since $dx = \frac{2y dy}{l}$,

(substituting the Values of tt , dt , t , dx , and dividing by dy ; and reducing the Equation, we

shall find $y^5 - 2ry^4 + rry^3 + \frac{1}{4}rrly - \frac{1}{4}r^2ll = 0$, as before.

5. The highest Point of the Curve above the Radius BA , is found by making AO (found before) Infinite,

: C A.

$$: \frac{p d q + q d m \times \sqrt{p p + q q}}{p d q - p d p}$$

7. *Application to the Parabola.* If $R C D$ be a Parabola, whose Parameter $= l$, so that $l m = p p$, then $l d m = 2 p d p$, and $d m = \frac{2 p d p}{l}$, and $q = 2 m$. Substituting these in the Value of $C A$, we shall find $C A = \frac{l l + 4 p p \sqrt{l l + 4 p p}}{2 l l}$; that is, since $P N = \frac{1}{2} l$, and $P C = \sqrt{\frac{1}{4} l l + p p}$, $C A$ will $= \frac{P C^2}{P N^2}$, that is a Fourth Proportional to $P N$ and $P C$.

8. *To find the Nature of the Curve AVX (form'd by the Intersections of the Perpendiculars DA, CA,) with respect to the Axis R B.* Cut off $R H = \frac{1}{2} l = P N$, and put $H B = y$, and $B A = z$, and then $A B + N C : A C ::$

$$z + p : \frac{l l + 4 p p \sqrt{l l + 4 p p}}{2 l l} ::$$

$$N C : C P ;$$

$$p : \sqrt{\frac{1}{4} l l + p p} ; \text{ and } \frac{V z}{z} \text{ will } = 2 p^2.$$

$$\text{Again, } N C : A B :: P N : P B ;$$

$$p : z :: \frac{1}{2} l : \frac{l z}{2 p} ; \text{ but } y =$$

$$H B = P B + P H = P B + N R = \frac{l z}{2 p} +$$

$$\frac{p p}{l}, \text{ or } 2 p^2 (= \frac{l l z}{2}) = 2 p l y - l l z ; \text{ that is,}$$

$$\frac{3 l z}{4 y} = p, \text{ and } 4 p^3 (= l l z) \frac{27 l^3 z^3}{16 y^3} ; \text{ that is,}$$

$16 y^3 = 27 l z z.$
Farther, because $A D, A C$, are perpendicular to the Curve $D C$, and the Particle $D C$ is infinitely small; therefore shall $A D = A C = A V + V C$; but (because of the same Reason) $V C = V X + X K$, and $X K = X I +$, &c. And therefore $A D = A V + V X + X I$, &c. = Curve $A I H + H R$. And since the Curve $A I H$ arises from the Intersections of the Indistant Perpendiculars $D A, C V, K X$, it follows, that they are Tangents to it in the same Points, and, consequently, that the Curve $R K D$ is that Curve which is described by the Evolution of the Curve $H I A$. From whence are manifest, at first view, all that *Hugenius* and others have publish'd about *Evoluts*, as also the excellent Discoveries of *Tschirnhausius* and *Leibnitz*, about the Curves formed by the Reflex'd Rays.

HELISPHERICAL Line, is the Rhumb Line in Navigation; and is so call'd because on the Globe it winds round the Pole spirally, and still comes nearer and nearer to it, but can't terminate in it.

HEM. The Ovens wherein the *Lapis Calaminaris*, or *Calamine*, is baked, have a Hearth made on one side of the Oven, divided from the Oven it self by a Partition open at the Top, by which the Flame passes over, and so heats and

bakes the *Calamine*. This Partition is called the *Hem*.

HEMITONE, in Musick, was what we now call an *Half Note*.

HERALD, with us signifies an Officer at Arms, whose Business it is to denounce War, to Proclaim Peace, or otherwise to be employ'd by the Sovereign in Martial Messages and other Businesses. The French call him *Herault*; *quasi Herus altus*. But *Verstegan* will derive the Word from two Dutch words, viz. *Here*, *exercitus*, and *Healt*, *Pugil magnanimus*; as if he should be so called, as being *Champion of the Army*. The Romans called Men of this Office in the Plural *Feciales*. With us they are the Judges and Examiners of Gentlemen's Arms: They Marshal all the Solemnities at the Coronation of Princes; formerly manag'd Combats, &c.

The Three Chief Heralds with Us are called *Kings at Arms*: The Principal of which is *Garret*, created by *Henry V.* His Office is to attend Knights of the Garter at their Instalments, or other Solemnities; To Marshal the Funerals of all the greater Nobility, as Princes, Dukes, Marquisses, Earls, Viscounts, and Barons.

The next *Herald* is *Clarencieux*, Ordain'd by *Edw. IV.* for his gaining the Dukedom of *Clarence*: His Office is to Marshal and Dispose the Funerals of all the lesser Nobility; as of all Knights and Esquires on this Side *Trent*.

The Third is called *Norroy*, or *North Roy*; whose Office is the same on the North Side of *Trent* as that of *Clarencieux* is on the South Side.

Besides these there are Six others, which are properly called *Heralds*, according to their Originals, as they were Created to attend Dukes, &c. in their Martial Expeditions; as *York*, *Lancaster*, *Somerset*, *Richmond*, *Chester* and *Windsor*.

There also are four others call'd *Marshalls*, or *Pursuivants at Arms*, reckon'd after a manner in the Number of *Heralds*, and do commonly succeed in the Place of *Herald* when they die, &c. and these are call'd *Blue-Mantle*, *Rouge Cross*, *Rouge Dragon*, and *Port-Cullis*.

HERBENGER, or *Harbinger*, is an Officer in the King or Queen's House, who alloteth the Noblemen and those of the Household their Lodgings.

HERETICO Comburendo: See *Heretico*, &c.

HERIOT, was originally a Proportion of Horse and Armour according to the Quality of the Deceas'd: This was settled by the Laws of *K. Canutus*, cap. 69. and is still (usually) the best Riding Horse of which a Tenant dies possess'd.

HERIOT Custom, was when a Tenant for Life was by Custom oblig'd to such a Payment at his Death; which Payment to be made not only by the next Heir in Blood, but by any the next Successor. In Abbeyes of Royal Patronage, at the Death or Cession of the Abbot, his Cup and Horse were paid as an *Heriot* to the King. Those also who held in Bondage and Villenage paid *Heriots*. The Religious Appropriators reserv'd the *Live Heriots* (i. e. such as were paid in Cattle) to themselves, and allow'd the inanimate ones of small value to the Vicar: And some Appropriators had a *Heriot* from the Vicar when he died. *Kennet's Glossary*.

HERIOT

HERIOT Service, was a Reserve by Charter or other Conveyance, and made one Condition of the Tenure of Estates in Fee Simple; which is now for the most part extinguish'd.

HERMITAGE, strictly signified a Convent of Hermits or Friars Minors, who, under the Institution and Discipline of St. Paul, inhabited Deserts and solitary Places. But this name at last came to be attributed to any one Religious Cell, built and endow'd in some private and reclusive Place, and then annex'd to some larger Abbey, of which the Prelate or Governour was called *Hermita*. Dr. Kennet's Glossary.

HERMITAN, is the Name of a dry North and North-Easterly Wind, usually, which blows on the Coast of Guinea in *Africk*; but sometimes it blows also from other Points.

HERMITORIUM, is the Oratory or Chappel belonging to an Hermitage.

HETERODROMUS, in Statics, is the Term for the common *Veſis* or Leaver, which hath the *Hypomochlion* placed below the Power and the Weight: And where the Weight is elevated by the descent of the Power, & *vice versa*. (See the Fig. in *Homodromus*.)

The *Dung-fork* and *Prong* are Leavers of this kind, whose *Hypomochlion* is usually the Knee of the Workman: And all Pincers, Sheers, Scissars, Cutting-Knives fasten'd to Blocks are double.

HETERODROMOUS Leavers. The Wheel, Windlass, Capstand, Crane, &c. are perpetual *Heterodromous Leavers*: As are also the outermost Wheels of all Wind and Water-Mills, and all Cog-Wheels, &c.

HETERODROMUS Veſis, in Mechanicks, when the Weight to be rais'd by a Leaver is placed beyond the *Hypomochlion* or Fulcrum, and so moves a contrary way to the Power, *viz.* is rais'd when that descends, and descends when that rises.

HEYBOTE, or *Haybote*, was antiently the Saxon Term for the Liberty granted to a Tenant for cutting so much Under-wood, Bushes, &c. as was necessary for Mending and Maintaining the Hedges or Fences belonging to his Land.

HIDAGE, was a Royal Aid or Tribute rais'd in such a Proportion on every Hide of Land: William the Conqueror imposed Six Shillings on every Hide; and William Rufus Four Shillings; and K. Henry I. Three Shillings. When the Lord paid *Hidage* to the King, the Tenants paid a Proportion to the Lord of the Mannor.

King *Ethelred*, when the Danes landed at *Sandwich*, rais'd this *Hidage* so, that every 310 Hides of Land found an arm'd Ship; and every 8 Hides found a Jack and a Saddle.

HIDE of Land, or *Plough-Land*, was as much as one Plow could Cultivate in a Year; for the Quantity was never expressly determin'd: Some call it 60, some 80, and some 100 Acres. One Hide of Land at *Chesterton* in the 15th of Hen. II. contain'd 64 Acres: And in the 35th of Hen. III. the yearly Value of a Hide of Land at *Blechesdon* in *Oxfordshire* was Forty Shillings. Kennet's *Paroch. Antiq.*

Bede calls it *Familiam*, implying by it, that it was as much as wou'd maintain a Family.

The Distribution of England by Hides of Land is very antient: Mention being made of it in the Laws of King *Ina*, cap. 14. And Henry I. to Marry his Daughter, had Three Shillings from

every Hide of Land. This Tax was call'd *Hidage*: See *Hidage*.

HIP-Roof, in Architecture, is such a Roof as hath neither *Gable-Heads*, *Shread-Heads*, nor *Ferkin-Heads*: (By which is meant such Heads as are both Gable and Hip at the same End; that is, Gable as far as the Cott or Beam, and then their over short Hips, which shut up with their Tops to the Tops of a pair of Rafters, call'd *Singlers* by the Country Workmen.) For a *Hip-Roof* hath Rafters as long, and with the Angles at the Foot, &c. at the Ends of Buildings, as it hath on the Sides: And the Feet of the Rafters on the Ends of such Buildings as have *Hip-Roofs*, stand on the same Plane, *viz.* parallel to the Horizon, and at the same Height from the Foundation with the Rafters at the Sides of the Roofs. These *Hip-Roofs* some call *Italian Roofs*.

HIPS, in Architecture, are those Pieces of Timber which are at the Corners of a Roof: They are a good deal longer than the Rafters, because of their oblique Position; for they are level at every Angle. The Country Workmen call them Corners; and by some they are call'd *Principal Rafters*, by others *Sleepers*. As Rafters have four plain Sides, these have usually five.

HOBELERS, were formerly a sort of Light-Horse-Men, which rode on small nimble Horses, and with only light Armour on; so that they were fit, (like our Dragoons) for any expeditious Service: At length they became ty'd by their Tenure, to maintain a little light Nag, for giving expeditious Notice of any Invasion or Danger: See 18 Edw. III. c. 7. 25 Edw. III. c. 5, 8. and *Cambd. Britan.*

HOBITS, are a sort of small Mortars from 6 to 8 Inches Diameter: Their Carriages are like those of Guns, only much shorter. They are very good for Annoying the Enemy at a distance with small Bombs, which they will throw two or three Miles: Or in keeping of a Pass, being loaded with Cartouches.

HODOMETRICAL Method of finding the Longitude at Sea, is that of the Computation of the Measure of the Way of a Ship between place and place; *i. e.* of observing the several Rhumbs or Lines in which the Ship saileth; and what Way she hath made, or how many Leagues and parts of a League she hath run.

HOGENHINE, was formerly the Term for one that coming Guest-wise to an Inn or House, lay there the third Night: After which he was accounted one of the Family; and the Host was answerable for his Breach of the King's Peace. In the Laws of K. Edward, set forth by Lambert, he is call'd *Agenevine*; and often in other places *Third-Night Awnevine*.

HOKE-Day, was the Tuesday Fortnight after Easter-Day; and was antiently celebrated with Sports and Rejoycings, in Memory of many of the Danes being kill'd on that Day, and the rest expell'd the Kingdom. This was done A. D. 1002. in the Reign of K. *Ethelred*.

HOKE-Tuesday-Money, was a Duty paid by the Tenants to their Landlord, to have leave to celebrate the *Hoke-Day*.

HOMAGIUM Reddere, was renouncing Homage, when a Vassal made a solemn Declaration of disowning and defying his Lord; for which there was a set Form and Method prescribed by the Feudatory Laws.

HOMO-

of Malta. All the Lands and Goods of such as were here in *England* were given to the Crown : See 32 H. VIII. c. 34.

HOUR of the Day: To find this readily by Projection of part of the *Analemma*, proceed thus: With 60 of the Chords draw the Circle $Z S n N$ for the Meridian of your Place: Then

having given you, as you must have, the Latitude of your Place, and the Sun's Declination and Altitude, set the first of these three from N to P ; so is P , the Pole of the World, draw PWp for the Axis. Set next the Latit. also from Z to E , and draw EWZ for the Equinoctial. Then set the Sun's Declination from E to D , and from Q to d , when 'tis North, as here; but on the lower Side of EZ when 'tis South; and draw the Parallel of Declination Dd : Then set the Sun's Altitude from S to A , and from N to a , draw Aa for the Almacanter or Parallel of the Sun's Altitude at the Time. The common Intersection of these two Parallels in $\odot$, will give you the Sun's Place in the Heavens at that Time. And, consequently, setting the Sector to the Radius DB , $\odot B$ will be the Sine of the Hour from 6, either in the Morning or Afternoon. If a Sector be not at Hand, you may find the Hour by your Chords, thus; Set the Extent BD from W to T ; on which Point T , as a Centre, with the Extent $B\odot$ (the parallel Sine of the Hour from 6) strike the Arch G ; for then a Ruler laid from W just to touch the Convexity of the Arch G , will cut the Limb in H . Then HN measured on the Chords, will give the Degrees of the Hour from 6, which must be turned into Time.

HOUR-Scale: On one of the Edges of *Colin's Quadrant* there is usually an *Hour-Scale* (as on the other Edge is a Line of Latitudes) which is no other than a Double Tangent, or two Lines of Tangents, each of 45 Degrees, set together in the middle; and so might, if there were need, be continued in *Infinitum*.

And on the other Face of this Quadrant there is also an *Hour-Scale* of another kind; being 62 Degrees of a Line of Sines, whose Radius is made equal to half the Secant of the Latitude (being fitted for *London*) to the Common Radius

HOOK-Pins, are taper Iron Pins, with an hook Head ; and are used to pin the Frame of a Floor or Roof together, by being put in through the Pin-holes in the Mortises and Tennonns, whilst it is framing or fitting into its due Position : As soon as which is done, these *Hook-Pins* are struck out, and 'tis pinn'd up fast with Wooden Pins.

HORIZONTAL-Line in Dialling, is a Line drawn on any Plane parallel to the Horizon. It is drawn on an Erect or Reclining Plane by a Level; or by applying a Quadrant to the Edge of a Ruler so, as that the String and Plumbet shall cut 00. or 90 Degrees in the Limb.

HOSPITALLERS, were the Knights of a Religious Order; so call'd, because they builded an Hospital at *Jerusalem*, wherein Pilgrims were received. To these, when the Templers were suppress'd by the Council of *Vienne* in *France*, *P. Clement* transferr'd that Order. Their chief Abode is now at *Malta*, and they are call'd *Knights*

Vol. II.

L 1

of

of the Sines. Against it, and running by it, is a prick'd Line of Declinations: To the Sun's greatest Declination is also a Portion of the Line of Sines, whose Radius is equal to the Sine of the Latitude of *London*, taken out of the other part of the Scale.

These *Hour-Scales* (especially the former) may be put on any Ruler, Sector, &c. and will serve for these Uses.

The first *Hour Scale*, or Double Tangent, is a Scale of Six Hours; and by help of the Line of Latitudes (which should always be placed by it) will serve very readily and universally to prick down all Dyals that have Centres; after this manner.

I. To draw on Horizontal, or a Direct Erect South Dial.

Draw first the Right-Line CE for the Hour-Line of 12, and cross it in C (which will be the Cen-

tre of the Dial) with the Perpendicular BA: Then from the Scale of Latitudes take off the Latitude of the Place for an Horizontal (or the Co-Latitude, for a Direct South and Vertical) Dial, and set it with your Compasses each way from C to A and B: Then take with your

Compasses the whole *Hour-Scale*, and setting the End of it at A and B, and its Beginning at E, transfer it, and all its Divisions (or such as you shall have occasion for at least) on each Side from A to E, and from B to E, making the Isosceles Triangle BEA: Then Numbring the Divisions with the proper Hours, as you see in the Figure, Right Lines drawn from C, through those Hours, Halves, or Quarters in the prick'd Lines AE and BE, shall be the true Hour-Lines of the Dial: And to the Dial you may give what Form or Figure you please.

II. To draw an upright Declining Dial.

Suppose for the Latitude of *London* $51^{\circ} 30'$ and declining Eastwards 25° . You must first, either by Calculation, or by *Collin's Dialling-Scales*, &c. find the Requisites of your Declining Dial; which will be these:

The Substyle Distance from the Meridian will be $18^{\circ} 34'$

The Angle of the Hour-Lines of 12 and 6 will be $62^{\circ} 00'$

The Angle of the Inclination of Meridians will be $30^{\circ} 47'$

And the Styles Height will be an Angle of $34^{\circ} 19'$

Being thus prepared, you may then draw the Line VIII, II, as the true Horizontal Line of your design'd Dial, and then to it, at Right-Angles, the Line XII C for the Meridian. Next make the Angle FC XII equal to $18^{\circ} 34'$ the Substyle's Distance from the Meridian; and by the Chords prick off FC for the Substyle. To which in C, the Centre of the Dial, draw the Perpendicular BA: Then make CA and CB equal to the Style's Height $34^{\circ} 19'$ (taking it in your Compasses from the Line of Latitudes;) And then apply the whole Scale of Hours (as before in the Horizontal Dial) on each side CF, from A to F, and from B to F. Next get the Difference between $30^{\circ} 47'$ the proper Inclination of Meridians, and the next Hours Distance from the Meridian that is less than that Angle; which in this Case is 10, or 30° from 12. This Difference will be found here to be $47'$ or, in Time, nearly 3 Minutes. The fitting the Scale of Hours, was before taught from A to B; count upon the said Scale

Hour. Min.

0	3	} From F to	10
1	3		11
2	3		12
3	3		1
4	3		2
5	3		3

And make Points at the Terminations with a Pin or Pen :
And draw Lines from those Points to the Centre C ; and
they shall be the true Hour-Lines on this Side the Substile.

Again, Fitting in the Scale of Hours from B to F, count from the End at B, the former
Arks of Time.

Hour. Min.

0	3	} From B to	4
1	3		5
2	3		6
3	3		7
4	3		8
5	3		9

And make Points at the Terminations, as before ; through
which draw Lines to the Centre, and they shall be the
Hour-Lines on the other Side the Substile.

The like must be done for the Halves, Quar-
ters, &c. getting the Difference between the
Half-hour next less (in this Example $22^{\circ} 30'$.)
under the Ark called the Inclination of Meridians,
the Difference is $1^{\circ} 17'$. (in Time nearly $33'$.)
to be continually augmented an Hour at a time,
and so prick'd off as before was done for the
Whole Hours.

If the Scale of Hours reach above the Plane,
as in this Case at B ; so that BC cannot be prick'd
down : Then may an Angle be laid down on the
upper Side of the Substile, equal to FCA on the
under Side, and thereby the Scale of Hours laid
in its true Situation, having first found the Point
F on the under Side.

The Stile may be easily laid down by the
Chords, or a Protractor. And if your
Scales are large and carefully made, as this
is one of the easiest, so 'tis as exact a Way
of Drawing Dials as any whatsoever.

HOUSEBOTE, the same with *Estovers*, or
an Allowance of necessary Timber out of the
Lord's Wood, for the Repair and Support of a
House or Tenement.

HOWKER, or *Houcre*, is a Vessel much
used by the *Dutch* ; built something like a Pink,
but Masted and Rigg'd like a Hoy. They carry
from 50 to 200 Tun : And with a small number
of Hands will go to the *East-Indies*. They Tack
soon and short ; will Sail well, and lie near the
Wind ; and will live almost in any Sea.

HULKS, are large Vessels, having their Gun-
Decks from 113 to 150 Foot long, and from 31
to 40 Foot broad. They will carry from 400
to 1001 Tons. But their chiefest Use is for set-
ting in Masts into Ships, and the like. Though
antiently the Word *Hulka* seems to signifie a small
Vessel.

HUNDRED, is a Part of a Shire or County,
properly so called, because it contained Ten *De-
cennæ* or Tythings ; And either because at first
there were an Hundred Families in each Hun-
dred ; or else that the Hundred found a hundred
Men for the King's Wars. These Hundreds
were first Ordain'd by King *Alfred*, the 29th
King of the *West Saxons* ; and he took the way
of doing it from *Germany* ; where *Centa*, or *Cen-
tena*, is a Jurisdiction over an hundred Towns.
Hence you see the Original of Hundreds,

which still keep the name, and remain, in some
sort, the same, as to their Service in several re-
spects : But their *Jurisdiction* is transferr'd to
the County Court ; some few excepted, which
have been by Privilege annex'd to the Crown,
or granted to some Great Subject, and so remain
still in the nature of a Franchise : And this hath
been ever since the Statute of 14 *Edw. III.* 1. c. 9.
whereby these *Hundred-Courts*, formerly Farm'd
out by the Sheriffs to other Men, were reduc'd
all, or most of them, to the County-Court ; and
so remain at present. Where-ever therefore
we meet with the Word *Hundred-Court* now, it
signifies some Franchise, where the Sheriff does
not intermeddle by his ordinary Authority, unless
when they of the Hundred refuse to do their
Duty.

HUNDRED-Courts, were held antiently by
the *Hundredarius*, or Chief-Constable, of every
Hundred, for better support of his Office. These
Courts were held in some Places once in three
Weeks, and in others once a Month. And by
Stat. 14 *Ed. III.* these *Hundred-Courts* were reduc'd
to the County-Courts ; tho' in some few Hun-
dreds the Old Franchises are still remaining.

HUNDREDERS, are Men Empanelled, or
fit to be Empanelled, on a Jury, upon a Contro-
versie ; and who dwell in the Hundred where
the Land in question lies. But

HUNDREDARIUS, the *Hundreder*, is he
that hath the Jurisdiction of a Hundred, and who
holdeth the Hundred-Court. And sometimes
'tis used for the Bail of the Hundred.

HUNDREDI *Seſſa*, was the Payment of per-
sonal Attendance, ordering Suit and Service at
the *Hundred-Court*.

HUNDREDUS *Affirmatus*, was the Profits of
an *Hundred-Court*, *Firmed* or *Farmed* out for a
standing Rent.

HURRICAN, is a most furious and dreadful
Storm of Wind, which the *Caribbe-Islands* and
some other Parts of the *Indies* are subject to : Its
Extent and Continuance is but small, but its Vi-
olence prodigious.

HUSE-BOTE, was formerly the Liberty a
Tenant had to cut as much Wood on the Pre-
misses as was necessary for the Support and Re-
pair of the Farm-House and adjoining Buildings.
This is now call'd *Estovers*, *Estoverium*.

HYDE-LAND : See *Hide-Land*.

HYDROSTATICKS. Weights which force out of the same Tube equal Quantities of the same Fluid, are to one another as the Squares of the Times in which the Fluid is forc'd out: But if the Times are equal in which the same Quantity of the Fluid is forc'd out thro' unequal Tubes; then the Powers are reciprocally as the Orifices of the Tubes: And therefore Powers which thrust out the same Quantity of a Fluid through unequal Tubes, are to one another in a reciprocal Proportion, compounded of the Squares of the Times, and of the Orifices of the Tubes.

HYDROSTATICAL-BALLANCE. *A Description of an Hydrostatical-Ballance, for finding the Specifick Gravities of Liquids and Solids with ease and accuracy.* By F. Hawksbee, in Vine-Office-Court in Fleet-Street.

For *L I Q U I D S*.

a a, a a, is the Foot to which the upright Piece or prop'd *b b, b b* is to be screw'd: (See Fig. 1.) To the upper End of this upright Piece is fastned a double Cheek of Steel, *c c, c c*, on which the Beam *d d, d d* is suspended. To one End of this Beam put on the General Scale, express'd by *e e, e e, e e*. At the other End of it, hang on the other Scale, which is a very thin and light one, and is only express'd on the Ballance by the Characters of *f f*. To the Loop at Bottom of it, is to be suspended by its Hair, and the Bottle *g g, g g*. Thus prepared, the Bottle being plung'd into the Glass of Water, *b b, b b*, the Beam will form an Horizontal Position: But if it happen something too light, or too ponderous (for all Waters have not the same Specifick Gravity, nor at all times) it must be adjusted by putting Weights on the lightest End, till brought to an *Equilibrium*. These Weights, in the Experiment, are to be taken no notice at all of. And by an Experiment, by and by to be mention'd, I found two Grains to be the greatest Variation, between the Weight of a Bulk of Water, equal to 574 Grains, at the greatest Degree of Heat in this Climate to the Freezing Point. And thus you may find the Specifick Gravities of all manner of Liquids, in comparison to their like Bulk of Common Water: For the Bottle will sink down in *lighter*, and be buoy'd up in *heavier* Fluids; and the Grains or Part of Grains, which must be put into one of the Scales, to reduce the Beam to an Horizontal Position, will shew the Difference of the Specifick Gravity.

For *S O L I D S*.

The General Scale *e e* remains in its Place: But instead of the Scale *f f* must be suspended the Brass Piece, represented by the Figure *i i, i i*. (See Fig. 2.) To the Loop, at the Bottom of which, must the Glass Bucket *k k, k k* be suspended by its Hair, which then becomes a Ballance to the other End. Into this Bucket must be put the Solid (what ever it be) whose Specifick Gravity you would find, or whose Weight you have a mind to compare with that of the like Bulk of Water: And having ballanc'd it by Weights at the other End, take it out of the Bucket, and plunge the Bucket empty into the Water. Then putting the Brass Dish *l l*, by its

Slit on the Brass piece *i i*, a Notch being cut in't to receive it; the Bucket then in the Water will be in *equilibrio* with the General Scale *e e*; the Dish *l l* being the Weight of a Bulk of Water equal to the Solidity of the Bucket: But if it chances to vary a little, you must reduce it as before. Then putting the Solid Body into the Bucket (having first well wetted it all over in Water; and it be irregular, take care that no Air lodges in any part of it) then you will soon find what it has lost of its Weight, in comparison to what it weigh'd in the Air: And by the Difference of which Weights, divide the Weight first found, which exactly gives you its Proportion to the like Bulk of Water: See *Specifick Gravity* in Vol. I. Where the Reason of this Practice is shewn: What is here design'd being only the Use of a commodious Ballance for such kind of Hydrostatical Experiments.

An Experiment, touching the different Densities of common Water, from the greatest Degree of Heat in this Climate to the Freezing Point; observ'd by a Thermometer. By Mr. Hawksbee.

I took about a Quart of Common Water, and gave it a pretty considerable degree of Heat over the Fire: Then putting it into a convenient Glass together with my Thermometer, where the Spirit soon arose into the small Ball a-top, and continued to remain there till the Water began to abate of its Heat; by which Time the Spirit in the Thermometer became of an equal degree of Temperature with the Water in which it was plac'd. When the Spirit has descended to 130 Degrees above the Freezing Point, (which is the greatest Height it has been observ'd in this Climate) I began my Observations, and found that the Bulk of Water, equal to that of the Bottle I weigh'd in't, in that State, was equal to 574 Grains, at 80 Degrees above the Freezing Point, the Bulk of Water, equal to the Bottle, then weigh'd $\frac{1}{4}$ of a Grain more than before: At 32 Degrees above the pre-mention'd Point, the like Bulk of Water equal to the Bottel, was again increased $\frac{1}{4}$ of a Grain; at the Freezing Point it weigh'd about $\frac{1}{2}$ of a Grain more: in all about 2 Grains, from 130 Degrees above the Freezing Point, to the same Point: Which to me seems very considerable, and ought to be observ'd by those, who at different Seasons, have occasion to find the Specifick Gravities of Liquids and Solids.

HYPERBOLA. In *Philos. Transact.* N. 34. you have a Quadrature of the Hyperbola by the Ld. Viscount Brouncker, by a Series founded on what Dr. Wallis hath demonstrated in his *Arith. of Infinites*, Prop. 87, 88, 89, &c. And in *Philos. Transact.* N. 306. by a New *Quadratrix*, invented by the Ingenious Mr. J. Perks, of Great Swinford in *Worcestershire*; together with the Construction and Properties of that *Quadratrix*.

HYPERBOLICAL *Cylindroid*, is a Solid Figure, whose Generation is given by Sir *Christoph. Wren*, in *Philosoph. Transact.* N. 48. There are two opposite Hyperbolæ, join'd by the *Axis Transversus*; and thro' the Center there is a Right Line drawn at Right-Angles to that *Axis Transversus*; and about that, as an Axis, the Hyperbolæ are supposed to revolve: By which Revolution a Body will be generated, which he calls an *Hyperbolick*

Fig: I.

Fig: II.

This must be placed
at the Word Hydronautical Balance.

Fig. 3

lick *Cylindroid*; and whose Bases, and all Sections parallel to them will be Circles. And in N. 53. of the *Transactions*, he applies it to the Grinding of *Hyperbolic Glasses*, and saith, they must be either form'd this way, or not at all.

HYPERBOLI-FORM Figures, are such Curves as approach in their Properties to the Nature of the Hyperbola; and are call'd also *Hyperboloids*.

The Method of drawing Tangents to Hyperbolic-form Figures.

Let AS, ST , represent the Assymptotes of the Equilateral Hyperbola Mm ; then will S be the Centre of the opposite Sections. Draw the Or-

dinate MB , and another infinitely near, as mb . Let p be the Parameter of the Figure, let $SB = x$, and $MB = y$; $Rm = \dot{y}$, and $Bb = \dot{x}$. And let it be required to draw MT , a true Tangent to the Curve in the Point M , suppose all done, as in the Figure: Then will the Triangles MBT , and MRm

be similar; and therefore $\dot{y} : x :: y : \frac{xy}{\dot{y}} (= BT)$.

Now the proper Equation for the Curve is $\frac{p}{y} = x$; wherefore their Fluxions will be equal, viz, $0 = \dot{x}y + y\dot{x}$; or $\dot{x}y = -y\dot{x}$:

And dividing by x , it will be $\frac{\dot{x}y}{x} = -\dot{y}$. But from the Ordinate's continual decrease as the Ab-

scissa increases, the $\frac{\dot{x}y}{y}$ ($= BT$), must be

$\frac{\dot{x}y}{-y}$, you have $BT = -x = SB$.

C A R O L. I.

When the Value of the Sub-tangent BT comes out negative; then the Point T will fall, as here, on the contrary Side of the Ordinate, with regard to S , the beginning of x . But when it comes out positive, the Point T will be on the contrary Side; as in the *Parabola*.

C O R O L. II.

If you suppose the Parameter $= 1$, and m to be a Negative Number; then $y^m = x$ is an Expression for all *Hyperbolic-form Figures*; and universally the Length of the Sub-tangent BT ,

($= \frac{xy}{\dot{y}}$) = (because $y^m = x$ and consequently $m y^{m-1} \dot{y} = \dot{x}$) I say, $=$ to $m y^m =$ (bec. $y^m = x$) to $m x$; that is, To the Exponent of the Power of the Ordinate multiplied into the Abscissa.

To Investigate the Area's of all sorts of Hyperbolic-form Figures.

In the following Figure, let the Curve $CMmB$ be an Hyperboloid; AK and AO the Assymptotes:

Let the Sub-tangent PT be called t , and the Ordinate $PM = y$. The General Equation for such Curves being $y^m = x$; and the Expression for the Sub-tangent PT being mx , as above. Let Gn , in the Figure, be always taken equal to PT :

Then will $t\dot{y} = y\dot{x}$. And the Rectangles $NI G n = t y$, will always be equal to the Rectangle $PR m p = y \dot{x}$: And if this be always done, the Figure $KAOBC$ infinite towards KC , will

JACK, in a Ship, is that Flag which is hoisted up at the Sprit-Sail-Top-Mast-Head.

JACTIVUS, *Jatious*, a Latin Word, signifying in the Law, him that loseth by Default: *Placitum suum neglexerit, & Jactivus exinde remansit.* Formul. Solenn.

JAM, or *Jamb*, is in the Language of our Lead Miners in *Mendip*, a thick Bed of Stone, which hinders their Work when they are pursuing the Veins of Oar.

ICH DIEN, the Motto under the Arms of the Prince of *Wales*; which Sir H. Spelman judges to be in *Saxon* *Io Thien*; the *Saxon* D with a traverse Stroke being the same with *Tb*; and signified *I Serve*, or *am a Servant*. As the *Saxon* King's Ministerial Lords were called *Thiens*.

IDEA'S. Our Observation employ'd, either about *External Objects*, or about the *Internal Operation* of our Minds, perceived and reflected only by our selves; is that which supplies our Understanding (saith Mr. Locke) with all the Materials of Thinking. These Two are the Great Fountains of Knowledge from whence all the *Idea's*, *Notions*, *Phantasms*, *Species*, &c. which we have, or can naturally have, do spring and arise.

1. Our Senses, being conversant about particular Sensible Objects, do convey into the Mind several distinct Perceptions of things: And this way we gain the *Idea's* of *Yellow*, *White*, *Heat*, *Cold*, *Soft*, *Hard*, *Bitter*, *Sweet*, and all those which we properly call *Sensible Qualities*; and this Great Source of most of the *Idea's* we have, depending wholly on our Senses, and derived by them to the Understanding, is called *Sensation*.

2. The other Fountain from which Experience furnishes the Understanding with *Idea's*, is the Perception of the Operation of our own Minds within us, as it is employed about the *Idea's* it hath before gotten by Sensation: Which Operations, when we come to Reflect and Consider on, our Understanding thereby becomes furnish'd with another Set of *Idea's*, which could not be had from things without; and such is Perception, Thinking, Doubting, Believing, Reasoning, Knowing, Wiling, &c. and all the different Actions of our Minds; which we being conscious of, and observing in our selves, do from these receive into our Understandings, as distinct *Idea's*, as we do from Bodies affecting our Senses. This is a kind of *Internal Sensation*; is called very properly, by Mr. Lock, *Reflection*: And these two, *Sensation* and *Reflection*, he takes to be the only Originals from whence all our *Idea's* take their Beginnings.

And so far the Mind or Understanding is merely passive; and cannot choose whether it will have these Beginnings or Materials of Knowledge or not. The Objects of Sense will obtrude their *Idea's* upon our Minds; and the Operations of our Minds will not let us be without some (at least obscure) *Notions* of them. No one can be wholly ignorant of what he doth when he Thinks: And as the Mind is forced to receive Impressions from without, so it cannot avoid the Perception of those *Idea's* that are annex'd to them.

I D E

Of *Idea's*, some (as we should carefully observe) are *Simple*, and others *Complex*. All those *Idea's* that come into our Minds by *Sensation*, are of the former kind: And tho' the *Qualities* in Bodies that affect our Senses are in the Things themselves, so united and blended, that there is no Separation nor Distance between them; yet the *Idea's* they produce in the Mind enter by the Senses simple and unmix'd. Some *Idea's* come into our Minds only by one Sense, which is peculiarly adapted to receive them: As the *Idea's* of all Colours are received only by the Eye; all Sounds and Tones by the Ear, &c. Heat, Cold, and Solidity, by the Touch.

Other *Idea's* we gain by more than one Sense; as of *Space*, *Extension*, *Figure*, *Rest*, and *Motion*: For these make forcible Impressions both on the Eyes and Touch.

There are other *Simple Idea's*, which convey themselves into the Mind by all the ways of Sensation and Reflection; as *Pleasure*, *Pain*, *Power*, *Existence*, *Unity*, and *Succession*; and these are all, or, at least, the most considerable of those *Simple Idea's* which the Mind hath; and out of which is made all its other Knowledge.

To understand the Nature of these *Simple Idea's* the better, and to discourse of them intelligibly, it will be convenient to distinguish them as they are *Idea's* or *Perceptions* in our Minds, and as they are Modifications in the Bodies that cause such Perceptions in us; that so we may not think (as perhaps is usually done) that they are exactly the Images and Resemblances of something inherent in the Subject: For most of those of Sensation are in the Mind no more the Likeness of something existing without us, than the Names that stand for them, are the Likeness of our *Idea's*. But here the Qualities in Bodies, which produce these *Idea's* in our Minds, must be distinguished into *Primary* and *Secondary*. *Primary Qualities* are such as are utterly inseparable from the Body, in what State soever it be; such as the Sense constantly finds in every Particle of Matter; which are *Solidity*, *Extension*, *Figure*, *Motion*, *Rest*, and *Number*. *Secondary Qualities* are such as are in reality Nothing in the Objects themselves, but only Powers to produce various Sensations in us by their *Primary Qualities*; i. e. by the Bulk, Figure, Texture, and Motion of their Insensible Parts; as Colours, Sounds, Tasts, &c. Now the *Idea's* of *Primary Qualities* are, in some sense, Resemblances of them, and their Patterns do really exist in the Bodies themselves; but the *Idea's* produced in us by these *Secondary Qualities* have no Resemblance of them at all. There is nothing like our *Idea's* existing in the Bodies themselves: They are in the Bodies, we denominate from them only a Power to produce those Sensations in us: And what is Sweet, Blue, or Warm in *Idea*, is but the certain Bulk, Figure, and Motion of the insensible Parts in the Bodies themselves, which we call so.

There are several Faculties which the Mind hath of managing these *Simple Idea's*, which are very well worth our Observation; as that of Discerning duly, and rightly Distinguishing one from another: In this consists the Accuracy of Judgment,

ment, and the avoiding all Confusions and Mistakes.

2. That of *Comparing* them one with another, in respect of *Extent, Degree, Time, Place*, or any other Circumstances of *Relation* or Dependence one on another.

3. The Faculty of *Compounding* or putting together the *Simple Idea's* receiv'd by *Sensation* or *Reflexion*, in order to make *Complex* ones.

4. When Children, by repeated *Sensations*, have got some *Idea's* fix'd in their Memories, they, by degrees, begin to learn the Use of Signs; and when they can speak articulately, they make use of Words to signify their *Idea's* to others; And the Use of Words being to stand as outward Marks of our Internal *Idea's*; and those *Idea's* being taken from particular things, if every particular *Idea* that we take in should have a particular Name, Names must grow endless. To prevent this, the Mind, by,

5. Another Faculty, can make the Particular *Idea's* received from such Objects, to become *General*: Which is done by considering them as they are in the Mind such Appearances, separate from all other Existences, and the Circumstances of real Existence; such as *Time, Place*, or any other concomitant *Idea's*; and this is called *Abstraction*; whereby *Idea's* taken from particular Things, become general Representatives of all of that kind; and their Names, general Names applicable to whatever exists conformable to such *Abstract Idea's*. Thus the same Colour being observ'd to Day in Chalk or Snow, which the Mind Yesterday received from Milk or Cerusse; it considers that Appearance alone; makes it a Representative of all of that kind; and having given it the name of *Whiteness*, it by that sound signifies the same Quality wheresoever to be met with or imagined. And thus *Universals*, whether *Idea's* or *Terms*, are made.

From the Power which the Mind hath of combining thus, comparing, and separating or abstracting its *Simple Idea's*, which come into it by *Sensation* and *Reflection*, all *Complex Idea's* are form'd; and, as before in the Perception of *Idea's*, the Understanding was *passive*, so here 'tis *active*; exerting the Power it hath in the several Acts and Faculties above-mention'd, in order to frame *Compounded Idea's*.

All *Complex Idea's*, tho' their Number be infinite, and Variety endless, may be, as it seems, all reduc'd to these three Heads, viz. *Modes, Substances* and *Relations*.

Modes are such *Complex Idea's*, which however compounded, are not supposed to exist by themselves, but are considered as *Dependancies* on, or *Affections* of *Substances*: Such are the *Idea's* signified by the Words *Triangle, Gratitude, Murder*, &c. and these *Modes*, as Mr. Locke calls them, are of two sorts.

1. Such as are only Variations, or different Combinations, of the same *Simple Idea*, without the Mixture of any other; as a *Dozen, a Score*, &c. and these may be called *Simple Modes*.

2. There are others compounded of *Simple Idea's* of several kinds put together to make one *Complex* one; as *Beauty, Theft*, &c.

Substances have their *Idea's* such Combinations of *Simple Idea's*, as are taken to represent distinct particular things subsisting by themselves; in which the supposed, or confused *Idea* of Substance, such as it is, is always the First and Chief.

Relations, are a sort of *Complex Idea's* arising from the Consideration and Comparison of one *Idea* with another. Of these, some depend only on the Equality or Excess of the same *Simple Idea* in several Subjects; and these Mr. Locke thinks may be called *Proportional Relations*; such as *equal, more, bigger, sweeter*, &c. Another Occasion of comparing things together, is the Circumstances of their Origin or Beginning; and this being not afterwards to be altered, make the *Relations* depending thereon as lasting as the Subjects to which they belong: These are *Natural Relations*, such as *Father, Brother, Uncle, Cousins*, &c. There are also *Relations* by *Institution*, as *Prince and People, General and Army*, &c. *Moral Relations*, are the Conformity or Disagreement of Men's free Actions to Laws and Rules, whether *Divine* or *Human*.

It may be considered also further about our *Idea's*, that some are *clear* and *distinct*; others *obscure* and *confused*. Our *Simple Idea's* are *clear*, when they continue such as the Objects represent them to us, when our Organs of Sensation are in a good Tone and Order; when our Memories retain them, and can produce and present them to the Mind when ever it hath occasion to consider them: And if along with this the Mind sees that these *Simple Idea's* are severally different one from another, and each single one from all the rest; then they are distinct also as well as clear: And the contrary to this will occasion *Obscurity* and *Confusion*.

IDENTITY: The *Idea's* of *Identity* and *Diversity* come into our Minds by the Power it hath of comparing the very *Beings* of Things; whereby considering any thing, as existing in any determined Time and Place, we compare it with it self existing at another time; and accordingly pronounce it to be the *same* or *diverse*. When we see any thing to be in any Place in any *Instant* of Time, we are sure (be the thing what it will) that it is *that very thing*, and not another: For what ever is *another* thing, must at that same time exist in another place, how like so ever it may be in all other respects. And in this consists *Identity*; when the *Idea's* it is attributed to, vary not at all from what they were that moment, wherein we consider'd their *former* Existence, and to which we compare the *present*: for never finding nor conceiving it possible, that two things of the same kind should exist in the same place at the same time, we rightly conclude, that whatever exists any where at any time, excludes all of the same kind, and is there it self alone. When therefore we demand, Whether any thing be the *same* or not? It always refers to some thing that existed at such a time in such a place, which, 'twas certain, at that instant, was the same with it self and no other. From whence it follows, that *one thing* can't have *two Beginnings* of

of Existence, nor *two* things *one*; it being impossible for two things of the same kind, to be or exist in the same instant, in the very same place; or one and the same thing in divers places. Whatever therefore had *one Beginning* is the same thing; and that which had a different Beginning in Time and Place from *that*, is not the same with that, but different from it.

We seem to have Idea's but of three sorts of Substances, G O D, *Finite Intelligences* or *Spirits*, and *Bodies*. Of G O D, 'tis demonstrable that He is without Beginning, Eternal, Unalterable, and Omnipresent; wherefore of His *Identity* there can be no doubt.

Finite Spirits having had each its determinate Time and Place of Beginning to *exist*; the Relation to that Time and Place, will always determine to each of them its *Identity*, as long as it *exists*.

And the same will hold of *Bodies*: And in every Particle of Matter, to which no Addition or Subtraction of Matter being made, it is the same. And though these three sorts of Substances do not exclude *one another* out of the same Place; yet we cannot conceive but that they must necessarily *each* of them exclude *any other of the same kind*, out of the same Place; or else the Notions and Names of *Identity* and *Diversity* would be in vain; and there could be no such Distinction of Substances, or any thing else from one another. Thus, *v. gr.* if two Bodies or Particles of Matter could be in the same place at the same time; then take them, great or little, they must be *one* and the *same*; nay, thus all Bodies must be one and the same.

'Tis plain then that the so much disputed *Principium Individuationis* is Existence it self; which determines a Being of any sort to a particular Time and Place, incommunicable to two Beings of the same kind.

And here it will do well to distinguish between dead and unactive Lumps of Matter, and such Bodies as those endow'd with Vegetable or Animal Life. If you consider one of the former kinds of Bodies; if it consist only of *one*, or a determinate Number of many Atoms, any way combined together; while that *one* continues without mixture with others; or while the *many exist*, united together in the same Mass, it will still be the same Body; but if one Atom be taken away, or any new one added, it is no longer the same Mass, or the same Body. But in the State of Living Creatures, their *Identity* depends not on a Mass of the same Particles, but on something else; for in them the Variation of great Parcels of Matter alters not the *Identity*. An Oak growing from a Plant to a great Tree; and a Child growing to an Adult Person, are still the same; tho' in both Cases there be a manifest Change of Parts: For here 'tis such a peculiar Disposition and Organization of Parts in one coherent Body, and partaking of one common Life, that constitutes their *Identity*; and as long as that continues, it will be the same Oak or Man. And so it is in a Watch; as long as the Mechanism of it continues the same, and it goes and answers the End of its Organization, 'tis the same Watch, tho' many Particles of Matter continually rub off and wear away. 'Tis clear therefore wherein consists the *Identity* of any Animal or Vegetable.

Vol. II.

But there is another sort of *Identity*, which hath not been improperly called *Personal*; which I think Mr. Lock truly determines to consist in the *Sameness of a Rational Being*: Since by *Person* we understand an Intelligent Being, having Reason and Reflection: And since there is a *Consciousness* which always accompanies Thinking; it is that which makes every one to be that, which he calls *himself*, thereby distinguishing him from all other Beings that think, and give him his *Personal Identity*. See *Essay of Human Understanding*, Book 2. Ch. 27.

JEWISH Hours, are the 24 Hours of the Day, accounted from Sun-setting to Sun-setting again, much after the manner as the *Italians* do now.

IKEMILDESTREET, one of the four old Roman Ways in England: See *Watling-street* in Vol. II. It was called *Stratum Icenorum*, because it took its Beginning from the *Iceni*, which were those that inhabited *Suffolk*, *Norfolk*, and *Cambridgeshire*.

ILLEVIABLE, is what cannot or may not be levied: And therefore *Nihil* is a Word set upon a Debt that is *Illeivable*.

IMPARSONEE, in the Law, or a Parson Imparsonee, is one that is Inducted into the Possession of a Benefice. And *Dyer* saith, a Dean and Chapter are *Parsons Imparsonees* of a Benefice appropriate to them.

IMPEACHMENT of Waste, *Impetio vasti*, from French *Empeschment*, *Impedimentum*, signifies in Law a Restraint from committing Waste on Lands and Tenements. And thus he that hath a Lease without *Impeachment of Waste*, hath by it a Property or Interest given him in the House and Trees, and may make Waste in them, without being *Impeached* for it; that is, without being question'd or demanded any Recompence for the Waste done.

IMPLEAD, in our Law, signifies to Sue, Arrest or Prosecute by Course of Law.

IMPOST, is the Tax which the Crown receives for Merchandize brought into any Haven within its Dominions, or from Foreign Parts. 31 *Eliz.* 5. and thus it may be distinguished from *Custom*; which is rather the Profit which the Queen makes of Wares exported: But they are frequently used promiscuously.

IMPOSTS in Architecture, are what are sometimes called *Chaprels*, being the Parts on which the Feet of Arches stand: Or the Capitals of Pilasters that support Arches. These Imposts conform to their proper Orders: The *Tuscan* hath a *Plinth* only: The *Dorick* two *Faces* and a *Round*: The *Ionick* a *Plancere* or Cavity between the two *Faces*; with, some times, carved Mouldings; as the *Corinthian* and *Composite* have their *Freises*. But the *Sallies* of the *Imposts* must not exceed the Body of the Pilaster. Sometimes the Entablature of the Order serves for the Impost of the Arch; and this looks very great and stately.

IMPROPRIATION, is the Word for the Profits of an Ecclesiastical Benefice, being in the Hands of a Lay-Man: As *Appropriation* is the Term, when 'tis in the Hands of a Bishop, College, or Religious House. Tho' these two Words are now often used promiscuously. It is said there are 3845 Improprations in England. *Cowel's Interpreter*.

M m

IN

I N *Alto* & *Imo* ; the same with *Alto* & *Basso* ; which see.

INCIDENCE. Sir *Isaac Newton*, in his *Opticks*, Printed since the first Edition of this Book, saith, That the *Sine of Incidence* is either accurately, or very nearly, in a given Ratio to the *Sine of Refraction* : (And the Angles of Incidence, Reflexion, and Refraction, are all in one and the same Plane.) Wherefore if that Proportion be known in any one Inclination of the Incident Ray, 'tis known in all ; and thereby the Refraction in all Cases of Incidence on the same Refracting Body may be determin'd. Thus, if the Refraction be made out of Air into Water, the *Sine of Incidence* of the Red Light Is to the *Sine of the Refraction*, As 4 To 3. If out of Air into Glass, the Sines are As 17 To 11. In Light of other Colours the Sines have indeed other Proportions ; but the Difference is so little, that it need seldom be consider'd.

To illustrate all this, Sir *Is. Newton*, *Opt.* p. 5. gives this Example :

Let *rs* be the Surface of the Still Water, *c* the Point of Incidence, in which any Ray coming in

the Air from *a* in the Line *ac*, is reflected or refracted : I would know whither this Ray shall go after such Reflexion or Refraction.

On the Surface of the Water *rs*, and in the Point *c*, I erect the Perpendicular *cp*, and produce it downwards to *q*. Knowing therefore that the Ray after Reflexion or Refraction will be found somewhere in the Plane of the Angle of Incidence *acp* produced : I let fall the Sine of that Angle (*viz.* *ad*) on the Perpendicular *pc* ; and then if the Reflected Ray be sought, I produce *ad* to *b*, so that *db = ad*, and draw *cb*, which shall be the Reflected Ray, because the Angle of Reflexion and its Sine, are equal to the Angle and Sine of Incidence, as they ought to be. But if the Refracted Ray had been sought, I produce *ad* to *b* ; so that *db* may be to *ad*, As the Sine of Refraction To that of Incidence ; *i. e.* As 3 To 4. Then with the Radius *ac*, describing the Circle *abe*, and in the Plane *acp*, I draw the Line *be* parallel to *pq*, and cutting the Circumference in *e* : Then drawing *ce*, that shall be the Refracted Ray. For if *ef* be let fall perpendicularly on the Line *pq*, it shall be the Sine of the Angle of Re-

fraction of the Ray *ce* ; and this Sine is equal *db*, and consequently in proportion to the Sine of the Angle of Incidence *ad*, As 3 To 4.

INCIDENT, in the Law, signifies a thing necessarily depending upon another, as more principal. Thus a Court Baron is so Incident to a Mannor, and a Court of Pie-Powdre, that they cannot be severed in a Grant of a Mannor or Fair, but must go along with it.

INCLINED Plane. If a Body, as *B*, be partly supported by the Inclined Plane *AC*, and partly

by the Power *R* acting on a Direction parallel to the Plane *AC*. Then that Power *R* : Is to the Body or Weight *B* :: As the Sine of the Angle of the Plane's Inclination *ACB* : Is to the Radius *CA*. *CD*, *AD*, *GF*, *ED*, and *HF*, being drawn as in the Figure. The Body *B* will be sustain'd as it were by three Forces or Powers, all acting according to different Directions, and in *Æquilibrio* to one another. The First of which is the Force of Gravity ; expressed by *BE* perpendicular to the Horizon *CD*. The Second, the Power *R*, according to the Direction *BR* parallel to the Plane *AC*. And the Third is supply'd by the Resistance or Contranite of the Plane *AC* ; and is express'd by *BH* perpendicular thereunto. For Action and Re-action being equal, and one acting directly contrary to the other ; the Plane which is pressed by the Body or Weight *B*, according to the Direction of the Perpendicular *HB*, must act on that Body by a contrary Direction, *viz.* that of *FB* or *BH*. And since these three Powers are all mutually in *Æquilibrio*, and that the Body *B* is sustained by them, 'tis plain (when *GF* is drawn perpendicular to *CD*, or parallel to *BE*) that the Force of Gravity will be expressed

by

by GF ; and that the Power R : To the Power of Gravity :: Will be as GB : To GF : But in the Right-angled Triangle CFG (FB being a Perpendicular to the Base CG) $BG : GF :: GF : GC$; and as $FG : GC :: AD : AC$: (by Similar Triangles;) wherefore the Power R : Is to the Force of Gravity :: As AD : To AC ; or as the Sine of the Angle of Inclination to the Radius. $\mathcal{Q}. E. D.$

COROLLARY I.

Wherefore the Force by which any heavy Body wou'd descend on any Inclined Plane to the Force of the Descent in the Perpendicular, is as the Sine of the Angle of the Plane's Inclination to the Radius.

COROLLARY II.

Frome hence also it follows, that the Inclination of the Plane may be so little, that the greatest Weight may be sustain'd on it by the least Power.

For Practice therefore, Let the Weight of any Body be W , and P the Power wanted to sustain it on an Inclined Plane.

I say, by this Theorem, $R : W :: S \text{ Incl.} : P$. That is, As Radius is to the Weight :: So is the Sine of the Angle of the Plane's Inclination to the Horizon : To the Power sought. The three first of which are given : Wherefore the Fourth is known. *Trigon. Calculation. E. G.* Let a Body weigh 9999 Pound; What Power will sustain it from descending on a Plane inclined to the Horizon with an Angle of 34 Degrees? Answer, 5590 Pound weight.

See the Work.

$$R = 10.$$

$$\begin{array}{r} \text{Weight } 9999. \quad 3.999957 \\ S, \angle \text{ Incl.} = 34^\circ. \quad 9.747562 \end{array}$$

$$\mathcal{Z} - R = 3.747419 = 5590 \text{ Ferè.}$$

INCOMBUSTIBLE Cloth, is a sort of very odd Linen, made from a Stone in the form of a Talk; and call'd *Lapis Ammanthus* and *Asbestos*, *Alumen Plumosum*, *Polia*, *Corsbides*, *Sparta Polia*, &c. 'Tis found in many Places in *China*, *Italy*, and *Wales*; and I have had a very clean sort, which would part into pretty long Threads, which was found in *Scotland*. The *Incombustible Cloth* made from this Mineral, is called *Linum Vivum*, *Linum Fossile*, *Linum Indicum*, *Creticum*, *Cyprium*, &c. from the Places where 'tis found. This was of such esteem among the Ancients, as to be rank'd (as *Dr. Plot* tells us) with the most precious Pearls: And in *China* a piece of it but $23\frac{1}{4}$ Inches long was valued at 80 *Tale*, i. e. 36 *l.* 13 *s.* 4 *d.* *Pliny* tells us expressly, and of his own Knowledge, That Napkins of this Cloth being taken foul from the Table at a great Feast, where he was a Guest, were cast into the Fire, and by that means came out fairer and cleaner than if they had been wash'd in Water. *Marco Antonio Castagna*, Superintendent of some Mines in *Italy*, saith (in *Phil. Transf. N. 72.*) that causing a kind of Paper to be made of some of the *Amianthus* which he found there; it would abide longer in the Fire without being

consumed than Plates of the hardest and most solid Metal; which would have scaled off in Flakes with a much less Heat. *Mr. Edward Lloyd* also, in *Numb. 166.* gives an Account of some that he found in *Wales*, which remain'd in the Fire above a Quarter of an Hour without any Signs of being consumed.

But in two Trials which were made before the Royal Society of a Piece of this Cloth of a Foot long, and half a Foot broad, and weighing about an Ounce and half; it was found to lose in a strong Fire, where it continued for several Minutes, above a Dram of its Weight at a time.

Of this Cloth, as *Pliny* informs us, Shrouds were anciently made, and used at *Royal Obsequies*, to wrap up the Corps in, that the Ashes of their Bodies might be preserved distinct from those of the Wood, which constituted the Funeral Pile. And we are assured, that the Princes of *Tartary* use it for the same purpose to this Day. And some of the antient *Indian Brachmans* are said to have made themselves Cloaths of it. They tell us also, that the *Wicks* for the Antients *Perpetual Lamps* (if there were any such thing) were made of the Threads of this *Alumen Plumosum*, or *Asbeston*.

Marcus Paulus Venetus acquaints us, That one *Curficar a Turk*, a Superintendent of the Mines in the *Tartarian Province* of *Chinchinthalas*, assured him that they first dried this Mineral (found there in a certain Mountain) in the Sun; then pounded it in a Brass Mortar, to separate the Earthy part from it; and that afterwards it was also washed from all remaining Filth; and then was spun into Threads like Wool, and afterwards woven into Cloth; which, said he, when spotted or foul they cleanse by throwing it into the Fire for an Hour's time, whence it comes out unhurt, and as white as Snow.

INCOMPOSITE Numbers, are the same with those *Euclid* calls *Prime Numbers*. In *Dr. Pell's* Edition of *Brancker's Algebra*, there is a Table, as it's there called, of *Incomposite Numbers*, less than 100000; tho' it contains far more *Composite* than *Incomposite Numbers*: For it doth not only give an orderly Enumeration of all Odd Numbers which are not *Composite*; but it shews also that none of the rest are so. This Table being of very great use, I have here placed. It hath 21 Columns throughout; whereof the first contains 40 Odd Numbers in their natural Order. The following Columns are distinguished on their Tops, by their Numbers, in their natural Order; as 0, 1, 2, 3, &c. and so on to 99999. These Top Numbers are *Hundreds*; and the 40 Marginal Numbers are *Unites* adhering to those *Hundreds*. A Line running from any of the *Marginal*, as he calls them (or Numbers in the first Column) across the Page, shews in any intermediate Column, the Place of the Number made up of the Top Number and that *Marginal*. In every such place of Concourse, you shall either find the Letter *p*, or some Prime Number less than 317. If *p* be there, it shews the Number to be a Prime or *Incomposite*. The whole Table consists of 50 Pages, or so many several Tables, number'd: In some one of which, if any Number be less than 100000, and do end either in 1, 3, 7, or 9, you may find its Place; and then see whether it be a Prime or not. If it be not a Prime, but *Composite*, you will there find its least Divisor. Thus for instance, in Table I. where the Lin'd mark'd with the Marginal

Marginal 67, crosses the Column which hath 16 at the Top, there you find the Letter p, which shews you that 1667 is a Prime or *Incomposite* Number. But where that Line crosses the next Column, you find 3, which shews you that 1767 is not a Prime but *Composite* Number; and that 3 is its least Divisor. So also in Table XXV. you see that 49031, 49033, and 49037 are all Prime or *Incomposite* Numbers: But 49039 is a *Composite*, and 19 is its least Divisor.

It will oftentimes be of very great use to have, as you may have here, a compleat orderly Enumeration of all Prime or *Incomposite* Numbers between 0, and 100.000, without any mixture of *Composites*; as the p's in these Tables will give you, leaving out 9, 21, &c. and all other *Composites*. 'Tis true that 2 and 5 are *Incomposite* Numbers, as well as 1 and 3; but they are not put into the Tables, because no other *Incomposite* Numbers can terminate in them: For if any Number end in 12, it may be halved; if in 5, it may be divided by 5.

If to each of these Primes you set the *Briggian Logarithm*, you may find the Logarithm for all the rest of the Numbers in the first Hundred Chiliads, by addition of the Logarithms of their *Incomposite* Factors.

In perplex'd Questions in Algebra it is oftentimes necessary to be able to determine how many *aliquot Parts* and *Divisors* any proposed Quantity or Number may have, for which Purpose these Tables are of excellent use.

Every *Aliquot Part* of a Number is one of its just Divisors; but the *greatest Divisor* being equal to the whole Dividend, cannot be called a Part.

If you have the least Divisor of any Number in these Tables of *Incomposites*, you may find all its other *Incomposites* Co-efficients.

For if the Divisor end in 1 or 9, and have a black Stroke under it, in the Dividend's place in

the Tables; or if the Divisor end in 3 or 7, and have such a Stroke over it in the Dividend's place; then the Dividend is the *Square* of an *Incomposite*, and consequently the *Quotient* is given, being equal to the Divisor.

If the least Divisor hath no such Stroke by it, let it divide the Number proposed; so shall the *Quotient* be the *greatest Aliquot Part* of that Dividend. Then seek that *Quotient* it self also in the Tables; if you find it there marked with p, it is a Prime or *Incomposite*, and you can proceed no further; your Enquiry is at an end.

Thus the Number 53191 is found in Table XXVII. with its smallest Divisor 43; and being divided by that 43, the *Quotient* is 1237. And in Table I. finding 1237 to be a Prime Number, I proceed no further.

But had the Number been 93611, you will find in Table XLVII. that 7 is its least Divisor; and that the *Quotient* will be 13373. This stands in Table VII. with 43 for its least Divisor, and the *Quotient* will be 311; which in Table I. I find to be an *Incomposite*: I conclude therefore, that the prime Co-efficients of 93611 are 7, 43, and 311.

If you divide any Odd Number by all the Primes in order, beginning with 3: Then the first Divisor that finds a *Quotient* without Fraction, is the least Divisor that Dividend can have. If no such Divisor find an Integer *Quotient*, before the *Quotient* becomes less than the Divisor, you may pronounce your Dividend to be *Incomposite*; and that that last Divisor is greater than the *Square Root* also of the Dividend.

Frequent occasion of dividing by *Incomposites* requires a *Tariffa* of as many Primes as shall be needful; but for resolving of Numbers less than 100000, it sufficeth if it be extended to 313. And such an one you have at the Beginning of these Tables of *Incomposite* Numbers.

I N C O M-

INDEFEISIBLE, in our Law, signifies what cannot be defeated or made void: As a Good and Indefeisible Estate.

INDEMNITIES. When a Church is Appropriate to an Abbey or College, then the Arch-Deacon loseth his Induction Money for ever: In Recompence whereof he shall have yearly out of the Church so appropriate *One or Two Shillings*, more or less, for a Pension, as was agreed at the Time of the *Appropriating*. And this Pension is call'd an *Indemnity*.

INDIVISUM, in our Law, is used for that which two Persons hold in common, without Partition. *Kitchin*, fol. 241. in these Words; He holds *pro Indiviso*, &c.

INDORSEMENT, is any thing written on the Back of a Deed or Instrument; as a Condition, written on the Back of an Obligation, is commonly call'd an *Indorsement*.

INDUCTION. When a Clerk is Instituted into a Benefice, he is to exhibit his Mandate from the Bishop to the Arch-Deacon, or other Person to whom it is directed; and hath a Right thereby to be *Inducted* into his Living: And if he be refused *Induction*, he hath a Remedy both in the Ecclesiastical Court, and also an Action of the Case in the Common Law, against the Arch-Deacon. If the *Inductor*, or Person to be Inducted, be kept out of the Church or House by Lay-Men, the Writ *de Vi Laicâ* lies for the Clerk; which is directed out of the *Chancery* to the Sheriff of the County, to remove the Force, &c. If another Clergyman, presented by the same Patron, keep Possession, a *Spoliation* is grantable out of the Spiritual Court; whereby the Tithes, &c. shall be sequestred till the Right be determined.

The Arch-Deacon rarely Inducts a Clerk by himself in Person, but issues out a Warrant to all Clerks and Letter'd Persons within the Arch-Deaconry, empowering any of them to do it in his stead. The usual Form and Manner of *Induction* is, for the *Inductor* to take the Clerk by the Hand, and then to lay it on the Key of the Church, which must be then in the Door, and to say; *By Virtue of this Instrument, which is the Arch-Deacon's Warrant, I Induct you into the Real, Actual, and Corporal Possession of the Rectory or Vicarage of A. with all its Fruits, Profits, Members, and Appurtenances.* This done, he opens the Door, and puts the Clerk in Possession of the Church, and shuts the Door upon him; who, after he hath tolled a Bell (if there be any) comes out, and desires the *Inductor* to indorse a Certificate of his *Induction* on the Arch-Deacon's Warrant, and that all present will signify it under their Hands.

If the Church Key cannot be had, 'tis sufficient that the Clerk lay hold of the Ring of the Door, and within the time limited read the Common-Prayer and Thirty Nine Articles in the Church Porch. If there be no Church, he may lay his Hand on the Wall or Fence of the Church-Yard, &c. there being no necessity of Niceness as to the Form of *Induction*; only that he must have Witness that he was truly possess'd of it. Within two Months after this, the Clerk must read the Thirty Nine Articles, and all the Service of the Day both at Morning and Evening Prayers; and declare his Assent and Consent; and he must then also read the Bishop's *English Certificate*, in which is the Declaration of his Conformity; and of all this he must have two or three good Witnesses;

who must Sign that they heard him do it, and be ready to attest it *viva voce*, if required: And within three Months after *Induction* he must take also the Abjuration Oath at the Quarter-Sessions, or in some one of the Courts in *Westminster*.

INFANGETHEF, is a Liberty granted from the King to some Lords of Manors, to try all Thieves, which are their Tenants, within their own Courts.

INFERIOR Planets, are *Mercury* and *Venus*, so called, because they are next the Sun, the Centre of the Planetary System. An Account of their Motion and *Phænomena* to an Eye placed at the Earth is as follows.

1. The *Periodical Times* of their Motion thro' the *Ecliptic* are plainly equal; which is contrary to what appears in the Motion of the Superior Planets: And their Progress through the *Ecliptic* is measured by the Motion of the Sun; so that if the apparent Motions of the *Sun*, *Venus*, and *Mercury*, be considered for many Years together, they will appear to run through the *Zodiac* in an equal Space of Time.

The Reason of this Diversity between the Superior and Inferior Planets is not from any real *Difference* in their Motions, but arises solely from the different Position of this Earth which we inhabit.

All the Planets are circulated round the *Sun* in one and the same Ratio; the more distant requiring a longer time for their Revolution, than those which are more near. Thus the Earth being farther from the Sun than *Venus*, is a longer time in moving round him; and *Venus* than *Mercury*: And to an Eye placed in the Sun the Motions of the Inferior and Superior Planets would appear alike uniform and proportionable to their Distance. But to an Eye at the Earth, as the *Superiors*, containing our Orbit within theirs, will appear to move sometimes *slower*, and sometimes *swifter*; now to be *stationary*, and now *retrograde*; so the Motions of the *Inferiors* will appear to depend upon the Motion of the Sun, to whom they are so nearly joined as it were; and to us, that are in an Orbit so far without them, will appear to be equal to the Motion of that Great Luminary.

2. The *Sun*, *Venus* and *Mercury*, singly considered, are each affected with such an Inequality of Motion, that it is very rare for them all three, or indeed for any two of them, to agree in the same Degree of Velocity.

Indeed, if *Venus* and *Mercury* had no Motion of their own round the Sun, but kept an invariable Position with regard to him, it were reasonable to suppose, that they should move on almost equably, as the Sun doth. But since that *apparent Motion*, with which they annually run through the *Zodiac*, is derived from a double Fountain, *viz.* from their own proper Motion round the Sun, which is not very unequable in it self; and from the Position of the Earth, which is continually various and changeable, in an Orbit that is without theirs; 'tis not strange that each of the *Inferior Planets* should appear to move unequally, and to go sometimes slower, and sometimes faster, by turns.

3. Although the *Periodic Times* of *Venus* and *Mercury* in the *Ecliptic* through the Course of the Year are thus accurately equal to one another; yet the *Periodic Times* of *Venus*, if reckon'd

T t

from

from any one present Position to the Sun, to a like subsequent one, if compared with the Periodic Times of *Mercury* in a like Position, will appear to be of a much longer Length.

For this Inequality of the Periodic Times, according to the unequal Distance from the Sun, is agreeable to the established Law of the Heavenly Bodies: For *Venus* is nearer to the Sun than the Earth, and *Mercury* than *Venus*. Wherefore the Periodic Times of *Venus*, considered in themselves, and with regard to the fix'd Stars, are not a little shorter than those of the Earth; and those of *Mercury* shorter than the Periodic Times of *Venus*. And though these Motions should be considered by a Spectator at the Earth, he would find in them the same Inequality: For the Motion of *Mercury*

will be sooner, and oftner *more swift*, than that of the Earth; and therefore their Periodic Times must be unequal.

4. These Inferior Planets are never either in *Opposition* or in *Quadrature* to the Sun; but always more near to him, than to occasion those *Phænomena*: For *Mercury* goes no farther from the Sun than about 28 Degrees, and *Venus* not above 48 Degrees; sometimes to the Eastward, and sometimes to the Westward. That neither of these Planets can come to be in *Quadrature*, much less in *Opposition* to the Sun, will be plain from the following Scheme.

Let the Circle *BFCE* be the Earth's Annual Orbit; *ADGH* the Orbit of *Venus*; and *NMK*

that of *Mercury*. The greatest Elongation of *Venus* from the Sun is determined by the Acute Angle LBA , made by the Line BL drawn from the Sun to the Earth, and the Line BA , which is a Tangent, to the Orbit of *Venus*. In like manner the Acute Angle LBN will determine the greatest Elongation of *Mercury* from the Sun. Now the Quantity of these Angles, in a Proportion assign'd, may be had from the Semidiameters of the Orbits being found by Observation, and by Trigonometrical Calculation: Or, indeed, they will be discovered by Observation of the greatest Elongations themselves.

5. Our Modern Astronomers have observ'd, That *Venus* appears *bigger* when she begins to recede from the Sun towards the East, and when she is yet but a little distance from him; but, on the contrary, that she appears *less* in her Approach towards the Sun, and when she comes pretty near him: Whereas, when she recedes from the Sun towards the West, then she appears *less*; but when she approaches towards him again, she again appears larger. And the same things have

been observed of *Mercury*, by the use of long and good Telescopes.

These *Phænomena* have quite overturn'd the *Ptolemaic System* of the Heavens, and may be accounted for thus: Since all the Planets, as well as the Earth, are Opaque, Scabrous, and Spherical Bodies, reflecting every way from them the Rays of the Sun falling upon them; 'tis plain, that that Hemisphere of any Planet only, which is turned towards the Sun, will be enlightened; the other Half of it remaining in Darkness. And, since also an Observer here can only see that Half or Hemisphere of any Planet, which is obverted, or turned towards the Earth, where he stands; if it be considered *what Part* of *Venus* is enlighten'd by the Sun in her different Position or Situation towards him, and *what Part* is seen by an Eye at the Earth in its Annual Orbit *BFCE*; (See the preceding Fig.) it will be plain that *Venus* must appear *least* to us when she is in *R*; because, tho' she be then the most near to us possible, yet her obscure Hemisphere being towards us, there will be but very little of her enlighten'd part seen: But when she comes into the Position *D*, then

then some part of her illuminated Disk will be turned towards the Eye in *B*; but a much greater part of her obscure or dark Hemisphere. And since she is of a Spherical Figure, which to a distant Eye appears as a Plane, 'tis clear that the illuminated part of her Disk must appear in the form of Horns, turned from the Sun, or towards the West. And this is her Appearance when *Venus* is our *Morning-Star*, as she is commonly called. But this Planet moving on in her Orbit to *G*, very near one half of her illuminated Disk will become visible to the Eye at *B*; and, consequently, she will then appear in the form of an Half-Moon. When she comes into the Position *O*, more than half of her enlighten'd Hemisphere will be visible, and so she will appear *Gibbose*: And when she arrives at that part of her Orbit which *P* designs, to an Eye at *B*, as before, she will appear, as we say of the Moon, at *Full*; that is, all her illuminated Disk will be visible. The same kinds of *Phases Venus* will put on, as she moves forward in her Orbit through *Q*, *H*, *A*; that is, in *Q* she will be *Gibbose*; in *H* like an Half-Moon; in *A* horned again; but her Horns will be turned a contrary way to what they were in *D*; that is, now to the Eastward, but still from the Sun: And this is her Appearance when she is the *Evening-Star*.

The same kinds of *Phænomena* belong to *Mercury*; respect being had to his particular Orbit and Period of his Revolution.

But here we must take care that we be not deceived by the general Consideration of her *Phases* only, so as to think that *Venus* will always appear brightest and largest in *P*, or in *Q* or *O*. The Appearance which *Venus* may seem to have in her *Opposition*, as it may be called in *P*, will be quite altered by her coming as near as she can to the Sun: And as to the Places *O* and *Q*, tho' *Venus* will shine with near a full Face; yet she will be then so far from the Earth, that her *Distance* from us will more than compensate for the Quantity of her Light: Wherefore you may expect to see her appear most bright and splendid when she is in *D* or *A*. For suppose her to move from *Q* to *H*; then will some part of her lucid Hemisphere be turned from us in *B*, and so cannot be seen; and yet the remaining luminous part comes still nearer to the Earth: And since her *Shining*, or apparent Light, increases in a Duplicate Ratio, or as the Square of her Distance from us diminishes, her Light will be much more increased by her Approach to the Earth, than it will be lessened by our seeing less of her illuminated Disk. So also suppose her to move from *H* to *A*, or yet farther on; here still the Quantity of her illuminated part decreases, but the duplicate Increase of her Approach to the Earth will yet make her Splendour increase. But between *A* and *R*, the Decrease of her visible Light will be greater than what her Access towards the Earth can compensate; and so her Light will continually diminish more and more, till she will set *Heliacally*, and so become invisible. Thus also while the Planet is moving from *P* towards *Q*, her Approach towards the Earth in *B* is inconsiderable, in comparison of the Parts of her illuminated Disk, which will be turned away from us; and, consequently, she will appear more obscurely in *Q* than she will in *P*: But between *Q* and *H*, and so towards *A*, her Approach to the Earth will

Vol. II.

very much increase her Splendor, tho' less and less of her lucid Disk become still visible. And from the whole it is plain, that while she is moving in the Arch *HA*, she will appear brightest and largest.

6. The greatest Elongations of *Venus*, whether towards the East or West, are unequal, and must be express'd by an unequal Number of Degrees. And the same thing is also true of *Mercury*.

This *Phænomenon* hath a double Original or Cause; for it depends on the Excentricity of the Orbits both of *Venus* and of the Earth. For if the Distance *LA* (in the former Fig.) of *Venus* from the Sun; or if *LB*, the Distance of the Earth from the Sun, be unequal; it cannot be, but that the Angle *LBA*, in the Triangle *LBA*, which is called the greatest Elongation, must also be unequal: And indeed both those Lines are subject to such an Inequality.

7. The same *Directions*, *Stations*, and *Retrogradations*, which we observe in the Course of the Superior Planets, are found to belong to these Inferiors; and with the same Circumstances of Change.

For suppose the Earth, as before, in *B*, and immoveable there, and the Planet in *P*; 'tis then plain, that while the Planet moves Easterly from *P* to *Q*, to an Eye placed in *B*, it must appear *Direct*, or to move in *Consequentia*, as they speak; that is, according to the Order of the Signs: And so it will appear to do till it come to *A*. But yet, because the Arches *Pβ*, *βγ*, *δε*, *εζ*, are equal; but the Angles that they subtend at *B*, are unequal; therefore the Planet will appear to move unequally through those Arches: For it will seem to move swiftest about *P*, and still slower and slower, the nearer it comes to *A*: And there it will begin to appear *Stationary*, or not to move at all: And while it runs over the Arch *AR*, it will meet with the former Lines *Bζ*, *Be*, *Bδ*, *Bγ*, and therefore must appear to be *Retrograde*, or to move backward, or in *Antecedentia*, as the Term is; that is, contrary to the Order of the Signs. Which apparent *Retrograde Motion* will continue till the Planet come to *D*; and then it will begin to be, or rather appear to be, *Stationary* again; and so on, as before.

And should you suppose the Earth, as it is, moving in the Orbit *BFC E*; when the Planet moves faster than the Earth, it will even then appear to be *Direct*; when at an equal Pace with it, *Stationary*; and when slower than it, it will appear *Retrograde*, as before; tho' the Times and Places of these *Directions*, *Stations*, and *Retrogradations* will not be the same, as if the Earth indeed stood still: As will be easily understood by a little Consideration of the Figure above; or by what is said on this Head under the Words *Superior Planets* in this Vol. II.

8. The Planes of the Orbits of the Inferior Planets being inclined to that of the Ecliptick, the same *Phænomena* will arise from thence in kind, as in the same Case of the Superiors; only it is worth taking notice of, that the Plane of the Orbit of *Mercury* making an Angle with that of the Ecliptick of very near 7 Degrees, he hath the greatest Latitude of any of the Planets; and therefore

fore will be subject to the greatest Anomalies of Latitude.

9. It is sometimes, but rarely, observ'd of these two Inferior Planets, That their Bodies being interposed between us and the Sun, they appear like *Spots* in the Plane of his Disk.

And 'tis plain, that this will happen whenever their Conjunction with the Sun falls on, or near either of the Nodes of their Orbits: Just as the Moon appears to eclipse or hide part of the Sun's Face, when her Conjunction happens in or near the Nodes of her Orbit.

INFINITELY Infinite Fractions. In *Phil. Collect.* N. 3. Dr. Rihood proves that *Ininitely Infinite Fractions*, or all the Powers of Fractions, whose Numerator is 1, are all of them together equal to Unity, or to an Unite.

The Demonstration is Short and Universal.

And from hence he deduces, by way of *Corollary*, that there are not only *Infinite Progressions*, or *Progressions in Infinitum*; but also, infinitely further than one kind of Infinity. That these *Ininitely Infinite Progressions* are notwithstanding computable and aggregable into one Sum; and that not only into a *Finite Sum*, but into one so small, as to be less than any assignable Number. That of Infinite Quantities, some are equal, others unequal: That one Infinite Quantity may be equal to two, three, or more Quantities, whether Infinite or Finite.

INFINITE Series. In Vol. I. I have shewn that this Method of *Infinite Series* took its Rise from the Arithmetick of Infinites, and hath been pursued with wonderful Sagacity and Penetration by several of our Excellent Modern Algebraists. The Use of this Method in the Extraction of Roots I have, in some measure, shewn in the former Volume, from the Ingenious Mr. Ralphson and Mr. Ward: What here follows is more Universal; and is from Parsons's and Wallis's Arithmetick.

Let $\begin{cases} A = \text{to the Absolute Numb. in any Equation.} \\ n = \text{to the Exponent of the highest Power.} \\ x = \text{to Root or Quantity sought.} \\ N = \text{any known Number taken at pleasure.} \\ n = \text{an unknown Number.} \\ i, p, q, r, s, \&c. = \text{to the respective Coefficients of the given Equation.} \end{cases}$

Then will $N + n = x$; and

$\pm 1 \times x^n \pm p \times x^{n-1} \pm q \times x^{n-2} \pm r \times x^{n-3} \pm, \&c. = A$, represent any Equation whatsoever.

And because $N + n$ is supposed equal to x , such a General Equation may be thus expressed:

$\pm 1 \times (N + n)^n \pm p \times (N + n)^{n-1} \pm q \times (N + n)^{n-2} \pm r \times (N + n)^{n-3} \pm, \&c. = A$.

$$n = \frac{A \pm 1 \times N^n \pm p \times N^{n-1} \pm q \times N^{n-2} \pm r \times N^{n-3} \pm, \&c.}{1 \times N^{n-1} \pm p \times N^{n-2} \pm q \times N^{n-3} \pm r \times N^{n-4} \pm, \&c.}$$

But to bring this into a *Series*, it is necessary first to prove, That every Power raised from a Binomial, (without regarding the Co-efficients) consists, or is composed of two Ranks or *Series* of Powers; one increasing from n^{n-n} , or 1, to n^n , and the other decreasing from N^n to N^{n-n} or 1; and each Member in one is multiplied into its corresponding Member in the other respectively; as may appear thus:

$$N + n^2 = \begin{Bmatrix} NN \\ 2 Nn \\ nn \end{Bmatrix} = \begin{Bmatrix} N^n \times n^{n-n} \text{ or } 1. \\ N^{n-1} \times n^{n-1} \text{ twice} \\ N^{n-n} \times n^n \end{Bmatrix}$$

Again,

$$N + n^3 = \begin{Bmatrix} NNN \\ 3 NNN \\ 3 Nnn \\ nnn \end{Bmatrix} = \begin{Bmatrix} N^n \times n^{n-n} \\ N^{n-2} \times n^{n-2} \\ N^{n-2} \times n^{n-1} \\ N^{n-n} \times n^n \end{Bmatrix} \text{ thrice}$$

And so it will always be *ad Infinitum*. Q. E. D. Hence these two *Corollaries*.

COROLLARY I.

That the Co-efficient of the second Term in any Power raised from a *Binomial*, is always $= n$ the Exponent of the highest Power.

COROLLARY II.

That the Root or Side of n^n the unknown Quantity is always multiplied into the second Term of the known.

Now from the *latter*, it is evident we are (in this Case) but to make use of the two first Members of the Power of such *Binomial*; and by the first we may express the Co-efficient of the second Term, by n the Exponent of the Power: Therefore the former Equation will now stand thus;

$$\pm 1 \times N^n \pm n N^{n-1} \pm p \times N^{n-1} \pm, \&c. = A$$

$$N \pm q \times N^{n-2} \pm, \&c. = A$$

$$N^{n-3} \pm, \&c. = A$$

Now to find the Value of n , or the unknown Quantity, it is plain, that those Members into which it is multiplied, will be the Divisor with the same Signs, and the others the Dividend, but with contrary Signs, as being to be transpos'd to the other side of the Equation: Therefore first,

Which

Which Theorem exhibits all possible particular ones, for extracting of Roots, according to the first sort of Mr. *Ralphson's*; agreeing exactly with them, as will be found on Tryal; always remembering that the Signs in the Dividend must be

contrary to those in the Equation, and in the Divisor the same respectively.

But $N + n = x$: Therefore secondly,

$$x = \frac{A \pm 1 \times N^{n-1} \pm p \times N^{n-2} \pm q \times N^{n-3} \pm r \times N^{n-4}, \&c.}{1 \times N^{n-1} \pm p \times N^{n-2} \pm q \times N^{n-3} \pm r \times N^{n-4}, \&c.}$$

Which gives us all those of the *second sort* universally: But in this Case the Signs both in the Dividend and Divisor will be the same as in the given Equation respectively: As likewise it may be proper to take notice, that if any Term be wanting in the Equation, the same must be omitted in either Theorem respectively.

Now from either of these *two Generals*, to deduce any *particular Theorem*, for finding the Root of any given Equation; we need only consider,

that $N^{n-n} = 1$, or $\frac{N^n}{N^n} = 1$, that Unity will

neither multiply nor divide; as also that $N^{n-n} = 0$, or $N^n - N^n = 0$, and any Quantity,

multiply'd into 0, is = 0; and when either Case happens (which always will, except where the last Term is wanting) the Theorem is determined.

Therefore,

Suppose any Equation, as

By the first General Theorem,

By the second General Theor.

$x^2 = A$ $x^3 = A.$ $x^4 = A.$ $x^2 \pm p x = A$ $-x^2 \pm p x = A$ $x^4 \pm p x^3 = A$ $x^3 \pm p x^2 \pm q x = A, \&c.$	Then we shall find $n =$	$\begin{array}{r} A - N^2 \\ \hline 2 N \\ A - N^3 \\ \hline 3 N^2 \\ A - N^4 \\ \hline 4 N^3 \\ A - N^2 \pm p N \\ \hline 2 N \pm p \\ A + N^2 - p N \\ \hline -2 N + p \\ A - N^4 \pm p N^3 \\ \hline 4 N^3 \pm 3 p N^2 \\ A - N^3 \pm p N^2 \pm q N \\ \hline 3 N^2 \pm 2 p N \pm q \end{array}$	$\times$ $\parallel$	$\begin{array}{r} A + N^2 \\ \hline 2 N \\ A + 2 N^3 \\ \hline 3 N^2 \\ A + 3 N^4 \\ \hline 4 N^3 \\ A + N^2 \\ \hline 2 N \pm p \\ A - N^2 \\ \hline -2 N + p \\ A + 3 N^4 \pm 2 p N^3 \\ \hline 4 N^3 \pm 3 p N^2 \\ A + 2 N^3 \pm p N^2 \\ \hline 3 N^2 \pm 2 p N \pm q \end{array}$
--	--------------------------	---	-------------------------	---

And after the same manner for any Equation whatsoever.

Thus having the particular Theorem, the Application in either Case is as follows:

Let N be any Number taken at Pleasure, as before.

T be = Theorem, in which N must always be of its last Value found.

Then the Process will be of the

First General Theorem.

Second General Theorem.

N the 1st. $\pm T = N$ the 2d. Then
 N the 2d. $\pm T = N$ the 3d. Then
 N the 3d. $\pm T = N$ the 4th. Then
 N the 4th. $\pm T = N$ the 5th, &c.

$T = N$ the 2d. Then
 $T = N$ the 3d. Then
 $T = N$ the 4th. Then
 $T = N$ the 5th, &c.

Some of which Values of N will terminate in the true Root sought, if it have one: But if it be a Surd; then the Value of N will proceed into an Infinite Series, but may be prosecuted nearer the Truth than any assignable: Which Series, each Operation, will proceed in Number of Places, in a Geometrical Progression; whose first Term is

1, and Ratio = 2, viz. First 1, then 2, then 4, then 8, then 16, then 32, &c. Places.

It is likewise observable, That the first General Theorem converges, by finding out a Number to be added to, or subtracted from the last Value of N , (as it shall be affected with $+$ or $-$) until $N = x$ sought. So the last converges by N itself,

self, whose Value, at each Operation, shall grow nearer and nearer, until it be $=$ to x sought.

We may also take notice, that though N be assumed never so far from the true Root, yet it will converge to it by renewing the Operation. But the Work may be much shortened, in case we point the given Equation (if it will admit of it) both in the *absolute Number* and *Coefficients*, according to their respective Degrees of *Adfection*: And take first 1, then 2, then 4, &c. of those *Points*, (from the first) each Operation: For it is evident, the Coefficients increase in their Powers, as the highest unknown Term decreases; therefore the *absolute Number* is of the same Power with the highest unknown *Quantity*.

One Instance may be sufficient to explain it: Suppose therefore this *Cubic Equation* were to be pointed;

$$\text{Viz. } xxx + 25xx + 836x = 53297 \\ \text{Or } xxx + pxx + qx = A.$$

Then it would be $xxx + 25xx + 836x = 53297$
For the *absolute Numb.* is a Cube
Co-efficients q a Square } and are pointed
 p a Lateral } accordingly.

And the like Method for any other Equation, where it will admit of it.

Now to apply this last, we are to take
the First Operation $xxx + 2xx + 8x = 53$
Second Operation $xxx + 25xx + 836x = 53297$

And consequently the Value of the Coefficients as well as the *absolute Number* alters, so long as there are *Punctations*.

But by a few *Numerical Operations*, the said Notification, as well as the *Method* of the Process of each *Theorem*, will be further illustrated: Therefore,

1. Suppose $xx = 2 = A$. Seek x by the first General Theorem.

$$\text{Then } n = \frac{A - A^2}{2N} = T, \text{ and take } N = 1;$$

Therefore $1 + T(=, 5) = 1,5 = N$ the 2d.
 $\therefore 1,5 - T(=, 083) = 1,417 = N$ the 3d.
 $\therefore 1,417 - T(=, 002783) = 1,414217 = N$ the 4th.
 $\therefore 1,414217 - T(=, 000003437622) = 1,414213562378 = N$ the 5th $= x$.

2. Suppose $xx = 2 = A$. Seek x by the second General Theorem.

$$\text{Then } x = \frac{A + N^2}{2N} = T, \text{ and take } N = 1, \text{ as before.}$$

Therefore $T = 1,5 = N$ the 2d.
 $\therefore T = 1,416 = N$ the 3d.
 $\therefore T = 1,414215 = N$ the 4th.
 $\therefore T = 1,414213562373 = N$ the 5th $= x$.

By which it is evident; First, That both Theorems amount to the same thing; the Difference

being only in the last Figure, which would be corrected the next Operation. Secondly, That x will proceed into an *infinite Series*, if a *Surd*. Thirdly, That each Operation gives double the Number of Figures of the last.

3. Suppose $xxxx = 2839,8241 = A$. Seek x by Theorem 1.

$$\text{Then } n = \frac{A - N^4}{3N^3} = T, \text{ and take } N = 10.$$

Therefore $10 - T(=, 3) = 7 = N$ the 2d.
 $\therefore 7 + T(=, 4) = 7,4 = N$ the 3d.
 $\therefore 7 - T(=, 1) = 7,3 = x$, the true Biquadratic Root sought.

4. Suppose $xxxx = 2839,8241 = A$, as before. Seek x by the second Theorem.

$$\text{Then } x = \frac{A + 3N^4}{4N^3} = T, \text{ and take } N = 5.$$

Therefore $T = 5,6 = N$ the 2d.
 $\therefore T = 8,2 = N$ the 3d.
 $\therefore T = 7,4 = N$ the 4th.
 $\therefore T = 7,3 = N$ the 5th $= x =$ true Root sought.

From which two last Examples it appears; First, That either Theorem will find the true Root, if it have one. Secondly, That it matters not, whether N be taken above or below the Root, nor how far from it.

5. Suppose $xx + 587x = 987459$ or $xx + px = A$. Seek x by Theor. 1. (i. e.) $n = \frac{A - N^2 - pN}{2N + p} = T$.

Because of the Punctations we are to take,

1. Operation $xx + 5x = 98$
2. $xx + 58x = 9874$
3. $xx + 587x = 987459$ } And suppose $N = 8$.

Therefore $8 - T(=, 2) = 78 = N$ the 2d.
 $\therefore 78 - T(=, 3,4) = 746 = N$ the 3d.
 $\therefore 746 - T(=, 3,34) = 742,66 = N$ the 4th.
 $\therefore 742,66 - T(=, 012689) = 742,647311 = x$ sought.

6. Suppose $xx - 20x = 53482$, or $xx - px = A$. Seek x by the second General Theorem.

$$\text{Then } x = \frac{A + N^2}{2N - p} = T, \text{ and take } N = 250.$$

Therefore $T = 241 = N$ the 2d.
 $\therefore T = 241,4 = N$ the 3d.
 $\therefore T = 241,475 = N$ the 4th.
 $\therefore T = 241,477860 = N$ the 5th $= x$ sought.

From these two last it is plain; First, That there is no absolute Necessity for Punctation. Secondly, That Punctation does nevertheless shorten the Work, where it can be done.

But

But I hope I have said enough to make the whole Matter, as well as the Manner, of Proceeding plain and easy to the meanest Capacity: And tho' I have given Numerical Examples no farther than an *affected Quadratic*, yet 'tis the same to any *Degree* of Power or Affection whatsoever; regard being had to its proper and particular Theorem, deduc'd from either of the general ones.

INFINITESIMALS, (as some Writers call them) are such Quantities as are supposed to be infinitely small.

INFLECTION.

INFLEXION of the Rays of Light. Sir Isaac Newton, in his Excellent *Opticks*, Book 3. makes these Experiments and Observations on this surprising Phenomenon.

1. That in a well darken'd Room, a Hole, whose Diameter was $\frac{1}{2}$ of an Inch, being made with a Pin in a Plate of Lead, to let in the Sun's Rays; he found that the Shadows of Hairs, Threads, Pins, Straws, &c. placed in that Beam of Light, were very considerably broader than they ought to be, if the Rays of Light had passed on by those Bodies in Right Lines: And for Instance, that the Hair of a Man's Head, whose Breadth was about the 280th part of an Inch, did, at the distance of 12 Foot from the Hole, and 4 Inches from the Hair, cast a Shadow which was a 60th part of an Inch broad, or four times its own Breadth; at 2 Foot from the Hair, the Shadow was ten times as broad as the Hair; and at the distance of 10 Foot, it was 35 times as broad. And he found, that it was not material, whether the Hair was encompassed with Air, or with any other pellucid Substance: For if the Hair were placed between polished Glasses, with Water between them, the Shadows were all one; as were also the Shadows of Scratches made on the Surface of polished Plates of Glass, and of the Veins of such Glasses: And therefore the great Breadth of these Shadows must arise from some other Cause than the Refraction of the Air. It is plain also from this Experiment, that the Rays are bent, and turned aside, in passing by the Hair, &c. and that the Hair acts on the Rays of Light at a good distance as they pass by it. And he shews, that the Action is strongest on the Rays which pass by at the least Distances, and grows weaker as the Rays are further from it.

2. He observed that the Shadows of all Bodies in this Light were border'd with 3 parallel Fringes of colour'd Light; whereof that next the Shadow was luminous. It was difficult to distinguish the Colours, unless the Light pass'd very obliquely on a white Paper, and then they exhibited Colours in this Order from the Shadows, viz. Violet, Indico, Pale-blue; Green, Yellow, Red; Blue, Yellow, Red; Pale-blue, Pale-yellow, Pale-red.

3. He took accurately the Measures of these Fringes, which he there gives in a Table.

And in the 4th Observation he shews, That the Breadth of the Fringes (when cast obliquely on a smooth white Body) seem'd to be in the Progression of the Numbers, $1 \sqrt{1}, \sqrt{2}, \sqrt{3}$; and their Intervals in the same Proportion with them; i. e. the Fringes and their Intervals together to be in the continued Progression of $1, \sqrt{\frac{1}{2}}, \sqrt{2}, \sqrt{3}$, or thereabouts.

5. The Sun shining into a darkened Room thro' a Hole $\frac{1}{2}$ of an Inch broad, at 2 or 3 Foot from it, he placed a Sheet of Pastboard, black'd well all over; and which had in the middle a Hole about $\frac{1}{2}$ of an Inch square for the Light to pass through. Behind the Hole, on the Pastboard, he fastned with Pitch the Blade of a sharp Knife, to intercept some part of the Light which passed through the Hole. Both Pastboard and Knife were placed perpendicular to the Rays of Light. Then placing the Pastboard so that all the Light fell upon the Hole in it, and part of it on the Blade of the Knife there placed, while the other Part went by the Edge; he let that part which passed by, fall on a white Paper, 2 or 3 Foot beyond the Knife; and there saw 2 Streams of faint Light shoot out both ways from the Beam of Light into the Shadows, like the Tails of Comets. Their whole Length, measured upon the Paper at the distance of 3 Foot from the Knife, was about 6 or 8 Inches; so that they subtended an Angle at the Edge of a Knife of about 12 Degrees.

6. He placed another by the former; so that their Edges were parallel and look'd towards one another; so that a Beam of Light might fall on both, and some of it pass through between them. And when the Distance between their Edges was about the 400th part of an Inch in breadth, the Stream of Light that passed through parted in the Middle, and left a Shadow between the two Parts: And this Shadow was so black and dark, that all the Light which passed between the Knives, seem'd to be bent and turned aside to the one hand or the other. As the Knives approach'd, the Shadow between the Streams of Light grew still broader; till at last, on their Contact, the whole Light vanished. Hence I gather (saith he) that the Light which is left bent, and goes to the inner Ends of the Streams, passes by the Edges of the Knives at the greatest distance: And this Distance, when the Shadow begins to appear between the Streams, is about the 800th part of an Inch: And the Light, which passes by the Edges at less Distances, is more bent, and goes to those Streams which are further from the direct Light.

7. The Fringes above mentioned also appear'd in this Experiment. And he gathers from this and the former Observation, that the Light of the first Fringe passed by the Edge of its Knife at a Distance greater than the 800th part of an Inch; and the Light of the two or three Fringes at still greater Distances; and consequently, that the Rays, which caused the Streams of Light, passed nearer to the Knives Edges than any other.

8. Two Knives, whose Edges were ground truly strait, were placed so (by sticking their Points into a Board, with their Edges towards one another) as to make an Angle of above $1^{\circ} 54'$. Here thro' a Hole, the 42d part of an Inch wide, the Beam of Light was let into the dark Room; which made the Fringe appear, at the distance of 10 or 15 Foot from the Hole, and on a Ruler held obliquely, at the distance of half an Inch from the Knives, parallel to the Edges of the Shadows, and without growing sensibly broader till they met in Angles equal to that made by the Edges

Edges of the Knives, where they met and join'd without crossing. But when the Ruler was plac'd at a much greater distance, the Fringes grew broader as they approached, and after meeting cross'd one another, and then grew yet much broader.

9. From hence he concludes, That the Distances at which the Fringes pass by the Knives are not increased nor altered by the Approach of the Knives; but that the Angles, in which the Rays are there bent, are much increased by that Approach: And also, that the Edge of the Knife, which is nearest any Ray, determines which way the Ray shall be bent, and the other Knife increases the Flexure. In observing,

10. He found, that when the Fringes of the Shadows of the Knives fell perpendicularly on a Paper at a great distance from the Knives, they were in the form of *Hyperbola's*.

11. When he placed a Prism at the Hole (made with a small Pin) to refract the Light, he found that the Shadows of all Bodies held in the colour'd Light between the Prism and the Wall were bordered with Fringes of the Colour of that Light only in which they were held: And also, that the Fringes in the Red Light were largest, and those in the Violet, least. Wherefore, the Rays, which made these Fringes in the Red Light, pass'd by the Hair at a greater distance, than those which made the like Fringes in the Violet: And consequently the Hair, in causing these Fringes, acts alike on the Red Light, or least refrangible Rays, at a greater distance; and on the Violet, or most refrangible Rays, at a less distance; and by these Actions disposed the Red Light into larger, and the Violet into smaller, and the Lights of intermediate Colours into Fringes of intermediate Bignesses, without changing the Colour of any sort of Light. When therefore the Hair, in the first and second Observation, being held in the common white Light of the Sun, cast a Shadow border'd with three Fringes of colour'd Light; those Colours ('tis plain) did not arise from any new Modifications impress'd on the Rays of Light by the Hair, but only from the various Inflections, whereby the several sorts of Rays were separated from one another; which before Separation, by the Mixture of their Colours, compos'd the White Beam of the Sun's Light; but, whenever separated, compose Lights of the several Colours which they are originally disposed to exhibit. And this mightily confirms his Doctrine and Theory of Colours, as indeed all kinds of Experiments and Considerations do. See Colours.

These wonderful Properties of the Inflection of the Rays of Light are caused by a Body acting at a distance on the Rays; and yet this Action of Inflection is the stronger, the less such distance is: So that perhaps the Attraction which causes it don't exert its Sphere of Activity beyond such a distance. The Rays of Light also themselves, as they differ in Refrangibility, are diversly inflected, and separated into those three Fringes of Colours mention'd by Sir Is. Newton in his excellent *Opticks*, Lib. 3. and before observed by Grimaldus to arise from any small Bodies, such as Hairs, Wires, &c. placed in the Sun's Rays, let into a well darkned Room, by a very small Hole,

†

made only by the Point of a Needle in a Plate of Metal. And these *Fimbrie*, or colour'd Fringes, seem to be made by a kind of undulatory Motion or Inflection of the Rays, as they come near the Extremities of Bodies, the three different Colours of the Fringes arising from three such different Inflections.

INGENUITAS *Regni*, was formerly used to signify the Freeholders, or Commonalty of the Kingdom, which were called *Ingenii*, *Liberi*, and *Legales Homines*: But the Word was not restrained only to *Plebeians*; since in the Reign of Hen. I. it was given to the Chief Barons.

INGENUOUS, in the Civil Law Sense, is one that was born of a Woman that was made Free any time after his Conception, and before his Birth.

IN *Grosse*, is a Term in Law for what belongs to the Person of any Lord, and not to the Manor, Lands, &c. as a *Villain in Grosse*, an *Advowson in Grosse*, &c.

INHOC, the same antiently with what is now in the North called an *Intock*; and in *Oxfordshire*, a *Hitchin*, or *Hitching*; being an Out-part or Corner of some common Field plow'd up and sow'd (usually with Oats or Tares) and sometimes fenced off with a dry Foot Hedge, and within that Year in which the rest of the Field lies fallow. It seems to be derived from *in*, within, and *Hoke*, a Corner.

INLAND, is an old Word found in *Doomsday* and other old Books, and signified that Part of any Land or Manor which lay next to the Mansion-House, and which was used by the Lord himself; whence it was called *Terra Dominicalis*, *Demesnes*, in opposition to *Utland* or *Outland*, which was in Tenancy. These *Inlands* the Feudists call *Terras Curtas*, ac *intra Curtem*, Court Lands, or such as were appropriated to the Court or House of the Lord. So

INLANTAL, *Inland* or *Demesne*, was opposed to *Delantal*, or *Out-land*, or *Land-Tenanted*.

INMATES, are such Persons as are admitted (for their Money) to live in the same House with, and which go in at the same Door, jointly with others to whom the House belongeth; and which are not able also to maintain themselves. These are inquirable in a *Court-Leet*. See *Kitchin*, Fol. 45.

INNATE IDEAS. Taking the Word *Idea* in the largest and most extensive Sense (see *Ideas* in Vol. II.) for whatsoever is the Object of our Understanding when we think; whether it be *Phantasm*, *Notion*, *Species*, &c. or whatever it is, that the Mind can be employ'd about in Thinking.

The excellent Mr. Locke, in his most useful *Essay on Human Understanding*, hath plainly proved there are not any such things as *Innate Ideas* or *Principles*: Tho' some Writers will needs have such primary Notions, as have been called *νοηματα εὐνοηματα*, to be as it were Characters stamp'd on the Mind of Man, which the Soul receives in its very first Being, and brings into the World with it.

That which hath led Men into this Mistake, seems to have been, First, a Notion of the mighty Advantage of such *Innate Ideas* for the due Direction and Regulation of the Human Mind; and therefore 'tis reasonable to suppose our Gracious

cious Creator should have furnished the Nascent Mind with them: And, secondly, that there are many Truths to which we pay so early and speedy an Assent, that they seem to be Innate, and interwoven as it were in our very Natures, and stamp and impress'd originally on our Minds.

To the former 'tis easy to answer; That, if the same Advantages will accrue to the Human Mind, from having a Power given it by God, by Study and Thought easily to gain such Notion or Principles; there is then no need of supposing them *Innate*: And if this Power can and doth exert it self early and easily, and enables us to assent to the Truth of such *useful Notions and Principles*, as soon as ever the Terms expressing them are understood, 'tis much more easy and natural to suppose the Power of obtaining them *innate*, than the Propositions and Notions themselves. Our Author might have thought it enough to Refute this Doctrine; by shewing (as he admirably and clearly doth) how we may attain to all the Knowledge we have, barely by the use of our natural Faculties, and without the help of any *innate Impressions*: For it seems as unreasonable to attribute *Truths* to be owing to the Impressions of Nature and *innate Characters*, which we find we can gain by the Exercise of our Faculties; as to suppose those *Colours* to be *innate* in our Eyes; which on opening our Eyelids will be painted there from external Objects, by the Operation and Action of Light.

But because some prejudicate Notions have long prevail'd *per contra*, and which one can hardly oppose without Censure; he gives us the Reasons at large, that made him doubt of the Truth of that received Opinion; which are in short such as these.

That should they argue that there are certain Principles both *speculative* and *practical*, which are universally agreed on by all Mankind: This doth not prove them *innate*, were it true in Fact, if another way can be assign'd how Men may come to such an universal Agreement in the things they consent to.

But indeed there are none such, to which all Mankind give an universal Consent. If you take the *Speculative Principles* into view; such as, *Whatsoever is, is*: 'Tis impossible any thing should be and not be at the same time, &c. Though these have a settled Reputation as *Maxims*; and deservedly; yet are they so far from having an universal Assent from Mankind, that a great Part of it doth not so much as *know* them: As all Children and Idiots, and indeed every one that is not used to *internal Reflexion*, and *abstracted Reasonings*. But these have Souls; and these Souls have these Impressions, it seems, stamp upon them; only the Stamp cannot be seen; the Impression is *there*, but 'tis *invisible*; the *Notion* is there, but they don't know it; the *Proposition* is there, but the Mind is *ignorant* of its Truth! 'Tis plain therefore, 'tis *there to no purpose*: Wherefore, he that hath a right Notion of the Wisdom of GOD, will conclude it is not there at all.

If it be said, *These innate Principles lie dormant and invisible there, till the Soul comes to the use of Reason*; 'tis plain they were there before to no purpose: And if it be fully made appear, that the Exercise of our Reasoning Faculty will help us to them another way; 'tis highly probable they are never so *impressed*, and *innate*, at all.

And if our reasoning Faculties, assenting to the Truth of these Principles, as soon as we understand the Words they are express'd in, be an Argument that they are *innate*; it will prove too much: For it will conclude all other Propositions to be so too; which we consent to as soon as we understand the Terms: Such as *two and two make four*, &c. *A Square is not a Circle*; *Redness is not Sweetness*, &c. and ten thousand such others, to whose Truth the Mind, at first proposing, assents.

Besides, no Proposition can be *innate*, unless their Terms are *innate*; or those Ideas which those Terms express. And as no one ever said that Words and Terms are *innate*; so in the whole Course of his Book Mr. Lock shews, how and after what manner both Simple, Compound, and Abstract Ideas come into the Mind: And he shews, that the Notion of Principles being *innate*, came probably from hence: That there being a abundance of plain and obvious Truths, to which the Mind pays a ready Assent as soon as the Terms that express them are understood, it was a much easier and shorter way for Men to suppose them *innate* there, than to trouble themselves about the Way and Manner of their coming into the Mind from without, by Observation and Experience.

INORDINATE Proportion, is where the Order of the Terms are disturbed.

INSCRIBED Bodies: On Gunter's Sector, are sometimes placed two Lines answering one another, and called the Lines of Inscribed Bodies, and are easily known there by the Letters D, S, I, C, O, T, which signify the Dodecahedron, Sphere, Icosihedron, Cube, Octahedron, and Tetrahedron.

The Uses of these Lines may be these.

1. The Radius of a Sphere being given, to find the Sides of the Five Regular Bodies inscribed in it.
2. The Side of any of the Five Regular Bodies given, to find the Radius of the Circumscribing Sphere.

If the Sphere be first given, apply its Radius over in the Points S, S, on each Leg of the Sector.

If any of the other Bodies be first given, apply its Side over between its proper Letters; so the Parallel taken between the Points of the other Bodies, shall be the Sides of those Bodies, and may be inscribed in the Sphere, whose Radius is the Distance between S and S.

INSCRIBED Hyperbola, is such an one as lies entirely within the Angle of its Asymptotes; as the Conical Hyperbola doth.

INSECTIVOROUS Animals, are such as feed on Insects: See Birds.

INSECTS, a kind of living Creatures so called by Aristotle and Pliny; because of their having certain Incisure, Cuttings or Indentings, in and about their Bodies. The Greeks called them *Εντομα*. The Judicious Mr. Ray in his *Methodus Insectorum* thus distinguishes the several Kinds of Insects.

Insects are (1.) either *Ἀμεταμορφωτα*, or such as do not change their Form; Or, (2.) *Μεταμορφωτα*, such as do really change their Form.

Those that do not change their Form are either (1.) *Ἀποδα* without Feet, or (2.) *Pedata* with Feet; and of these there are some Kinds that cast their Skins.

Insects without Feet are either *Terrestrial*, or *Land Insects*, or *Aquatick*.

Terrestrial Insects are either such as are produced on the *Land*, or in the *Earth*; and not in the *Water*; as the *Lumbrici Terrestres*; which are either of the larger sort, and are called *Dew-Worms*; or of a smaller size: And of these there are *Red* and *Green*, with *Yellow Tails*: Which last are commonly called *Gilt-Tails*.

Or such as are found in the *Bowels* of *Animals*: And of these some are found in the *Intestines* of *Men*; as (1.) the *Lumbrici Teretes*; (2.) *Lumbrici Lati*, which are called also *Tania*. (3.) *Cucurbitini*, which some will have to be only the *Fragments* of the *Tania*: (See *Nich. Andri M. D. De Variis Vermium Speciebus*.) (4.) The *Ascarides*, which are chiefly found in the *Rectum*.

Those *Worms* that are found in the *Intestines* of *Beasts* are of two sorts, the *Oblongi* and *Pellucidi*, of the thickness of a *Horse-Hair*; and therefore called *Vermiculi Setiformes*: And the *Breves* and *Crassiores*, which often are found in *Horses*, and are called the *Botts*.

To this *Genus* of *Terrestrial Insects* many *Natural Historians* refer *Snails*, whether with or without *Shells*.

Water Insects without Feet, not changing Form, are either of the

Greater sort, which have a peculiar way of moving, by first fixing their *Head* to the *Ground*, and then drawing up their *Tail* towards it, &c. Of these some are *Teretes*, round and smooth; of which are three sorts; As the *Medicinal Hirudines*, or *Leaches*; the common *Black-Horse-Leaches*, and the *Asp-colour'd Sea-Leaches*: But there is also a sort of this kind that is smaller and flatter, which is found sticking to *Stones* in the *Bottoms* of little *Brooks*.

Lesser sort, which have a different way of crawling or moving from the former. These also are either *Round* or *Flat*: Of the *Round* sort there is one that is *Black*, with two small *Horns* on its *Head*; and is found sticking to wet *Stones* in the watery *Tops* of *Hills*: And another, which is *Red*, of about a *Fingers's* length, with a *Forceps* at the *Tail*, found at the *Bottom* of *Fish-Ponds* and stagnant *Waters*.

The *Flat* sort are very small and thin, and are called *Flukes*; being sometimes found in *Waters*, and sometimes in the *Branches* of the *Porus Biliaris* in *Sheep*.

Insects not changing Form, and having Feet, are either (1.) *Hexapoda*, with six Feet; (2.) *Octapoda*, with eight Feet; (3.) with fourteen Feet; (4.) *Polypoda*, with many Feet.

Those that have but six Feet are either,

1. *Terrestrial*; and these of a *Larger kind*; As (1.) The *Yellowish Insect* found in rotten decaying *Oaks*; (2.) The *Black one* on the *Ground*, called by *Mouffet*, *Vermivorous*; (3.) The *Black one* li-

ving under *Ground*, with a *Forceps* at the *Tail*; (4.) A *White sort*, with square *black Spots* on its *Back*; (5.) The *Farinarium*, bred in *Meal*, of a whitish *Colour*.

Smaller sort: Some of which are found about the *Bodies* of *Animals*; As (1.) the *Cimex*, or *Wall-Louse*, of a stinking *Smell*; (2.) *Ricinus*, the *Tick*; (3.) *Pediculus*, the *Common Louse*; (4.) *Pediculus ferus* seu *Inguinalis*, the *Crab-Louse*; (5.) *Pulex* the *Flea*; of all which there are various kinds.

Others are not troublesome to *Animals*; as (1.) One that in *Bigness* and *Figure* resembles a *Louse*, but is very nimble and swift, and is found in *Books* and rotten *Wood*; (2.) Another there is with a very long *Body*, and a forcipitated *Tail*; (3.) The *Black Insect*, found often in the *Flowers* of the *Chelidonium*; (4.) A *Subterraneous* sort, a little whitish; (5.) One that skips like a *Grashopper*, but is much less.

2. *Aquatick*. As (1.) the *Pediculus Marinus Grandis*, which adheres to *Fishes*; (2.) The *Squilla Fluvialis*, with a *Pyramidal Tail*, and two *Hairs*, or *Bristles* at the *End*.

Insects not changing Form, and having eight Feet, are either with a *Tail*, as the *Scorpion*; or without, as the *Spider*; of which some spin no *Web*, have but two *Eyes*, and very long *Legs*, as the *Opilio*, or the *Shepherd*.

Some do spin a *Web*; and of these they count three sorts: (1.) The *Aranea Colcestrensis Abdomine tumido, subrotundo & elato*; (2.) The *Spider* with the *Thorax*, or middle *Part* of its *Body*, as big as the *Abdomen*; (3.) The *Spider* with the long *Abdomen*, found among *Reeds*, *Rushes*, *Grass*, &c.

2. The *Ricini Octopodes*, which are some more flat and compress'd; as the rambling *Ticks* that run o'er the *Bodies* of *Animals*, but don't fasten; and some more round and thick, which do adhere to the *Skin*.

3. The *Syrones* or *Mites*.

Insects not changing Form, and with fourteen Feet, and therefore by *Mr. Ray* called *Τεσσαρεκκαίδεκαποδα*, are the *Aselli*: Of which there are three sorts: As,

1. The *Sea-Asellus*; the longest and largest of all; living amongst the *Rocks*.

2. *Asellus Lividus*; which rolls itself up into a *Ball*. The *Common Wood-Lice*, *Sows* or *Chefs Buggs*.

3. *Asellus Aspinus*, with a forked *Tail*, not rolling itself up. To this Species may be added the *Asellus Marinus Figura brevioris*, rolling itself up; (2.) *Asellus Aquarum dulcium*, with long *Legs*, and two *Bristles* on its *Tail*; (3.) *Pulex Aquaticus*, both in *Fresh* and *Salt Water*; (4.) *Pediculus Aquaticus*, which fastens upon *Fish*.

Insects not changing Form, with twenty-four Feet. These have the eight *Fore-Feet* lesser, and the sixteen *Hinder* ones larger. There are two kinds of them observ'd, both with long *Bodies*, one larger, and of an obscure *Colour*, among the *Rocks* by the *Sea-fides*; the other of a *Silver Colour*, found in *Houses*.

There

There is a Kind with thirty Feet, of an oblong Shape, Chesnut Colour, and full flattish Body, usually lying under Logs and Trunks of Trees. 'Tis very agile and swift.

Insects not changing Form, with many Feet (called *πολύποδα*) are some on Land; and either roundish in Body, with all their Legs rising out of the middle of the Belly (nearly) as the *Fulus*; or more flat and compress'd, with their Legs not rising as before from a Point in the middle of their Body, but growing along on the Sides; as the *Scolopendra*. And some of this Kind are

Aquatick; of which Mr. Ray makes three Differences: (1.) the *Cornish Luggs*, used for Baits in catching Fish, with 38 Legs, and a smooth roundish Body; (2.) The *Scolopendra Marina*, *Corpore plano*; (3.) *Animalculum Bicorpor*, or rather *Bicaudatum*, lying in the Clefts of Stones under the Salt Water.

Insects which do really undergo a Change of their Form are called *Μεταμορφόμενα*; of which *Swammerdam* hath given the best Account: Tho' he shews that this Word is improperly used, since there is by no means any real Transformation, but only an Explication of the Parts of the Animal, latent before in Miniature (as it were in the *Ovum* or *Nympha*, like the Plant in the Seed) and an Encrease of all the Parts by proper Degrees.

The first Species of Transmutation or Change (which *Swammerdam* makes the second) is Instantaneous; there being no sensible Rest or Stop between the Old and the New Form. And the Insects of this Order don't lose their Motion at the Time that they shift the *Pellicula*, at least not to Appearance. And *Swammerdam* describes the second Order of Change to be, when the *Vermiculus* (leaving the former Shape of the *Nympha*, with which it appeared in the Egg, and subsisted without Food) now beginning to feed, hath its Members or Parts visibly increased, and stretched out, and takes the Form of a new *Nympha*, which is not without Motion; and from thence becomes a Flying Insect. Of this sort are,

1. The *Libellæ*, or *Perleæ*, which are produced from an Insect of six Feet, (vid. *Mouffet*, p. 322.) who takes it for the *Pulex Marinus*, as in the preceding Page he calls it the *Locusta Aquatica*. Out of the Cruaceous Skin, or Husk, of this Insect, the *Libella* breaks by a Fissure, which begins between the Eyes, and is continued to the Roots of the Wings, and is there join'd to the Lateral Fissures.

2. The *Cimices Silvestres*, whose Characteristick Marks (according to *Willoughby*) are (1.) A long *Proboscis*, not spiral, but strait; (2.) Their upper Wings to the middle are thick, and like Leather; thence to the Ends thin and membranous; (3.) There is the Figure of St. Andrew's Cross on their Backs.

3. The *Locustæ*; which *Willoughby* refers to the *Insecta Αμεταμορφόμενα*.

4. The *Grylli Campestris*.

5. The *Grylli Domestici*, or *Crickets*.

6. The *Gryllo Talpa*, *Mole Cricket*.

7. The *Cicada*, or *Grasshopper*.

8. The *Blatta*, according to *Swammerdam*.

9. The *Tipulæ Aquaticæ*, which run very swiftly on the Surface of the Water, and have a

Sting in their Mouths like the *Cimices* or *Ticks*.

10. The *Scorpius Aquaticus*, with a Sting also in its Mouth.

11. The *Muscæ Aquaticæ*; called by *Androvandus*, *Apes Amphibiae*.

12. The *Hemerobius*, or *Ephemera*, or *Diaria*, of *Swammerdam*.

13. The *Forficula*, or *Auricularia*. Vid. *Mouffet*, p. 175.

The Second Species of Transmutation includes such Insects as undergo a double Metamorphosis, or Change of Shape.

1. Into a *Chrysalis*, or something analogous to it.

2. Into a Flying Insect.

These Kinds of Insects, a while before their Change, lie quite still without Food or changing Place; and in respect of their Wings are

1. *Καλέοπτειρα*, or *Vaginipennia*, as the *Scarabæi*, *Beetles*.

2. *Ἀνίλυτοι*, whose Wings are open and expanded: And the Wings of these are either *Farinaceous*, as the *Papiliones*, &c. or *Membranous*, as the *Apes*, *Muscæ*, &c. and these are either *Δίπτερες*, with two Wings, or *Τετράπτερες*, with four Wings.

The *Scarabæi* may be divided (1.) In respect of their Horns, into the *Nasicornis*, *Bucerota* and *Cercus Volans*, or *Taurus*. (2.) In respect of their *Antennæ*, they are of many kinds; of which the most eminent are those called *Capricorni*. (3.) With regard to their Motion, as the *Saltatrices*. (4.) With regard to their Colour, as *Cantharides*.

To the Beetle Kind may be referred the

Cicindela, or *Glow-Worm*: The

Staphylinus, called by *Willoughby* *ἡμικαλέοπτειρα*: The

Proscarabæus, or *Oyl-Beetle*; so called from its emitting from its Joints a kind of Oyl, on its being pressed or squeezed.

The *Anelytra*, with farinaceous or mealy Wings, are called *Papiliones*, *Butter-flies*; and these are either *Diurnal*, or *Nocturnal*, or the *Phalæna*.

The Specifick Distinction of the *Diurnal* is, that they always settle with their Wings erect; are produced from an angulous *Aurelia*, and have their *Antennæ* Studded (*Clavatae*.) Of these there are about 50 kinds observed in *England*.

The *Nocturnal Butterflies*, or the *Phalæna*, are vastly numerous; and cannot very clearly be methodized. But for Memory and Distinction's sake they may be divided into,

1. The *Geometrigenæ*, which come from the *Eruca*, (called *Geometra*, from the manner of its Walk, which is *Ansatini*, by curling up its Back like the Handle of a Cup, &c.) with 8 or 10 Feet.

2. Such as come from *Eruca*, with 14 Feet. Of this Kind, which is very numerous, there hath been distinguished the *Phalæna Fasciata*; whose Wings are in Patches or Area's of different Colours. *Phalæna Lineata*, whose Wings are marked with transverse Lines. *Phalæna Punctata*, whose Wings are mark'd with one or more Points. And these excepted, all the others are distinguished into greater and lesser, and of a middle size between both. One of the larger Kinds may be distinguish'd also by their inner Wings running out beyond the upper, when they sit or

rest : And another by the Appearance of the Figure of Eyes upon the Wings : And a third, by their long Tails and narrow sharp Wings ; which by some are called *Phalena Prædatrices*, or *Accipitrinae*.

The *Anelytra*, with membranous Wings, are Bees, Flies, Wasps, Bombylii, Crabrones, &c. And to this Kind the *Culex Vulgaris* (vid. Swammerdam, p. 95. *Hist. Insects*) or Gnat is referr'd ; as also the *Formica*, or *Ant*.

And hither must be referr'd such *Water Insects* as are cover'd by a *Theca* ; according to the Observations of Willoughby. And these have either

1. An *immoveable Theca*, or Case, which is fixed to the Stones ; and this Case is either of a round Figure, or of one more compressed and flat.

2. A *moveable portable Theca* ; and these are commonly called *Phryganea*.

And this *Theca* is either,

1. *Strait* ; and that either composed of Straws and little *Festucæ*, lying parallel one to another ; of which there are two kinds ; a Greater, where the *Festucæ* are two Inches long ; and a Lesser, which is very common, and are called *Straw-Worms* : Or else the *Festucæ* lie transversely, and are shorter ; having sometimes pieces of Shells and Stones intermix'd with them. Others, whose Cases are *strait* also, have no *Festucæ* ; but always either Sand or Gravel. And of these, some have the *Theca* round, and are called *Cod-Baits* : Others are *flat* and *compressed*.

2. *Crooked or Horned* ; which run tapering. Of these Mr. Ray reckons four kinds ; a greater and lesser Black sort, and a greater and lesser Ash-colour'd one.

These all produce Flies with large Wings, like Butter-flies.

The Third Species of *Transmutation* is a simple Change from a *Vermiculus* to a flying *Insect* ; but yet with a sensible *astitia*, Rest or Stop, between one Form and the other.

This Change Swammerdam thus describes :

" The *Vermicle*, excluded from the Egg, gets
" Nourishment, by little and little, from with-
" out ; and under that first Skin or Covering hath
" its Members increased by degrees ; not slipping
" it, or putting it off, as other *Vermiculi* do when
" they change into *Nymphae*, but assuming the
" Figure of a *Nympha* in it : For a time 'tis quite
" motionless, till the superfluous Moisture is eva-
" porated, and then in a few Days recovers its
" Motion again ; and then casting off this Skin,
" which is as it were double, it becomes a *Flie*."

Of this Kind are our *Flesh-Flies* ; and all the *Nymphae Vermiformes* ; the *Vespa Ichneumones*, &c.

As to the Generation of *Insects*, Dr. George Gordon, in *Philos. Transact.* N^o. 237. from the Observations he had made about the true Origin of Caterpillars, concludes very well ; (1.) That we ought not to believe that any *Insects* are bred of Corruption, and not *ex Ovo*, only because we cannot discern the particular Manner of their Propagation ; because there are and may be more full Discoveries made of that Kind accidentally, where the Process is not visible to the naked Eye. (2.) The Female *Insects* of all Kinds of Flies and Butter-flies do put their Spawn near

those Places where the *Eruca's*, which are hatched out of them, are to have their Food. (3.) There is a kind of Gluten, by which the Female fastens her Eggs to the bearing Buds of Trees, &c. so that the Rains cannot wash them off. (4.) These Eggs will not be hurt by the greatest Frost.

Mr. Andry, in his Book *De la Generation de Vers dans le Corps de l'Homme*, Paris 8vo. 1700. takes notice, that the Ancients were mistaken in denying that *Insects* did breath, on the Account of their wanting Lungs : For modern Observations do convince us, that *Insects* have a greater Number of Lungs than other Animals. The Ancients thought also that *Insects* had no Blood, because many of them had no red Liquor like our Blood : But 'tis not the Colour, but the Use of the Liquor that is to be regarded. They believed also that *Insects* had no Hearts ; whereas our Microscopes do now discover, that when *Insects* have several Lungs, they have also several Hearts ; and in particular 'tis found that Silk-Worms have a continued Chain of Hearts, from the Head almost to the very Extremity of the Tail. And 'tis this Number of Hearts and Lungs that occasion those *Insects* to give Signs of Life a long while after they are divided into several Parts. He observes also that 'tis wrong to call *Insects* imperfect Animals, since they want no Parts either necessary or convenient for their use, and to render them compleat in their Kind.

Mr. Poupert affirms that the Earth-Worms and Round-tail'd Worms, which are found in the Intestines of Men and Horses, &c. also Snails and Horse-Leaches, are *Hermaphrodites* ; but that such Worms as become Flies, and Silk-Worms, are not so, being of no Sex, but are Nests full of real Animals, which we see in time come out with Wings. *Histoire de l'Academ. Royale des Sciences Année 1699.*

INSINUATION of a Will, in the Civil Law, signifies the first Production of it, or the leaving it *Penes Registrum*, in order to his Probate.

INSTALLMENT, is a Settlement or sure Placing of any Person in his proper Place ; See 20 Car. 2. c. 2. 'Tis sometimes confounded in the Law with Abatement : The Word is chiefly used for the Induction of a Dean, Prebendary, or other Ecclesiastical Dignitary, into the Possession of his Stall, or Proper Seat, in the Cathedral Church

Church to which he belongs. 'Tis sometimes called *Installation*.

INSTAURUM, is used in old Deeds for a Stock of Cattle; and was commonly taken for the whole Stock upon a Farm; as Cattle, Waggon, Ploughs, and all other Implements of Husbandry. So *Instaurum Ecclesie* was used for the Books, Vestments, and Utensils belonging to a Church. And *Instaurata Terra* was Land ready stock'd with all things necessary for the Use of the Farmer. *Instauratio* is often used in this Sense by our old Historians and M.S.

INSTITUTION, is the Act of the Bishop, or one Commissioned to Act for him; whereby any Clerk is invested with the Spiritualities of a Rectory or Vicarage.

The Clerk kneels down before the Bishop while he pronounces the Words of *Institution*, (*Instituo te Rectorem Ecclesie de A. B. cum Cura Animarum, & accipe Curam tuam & meam*) and the Clerk holds the written Instrument, with the Episcopal Seal annexed, in his Hand during the Ceremony. But the Clerk must have *Induction* after this, without which he hath no Right to his *Temporalities*, if the Benefice be not a Donative.

Before the Clerk is Instituted, he must subscribe the 39 *Articles of Religion*, in the Presence of the Ordinary (or his Substitute;) And the Ordinary is not bound to Offer them, but the Clerk is to offer to Subscribe them; and he must Subscribe them without Reserve, Exception or Qualification, or else his *Institution* is *ipso facto* void and null; and the Church is still vacant.

At the same time the Ordinary requires the Clerk to subscribe the other 2 *Articles* mention'd in *Can. 26.* about the King's Supremacy, and the Lawfulness and Use of the Liturgy.

The Clerk must also, before *Institution*, subscribe to that Part of the Declaration enjoin'd by the Act of Uniformity, 14 *Car. 2. c. 4. Viz. I will conform to the Liturgy of England as by Law establish'd.*

Before *Institution* he must also take the Oaths mention'd in the first *Statute of William and Mary, c. 8.* instead of the former Oaths of *Allegiance* and *Supremacy*, required by *Stat. 1 Eliz. c. 1.*

And then he must take the Oath against Simony, enjoin'd by *Can. 40.* and the Oath of Canonical Obedience. All this before *Institution*.

And he is to have Certificates given him of his subscribing the Declaration, contain'd in the Act of Uniformity, in *English*, in a distinct Instrument, under the Hand and Seal of the Bishop; and of his other Subscriptions and Oaths in *Latin*.

The Clerk ought to have, by all means, Witnesses of his *Institution*, his taking the Oaths, making Subscriptions, &c. and therefore he should desire some present to write their Names on the Back of his Instruments; and make *Memorandums* who they are, and where they live.

The Church, by *Institution*, is full, against all Persons but the King; and the Clerk by it may enter upon the Glebe, and take the Tithes; but he cannot Lett or Grant them; nor Sue for them, if they are refused to be paid.

After *Institution* the Clerk is to receive a written Mandate from the Ordinary to the Arch-Deacon, or other proper Person, in order to his *Induction*; which see.

INSTRUMENTS. Besides the several useful Instruments, both Mathematical and Mechanical, which are described under their proper

Names in this Volume and the former; I have at the End of this Volume given you the Figures and Descriptions of some others, which are not only very Curious and Accurate, but in a great measure also New and Non-descript.

INSULATA Columna, in Architecture, is a Pillar which stands alone, like an Island, as it were, in the vast Ocean of the Air. *Evelyn's Parallel.*

INSULT, is a Word used in the Military Art, for attacking any Post with open Force, without using Trenches, Saps, or any common Approaches. 'Tis usual to *Insult* thus the *Counter-scarp* of any Place, that they may not give the Enemy time to fire their Mines, which they have prepared.

INSUPER, is a Word used by the Auditors of the *Exchequer*: In their Accounts they say, So much remains *Insuper* to such an Accountant: That is, So much remains due on such an Account.

INTAGLIO'S, are Precious Stones engraved with Heads of Great Men, or Inscriptions, &c. such as are often set in Rings, or Seals.

INTER Canem & Lupum, was an Expression formerly used for *Twilight*. In the North this is called in some places *Day-light's Gate*; and in others, *betwixt Hawk and Buzzard*. In *Herefordshire* 'tis called corruptly the *Muck-Shade*, i. e. *Mock-Shade*.

INTERDICT, was a Censure formerly inflicted by Bishops or Ordinaries in Times of Popery; forbidding all Sacraments and Divine Offices (except Baptism to Children, and the Sacrament of the Eucharist, and Extream Unction at the Point of Death) to be performed within any Parish, Town, Country, or Nation; and sometimes they prohibited them within such Places to be present at Divine Service in any other Place. This Censure was commonly inflicted on a Pretence that the Privileges of the Church had been violated by the Lords, Magistrates, or Princes of any Place or Nation. In the Reign of our King John this Kingdom lay under a Papal *Interdict* for above six Years together: It began *A. D. 1208.* In our Common Law the Word

INTERDICTION is used also in the same Sense as in the Canon Law; where 'tis design'd to be *Censura Ecclesiastica prohibens administrationem divinorum*: And thus 'tis used 24 *H. 8. c. 12.*

INTEREST. Besides the Ways of Computing *Interest*, both *Simple* and *Compound*, which you will find in Vol. I. I shall here give you another very plain, easy and ready Method, of Computing all *Simple Interest* and *Discount*; as also the Way to find the *Amount* or present Value of any Sum of Money; or of any *Annuity*, or other Yearly Payment, &c. for any *Term*, not exceeding an *Hundred Years*: And this from the Accurate and Useful Tables of Mr. John Smart, of the Town-Clerk's Office in London. And in order to this, the following Table of Shillings, Pence and Farthings, reduc'd to the Decimal Parts of a Pound, are previously necessary.

SHILLINGS,

SHILLINGS, PENCE, and FARTHINGs, reduc'd to the Decimal Parts of a POUND.

s.	d.	Decimal Parts of a Pound.	s.	d.	Decimal Parts of a Pound.	s.	d.	Decimal Parts of a Pound.	s.	d.	Decimal Parts of a Pound.

Examples of the Use of the preceding Table.

What Decimal Part of a Pound is 7 d.?

Look in the Table for 7 d. and even with it you will find .029167, which is the Decimal required.

What Decimal Part of a Pound is 17 s. 6 d.?

You will find the Decimal of 17 s. to be .85, and the Decimal of 6 d. to be .025; which added, makes .875, and answers the Question.

What is the Value of this Decimal .09375 in Shillings, Pence and Farthings?

Look in the Table, and you will find it to be 1 s. 10 d. $\frac{1}{2}$.

Note, If you cannot find in the Table the exact Decimal sought for, take that which is nearest to it, and you can never err above half a Farthing.

Knowing thus the Use of these Decimal Tables, all the Business of *Simple Interest* will very easily be understood and dispatch'd as followeth.

Simple Interest.

The *Yearly Interest* of any Sum of Money is had, by only multiplying the *Principal* Sum by the *Hundredth* part of the *Rate* of Interest: For the Product in Decimals is the true Answer.

Examples.

1. What is the Interest of 75 Pounds for one Year, at the Rate of 6 l. per Cent.?

75 = Principal.

.06 = the Hundredth part of 6 l.

4.50 the Product; which is 4 10 00

†

2. What

INT

INT

2. What is the Yearly Interest of 157 l. 17 s. 6 d. at 5 l. per Cent.?

157.875 is the Decimal for 157 l. 17 s. 6 d. .05 the Hundredth part of 5 Pounds.

7.89375 which is the Decimal answering to 7 l. 17 s. 10 d. the Interest of 157 l. 17 s. 6 d. for one Year at 5 l. per Cent.

And so for any other Rate or Sum whatsoever.

When thus the Interest for one Year is found, divide it by 365; the Quotient will be the Interest for one Day.

Thus or being the Interest of one Pound for one Year; if you Divide that Decimal by 365 (continuing the Work as long as you please) you will have .00002739726028, &c. for a Quotient; which will be the Interest of one Pound for one Day; and at one per Cent.

Then will this Decimal .000027, &c. found as above; if you multiply it continually by the Principal, the Number of Days, and the Rate of Interest, become of itself an Interest Table for any Sum of Money, for any Time, and at any Rate.

Example.

What is the Interest of 150 l. for 365 Days, at 6 l. per Cent.?

.00002739726028
150

410958904200
365

150000000033000
6

9.00000000198000

Which Decimal gives the Answer near enough for any Use, to be 9 Pounds.

By the same Rule .02 Divided by 365, will give in the Quotient the Interest of one Pound for one Day, at 2 per Cent. and .03 Divided by 365, will do the same at 3 per Cent. And thus these Numbers following were found.

1000.	10	1000.	10
900.	9	900.	9
800.	8	800.	8
700.	7	700.	7
600.	6	600.	6
500.	5	500.	5
400.	4	400.	4
300.	3	300.	3
200.	2	200.	2
100.	1	100.	1
000.	0	000.	0

The Interest of one Pound for one Day, at all Rates, from 1, to 10 per Cent.

At 1 l. per Cent. is .000027397260 &c. as above.

2	.000054794512
3	.000082191781
4	.000109589041
5	.000136986301
6	.000164383562
7	.000191780822
8	.000219178082
9	.000246575342
10	.000273972603

And when thus the Interest of one Pound for one Day, and at any Rate, is found; Then that Interest multiplied by 2, 3, 4, 5, 6, 7, 8, and 9, &c. gives the Interest of any Sum of Money, at the same Rate.

Take an Example at 3 l. per Cent.

Interest of 1 l. for one Day, is	.00008219178
2	.00016438356
3	.00024657534
4	.00032876712
5	.00041095890
6	.00049315068
7	.00057534246
8	.00065753424
9	.00073972602

And then 'tis easy to find, that the Interest of 1 l. being, as before, .000082, &c. That of

10	will be .000822*
100	.008219
1000	.082192*
10000	.821918*
100000	8.219178
1000000	82.191781

Because moving the Point of Separation still one Place nearer to the Left Hand, multiplies any Decimal by 10, 100, 1000, &c. as is shewn under Decimals.

And thus the following Tables of Daily Interest were made.

The Reason of the Stars above, set to some of the Numbers, is only to shew that in the Contraction of a Decimal Fraction to fewer places, is is proper to add one to the last Figure retain'd, when the next Figure to it, which is omitted, exceeded 5.

INTEREST

I N T

I N T

INTEREST for One Day, at 3, 4, 5, and 6 Pound per Cent. per Annum.

The Use of the preceding Tables.

When the Interest of any Sum of Money is required for any Number of Days, multiply the Principal Sum by the Number of Days; and the Interest of that Product for one Day answers the Question.

For, the Interest of one Pound for one hundred Days, is equal to the Interest of one hundred Pounds for one Day.

Example.

What is the Interest of 265 l. for 438 Days, at 6 l. per Cent. per Ann.?

265 l. Multiply'd by 438, (the Number of Days) the Product will be 116070 l. the Interest of which Sum take out of the Table of 6 l. per Cent. thus;

The Interest for one Day of 100000 is 16.4384
10000 is 1.6438
6000 is .9863
70 is .0115

Principal 116070 Int. 19.0800

Answer 19 l. 1 s. 7 1/2 d.

And thus, by these Tables, the Interest of any Sum of Money, for any Time, and at any Rate of Interest, from 3 l. to 10 l. per Cent. per Ann. is readily found.

For the more easy finding the Number of Days, from any one time given, to any other, the following Table is made.

The Number of Days from any Day in any one Month, to the same Day in any other Month.

From	January	Febru.	March	April	May	June	July	August	Septem.	Octob.	Novem.	Decem.
	Feb. 31	Mar. 28	Apr. 31	May 30	June 31	July 30	Aug. 31	Sept. 31	Oct. 30	Nov. 31	Dec. 30	Jan. 31
	Mar. 59	Apr. 59	May 61	June 61	July 61	Aug. 61	Sept. 62	Oct. 61	Nov. 61	Dec. 61	Jan. 61	Feb. 62
	Apr. 90	May 89	June 92	July 91	Aug. 92	Sept. 92	Oct. 92	Nov. 92	Dec. 91	Jan. 92	Feb. 92	Mar. 90
	May 120	June 120	July 122	Aug. 122	Sept. 123	Oct. 122	Nov. 123	Dec. 122	Jan. 122	Feb. 123	Mar. 120	Apr. 121
	June 151	July 150	Aug. 153	Sept. 153	Oct. 153	Nov. 153	Dec. 153	Jan. 153	Feb. 153	Mar. 151	Apr. 151	May 151
	July 181	Aug. 181	Sept. 184	Oct. 183	Nov. 184	Dec. 183	Jan. 184	Feb. 184	Mar. 181	Apr. 182	May 181	June 182
	Aug. 212	Sept. 212	Oct. 214	Nov. 214	Dec. 214	Jan. 214	Feb. 215	Mar. 212	Apr. 212	May 212	June 212	July 212
	Sept. 243	Oct. 242	Nov. 245	Dec. 244	Jan. 245	Feb. 245	Mar. 243	Apr. 243	May 242	June 243	July 242	Aug. 243
	Oct. 273	Nov. 273	Dec. 275	Jan. 275	Feb. 276	Mar. 273	Apr. 274	May 273	June 273	July 273	Aug. 273	Sept. 274
	Nov. 304	Dec. 303	Jan. 306	Feb. 306	Mar. 304	Apr. 304	May 304	June 304	July 303	Aug. 304	Sept. 304	Oct. 304
	Dec. 334	Jan. 334	Feb. 337	Mar. 334	Apr. 335	May 334	June 335	July 334	Aug. 334	Sept. 335	Oct. 334	Nov. 335
	Jan. 365	Feb. 365	Mar. 365	Apr. 365	May 365	June 365	July 365	Aug. 365	Sept. 365	Oct. 365	Nov. 365	Dec. 365

This Table shews the Number of Days, from any Day in any one Month, to the same Day in any other Month; as from the 1st, 5th, 10th, or 20th of May, to the 1st, 5th, 10th, or 20th of November, is 184 Days: Which is thus known.

I find May at the Head of one of the Columns; and looking down that Column, I find November, and even with it 184.

But if the Question is from the 5th of May, to the 10th of November, I must add 5; and the Number of Days will be 189. On the contrary, if it be demanded from the 10th of May, to the 5th of November, 5 must be subtracted, and the Number will be 179. And thus any Number of Days, not exceeding a Year, are found by Inspection.

If the Time exceed a Year; as from the 10th of May 1706, to the 10th of November 1707, add 365 to the Number found in the Table, and the Answer will be 549 Days.

And as you may thus very easily, and accurately enough, solve all Questions and Cases of Simple Interest; so he next shews how to find the Discount of any Sum of Money for any Time, and at any Rate of Interest, thus.

1. To find the Annual Discount of one Pound, at 1 l. per Cent. Divide .01 by 1.01. If at 2 per Cent. Divide .02 by 1.02. At 3 per Cent. Divide .03 by 1.03, &c. and the Quotients will be the several Discounts required.

Thus the Discount of one Pound for one Year at

1.	
1 per Cent.	.009900990099
2 — —	.019607843137
3 — —	.029126213592
4 — —	.038461538462
5 — —	.047619047619
6 — —	.056603773585
7 — —	.065420560748
8 — —	.074074074074
9 — —	.082568807339
10 — —	.090909090909

And then the Discount of 1 l. being multiply'd by any Principal Sum, the Product will be the Annual Discount of that Principal.

Example.

What is the Discount of 100 l. at 6 l. per Cent. per Annum? .056604

.05660, &c. being the Discount of 1 l. for one Year, at the Rate of 6 per Cent. as above; that multiplied by 100 l. will produce 5.5660377, &c. Which Decimal being reduced, gives us 5 l. 13 s. 2 $\frac{1}{2}$ d. and no more: And therefore that is to be look'd upon as the true Discount of 100 l. at 6 l. per Cent. for one Year.

And yet nothing is more common, than to allow 6 l. for the Discount of 100 l. for a Year, at 6 l. per Cent. But he that doth so, certainly wrongs himself: For he ought to receive so much Money as, at 6 l. per Cent. Interest, will amount to 100 l. in one Year, which less than 94 l. 6 s. 9 $\frac{1}{2}$ d. will not do.

The several Discounts of 1 l. for one Year (as above) and at the aforesaid Rates, being divided by 365, will give the Discounts for one Day, at the same Rates; Viz.

The Discount for one Day at

1 l. per Cent.	.000027126000
2 — — —	.000053720118
3 — — —	.000079797845
4 — — —	.000105374078
5 — — —	.000130463144
6 — — —	.000155078832

The

The Use of the preceding Tables.

When the Discount of any Sum of Money is required for any Number of Days, multiply the principal Sum by the Number of Days, and the Discount of that Product for one Day answers the Question.

Example.

What is the Discount of 265 l. for 438 Days, at 6 l. per Cent. per Annum?

265 l. Multiplied by 438, (the Number of Days) the Product will be 116070 l. the Discount of which Sum take out of the Table of 6 l. per Cent. thus;

So 1.

1.03
1.0609
1.092727
1.125509
1.159274
1.194052

Multiplied by 103, the Amount (at 3 l. per Cent.) will be

1.03
1.0609
1.092727
1.127509
1.159274
1.194052
1.229874

At the End of the

1st Year,
2d Year,
3d Year,
4th Year,
5th Year,
6th Year,
7th Year.

And thus Table the First, following, of the Amount of 1 l. is form'd.

The Present Value of any Sum of Money, payable at the End of any Number, is found by the Reverse of the former Method; viz. by the con-

tinued Division of the Principal by 1.03, 1.04, 1.05, 1.06, &c. according to the Rate of Interest, is 3, 4, 5 or 6 l. per Cent.

Thus 1.

.970874
.942596
.915142
.888487
.862609
.837484

Divided by 103; the present Value (at 3 l. per Cent.) will be

.970874
.942596
.915142
.888487
.862609
.837484
.813092

Payable at the End of the

1st Year,
2d Year,
3d Year,
4th Year,
5th Year,
6th Year,
7th Year.

And thus the Second of the following Tables may be form'd.

The Amount of any Annuity or other yearly Payment, in any Number of Years, at 3 l. per Cent. per Ann. Compound Interest, will be found thus:

Multiply the first yearly Payment by 1.03 (when as in this Case, the Rate of Interest is 3 l. per Cent. otherwise by 1.06, &c. whatever that be) and to the Product add the second Yearly Payment; which Addition will give the Amount in two Years: Multiply that Amount again by 1.03, 1.06, &c. and to the Product add the third yearly Payment; which Addition will give the Amount in three Years, &c.

Example of 1 l. per Ann. at 3 l. per Cent.

First yearly Payment 1 l. the Amount in 1 Year.

Multiplied by 1.03

Second Yearly Paym.

1.03

1.

2.03 Amount in 2 Years.

Multiplied by

1.03

2.0909

Third Yearly Paym. 1.

3.0909 Amount in 3 Years.

Multiplied by 1.03

3.183627

Fourth Yearly Paym. 1.

4.183627 Amount in 4 Years, &c.

And thus the Third Table following is constructed.

The present Value of any Annuity, or other Yearly Payment, to continue any Number of Years, is thus found.

Find the present Value of that yearly Sum payable at the End of 1, 2, 3, 4, or 5, &c. Years by Division; as is above directed; the first of which Values will be the present Value of that Annuity, or Yearly Payment for one Year: The first and second of those Values added together, will be the present Value for two Years: The first, second, and third, so added, will give the Value for three Years, &c.

Exam-

Example of 1 l. per Ann. at 3 l. per Cent.

I find the present Value of 1 l. payable at the End of several Years, to be, as here under express'd.

At the End of	1	.970874
	2	.942596
	3	.915142
	4	.888487
	5	.862609
	6	.837484
	7	.813092, &c.]

Then the present Value of 1 l. per Ann. at 3 l. per Cent.

For	1	.870874	1st Number above,
	2	1.913470	1, 2,
	3	2.828612	1, 2, and 3,
	4	3.717099	1, 2, 3, and 4,
	5	4.579708	1, 2, 3, 4, and 5,
	6	5.417192	1, 2, 3, 4, 5, and 6,
	7	6.230284	1, 2, 3, 4, 5, 6, and 7,

added together,

And thus the Fourth Table following is Form'd and Compos'd..

TABLE

I N T

I N T

T A B L E I.

The Amount of One Pound in any Number of Years not exceeding 100, at the several Rates of 3, 4, 5, 6, 7, 8, 9, and 10 l. per Cent. per Ann. Compound Interest.

The

The Use of the preceding Tables.

The Amount or present Value of any Sum of Money, for any Number of Years, not exceeding 100, at any of the aforesaid Rates of Interest, is thus found :

Look in the first or second Table for the Number of Years, and even with that Number, under the Rate of Interest, is the Amount or present Value of 1 l. which Amount or present Value so found, being multiply'd by the principal Sum, the Product is the Amount or present Value requir'd.

After the same manner, the Amount or present Value of any Annuity, or other yearly Payment, is found by the third or fourth Table.

Examples.

Quest. 1. What will 125 l. amount unto in 15 Years, at 5 l. per Cent. per Ann. Compound Interest?

In Table I. even with 15 Years, and under 5 l. per Cent. I find the Amount of 1 l. to be } 2.078928

Which multiply'd by the Principal - - 125

The Product will be - - - 259.866, &c.

Ans. 259 l. 17 s. 4 d.

Quest. 2. What is the present Value of 259 l. 17 s. 4 d. to be paid at the End of 15 Years, discounting at the Rate of 5 l. per Cent. per Ann. Compound Interest?

In Table II. even with 15 Years, and under 5 l. per Cent. I find the present Value of 1 l. to be } .481017

Which multiply'd by the Principal } 259.8667

The Product will be - - - 125.000, &c.

Ans. 125 l.

Quest. 3. What will 15 l. per Ann. amount unto in 21 Years, at 8 l. per Cent. per Ann. Compound Interest?

In Table III. even with 21 Years, and under 8 l. per Cent. I find the Amount of 1 l. per Ann. to be } 50.422921

Which multiply'd by - - - - - 15

The Product will be - - - - 756.343815

Ans. 756 l. 6 s. 10 $\frac{1}{2}$ d.

Quest. 4. What is the present Value of 15 l. per Ann. for 21 Years to come, at 8 l. per Cent. per Ann. Compound Interest?

In Table IV. even with 21 Years, and under 8 l. per Cent. I find the present Value of 1 l. per Ann. to be } 10.016805

Which multiply'd by - - - - - 15

The Product will be - - - 150.252075

Ans. 150 l. 5 s. 0 $\frac{1}{2}$ d.

Quest. 5. What will 150 l. 5 s. 0 $\frac{1}{2}$ d. amount unto in 21 Years, at 8 l. per Cent. per Ann. Compound Interest?

In Table I. even with 21 Years, and under 8 l. per Cent. I find the Amount of 1 l. to be } 5.033834

Which multiply'd by - - - - 150.252

The Product will be - - - 756.343, &c.

Ans. 756 l. 6 s. 10 $\frac{1}{2}$ d.

Which Answer is the same with that given to the third Question, and shews the Agreement of the Tables one with the other.

Quest. 6. One having the Lease of an Estate, Value 60 l. per Ann. more than the reserv'd Rent, 12 Years to come, would know what Sum ought to be paid, to add 28 Years to the Term, and thereby make it 40 Years to come, computing at the Rate of 6 l. per Cent. per Ann. Compound Interest?

I find in Tab. IV. the present Value of 1 l. per Ann. for 40 Years to come, at 6 l. per Cent. per Ann. to be } 15.046297

I find in the same Table the Value of 1 l. per Ann. for 12 Years to come, at the same Rate, to be } 8.383844

The Difference is - - - - 6.662453

Which multiply'd by - - - - 60

The Product will be - - 399.747180

Ans. 399 l. 14 s. 11 $\frac{1}{4}$ d.

Quest. 7. A has the Possession of an Estate of 100 l. per Ann. 15 Years to come, B has the Reversion of the same Estate for ever, after the Expiration of the said 15 Years. It is demanded, What is the present Value of A's Term of 15 Years? And, What the present Value of B's Reversion, computing at the Rate of 5 l. per Cent. per Ann. Compound interest?

I find in the last Line of Table IV. under 5 l. per Cent. the Fee Simple of 1 l. per Ann. to be worth 2000. 20 l. which multiply'd by 100, the Product is

I find in the same Table, the Value of 1 l. per Ann. 15 Years to come, at the same Rate, to be 10.379658; which multiply'd by 100. the Product is } 1037.9658

The Difference is - - - 962.0342

Ans. 1037 l. 19 s. 3 $\frac{1}{4}$ d. the Possess. 15 Ys. to come.
962 l. 0 s. 8 $\frac{1}{4}$ d. the Revers. after the said (15 Years.)
2000 l. - - the Fee Simple.

Quest. 8. For a Lease of certain Profits for seven Years, A makes two Offers, either to pay 150 l. as a Fine, and 300 l. per Ann. or 1700 l. Fine, without any Rent. B bids 650 l. Fine, and 200 l. per Ann. And C 200 l. Fine, and 405 l. per Ann. The

INT

INT

The Question is, which is the best Offer, and what the Difference, computing at the Rate of 5 l. per Cent. per Ann. Compound Interest?

The Amount of 1 l. in 7 Years at 5 l. per Cent. (in Table I.) multiply'd by 150 l. is

The Amount of 1 l. per Ann. in 7 Years, at 5 l. per Cent. (in Table III.) multiply'd by 300 l. is

Therefore A's first Offer, at the End of 7 Years, will amount unto

The Amount of 1 l. in 7 Years, at 5 l. per Cent. multiply'd by 1700 l. is what A's 2d Offer will amount to in the same time

The Amount of 1 l. in 7 Years, at 5 l. per Cent. multiply'd by 650 l. is

The Amount of 1 l. per Ann. in 7 Years, at 5 l. per Cent. multiply'd by 200 l. is

Therefore B's Offer, at the End of 7 Years, will amount unto

The Amount of 1 l. in 7 Years, at 5 l. per Cent. multiply'd by 200 l. is

The Amount of 1 l. per Ann. in 7 Years, at 5 l. per Cent. multiply'd by 405 l. is

Therefore C's Offer, at the End of 7 Years, will amount unto

The Amounts of the said Offers, at the End of the said Term, being thus known, look (in Tab. II.) for the present Value of 1 l. payable at the End of 7 Years, at 5 l. per Cent. which will be found to be .710682. Which said Value being multiply'd by the said several Amounts, the Products will be the present Value of the said several Offers, Viz.

The present Value of A's 1st will be 1885 18 03
A's 2d 1700 00 00
B's - 1807 05 06
C's - 2543 09 08

Therefore the present Value of what C offers is more than A's 1st. 657 11 05
A's 2d. 843 09 08
B's - 736 04 02

Which answers the Question.

Or thus;

A's 1st Offer is 300 l. per Ann. the present Value of which, for 7 Years, at 5 l. per Cent. is

And a Fine of — — 150 00 00

1885 18 03

A's 2d Offer is a Fine of 1700 00 00

Vol. II.

B's Offer is 200 l. per Ann, the present Value of which, for 7 Years, at 5 l. per Cent. is

And a Fine of — — 650 00 00

1807 05 06

C's Offer is 405 l. per Cent. the present Value of which, for 7 Years, at 5 l. per Cent. is

And a Fine of — — 200 00 00

2543 09 08

l. s. d.

Therefore C's is more than A's 1st 657 11 05

A's 2d 843 09 08

B's — 736 04 02

Quest. 9. A gives 1550 l. for an Annuity of 100 l. per Ann. for 99 Years. B puts 1550 l. out at Interest. It is requir'd to know, which will amount to the greatest Sum, at the End of the said 99 Years, at the Rate of 6 l. per Cent. per Ann. Compound Interest?

The Amount of 1 l. per Ann. in 99 Years, at 6 l. per Cent. (in Tab. III.) multiply'd by 100 l. is

The Amount of 1 l. in 99 Years, at 6 l. per Cent. (in Tab. I.) multiply'd by 1550 l. is

Therefore A's 100 l. per Ann. will amount to more than B's 1550 l. in that Term.

Which answers the Question.

If the present Value of that Difference is required, find the present Value of 1 l. payable at the End of 99 Years, at 6 l. per Cent. (in Table II.) which multiply'd by the Difference, the Product will be the present Value thereof, viz. 111 l. 9 s. 2 d.

The present Value of the Difference is likewise thus found:

Find the present Value of 1 l. per Ann. for 99 Years to come, at 6 l. per Cent. (in Tab. IV.) which multiply'd by 100 l. the Product will be

Which is the present Value of 100 l. per Ann. for 99 Years, at 6 l. per Cent.

And from which subtract 1550 00 00

There will remain — — 111 09 02

Which is the present Value of the Difference.

Or thus:

The Interest of B's 1550 l. at 6 l. per Cent. is 93 l. per Ann. Therefore A receives 7 l. per Ann. more than B.

l. s. d.

The present Value of 7 l. per Ann. for 99 Years to come, at 6 l. per Cent. is

116 06 00

Z z

The

The present Value of 1550*l.* to } *l. s. d.*
be paid at the End of 99 Years, is } 4 16 10

Therefore the present Value of } 111 09 03
the Difference, is }

After the same manner, most other useful Questions in *Compound Interest*, are easily answered.

INTERTIES in a Building, are those small Pieces of Timber that lie horizontally between the Sommers; or between *them* and the *Sell* or *Reason*.

INTERVAL of the Fits of easy Reflexion, and of easy Transmission of the Rays of Light, is the Spaces between every Return of the Fit, and the next Return.

These *Intervals* Sir *Is. Newton* shews how to collect, and thence to determine whether the Rays shall be reflected or transmitted at their subsequent Incidence on any pellucid Medium. (See *Light*, &c. and *Newton's Opticks*, Book 2. Part 3.)

INTESTINES, are a long and large Pipe, which by several Turnings and Windings reaches from the *Pylorus* to the *Anus*: They are knit all along the Edge of a Membrane call'd the *Mesentery*, and are usually six times as long as the Body to which they belong; that so the Chyle, which escapes the Lacteals of one of the Guts, may be taken up by those in the next. They have three Coats, of which the inmost is made up of short Fibres bound together by fine Blood-Vessels, and disposed as those of the Stomach: For the Length of a Fibre is the Thickness of the Coat. This Coat being much larger than the other, lies in Wrinkles or Plaits, which are call'd *Valvule Conniventes*. It hath also a great Number of little Glands, which in the small Guts lie in Clusters every where, but where they are knit to the *Mesentery*, These Glands seem to separate a Liquor for the diluting of the thick Chyle, that it may the more easily enter the small Orifices of the Lacteals. The second Coat is made up of two Orders of Muscular Fibres, one running straight, according to the Length of the Guts; the other goes round, describing rather a spiral than a circular Line. By the successive Motion of these two Orders of the Fibres, the Guts are in a continual Undulation; which is called the *Vermicular* or *Peristaltick* Motion of the *Intestines*. The third and external Coat is common, and comes from the *Peritonaeum*.

The *Intestines*, tho' properly but one continued Pipe, yet are divided into six Parts; three thin and small, and three thick and great. The thin and small are the *Duodenum*, the *Jejunum*, and *Ileum*. Thick and great Guts are the *Cecum*, *Colon*, and *Rectum*: See those Words.

INTESTINE Motion of the Parts of Fluids. Where the attracting Corpuscles of any Fluid are elastick, they must necessarily produce an *Intestine Motion*; and this greater or lesser, according to the Degrees of their Elasticity and attractive Forces.

For two elastick Particles, after meeting, will fly from one another (abstracting from the Resistance of the Medium) with the same Degree of Velocity that they met together with. (See *Elasticity*.) But when in leaping back from one another they approach other Particles, their Velocity will be encreased.

INTRENCHMENTS, are all Sorts of Works made to fortify any Post against an Enemy: There is usually a Ditch with a Parapet, or Rows of Fascines loaded with Earth, Gabions, Sand-Bags, or Hogsheds filled with Earth to cover the Men from the Fire.

INVADIATIONES, was a Term formerly used in the Law for *Mortgages and Pledges*: And so *Invadiare*, was to *Mortgage Land*.

INVENTION, in Painting, Sculpture, &c. is the Art of finding out proper Objects for a Picture, by the Help of History or ancient Fables, &c.

INVENTIONES, was the Term formerly for what is now call'd *Treasure-Trove*, viz. Money or Goods found by any Person, and not challeng'd by any Owner: Which therefore by Common Law was due to the King (whence that old Rhyme used to this Day in many Countries by the Children, *Who has lost? I have found, In the King's Holy Ground.*)

And King *Edw. I.* we find, granted to the Barons of the Ports, *Inventiones suas per Mare & Terras*, &c.

INVERSE Method of Fluxions, is the Method of finding the *Flowing Quantity* from the *Fluxion* given; and is the same with what the foreign Mathematicians call the *Calculus Integralis*: On which Subject there is a Treatise publish'd in French by Mr. *Carré*, A.D. 1700, Printed at Paris.

Some call it *Summatory Arithmetick*; and the Reason and Foundation of it Mr. *Hayes* shews in his Book of *Fluxions*.

He had, in *Prop. 2.* of his fourth Section, been shewing how to investigate the *Area's* of *Hyperbolic* Figures: And in *Cor. 3.* of that Proposition, he shews that 'tis manifest, that any *Parabola*, or the Complement of any *Parabola*, to the circumscribed *Parallelogram*; or an *Hyperbola* being given: And supposing the Ordinate (See *Fig. 2. annex'd*) $PM = y$; the Abscissa $AP = x$; $PR = OD = b$; the Axis $OA = c$: That all the PR , or b 's are: to all the PM , or y 's:: as $m - 1$: is to m .

And if it be required to find what Proportion all the b 's, advanced to any Power n , has to all the y 's advanced to the same Power n , it may be thus investigated.

Suppose the new Curve NG to be described, so that PN be always equal or proportional to PM^n or y^n , then it is manifest that the Sum of

all the y^n is equal to the Sum of all the PN , or to the curvilinear Space $OAGN$: And because y^n is always equal or proportional to PN , and PN becomes equal to OG , at the same time that

that y^n becomes equal to $b^n = \overline{OD}^n$; 'tis likewise manifest, that the Sum of all the b^n is equal or proportional to the Sum of all the OG , or the Parallelogram $AO GK$. Whence it appears,

that to investigate the Proportion of all the y^n to all the b^n is the same thing as to investigate the Proportion of the Curvilinear Space $AO GN$ to the Parallelogram $AO GK$. Which may be done

thus: In Paraboloids and Hyperboloids, the General Equation expressing the Nature of such Curves is $y^m = x$, and consequently $y^n = x^{\frac{n}{m}}$.

Now suppose $y^n = z$, then $z = x^{\frac{n}{m}}$, and $z^m = x^n$, which is an Equation, expressing the Nature of a Paraboliform, or Hyperboliform Curve.

Let the said Curve be ANG , and $AP = x$, $AO = c$, $PN = z$, and $OG = d$. Then (Hayes, Sect. 3. Art. 90.) $\frac{m}{n} \pm 1 : \frac{m}{n} :: (m \pm n : m)$ all the d : to all the z . And because z was put equal to y^n ; therefore when z or PN becomes OG or d , then y^n becomes b^n ; and consequently d is $= b^n$; therefore $m \pm n : m :: S : b^n : S : y^n$.

Hence we may easily deduce the 64th Prop. Arith. Infinit. first discovered by the Learned Dr. Wallis.

CONSECTARY I.

1. For we found before $z = x^{\frac{n}{m}}$, and it is also $m : m \pm n :: 1 : 1 + \frac{n}{m} :: y^n : b^n$. in the direct

Series, and $1 : 1 - \frac{n}{m} ::$ all the y^n : all the b^n . in the Negative Series. Whence it is evident, that if the Exponent of the Power of the intercepted Diameter x , be taken for the Index of the Series, it will be as 1 is to the Power of the intercepted Diameter or Index of the Series (because

Vol. II.

$z = y^n = x^{\frac{n}{m}}$; and consequently, $x^{\frac{n}{m}}$ represents y^n in the Dimension requir'd) increas'd by Unity; so are all the y^n to all the b^n .

CONSECTARY II.

2. Hitherto we have found the Proportion of all the y^n , or (multiplying both by the Fluxion $\dot{x}$) $y^n \dot{x}$ to all the $b^n \dot{x}$, their absolute Value may be found thus: It was by the preceding Corollary, $m : m \pm n ::$ all the $z \dot{x}$: all the $d \dot{x}$; that is, so is the Space $AO GN$, to the Rectangle $AO GK = dc$: Therefore $\frac{m dc}{m \pm n} =$ all the

$z \dot{x} = S : y^n \dot{x}$, (because $z = y^n$.) But $b^n = d$;

Therefore $S : y^n \dot{x} = \frac{m dc}{m \pm n} = \frac{m c b^n}{m \pm n} =$

$$\frac{1 c b^n}{1 \pm \frac{n}{m}}$$

CONSECTARY III.

3. And if we suppose the Index $\pm \frac{n}{m} = \pm \mu$, then the Value of all the $y^n \dot{x}$ is $= \frac{1 c b^n}{1 \pm \mu}$; and again, If in the Place of b^n we substitute $c^{\pm \mu}$ (because $y^n = x^{\pm \frac{n}{m}}$, that is, when y becomes $= b$, and

Z z 2

and $x = c, c^{\frac{n}{m}} = b^n = c^{\frac{n}{m}}$ we shall have
all the $y^n \dot{x} = \frac{c^{\frac{n}{m}}}{1 - \frac{n}{m}}$.

CONSECTARY IV.

4^o. Hence Mercator's Lem. Prop. 16. Logarithmotechn. may be deduced, upon which the Learned Dr. Gregory's Geometrical Exercise chiefly depends. For because all the $y^n \dot{x}$ are = all the $x^{\frac{n}{m}} \dot{x}$, it is evident, that (rejecting the invariable Quantities, if there be any) all the $x^{\frac{n}{m}} \dot{x}$

$$= \frac{c^{\frac{n}{m}}}{1 - \frac{n}{m}} = (\text{by putting the greatest } x = c)$$

$$\frac{x^{\frac{n}{m}}}{1 - \frac{n}{m}}. \text{ Whence we have the Demonstration of}$$

the fundamental Rule in Summatory Arithmetick, to find the flowing Quantity of a given Fluxion.

CONSECTARY V.

5^o. For instance, if the Right Line $AO = c$ be divided into an infinite Number of $\dot{x}$, the Sum of all the Rectangles contain'd under any Power of the Abscissa x , and all the $\dot{x}$ respectively, that is, the Sum of all the $x^{\frac{n}{m}} \dot{x}$, or the Flowing Quantity, whereof $x^{\frac{n}{m}} \dot{x}$ is the Fluxion, is equal to $\frac{c^{\frac{n}{m}}}{1 - \frac{n}{m}} = \frac{x^{\frac{n}{m} + 1}}{\frac{n}{m} + 1} =$ to the Power of x increased by Unity, and divided by the new Exponent. And seeing the Thread of my Discourse has led me on to this Head, I shall insist more at large on the same in the next.

PROP. I.

To find the flowing Quantity of any Fluxion.

The summing up of Infinites, or finding the Sum of all the Fluxions of an unknown Quantity, or the finding the Flowing Quantity from its Fluxion given, is not less difficult in many Cases, than the Reverse is easy. I shall begin with the easiest Examples, and proceed gradually to those that are more intricate and difficult.

Example I.

Let it be required to find the flowing Quantity of this Fluxion $a a \dot{x}$, or $a a x^0 \dot{x}$; to the Index of the flowing Quantity add 1, and then we have $a a x^{0+1} \dot{x}$; divide this by the fluxionary Letter $\dot{x}$, and by the new Index $0 + 1$, or 1, the Quotient $a a x$ is the flowing Quantity of the given Fluxion.

Example II.

Let it be required to find the flowing Quantity of $a y \dot{x} + a x \dot{y}$; the flowing Quantity of the first Member $a y \dot{x}$ is $= a x y$; and that of the second Member $a x \dot{y}$ is $= a x y$: Whence it is plain, that the flowing Quantity of $a y \dot{x} + a x \dot{y}$ is $= a x y$.

Example III.

Let it be required to find the flowing Quantity of $3 x x \dot{x}$; increase the Index of the flowing Quantity x by 1, and then we have $3 x^3 \dot{x}$, which divide by the new Index 3, and by the fluxionary Letter $\dot{x}$, then the Quotient $= \frac{3 x^3 \dot{x}}{3 x x} = x^2$ is the flowing Quantity of the given Fluxion.

And Universally;

If it be requir'd to find the flowing Quantity of $m x^{m-1} \dot{x}$, increase the Index of the flowing Quantity x by 1, and then we have $m x^m \dot{x}$, which divide by the new Index m , and by the fluxionary Letter $\dot{x}$, and there will arise x^m for the flowing Quantity requir'd.

Example IV.

Let it be requir'd to find the flowing Quantity of $\frac{a \dot{x}}{x x}$; the Fluxion (Hayes, Art. 16.) express'd by the other way of Notation, is $a x^{-2} \dot{x}$, and the flowing Quantity thereof is $= a x^{-1} = \frac{-a}{x}$. Thus the Flowing Quantity of

$$\frac{a x \dot{x}}{x^{\frac{3}{2}}} = \frac{a \dot{x}}{x^{\frac{1}{2}}} = a x^{-\frac{1}{2}} \dot{x} \text{ is } = 2 a x^{\frac{1}{2}}.$$

Example V.

Let it be required to find the flowing Quantity of $\frac{-3 \dot{x}}{x^4} = -3 x^{-4} \dot{x}$. To the Index of the Power of the flowing Quantity add 1, and divide by the new Exponent, and by $\dot{x}$, the Quotient is $= x^{-3} = \frac{1}{x^3} =$ the flowing Quantity required.

Example VI.

Let it be required to find the flowing Quantity of $\frac{x^2 \dot{x}}{\sqrt{r x}}$; this Fluxion may be express'd thus,

thus, $r^{-\frac{1}{2}} \times x^{\frac{3}{2}}$, and then the flowing Quantity thereof is $\frac{1}{2} r^{-\frac{1}{2}} x^{\frac{5}{2}} = \frac{2}{5} \sqrt{x^5/r}$.

Example VII.

The flowing Quantity of $\dot{x} \sqrt{2rx}$, or $\dot{x} \times \overline{2r}^{\frac{1}{2}} x^{\frac{1}{2}}$ is $\frac{1}{2} \times \overline{2r}^{\frac{1}{2}} x^{\frac{3}{2}} = \frac{1}{2} \sqrt{2rx} x$, and the flowing Quantity of $\dot{x} \sqrt{2rx - xx}$ is found by reducing $\overline{2rx - xx}^{\frac{1}{2}}$ to an infinite Series, and multiplying the same by $\dot{x}$, and then finding the flowing Quantity of every Term.

Example VIII.

To find the Fluent of $\dot{x} \sqrt{ax - aa}$. In such Cases where the Fluxion is affected with a Vinculum, we must consider whether the fluxional Quantity, standing before the Radical Sign, be the Fluxion of the simple or compound Quantity under the Vinculum, for in such Cases the Fluent may be found by the General Rule.

Thus in this Example I observe, that $\dot{x}$ is the Fluxion of $ax - aa$, and therefore the Fluent of $\dot{x} \sqrt{ax - aa}$ or $\dot{x} \times \overline{ax - aa}^{\frac{1}{2}}$ is $\frac{1}{2} \times \overline{ax - aa}^{\frac{3}{2}} = \frac{2ax - 2aa}{3} \sqrt{ax - aa}$.

In like manner the Fluent of $\frac{rx - xx}{2rx - xx^{\frac{1}{2}}}$, or $\overline{rx - xx} \times \overline{2rx - xx}^{-\frac{1}{2}}$ or $2rx - 2xx \times \overline{2rx - xx}^{\frac{1}{2}}$ will be found (if to the Exponent $-\frac{1}{2}$ we add 1, and divide by the new Exponent $\frac{1}{2}$, and by the fluxionary Quantity $2r\dot{x} - 2x\dot{x}$) to be $\sqrt{2rx - xx}$.

These Rules may be demonstrated by Induction also; and because that Method, by particular Instances, may serve to give the Reader a clearer Notion of Summatory Arithmetick, I shall explain the same in the following Examples.

1. In the Rectangular Triangle ABC : Suppose $AB = a$, $BC = b$, $AP = x$, $Pp = \dot{x}$, $PM = y$; then the Equation of the Triangle is

$y = \frac{bx}{a}$, and the infinitely little Parallelogram

Mp = to the Fluxion of the Triangle, is $y\dot{x}$

= (by Substitution) $\frac{bxx}{a}$: And the flowing Quantity is $\frac{bxx}{2a} = \left(\text{putting } y = \frac{bx}{a} \right) \frac{xy}{2}$. it remains to be proved that the Sum of all the $y\dot{x}$ is $\frac{xy}{2}$.

Compleat the Parallelogram $ABCD$, then it is evident that the Triangle ABC is equal to the Sum of all the $y\dot{x}$, and the Triangle ADC is equal to the Sum of all the $x\dot{y}$. But both these Triangles are equal to the Parallelogram, and each is equal to $\frac{1}{2}$ the Parallelogram, and the Parallelogram is equal to xy ; therefore all the $y\dot{x} = \frac{xy}{2} = \text{Triangle } ABC$.

2. Let AMB be a Parabola, $AP = x$, $PM = y$, the Parameter = 1, then the Equation of the Curve is $x^m = y$, and the Fluxion of the Parabolick Space, viz. $Mp = y\dot{x} = x^{\frac{1}{m}} \dot{x}$. Now it is evident, that the Sum of all those Parallelograms is equal to the Parabolick Space AMB . And the flowing Quantity of $x^{\frac{1}{m}} \dot{x}$ is $\frac{m}{m+1} x^{\frac{1}{m}+1} = \left(\text{putting } y \text{ for } x^{\frac{1}{m}} \right) \frac{m}{m+1} xy$, which we must prove to be equal to the Sum of all the $y\dot{x}$.

Compleat the Parallelogram $ADBC$, then it is manifest that the Space AMB is equal to all the $y\dot{x}$, and the Space $AMBC$ is equal to all the $x\dot{y}$. But by the Method of Tangents it is $y : \dot{x} :: y : t$, and $t\dot{y} = y\dot{x}$, and in the Parabola $t = mx$; ergo $y\dot{x} = m x \dot{y}$.

$$\text{Whence } 1 = \frac{m x \dot{y}}{y \dot{x}}$$

$$\text{And } \frac{1}{m} = \frac{x \dot{y}}{y \dot{x}}$$

$$\text{Adding 1 to each Side of the Equation } \left\{ \frac{1}{m} + 1 = \frac{x \dot{y}}{y \dot{x}} + 1 \right.$$

$$\text{That is } \frac{m+1}{m} = \frac{x \dot{y} + y \dot{x}}{y \dot{x}}$$

Whence

Whence

$$m : m + 1 :: y \dot{x} : x \dot{y} + y \dot{x};$$

And consequently,

$$m : m + 1 :: S : y \dot{x} : S : x \dot{y} + S : y \dot{x};$$

But

$$S : x \dot{y} + S : y \dot{x} = x y.$$

Therefore

$$m : m + 1 :: S : y \dot{x} : x y;$$

And consequently

$$\frac{m}{m+1} \times x y = S : y \dot{x}. \quad Q. E. D.$$

And besides the Examples I have produced, there are others which occur, to which these Rules cannot be immediately applied; and that the Reader may not be at too great a Loss in such Cases, I shall endeavour to assist him in that Particular. But first, It will be necessary to premise this.

LEMMA.

If a Binomial be to be rais'd to any Power, g. v. m , (which represents any Number, whole or broken, positive or negative) then the *Uncie* or Numbers prefix'd to the several Terms are,

$$1 \times \frac{m-0}{1} \cdot 1 \times \frac{m-0}{1} \cdot \times \frac{m-1}{2} \cdot 1 \times \frac{m-0}{1} \cdot \times \frac{m-1}{2} \times \frac{m-2}{3} \times, \&c. \text{ respectively.}$$

And if $P + PQ$ represent the Quantity to be raised to the given Power; P the first Term, and Q the rest, divided by that first Term, and $\frac{m}{n}$ the Exponent of that Root or Dimension,

Then

$$\begin{array}{ccc} & A & B \\ P + PQ \end{array}^{\frac{m}{n}} = P^{\frac{m}{n}} + \frac{m}{n} A Q + \frac{m-n}{2n} B Q + \frac{m-2n}{3n} C Q, \&c.$$

For Instance, if it be required to extract the square Root of $rr - xx$; that is, to raise (the Word *raise* being used indifferently for involving or evolving any *Binomial*) the Binomial $rr - xx$ to the Power or Dimension, whose Exponent is $\frac{1}{2}$, then $P = rr$, $Q = \frac{-xx}{rr}$, $m = 1$, and $n = 2$;

$$\text{and consequently, } rr - xx^{\frac{1}{2}} = r - \frac{xx}{2r} - \frac{x^4}{8r^3} - \frac{x^6}{16r^5} - \frac{5x^8}{128r^7} -, \&c.$$

Let it be required to raise the Binomial $a + x$ to the Power whose Exponent is m , or let m be the Index of the Root of the Binomial, which is to be extracted. Then, $P = a$, $Q = \frac{x}{a}$, and $\frac{m}{n} = (n \text{ in this Case being } = 1) m$; there-

↓

$$\text{fore } a + x^m \text{ is } = a^m + m a^{m-1} x + m \times \frac{m-1}{2} \times a^{m-2} x^2 + m \times \frac{m-1}{2} \times \frac{m-2}{3} a^{m-3} x^3 + m \times \frac{m-1}{2} \times \frac{m-2}{3} \times \frac{m-3}{4} a^{m-4} x^4, \&c.$$

By the same Method any *Trinomial*, *Quadrinomial*, &c. or *Infinito-nomial* may be raised to any given Power, v. g. To raise the *Infinito-nomial* $a + bz + cz^2 + dz^3 +, \&c.$ to the Power, whose Exponent is m : In the preceding *Binomial Theorem*,

$$\text{Instead of } x \text{ put } bz + cz^2 + dz^3, \&c. \text{ and instead of } x^2 \text{ substitute } bz + cz^2 + dz^3, \&c. \text{ Then it is manifest that } a + bz + cz^2 + dz^3, \&c. \text{ is } = a^m + m a^{m-1} \times bz + cz^2 + dz^3, \&c. + m \times \frac{m-1}{2} a^{m-2} \times (bz + cz^2 + dz^3, \&c.)^2 + m \times \frac{m-1}{2} \times \frac{m-2}{3} a^{m-3} \times (bz + cz^2 + dz^3, \&c.)^3 + m \times \frac{m-1}{2} \times \frac{m-2}{3} \times \frac{m-3}{4} a^{m-4} \times (bz + cz^2 + dz^3, \&c.)^4 +, \&c.$$

Example I.

Let it be required to find the flowing Quantity of this Fluxion $\dot{x} \sqrt{rr - xx}$. Reduce $\sqrt{rr - xx}$ to an (*Hayes's Art.* 93.) Infinite Series, and then

$$\begin{array}{l} rr - xx^{\frac{1}{2}} \text{ is } = r - \frac{xx}{2r} - \frac{x^4}{8r^3} - \frac{x^6}{16r^5} - \frac{5x^8}{128r^7} -, \&c. \text{ And consequently, } \dot{x} \sqrt{rr - xx} \text{ is } = r\dot{x} - \frac{x^2\dot{x}}{2r} - \frac{x^4\dot{x}}{8r^3} - \frac{x^6\dot{x}}{16r^5} - \frac{5x^8\dot{x}}{128r^7} -, \&c. \text{ And finding the flowing Quantity of every Term of this Series, then the Sum of all the } \dot{x} \sqrt{rr - xx} \text{ is } = rx - \frac{x^3}{6r} - \frac{x^5}{40r^3} - \frac{x^7}{112r^5} - \frac{5x^9}{1152r^7} -, \&c. \quad Q. E. I. \end{array}$$

Example II.

It is required to find the flowing Quantity of $\frac{rrx}{r+x}$. It is evident from the (*Hayes's Art.* 16.)

$$\text{Notation of Powers, that } \frac{rr}{r+x} \text{ is } = rr \times \frac{1}{r+x}. \text{ But } \frac{1}{r+x} \text{ is } = (\text{Hayes's Art. 93.}) r^{-1} - \frac{x}{rr} + \frac{xx}{r^3} - \frac{x^3}{r^4} +, \&c. \text{ And conse-}$$

consequently $\frac{rr}{r+x}$ or $rr \times \frac{1}{r+x}$ is $= r$

$-x + \frac{xx}{r} - \frac{x^3}{r^2} +$, &c. and $\frac{rrx}{r+x}$ is $=$

$rx - x^2 + \frac{x^3}{r} - \frac{x^4}{r^2} +$, &c. and the flow-

ing Quantity of $\frac{rrx}{r+x}$ is $= rx - \frac{xx}{2} + \frac{x^3}{3r}$

$-\frac{x^4}{4r^2} +$, &c. Q. E. I.

SCHOLIUM.

And if we divide the Series (Examp. I.) by $\frac{rr - xx}{r+x}$ reduced to an infinite Series, and multiply the Divisor by the Quotient, we shall

have $rx - \frac{x^3}{6r} - \frac{x^5}{40r^3} - \frac{x^7}{112r^5} - \frac{5x^9}{1152r^7} -$

&c. $= x + \frac{2x^3}{6r^2} + \frac{32x^5}{123r^4}$, &c. $rr - xx$

And in general, If the given Fluxion consists of Universal Exponents and Coefficients, reduce the Part under the Vinculum to an infinite Series, which multiply by the Part before the Vinculum, and find the flowing Quantity of every Term; Lastly, divide this last Series or the Fluent by the Part under the radical Sign affected, with any the most convenient Exponent, and multiply the said Part under the said Exponent by the said Quotient; so shall you have a Series expressing the Fluent of the given Fluxion, and readily shewing when and whether the Series consists of a finite Number of Terms or not.

The Fluent of a Fluxion involving surd Quantities, may be investigated after another manner, which is sometimes preferable by much to the former: The Principles of this Method are,

1. Reduce the given Fluxion to its simplest Terms.

2. Assume a new Equation affected with indetermined Coefficients; so that reducing the same to Fluxions, the Terms of this may be compared with those of the given Fluxion, in order to determine the unknown Coefficients.

3. Having determined the assumed Coefficients, substitute their respective Values in the assumed Equation, and you have the Fluent of the given Fluxion.

Since this Method deserves the Reader's Consideration, I shall endeavour fully to explain the same;

and that I may not be misunderstood, I shall begin with some easy Examples.

Example I.

Let it be required to find the Fluent of $a\dot{x}\sqrt{ax - aa}$, the Fluxion reduced to its simplest Terms is $a\dot{x} \times \frac{ax - aa}{2}$. Now suppose the Fluent of this Fluxion to be $A \times \frac{ax - aa}{2}$, then it is evident, that the Fluxion of this Fluent must be equal to the given Fluxion, i. e. $\frac{1}{2} A \times a\dot{x} \times \frac{ax - aa}{2}$ is $= a\dot{x} \times \frac{ax - aa}{2}$. Therefore (dividing by $\frac{ax - aa}{2}$) $\frac{1}{2} A \times a\dot{x} = a\dot{x}$, and $A = 2$. Having thus found the true Value of the indeterminate Coefficient A (viz. 2) in the assumed Equation, substitute the same in place of A , and then we have $2 \times \frac{ax - aa}{2}$ or $ax - aa$ equal to the Fluent of the given Fluxion.

Example II.

To find the Fluent of $\frac{rx - xx}{\sqrt{2rx - xx}}$, this Fluxion is expressed thus, $\frac{rx - xx}{\sqrt{2rx - xx}}$. Suppose the Fluent thereof to be $A \times \sqrt{2rx - xx}$. Then the Fluxion of this Quantity is $\frac{1}{2} A \times \frac{2r - 2x}{\sqrt{2rx - xx}} = \frac{r - x}{\sqrt{2rx - xx}}$. Therefore $\frac{1}{2} A \times \frac{2r - 2x}{\sqrt{2rx - xx}} = \frac{rx - xx}{\sqrt{2rx - xx}}$, and $A = 1$; and consequently, the Fluent of the given Fluxion is equal to $\sqrt{2rx - xx}$.

Example III.

To find the Fluent of $dx^r \times e + fx^n$. Assume an Equation with indeterminate Coefficients, so that reducing the same to Fluxions, the Terms thereof may be compared with those of the given Fluxion. Let the said Equation be $A dx^{r-n+1} + B dx^{r-2n+1} + C dx^{r-3n+1}$, &c. $\times e + fx^n$ $= S: dx^r \times e + fx^n$

Then,

$$\begin{aligned} & r - n + 1 \times A dx^{r-n} \dot{x} + r - 2n + 1 \times B dx^{r-2n} \dot{x} + r - 3n + 1 \times C dx^{r-3n} \dot{x}, \\ & \text{&c.} \times e + fx^n \quad + \quad m + 1 \times e + fx^n \quad \times n f x^{n-1} \dot{x} \times A dx^{r-n+1} + B dx^{r-2n+1} + \\ & C dx^{r-3n+1}, \text{&c.} = dx^r \dot{x} \times e + fx^n \dot{x}. \end{aligned}$$

Whence

Whence, supposing $\frac{1}{p} = m + 1$, and putting $x = 1$.

$$\overline{r-n+1} \times A dx^{r-n} + \overline{r-2n+1} \times B dx^{r-2n} + \overline{r-3n+1} \times C dx^{r-3n}, \text{ \&c.}$$

$$\times e + f x^n \Big|^{\frac{1}{p}} + \frac{1}{p} \times n \times A d f \times x^r + \frac{1}{p} \times n \times B d f x^{r-n} + \frac{1}{p} \times n \times C d f x^{r-2n}, \text{ \&c.}$$

$$\times e + f x^n \Big|^{\frac{1-p}{p}} = d x^r \times e + f x^n \Big|^{\frac{1-p}{p}}.$$

And multiplying each Side of the Equation by $p \times e + f x^n \Big|^{\frac{p-1}{p}}$ we have $p \times \overline{r-n+1}$
 $\times A dx^{r-n} + p \times \overline{r-2n+1} \times B dx^{r-2n} + p \times \overline{r-3n+1} \times C dx^{r-3n}, \text{ \&c.} \times e + f x^n \Big|^{\frac{1-p}{p}}$
 $+ n \times A d f \times x^r + n \times B d f x^{r-n} + n \times C d f x^{r-2n}, \text{ \&c.} = d x^r \times e + f x^n \Big|^{\frac{1-p}{p}} \times p \times$
 $e + f x^n \Big|^{\frac{p-1}{p}}.$

Which being order'd, we have

$$\begin{aligned} & p \times \overline{r-n+1} \times A d f \Big\} + p \times \overline{r-n+1} \times A d e \Big\} + p \times \overline{r-2n+1} \times B d e \Big\} \\ & \quad n \times A d f \Big\} x^r + p \times \overline{r-2n+1} \times B d f \Big\} x^{r-n} + p \times \overline{r-3n+1} \times C d f \Big\} x^{r-2n}, \\ & \quad + \quad \quad \quad n \times B d f \Big\} + \quad \quad \quad n \times C d f \Big\} \text{ \&c.} \\ & = d x^r \times e + f x^n \Big|^{\frac{1-p}{p}} \times p \times e + f x^n \Big|^{\frac{p-1}{p}} = p \times d x^r. \end{aligned}$$

From which Equation the unknown Coefficient $A, B, C, \text{ \&c.}$ may be determined in this manner;

$$p \times \overline{r-n+1} \times A d f + n \times A d f = p d$$

And dividing by $p d$,

$$\overline{r-n+1} \times A f + \frac{1}{p} \times n \times A f = 1,$$

Substituting $m + 1$ for $\frac{1}{p}$,

$$\overline{r-n+1} \times A f + m + 1 \times n \times A f = 1.$$

$$\text{Whence } A = \frac{1}{\overline{r-n+1} \times f + m n + n \times f} = \frac{1}{m n + r + 1 \times f}.$$

Secondly,

$$p \times \overline{r-n+1} \times A d e + p \times \overline{r-2n+1} \times B d f + n \times B d f = 0.$$

And by Transposition, Division and Resitution.

$$\overline{r-2n+1} \times B f + m n + n \times B f = \overline{r-n+1} \times A e.$$

$$\text{Whence } B = \frac{\overline{r-n+1} \times A e}{\overline{r-2n+1} \times f + m n + n \times f} = \frac{\overline{r-n+1} \times A e}{m n + r - n + 1 \times f}.$$

In like manner,

$$C = \frac{\overline{2n-r-1} \times B e}{m n + r - 2n + 1 \times f},$$

Whence it is evident that $A dx^{r-n+1} + B dx^{r-2n+1} + C dx^{r-3n+1}, \text{ \&c.}$

$$\times e + f x^n \Big|^{\frac{m+1}{p}} = \frac{d}{m n + r + 1 \times f} \times x^{r-n+1} + \frac{d}{m n + r + 1 \times f} \times \frac{\overline{r-n+1} \times e}{m n + r - n + 1 \times f}$$

†

xx

$$x x^{r-2n+1} + \frac{d}{mn+r+1 \times f} x x^{r-n+1} \times \frac{n-r-1 \times de}{mn+r-n+1 \times f} \times \frac{2n-r-1 \times de}{mn+r-2n+1 \times f} x x^{r-3n+1}, \&c. x e + f x^n \Big|^{m+1} = S: d r x \times e + f x^n \Big|, Q. E. I.$$

In which it may be observed, That the Exponents of the Terms of the Indeterminate Series before the Radical Sign may be taken different from those above, provided that the Exponent of the first Term be not less than $r-n+1$, and that the following Exponents proceed regularly: That the Exponents of the Terms before the Radical Sign may be continually increased or decreased by n ; for in either Case the Terms of the Fluxion of this assumed Equation will become homologous to those of the given Fluxion: That when the Exponents increase regularly by n , the Fluent will consist of a finite Number of Terms, when $\frac{r+1+mn}{-n}$ is equal to a positive whole Number: And that when the Exponents decrease regularly by n , the Fluent will

consist of a finite Number of Terms, when $\frac{r+1}{n}$ is equal to a positive whole Number.

This General Theorem may easily be applied to find the Fluent of any given Fluxion included

in the General one $dx^r \times x e + f x^n \Big|^{m+1}$. V. G.

To find the Fluent of $a x \times \sqrt{ax-aa}^{\frac{1}{2}}$. I put the same equal to the General Fluxion, viz.

$$dx^r \times x e + f x^n \Big|^{m+1} = a x \times \sqrt{ax-aa}^{\frac{1}{2}}.$$

Then $d=a$, $f=0$, $f=a$, $n=1$, $m=\frac{1}{2}$, $e=-aa$; and if we substitute the said particular Values of d, r, f, n, m, e in the General Fluent, we shall have

$$\frac{d}{mn+r+1 \times f} x x^{r-n+1} + \frac{d}{mn+r+1 \times f} x \frac{n-r-1 \times de}{mn+r-n+1 \times f} x x^{r-2n+1} + \frac{d}{mn+r+1 \times f} x \frac{n-r-1 \times de}{mn+r-n+1 \times f} x \frac{2n-r-1 \times de}{mn+r-2n+1 \times f} x x^{r-3n+1} + \&c. x e + f x^n \Big|^{m+1} = \frac{a}{\frac{1}{2}+1 \times a} x x^{0-1+1} x \sqrt{ax-aa}^{\frac{1}{2}+1} = \frac{1}{3} x \sqrt{ax-aa}^{\frac{3}{2}} = S: ax \sqrt{ax-aa}.$$

Q. E. I.

I have hitherto explained the General Methods of finding the Fluent of any Fluxion by help of Series's, and therefore shall not farther insist on these or other Methods invented for the same Purpose, but refer the Reader (who desires to have a fuller Account of them) to a late Learned Treatise, writ by that excellent Analyst G. Cheyne, M. D. and entitled Fluxionum Methodus Inversa.

Since the Business of Infinite Series is sometimes tedious and too perplex'd, several other particular Methods have been invented to find the flowing Quantity of a Fluxion. It shall suffice, in this Place, to give the Reader an Idea of them, which will become more plain and familiar by several other Examples, to be seen in their proper Places.

Example I.

Let it be required to find the Flowing Quantity of $x \sqrt{2rx-xx}$. On the Center C, with

the Radius $CB=r$, describe the Semi-circle AMB , and suppose $AP=x$; then is $PB=$

Vol. II.

$2r-x$, and $MP = \sqrt{2rx-xx}$, and $Pp = x$; therefore the Fluxion of the Area, viz. the Parallelogram Mp is $= x \sqrt{2rx-xx}$, and consequently the Sum of all the $x \sqrt{2rx-xx}$, that is, the Flowing Quantity of the given Fluxion is equal to the Semi-segment AMP .

Example II.

Let it be required to find the Flowing Quantity of $\frac{rx\dot{x}}{2\sqrt{2rx-xx}}$. Draw the Lines AM ,

Am , infinitely near each other, MP, mp , perpendicular to the Diameter AB , and MR perpendicular to Am ; then by the Property of the Circle $AM = \sqrt{2rx}$, and Rm the Fluxion

thereof is $\frac{r\dot{x}}{\sqrt{2rx}}$. Now because the Triangles

APM, MRm , are (the Angles AMP and MmR standing on equal Arches of the Circle)

similar, it is $PM(\sqrt{2rx-xx}):AP(x)::Rm$

$\left(\frac{r\dot{x}}{\sqrt{2rx}}\right):MR = \frac{rx\dot{x}}{\sqrt{2rx} \times \sqrt{2rx-xx}}$;

and consequently the infinitely little Sector MAR

$= \frac{1}{2} AR \times MR$ is $= \frac{rx\dot{x}}{2\sqrt{2rx-xx}}$ = to the

given Fluxion: Whence it is evident that the

A a a

Segment

Segment $AO MA$ is the flowing Quantity of the given Fluxion.

Example III.

Let it be required to find the flowing Quantity of this Fluxion $xx \times 2\sqrt{2rx - xx}$. On

the Center C , with the Radius $CA = r$, describe the Circle $AFEM$; and suppose $AP = x$, $PP = x$, $PE = 2r - x$, the Circumference $AFEM = c$; then, I say, that the Sum of all the $xx \times 2\sqrt{2rx - xx}$ is $= \frac{crr}{2}$.

Demonstration.

Let the Circle $AFEM$ be the Base of an upright Cylinder, and the Parallelogram $ABDE$ the Section of the Cylinder thro' its Axis, AB the Height of the Cylinder is equal to AE the Diameter of the Base. Draw the Diagonal AD , then a Plane passing thro' AD , and perpendicular to the Plane BE , will divide the Cylinder in two equal Parts, and cut off the Semi-quadrantal Ungula ADE . Now the Fluxion of this Ungula is equal to the Parallelogram Qm , multiplied into its Height PR or AP (because the Angle RAP is equal to 45°) $= xx \times 2\sqrt{2rx - xx}$; and consequently the Sum of all the $xx \times 2\sqrt{2rx - xx}$ is (when AP becomes equal to AE , or $x = 2r$) equal to the Semi-quadrantal Ungula $ADE = \frac{crr}{2}$. Q. E. I.

And thus innumerable Instances might be assign'd, to assist us in finding the flowing Quantity of any Fluxion, without having immediate Recourse to an Infinite Series.

INVERSE Method of Tangents, is the Method of finding an Equation to express the Nature of a Curve in an Equation, express'd in the nearest Terms. This depends on the Problem of finding the fluent or flowing Quantity, by having the Fluxion given (of which see the Inverse Method of Fluxions above given.) And the Art of doing it Mr. Hayes (in *Fluxions*, p. 48.) shews after this manner.

At Page 33. he had shewn how to deduce Universal Rules for drawing Tangents to all sorts of Geometrical Curves, when the given Equation expresses the Relation between the Ordinate and the inter-

cepted Diameter. And therefore he states his 16th Proposition thus:

An Equation expressing the Value of the Subtangent of any Curve, in the nearest Terms being given: 'Tis requir'd to find the Equation expressing the Nature of the Curve.

1. What I mean by the nearest Terms will be best explain'd by an Example.

Suppose $PT = t$, $AP = x$, $PM = y$, $MT = s$; and let the Equation expressing the Nature of

the Curve be $y^3 + ayy = x^3 + bxx$; Then the Sub-tangent TP will be $t =$ (Hayes, Sect. 10.

Art. 61.) $\frac{3y^3 + 2a yy}{3xx + 2bx}$. Now I call these Terms,

expressing the Value of the Sub-tangent, the nearest, because they immediately flow from the Equation of the Curve: But if this Value of the Sub-tangent be changed, by applying the Equation of the Curve; v.g. If we put $3y^3 = 3x^3 + 3bxx$

$- 3a yy$; and consequently $t = \frac{3x^3 + 3bxx - ayy}{3xx + 2bx}$,

such I call Remote Terms.

Now if the Value of the Sub-tangent be express'd in the nearest Terms, the Equation of the Curve may be investigated in this manner.

Let the Curve (Hayes, Fig. Art. 77.) AMm be described, and draw MT to touch the Curve in M ; then suppose the Abscissa $AP = x$; the

Ordinate $PM = y$, $Pp = \dot{x}$, $Rm = \dot{y}$; then because the Triangles mRM , MPT are similar;

therefore $mR(\dot{y}) : RM(\dot{x}) :: PM(y) : PT$

$= \frac{y\dot{x}}{y}$. Put this Value of the Sub-tangent equal

to its Value given in the nearest Terms; clear the Equation of the Fractions, and find the flowing Quantity of each Term; so have you the Equation of the Curve.

Example I.

Let it be required to find the Equation of the Curve AMm , the Value of the Sub-tangent PT

being $= \frac{2y^3}{3rr}$. The Sub-tangent PT is $=$

$\frac{y\dot{x}}{y} = (exHyp.) \frac{2y^3}{3rr}$; therefore $3rr y \dot{x} = 2y^3 \dot{y}$,

and $3rr \dot{x} = 2y^2 \dot{y}$: And substituting x for $\dot{x}$, and

and y for y : $3rrx \square 2y^3$, and (dividing $3rrx$ by 1 the Exponent of x , and dividing $2y^3$ by 3 the Exponent of y) $3rrx = \frac{3}{2}y^3$, and $9rrx = 2y^3$, which divided by 2, we have $rrx = y^3$, the Equation expressing the Nature of the Curve AMm .

Example II.

Let it be required to find the Property of the Curve AMm , the Sub-tangent PT being $= \frac{2yy}{r}$.

The Sub tangent PT is $= \frac{yx}{y} =$ (by Supposition) $\frac{2yy}{r}$; and therefore $ryx = 2yyy$, and $rx = 2yy$, and (substituting x for x , and y for y) $rx \square 2yy$, and consequently (dividing rx by the Exponent of x , and $2yy$ by 2 the Exponent of y) $rx = yy$, which shews that the Curve AMm is a Parabola.

Example III.

Let it be required to find the Property of the Curve AMm , the Value of the Sub-tangent PT being $= \frac{3y^3 + 2byy}{3xx + 2ax}$.

The Sub-tangent PT is $= \frac{yx}{y} = \frac{3y^3 + 2byy}{3xx + 2ax}$.

Therefore $3xx\dot{x} + 2ax\dot{x} = 3y^2\dot{y} + 2by\dot{y}$ and (putting x for x , and y for y) $3x^3 + 2ax^2 \square 3y^3 + 2by^2$, and (dividing every Term by the Exponent of the Flowing Quantity therein) $x^3 + axx = y^3 + byy$; which Equation expresses the Nature of the Curve AMm .

But because this Method depends on that *Problem*, to find the Flowing Quantity of any Fluxions, with which the Reader is yet supposed to be unacquainted, I shall desist from prosecuting the same any further at present, and content my self to deduce the Solution of the present *Proposition* from the (*Hayes*, Art. 61.) sixth preceding; this being nothing else but the *Reverse* of that.

That we may be able to proceed with the greater Certainty in this Enquiry, it will be necessary to observe from the forecited Place:

1°. The Sub-tangent t is always of one Dimension, and is express'd by a Fraction.

2°. When the Value of the Sub-tangent is expressed in the nearest Terms, then the Numerator of the Fraction consists only of those Terms wherein the Ordinate y , (or the Tangent s) is found.

3°. And if all the Terms of the Equation of the Curve be simple Terms, then the intercepted Diameter x never occurs in the Numerator; nor the Ordinate y , Tangent s , or Curve z , in the Denominator.

4°. But if the Equation of the Curve contain mix'd Terms, then both x , z , s and y may be found in both parts of the Fraction; but with this Condition, That the Fraction being reduced to an Equation, and all the Terms of the Equation being brought over to one side, and every t changed into x , and every s into z , every mix'd Term will be found as often as there are variable Quantities in the same. And the Coefficients, or prefixed Numbers, will be equal or proportional to the respective Exponents of the Powers of the variable Quantities.

5°. Whence it follows, that the Signs of the Terms, wherein the same variable Quantities occur, are the same, after a due Division by the prefix'd Numbers (or rather by the Exponents of the variable Quantities.)

Hence to resolve the *Problem* concerning the

Inverse Method of Tangents.

1°. Change every t into x , and every s into z (denoting the Curve) and transpose all the Terms to one side of the Equation, and diligently observe whether all the Terms are Simple, or some Simple and others Mixt.

2°. If all the Terms be Simple, divide every Term by the Exponent of the Intermediate or Flowing Quantity in the same; so have you the Equation expressing the Nature of the Curve.

3°. And if there be any mixt Terms, then observe (*Hayes*, Sect. 4, 5. Art. 78.) and let every Term containing the same variable Quantities be divided by the Exponent of the Power to which the respective Flowing Quantities are advanced, so that the same Term result from every such Division, and be as often found in the Equation as it has Flowing Quantities.

4°. Retain only one of those mixt Terms which occur more than once in the Equation, and manage the other simple Terms according to *Hayes*, Sect. 2. and there will arise an Equation expressing the Nature of the Curve.

Example I.

Suppose $t = \frac{y^3 + ayy - bby}{xx + ax + bb}$; then (by

Rule 1.) changing t into x , and transposing all the Terms to one side of the Equation, we have $x^3 + axx + bbx - y^3 - ayy + bby$; and because all the Terms are simple Terms, therefore (2.) $\frac{1}{3}x^3 + \frac{1}{2}axx + bbx - \frac{1}{3}y^3 - \frac{1}{2}ayy + bby = 0$, which is an Equation expressing the Nature of the Curve, as was required.

Example II.

Let the Value of the Sub-tangent be $t = \frac{3y^3 + 2ayy - 2xyy - xxy}{3xx + 2xy + yy}$, then we have

(by 1.) $3x^3 + 2yx^2 + y^2x - 3y^3 - 2ayy + 2xyy + xxy$, and because we have the

mixt Terms $2yx$ and yx , also yy , and $2yyx$, each repeated twice, according to the Number of the flowing Quantities; therefore if one of them be divided by the Exponent of x , and the other by the Exponent of y , (3.) there will arise $yx + yyx$ (by 4.) and dividing the simple Terms by the Exponents of the flowing Quantities in each respectively, the Equation expressing the Nature of the Curve will be $x^3 + yxx + yyx - y^3 - ayy = 0$.

Example III.

And the Method is the same if the Curve z enter into the Value of the Sub-tangent, v.g. suppose

$$t = \frac{6ay^2z + 4ay^2z + aay^4 - yxxz^3 - 2yxxz^2s}{2yxz^3}$$

change every t into x , and every s into z ; and transpose all the Terms over to the same Side of the Equation, and then we have $2yz^3xx + yxxz^3 + 3yxxz^2 - 6ay^2zz - 4ay^2zz - aay^4$.

Wherein the Term $yxxz^3$, containing three flowing Quantities, is found thrice, and the Term ay^2zz , containing two, is found twice: And because those mixt Terms being divided by the respective Exponents of the Powers of the flowing Quantities, the same Quotient always results; it is plain, that the Value of the Sub-tangent is given in the nearest Terms; and therefore the Equation expressing the Nature of the Curve will be $yz^3x^2 - 2ay^2zz - \frac{1}{2}aay^4 = 0$: Or adding any determinate Quantity bb ; $yz^3x^2 - 2ay^2zz - \frac{1}{2}aay^4 + bb = 0$.

Hence it appears that a determinate Quantity may be added to the Equation of the Curve; which is plain from the direct Method of Tangents; because then when we investigate the Value of the Sub-tangent, all the Terms consisting of invariable Quantities are rejected and vanish: And this is sometimes absolutely necessary, v.g.

Suppose $t = \frac{-xy}{2x+y}$: then we have $2xx + yx + xy$; and consequently $xx + xy = 0$: And because this Equation has no true Root, therefore we must add a determinate Quantity, and then the Equation of the Curve may be $xx + xy = bb$.

C O R O L L A R Y.

Hence, if the Value of the Subnormal (Fig. Hayes, Art. 82.) PQ be given, the Property of the Curve may be found. For the Triangles QMP , MTP are similar; therefore $QP:PM::PM:PT$; and if PQ be $= q$, then $t = \frac{yy}{q}$. Whence the Equation of the Curve may easily be (Hayes, Art. 78, 79.) found.

The Property of the Curve may be investigated otherwise, thus: The Triangles mRM , QPM , are similar; therefore $MR(x):Rm(y)::PM(y):PQ = \frac{yy}{x}$, and putting this equal to the Value of the Subnormal given, the Property of the Curve may be (Hayes, Art. 77.) found.

Example.

Suppose $PQ = \frac{aax}{2yy}$; then is $\frac{yy}{x} = \frac{aax}{2yy}$, and

$aaxx = 2y^3y$; and (substituting x for x , and y for y) $aaxx \square 2y^4$; therefore (dividing the Terms by the Exponents of x and y respectively) $\frac{1}{2}aaxx = \frac{1}{2}y^4$. Whence $ax = y^2$, which shews that the Curve AMm is a Parabola.

INVEST. To Invest, in the Law, signifies to give Possession: And the Action of doing this, which is attended in different Places with different Ceremonies, Forms and Customs, is called INVESTITURE.

INVOYCE, 12 Car. 2. c. 34. is a Particular of the Value, Custom and Charges of any Goods sent by a Merchant in another Man's Ship, and consign'd to a Factor or Correspondent in another Country.

JOBENT Nails, are a smaller sort, commonly used to nail thin Plates of Iron to Wood.

JOINT-Tenants, are such as come to, and hold Lands or Tenements by one Title *pro Indiviso*, or without Partition.

These are distinguish'd from Sole, or Several Tenants; from Parceners, and from Tenants in Common: And anciently they were called *Participes*, and not *Heredes*: And these must jointly implead, and jointly be impleaded; which Property is common to them and to Coparceners. But Joint-Tenants have a sole Property of Survivorship, which Coparceners have not: For if there be two or three Joint-Tenants, and one hath Issue and dies, then he, or those Joint-Tenants that survive, shall have the whole by Survivorship.

JOISTS, in Architecture, are such Pieces of Timber as are framed into the Girders and Summers, and on which the Boards of the Floor are laid.

JOYNDER, in Law, is the coupling or joining of two Persons in one Action or Suit against another.

JOYSTS. See JOISTS.

IRON. In the Forest of Dean in Gloucestershire, the best Iron Ore is of a bluish Colour, and is called *Brus Ore*: But this being melted alone produces a Metal very short and brittle: To remedy which Inconvenience they make use of Cynder, which is found in great Quantity where any old Works have been in that County: For in former Times, their Bellows being moved only by Hand, their Furnaces produced a Fire much less intense, than those they now employ: So that formerly they melted down only the principal Part of the Ore, rejecting the rest as useless. This Refuse is the Cynder; which being mingled with the Ore in a due Quantity, gives it that excellent Temper of Toughness, for which this Iron is preferred before any brought from abroad.

The Ore is first calcined in Kilns, like ordinary Lime-Kilns, which they fill up to the Top with Coal and Ore, S.S.S. Then putting Fire to the Bottom, they let it burn till the Coal be wasted. This is done without Fusion of the Metal, and serves to consume the more droffy Part of the Ore, and to make it friable. From hence they carry it to the Furnaces, which are built of Brick or Stone, about 24 Foot square on the Outside,

Outside, and near 30 Foot in Height. Within they are not above 8 or 10 Foot over in the middle, and the Top and Bottom have a yet narrower Compass; so they are almost of the Shape of an Egg. Behind the Furnace are placed two very large Pair of Bellows, whose Noses meet at a little Hole near the Bottom. These are compressed together by certain *Buttons* placed on the Axis of a very large *Overshot Wheel*.

The Furnaces are at first filled with Ore and Cynder, intermix'd with Fuel, which in these Works is always of Charcoal, laying them hollow at the Bottom, that they may the more easily take Fire. But after they are once kindled, the Materials run together into a hard Cake or Lump, which is sustain'd by the Fashion of the Furnace; and through this the Metal, as it melts, trickles down into the *Receivers*, where there is a Passage open, by which they clear away the Scum and Dross. Before this lies a great Bed of Sand, wherein they make Furrows of what Fashion they please, into which they let their Metal; which is made so very fluent by the Violence of the Fire, that it continues boiling for a good while. The Furnaces are kept at work Day and Night for many Months, still supplying the Waste of the Fuel and other Materials with fresh, pour'd in at the Top.

From these Furnaces they bring their *Sows* and *Pigs of Irons* (as they call them) to their *Forges*. These *Forges* are of two sorts, tho' standing together under the same Roof: And one they call *Finery*, the other their *Chafery*. Both of them are on Hearths, on which they place great Heaps of *Sea-Coal*, and behind them Bellows, like the former, but not near so large. Into their *Finery* they first put the *Pigs of Iron*, placing three or four of them together behind the Fire, with a little of one End thrust into it; where softning by Degrees, they stir and work them with long Bars of *Iron*, till the Metal runs together into a round Mass or Lump, which they call an *Half Bloom*. This they take out, and giving it a few Strokes with their *Sledges*, they carry it to a great weighty *Hammer*, raised by the Motion of a Water-Wheel; where applying it dextrously to the Blows, they presently beat it out into a thick short Square: This they put into the *Finery* again; and heating it red hot, they work it out under the same Hammer, till it comes to be in the Shape of a Bar in the middle, but with two square Knobs on the Ends. Last of all, they give it other Heats in the *Chafery*, and more Workings under the Hammer, till they have brought their *Iron* into Bars of several Shapes and Sizes. If they omit any one Process, it will be sure to want something of its *Toughness*, which they esteem its Perfection.

For the Backs of Chimneys, Hearths of Ovens, or the like, they take the melted Metal out of the *Receivers* in great Ladles, and pour it into Moulds of fine Sand. *Philos. Trans. N° 137.*

At *Milthorpe* in *Lancashire* they have several Sorts of *Iron-Stone*, some of it making *Coldshire-Iron*; that is, such as is brittle when it is cold. Another sort makes *Redshire*, which is such as is apt to break if it be hammer'd when 'tis of a dark red Heat; and therefore they are never melted down but in Mixture, and so they yield an indifferent good sort of *Iron*. They have of late made it much better than before, by melting the *Sow-Metal* over again, as likewise by using Turf and Charcoal; whereas formerly the Fuel was only Charcoal.

They first burn the *Iron-Stone*, and then for every seventeen Baskets of this burnt Stone they put in one of *Lime-Stone*, *unburnt*, to make it melt freely and cast the Cynder, which they always take off from the melted *Iron*, before they let it run.

The Bottom of the Furnace is about two Yards square, and so rises perpendicularly for a Yard or more, which is also lined within with a Wall of the best Fire-stone, to keep off the Force of the Fire from the Walls of the Furnace. The Bellows, which are very large, and moved by Water, enter about the middle of the *Focus*: The rest of the Furnace is raised above this six or seven Yards square-wise, but tapering; so that the top Hole, where they throw in the Mine and Fuel, is but half a Yard square. When they find it to have subsided about a Yard and Quarter, they fill the Furnace again.

Their *Forge* is much like that of a common Blacksmith's, about one Yard and half over, and of the same Height. The *Hearth* is all of *Sow-Iron*, much of the Shape of a Broad-brim'd Hat, with the Crown downwards. The hollow Place they fill and heap up with Charcoal, and lay the Ore (first broken into Pieces as big as a Pigeon's Egg) all round about the Charcoal on the flat *Hearth*, to bake it as it were, or Neal it; thrusting it by little and little into the Hollow, and keep blowing for twelve Hours. Then they pull out a Stopple at the Bottom of the Wall, and out comes all the *Glassy Cynder*, being very liquid, leaving the *Iron*, which is never in a perfect Fusion, in a Lump at the Bottom: This they take out with great Tongs, and turn it under heavy Hammers moved by Water, which at the same time beat off, or rather squeeze out the fluid *Scoria* or Dross, and after several Heats form it into Bars. They use no *Lime-Stone*, or any thing else, to promote the Flux. They get about 100 Pound Weight of Metal at one *Melting*, out of about three times as much Ore.

The *Iron Mine* in *Suffex* lies from four Foot deep to forty and upwards. There are several sorts of Mine, some hard, some gentle, some rich, some poor, some fine, some coarser. The *Iron Masters* mix different sorts of Mine together, otherwise it will not melt to so good an Advantage.

When the Mine is brought in, they take Small-coal, and lay a Row of that and a Row of Mine alternately, *S. S. S.* one above another; and setting the Coals on Fire, therewith burn the Ore. This is done to mollify it, that so it may be broken in small Pieces, otherwise it would not melt in the Furnace, but come away whole: Nor must it be over-burnt; for then it will *loop*, as they call it, that is, run together in a Mass.

After 'tis burnt, 'tis beat into small Pieces with an *Iron Sledge*, and then put into the Furnace, which is before charged with Coals, on the Top of which it is cast, where it melts and falls down into the *Hearth* in about twelve Hours more or less, and then 'tis run into a *Sow*.

This *Hearth* is made of Sand-Stone, as also its Sides round to the Height of about a Yard; and then the rest of the Furnace is lined up to the Top with Brick.

When they begin upon a new Furnace, they put Fire for a Day or two before they begin to blow: Then they blow gently, and increase by Degrees, till they come to the Height in ten Weeks or more. Every

Every six Days they call a *Founday*, in which time they make 8 Ton of Iron; that is, if you divide the whole Sum of Iron they make by the *Founday*; or at first they make less in a *Founday*, at last more.

The *Hearth*, by the Force of the Fire continually blown, grows wider and wider; so that if at first it contains so much as will make a *Sow* of 600 or 700 Pound Weight, at last it will contain so much as will make a *Sow* of 2000 Pound. The lesser Pieces of 1000 Pound, and under, they call *Pigs*.

Of twenty four Load of Coals, they expect eight Ton of *Sows*. To every Load of Coals, which consists of eleven Quarters, they put a Load of Mine, containing eighteen Bushels.

A *Hearth*, if made of good Stone, will ordinarily last forty *Foundays* or Weeks; during which time the Fire is never let go out. They never blow twice on one *Hearth*, tho' they go upon it but five or six *Foundays*. The *Cynder*, like Scum, swims upon the melted Metal in the *Hearth*, and is let out once or twice before a *Sow* is cast.

The Manner of Working Iron at the Forge or Hammer.

In every Forge there are two Fires at least, which, as before is observed, are called, one the *Finery*, and the other the *Chafery*.

At the *Finery*, by the Working of the Hammer, they bring it into *Blooms* and *Anconies*, thus: They roll the *Sow* at first into the Fire, and then melt off a Piece of about $\frac{1}{4}$ of a hundred Pound Weight; which, as soon as 'tis broken off, they call a *Loop*. This *Loop* they take out with their *Shingling-Tongs*, and beat it with Iron Sledges on an Iron Plate near the Fire, that so it may not fall in Pieces, but be in a Capacity to be carried under the Hammer; where it is beat very gently at first, only to draw *Cynders* and *Dross* out of the Matter: But afterwards they let out or draw more Water, and so by degrees beat it thicker and stronger, till they bring it to a *Bloom*; which is a four-square Mass, about two Foot long. This Operation they call *Shingling the Loop*. This done, they immediately return it to the *Finery* again; and after two or three Heats, and Working, they bring it to an *Ancony*, whose Figure is in the middle a Bar of about three Foot long, and of the Shape they intend the whole Bar shall be made of; but at both Ends is a square Piece left rough, to be wrought at the *Chafery*.

Note, At the *Finery* three Load of the biggest Coals go to the making of one Tun of Iron.

At the *Chafery* they only draw out the two Ends suitable to what was drawn out at the *Finery* in the middle, and so finish the Bar.

Note, One Load of smaller Coals draws out a Tun of Iron at the *Chafery*.

At the *Finery*, they expect that one Man and a Boy should make two Tun of Iron in a Week; and at the *Chafery*, that two Men should take up, that is, make or work five or six Tun in a Week.

One thing is remarkable here: They say, That if into the *Hearth* where they work the Iron *Sows* (whether the *Finery* or the *Chafery*) you cast on the Iron a piece of Brass, it will hinder the Metal from Working, causing it to spatter about

so, that it cannot be wrought into a solid Piece. Ray's Collect. of English Words, at the End.

IRREGULARITY, in the Canon-Law, signifies an Impediment, which will hinder a Person's going into Holy Orders, as being a *Bastard*, *Maimed*, *Consenting to a Murder*, &c.

IRREPLEVABLE, in the Common-Law, signifies what may not be *Replevied*, or set at large, upon *Sureties*.

ISOCHRONAL-LINE, is that in which a heavy Body is supposed to descend without any Acceleration. And the Excellent G. G. Leibnitz, in the *Act. Erud. Lips.* for Febr. 1689. hath a Discourse on this Subject; in which he shews, That an heavy Body, with a Degree of Velocity acquired by the Descent from any Height, may descend from the same Point, by an infinite Number of *Isochronal-Curves*, and which are all of the same Species, differing from one another only in the Magnitude of their Parameters; such as are all the *Quadrato-Cubical Paraboloids*, and consequently similar to one another.

He shews also there how to find a Line, in which a heavy Body descending shall recede uniformly from a given Point, or approach uniformly to it.

ISTHMUS, in Anatomy, is a Passage in that part of the *Medulla Oblongata* of the Brain, which lies between the *Cerebrum* and *Cerebellum*, and which reaches from the place called the *Anus* to the fourth Ventricle. The Upper Part or Cover of this Conduit or Passage, which is betwixt the *Testes* and the foremost Vermicular Process of the *Cerebellum*, and to which two it is tied at its two Ends, and to the Processes that come from the *Cerebellum* to the *Testes*, at its Sides, is called *Valenta Major*: It is of a Medullary Substance; and its Use is to keep the *Lympha* from falling out above the Nerves in the *Basis* of the Skull.

ITALIAN Hours, are the 24 Hours of the Natural-Day, accounted on from the Sun-setting of one Day, to the same time again the next Day, as 'tis the Custom in Italy to do at this day, and as the Jews did of old.

ITINERANT Judges or Justices, are such as were formerly sent with Commission into divers Countries, to hear chiefly such Causes as were called *Pleas of the Crown*, the same with *Justices in Eyre*; which see.

JUBILEE, is a solemn Time of Festivity at Rome, in which the Pope pretends to give Pardons, Indulgencies, and Blessings, to such rich credulous Persons as have as much Money as Faith, and who have leisure enough to go thither to fetch them. The first Jubilee is said to have been Instituted by Pope Boniface VIII. A. D. 1300. to return every Hundred Years. But Pope Clement VI. thought such a Fair of Indulgencies should be kept oftner; and so he order'd that the Jubilee should return again every Fifty Years; which was decreed A. D. 1350.

In Imitation of this profitable Pardon-Market at Rome, the Monks of Christ's-Church in Canterbury set up a Jubilee of their own every Fiftieth Year also, to get a Concourfe of Fools to the Shrine of that insolent Prelate Thomas Becket.

Our King Edward II. kept a kind of Civil Jubilee at his Court in the Fiftieth Year of his own Age, which was in 1362, granting Pardons, Privileges, and other Civil Indulgencies.

JUDICIUM Dei. Our Ancestors used to call those now prohibited Trials of guilty Persons by *Ordeal*, *Judicium Dei*, the Judgment of God: See *Ordeal* in this Volume.

JUGUM Terræ, is half an Arpent or fifty Perches, mention'd in *Domesday-Book*, and interpreted there to contain half a Plough-land.

JUPITER. The Calculation of the Eclipses of *Jupiter's* Satellites, being a thing of great Use for determining the Longitude of Places on the Earth, I judg'd it necessary to insert the Manner and Method of it here, from Mr. *Whiston's Praelectiones Astronomicae*, p. 219.

He takes for an Example an Eclipse of the first Satellite; because, both those Excellent Astronomers, *Cassini* and *Halley*, have shewn how to calculate that by proper Tables; and that the same Method will serve to find the Eclipses of the other Satellites of this Planet.

And he observes that these *Cassinian* Tables are formed after a new and accurate Method, and will give the Moment of the Eclipses in as new and accurate a Way.

It is supposed there, That the Periodick Time of this first Satellite is precisely one 2448th Part of the Periodick Time of *Jupiter* from one Aphelion to another. Whence the Equations of the Jovial Orbit being turn'd in Minutes of Time, and adapted to those particular Revolutions of the Satellites, will make good the principal Parts of the Equation of these Eclipses. 'Tis to be observed also, that these Tables suppose the Aphelion of *Jupiter* to be in the Beginning of the 9th Degree of *Libra*; and that the Orbit of the Satellite is so little distant from the Plane of the Orbit of *Jupiter*, or also of the Ecliptick, that the Differences thence arising may usually not be taken notice of. Note also, That in the accurate Calculation of these Eclipses, there is need of another Equation, according to the various Position of the Earth to *Jupiter*. Which Restitution of the Position, suppose the Opposition of the Sun and *Jupiter*, contains $22\frac{5}{8}$ Periods of this Satellite.

The first Observer of this Equation, Mr. *Romer*, asserts, That 'tis in its greatest Quantity 22 Minutes of Time; but *Cassini* saith it don't exceed 14 Minutes and 10 Seconds. The Cause of this Equation is the successive Propagation or Motion of Light; which is by no means instantaneous. And from this Fountain the Equations of the $22\frac{5}{8}$ Revolutions of the second Satellite, being respectively adapted, do compleat the second Parts of these Eclipses. But a little Table may also be added, shewing the *Half-Stay* of the Satellite in the Shadow of *Jupiter*, accommodated to the former Periods of 2448. For as *Jupiter* accedes to the Sun, the Shadow increases; and as he recedes from the Sun, it decreases. But this Equation is so inconsiderable, that it may most safely be omitted. There is added also, as there ought, a Tablet, shewing the *Half Duration* of the Satellite in the Shadow of *Jupiter*, according to the different Position of the Satellite with respect to the Nodes and Limits: For tho', as was said above, the Angle of the Inclination of the Plane of the Satellite's Orbit be not great, 'tis yet something: And therefore about the Nodes of the Orbit, the Immersion will be more direct and deep in the Shadow, than about the Limits: And these Tables, together with the common

one of the Equation of Time, and no other, according to Mr. *Halley's* Judgment, are to be used in the Calculation of the Eclipses of this Satellite.

In order to Calculation then,

1. From the Table of the *Epochæ* of the Revolutions of the first Satellite to the Shadow of *Jupiter* (which you will find amongst the Astronomical Tables, under those Words in this Vol. 2.) find first the Year in the left Hand Column, and then write down the Numbers that stand against it, expressing the Days, Hours, Minutes, and Seconds of the Revolution; and also those in the other two Columns, N° 1, N° 2. Under these Numbers place also in their proper Order (from the next Table) those which belong to the Month and Day assign'd, with those also in the little Columns, N° 1, N° 2. And then add them all severally, as they stand in order, into one Sum. Then will the first of those Sums shew the middle Moment of the middle of the Eclipse: The second serves for the first Equation: The third finds the second Equation; that is, if you write down also in every *Leap-Year*, and in the Months of *January* and *February*, the Day next after the given one, instead of the given Day, with its Equations: For the Table accommodated, as it should be, to the greater Part of the *Leap-Year*, can't serve without Correction for the former Part of the Year, before the interposed *Leap-Year* Day.

2. If the Number placed in the former Column, and appointed for the former Equation, be less than 1224 (the half of the greatest 2448) that greatest Number itself also, if it be needful, being, as the entire Circle, first omitted, go to the next following Table agreeing to that Equation, and add the Equation there placed to the middle Time of the Eclipse before found. If the Sum exceed the half of the greatest Number, subtract the Equation corresponding to it from the middle Time of the Eclipse: Then will the Sum in the former Case, and the Difference in the latter, give you the Time of the middle of the Eclipse equated the first Time.

3. If the Number placed in the latter Column, and either increased by the eleventh Part of the former Equation, where the first Equation was found by Subtraction; or lessened by it, where it was gain'd by Addition; be less than 113, the half of the greatest Number 225.4 (that greatest also itself, where 'tis necessary, being quite rejected); Then take that very Number, or if it be greater than the same half, its Complement to the greatest Number, and apply it to find the second Equation; and add the proper corresponding Numbers, taken out of the Table, to the first Equated Time of the middle of the Eclipse. So shall the Sum of both be the true Moment of the middle of the Eclipse. From which Moment of Time, if you subtract the *Half Duration* of the same Eclipse (taken easily out of the next following Table) you will have the Moment of the Immersion; if you add it to that Time, you will have the Moment of the Emer-sion, and both duly accommodated to the mean Time of the Eclipse.

And these few Rules and Operations are fully sufficient for the Calculation of these Eclipses; only I shall add an Example to make all plain and clear.

The

	D.	H.	'	"	Numb. 1.	Numb. 2.
The Year 1702.	1	14	50	36	2292	78.9
The Day November	23	10	11	00	0185	184.0
November	25	01	01	36	2477	262.9
Equation 1 +	00	00	03	06	2448	.3
Time first Equated	25	01	04	42	29	262.6
Equation (2) +	00	00	03	29		225.4
The Half Stay +	00	01	04	39		37.2
The equal Time of the Emerfion	25	02	12	50	11) 3,1 (.3	
The Equation of Time +	00	00	08	25	⊙ in ♄ 14	
The apparent Time of the Emerfion	25	02	21	15	p. m.	

But since this Eclipse happens in the Day-time, viz. Nov. 25. at 2 Hours, 25 Minutes, and 15 Seconds past Noon; a Period or two must be added, to find when one will happen in the Night-time.

D. H. ' "

The Radix is - - - 25 02 21 15 p. m.
Add one Revolution 1 18 28 36

The Sum will be 26 20 49 51 p. m. for the Time of the next Emerfion.

Which Eclipse being also invifible, add to the last Sum another Revolution.

D. H. ' "

26 20 49 51
1 18 28 36

28 15 18 27 p. m. which will be the Time of the next vifible Emerfion of the Satellite in the Meridian of London.

And thus may the Times of the Eclipses of the Satellites of Jupiter be calculated with great Exactness for the Meridian of any particular Place, and Tables made of them for any Time to come. And wherever, under any other Meridian, the exact Moment of the Eclipse of a Satellite can, by a good Telescope, be observ'd; the Time of its happening fooner or later than the Tables shew it will do, at London (fuppofe, or for any other Meridian) will shew how much the Meridian of the Observer is diftant either East or West from the Meridian of London: That is, the Difference of the Longitude between these two Places will be known.

JURIDICAL Days, the same with Court-Days.

JURISDICTION, is a Dignity which a Man has conferr'd on him to do Justice in Cafes of Complaint made before him. Of this there are two Kinds; one, which a Man hath by reason of his Fee, of doing Right in all Plaints relating to his Fee, by Vertue thereof. The other is collated by a Prince to a Bailiff; which in a large Sense may fignify all fuch as have Commiffion from the Prince to give Judgment in any Cafe.

JUS Honorarium, or the *Edicts of the Prætors*, was a Part of the written Roman Laws, and was what the Prætors, and fuch kind of Magiftrates, did propofe by the Consent of the People.

JUS Retrañtus five Retrovendendi, in the Civil Law, is an Agreement between Buyer and Seller, that the latter and his Heirs may buy back the Goods or Wares again before any other.

JUSTICE. The Virtue of Justice is either Universal or Particular. General or Universal Justice is a constant giving to every one his Due; and this hath for its Object all Laws, both Divine and Humane. Particular Justice, is a constant Will and Desire of giving every one his Due, according to particular Agreement, or the Laws of Civil Society. Particular Justice, as 'tis exercifed in Commerce, is ufually called Commutative, and fometimes Expletory Justice, being directed without any Regard to the different Conditions of Men, but obferves the fimple Proportion, and is wholly bent on the Value or Price of Things, or what is really and juftly due. But if you confider Particular Justice, as it is exercifed in Governing, or in Beneficence, it is called Diftributive or Attributive Justice; and is concern'd in the appointing of Rewards and Punifhments, according to the feveral Conditions, Stations and Qualities of Men, according as they are more or lefs good or bad, ufeful or prejudicial, worthy or unworthy. And when there are many Claimers for Rewards, it obferves a Comparative Proportion.

JUSTICE of the Hundred, was formerly the fame with the *Dominus Hundredi*; called alfo *Centurio*, *Centenarius*, and *Aldermannus*.

JUSTICES of Labourers, were Justices heretofore appointed to redrefs the Frowardness of Labourers, that would either be Idle, or have unreasonable Wages.

JUSTICES of the Pavillion, are certain Judges of a Pie-Powder Court, of a moft transcendent Jurisdiction; anciently authorized by the Bishop of Winchester, at a Fair held on St. Giles's Hill, near that City, by Virtue of Letters Patents granted from King Edw. IV. See the Patents at large in Pryn's *Animadv.* on 4 *Inftit.* fol. 191.

JUSTICES of the Peace, are they that are appointed by the King's Commiffion to preferve the Peace of the Country where they dwell. Of these fome are made of the *Quorum*; becaufe fome Bufinefs of Importance cannot be difpatch'd (fee *Quorum*) without the Prefence or Affent of them, or one of them.

The Office and Power of the Justices of the Peace is very large and various, being founded on feveral Statutes; of which, fee *Fitzberbert*, *Lambert*, *Crompton*, and in *Smith de Repub. Aulor.* lib. 2. cap. 9. They were called

Guar-

Guardians of the Peace till the 36 *Edw. 3. cap. 12.* where they are stiled *Justices*. Those that live in, and are Members of Towns, Corporations, &c. are called *Justices within Liberties*.

JUSTICE SEAT, is the highest Court that is held in a Forest, and before the Lord Chief Justice in Eyre of the Forest, upon Warning given forty Days before; and then the Judgments are always given, and the Fines set for Offences, that were presented at the Courts of *Attachments*, and the Offenders indicted at the *Swain-Motes*: See *Manwood's Forest Law, c. 24.*

JUSTICES of Traile Baston, were a kind of

Justices appointed by *Edward the first*, on great Disorders arising in the Kingdom, while he was absent in the *Scotch and French Wars*. Their Office was to make Inquisition throughout the Realm, by the Verdict of substantial Juries, upon all Officers, as Mayors, Sheriffs, Bailiffs, &c. for their Breach or Neglect of Duty, in not punishing Bribery, Extortion, &c. 'Tis most likely they received their Name from a *Baston*, or Staff, that was the Badge of their Office, as it is of a *Mareschal of France*: And whoever was brought before them was *Traile à Baston, traditus ad Baculum*, brought to the Staff of Justice.

K A L

KALENDÆ, were formerly Rural Chapters, or Conventions of the Rural Dean and Parochial Clergy; so called, because they were held on the Kalends, or first Days of every Month; as at first every three Weeks: At last these Conventions came to be held only once a Quarter; and by Degrees have been wholly intermitted, to the great Decay of good Discipline. *Parochial Antiquities, p. 640.*

KALENDAR Month, is mentioned in 16 *Car. 2. cap. 7.* and consists of 30, or 31 Days (except February, which never hath more than 28 Days, excepting *Leap-Year*, and then has 29) twelve of which being those mentioned in the *Kalendar*, make a Year; which hence is vulgarly express'd in the Singular Number, and called a *Twelve Month*: But when in the Plural Number we say *Twelve Months*, then it shall be accounted a *Month of Weeks*, which is but 28 Days.

KALENDAR. There is in Use still in *Staffordshire*, among the common People, a very peculiar Kind of perpetual *Kalendar* or Almanack, which *Dr. Plott*, in his *Natural History* of that County, describes very accurately, and proves to be of *Danish* Invention, and no doubt brought in when the *Danes* had the Government of this Kingdom.

It is called there the *Clogg*, I suppose from its Form and Matter, being usually made of a Piece of Wood, squared into four plane Sides, and with a Ring on the upper End of it, to hang it on a Nail somewhere in the House.

There is some Diversity in the Form of them, some being more perfect than others. The following Figure, which I borrow from *Dr. Plott*, represents the Common or Family Clogg, where each Angle of the *Square Stick*, with one half of each of the flat Sides belonging to it, is express'd; and this is the most clear and intelligible Form it can well appear in, upon a Flat.

On each of the four Sides are three Months, the Number of the Days being represented by the Notches; That which begins every Month having a patulous Stroke turn'd up from it: Every seventh Notch, being also of a larger Size, stands for *Sunday*, which seems to shew that the Cycle of the Sun or Dominical Letters, are here committed to Memory; the *Sundays* and other Days here being fix'd.

Over against many of the Notches, whether great or small, there are placed on the left Hand

K A L

several Marks or Symbols, denoting the *Golden Number*, or Cycle of the Moon; which Number, if under 5, is represented by so many Points; but if it be 5, then a Line is drawn from the Notch, or Day to which it belongs, with a Hook return'd back against the Course of the Line; which seems to be design'd to represent V the Roman Letter for 5.

If the *Golden Number* be above 5 and under 10, then 'tis mark'd out by the former hooked Line for 5; and with the Addition of as many Points as make up the Number design'd, As if it be 8, there are three Points added to the hooked Line, &c.

When the *Golden Number* is 10, there is a Cross on the Notch to represent X; And if it be above, and under 15, 'tis express'd by Points as before; And if above 15, by the cross Stroke, Points, and a hook Line for V: When 'tis 19, the Line issuing from the Notch for the Day, hath two patulous Crosses, or Strokes, as is plain from the following Figure.

And these Numbers are not set so wildly and confusedly against the Days of the Month, as at first Sight may appear, but in a Method and Order; whether you consider them as they immediately precede and follow one another, or the Distance interceding each Figure, or the Value, or Denomination; for every following Number is made by adding 8 to the preceding; and every preceding one, by adding 11 to the following one; still casting away 19, the whole Cycle, when the Addition shall exceed it. Thus to 3, which stands against *January 1*, add 8, it makes 11; which stands against the third Day of the Month; to which add 8 again, and it makes 19; whence 8 itself comes to be the following Figure, and 16 the next: On the contrary, if to 16 you add 11, it makes 27; whence deducting 19, there remains 8, the Number above it; and so on, &c.

And for the Distances of the Numbers of the same Denomination, 'tis to be noted that they stand asunder either 30 or 29 Days, interchangeably. Thus after 3, which stands over against the 1st of *January*, at 30 Days Distance you will find 3 again at the 30th of the same Month; and from thence, at 29 Days Distance, you will have 3 again set to the 1st of *March*; and at the last of *March*, at 30 Days Distance, 3 again, &c.

Note, 3 stands against the 1st of January, because 3 was the Golden Number, when the Fathers of the Nicene Council settled the Time for the Observation of Easter. See Plot, in Loc. cit.

On the Right Hand, and issuing from the Notches, are several Inscriptions and Figures, Hieroglyphically representing the Festival Days, by some Actions, Offices, or Endowments of the Saints; or else the Work or Sport in fashion at the Time of the Year.

Thus from the Notch of January 13. being St. Hillary's Day, issues a Cross, the Badge of a

Bishop. From the 1st of March an Harp for St. David. Against June 29. St. Peter's Day, you have his Keys: And against St. Crispin's Day a Pair of Shoes. Against Jan. 25. St. Paul's Day there is an Ax: And against June 24. a Sword for St. John Baptist. On Aug. 10th a Gridiron for St. Lawrence. So a Wheel for St. Katherine, a Star for Epiphany, a True-Lover's-Knot for St. Valentine's Day, &c. And against Christmas-Day is the old Wassailing, or Carousing-Horn, that the Danes used to make merry withal at that Time.

The Use of this Clogg is chiefly to find by the Prime or Golden Number the Ecclesiastical New

Moons, and the Moveable Feasts; and the Immoveable Feasts by the Symbols on the Right Hand.

KANT-

KANT-Rref, was used anciently in *Wales* for the Government of an Hundred Towns; under which were so many *Commots*, which the *Welch* call *Cwmwd*, and signifies *Provincia* or *Regio*, and consisted of twelve Manors or Circuits, and two Townships.

KARITE, or *Carite*, was the Word used formerly by the *Religious* for their best Conventual Drink, or Strong Beer; because in this they drank their *Poculum Caritatis*, or Grace Cup: Which Grace-Cup itself was sometimes called by the Name of *Karite* or *Carite*.

KEELS or *Keyles*, were a kind of Long-Boats, of great Antiquity, and mentioned 23 H. 8. 18. *Spelman* saith they were those in which the *Saxons* invaded *England*.

KELP, what it is, and how made, see under *Allum Works* in this Vol.

KERF, is the Notch or Slit that is made by the Saw between two Pieces of Wood, when they are sawing asunder.

KERNELLATUS, anciently signified *Embat-telled* or *Crenelled*, i. e. *Fortified*: And

KERNELLARE *Domum*, was to build a House with such Walls and Towers; which to be allow'd to do, was a Favour commonly granted by our Kings after the Demolishments of the Castles.

KEystone in an Arch, is placed at the Top or Vertex of Elliptical or such-like flat Arches, to bind the Sweeps of the Arch together.

KIDNEYS. The Kidneys in Man are always two in Number, one on each Side, being nearly of the Figure of the *French* or *Kidney-Beans*; which latter Name they take from being like the Kidneys.

The Length of the human Kidney is between four and five Fingers Breadth. They are about two Fingers Breadth in Thickness, and three over. The Right Kidney is situated under the Liver; the left under the Spleen.

In a *Fœtus* their external Substance is divided into several Lobes join'd together, which in adult Persons become more close; wherefore in such their Surface is equal and smooth. They have two Membranes; one *Common* from the *Péritonæum*, the other *Proper*. Usually they are cover'd with a good deal of Fat; their Colour is of a dark Red.

There are several *Lymphatic Vessels* observed in the Kidneys, which discharge themselves into *Pecquet's Repository*: The *Veins* go into the *Vena Cava*: The *Arteries* come from the *Aorta*.

Those *Veins* and *Arteries* are called *Emul-gents*: They come out from the Kidneys in their hollow Sides (which lie nearest to the *Cava* and *Aorta*) included in one common *Capsula*, and are divided into several Branches, which surround the *Pelvis*. These Branches are again sub-divided into an Infinity of other lesser ones, which go to the external Parts of the Kidneys, where they inosculate, and form a kind of *Net*; from which their Extremities coming, terminate also in Infinity of Glands, which are all very small.

These Glands are in Figure roundish, and they compose the outer Substance of the Kidneys, which is half a Finger thick. From each of them there goes a long small Tube; and the Collection of these Tubes compose the innermost Substance of the Kidneys.

As these *Tubules* approach the *Pelvis*, they gather together in little Bundles; whose Extremities piercing the Membrane of the *Pelvis*, form those little Protuberances on the Inside of the *Pelvis*, or Cavity in the middle of the Kidney, which are called the *Papillæ*.

This Cavity, or *Pelvis*, is form'd by the Dilation of the *Ureters*: It sends out several Ramifications, which divide the Urinary Tubes into Bundles, and which make a sort of *Capsula* to the Blood Vessels.

The Use of the Kidneys is to separate the Urine from the Blood; which by the Motion of the Heart and Arteries is thrust into the Emulgent Branches, which carry it to the little Glands; by whose Means the Serosity being separated, is received by the Orifice of the little Tubes, which go from those Glands to the *Pelvis*; from whence it runs by the *Ureters* into the Bladder.

The Blood which was carried into the Glands, its Particles being too gross to enter into the small excretory Tubes, is brought back from the Kidneys by the Emulgent Veins, to be mingled with the other Venal Blood in the *Cava*.

The Description of the *Ureters*, *Vesica Urinaria*, *Glandulæ Renales*, &c. you will find in their proper Places.

Dr. Keil, in his *Animal Secretion*, pag. 33. judges that the Kidneys are placed so near the Heart as they are, because Salts are Corpuscles, which are strongly attracted, and have a most close Union with the Fluid of Water: For tho' the Lungs may divide the Particles of Salt one from another, yet still they firmly adhere to the aqueous Humour in which they swim; and therefore they may likewise at first be drawn off: And he thinks that the Kidneys could not well have been placed at a greater Distance, to have separated such a Quantity of Urine as they now do; and that not only on the account of the great Quantities of Blood they receive where they are; but likewise, if they had a more distant Situation, other Particles must have united with the Salts and aqueous Particles (as even in their present Station some terrestrial Particles do) and consequently the Urine could not have been distilled such as it is now, or at least but in a small Quantity.

KING-PIECE in any Building, is a Piece of Timber standing upright in the middle between two principal Rafters, and having Strutts or Braces going from it to the middle of each Rafter.

KINGS at Arms: See *Heralds* in this Vol.

KING-SILVER, is properly that Money due to the King or Queen in the Court of Common-Pleas *pro Licentia concordandi*, in respect of a Licence then granted to any Man for passing a Fine.

KINTAL, is a Weight in Merchandise, usually of about an hundred Pounds, but something more or less, according to the different Customs of different Nations.

KNAVE, is an old *Saxon* Word for a Man-servant, and is so used in 14 E. 3. Stat. 1. c. 3. and *Verstegan* thinks it comes from the *Dutch* *Cnapa*, which signifies the same Thing. *Cnapa* in *Saxon* also is a Male-Child or Boy; and in this Sense a *Knave-Child* hath been frequently used formerly in Contradistinction to a *Girl*; and in this Sense *Wickliff* uses the Word in his Translation of *Exod.* 1. 16. and other Places of the Bible.

B b b 2

KNEVELS,

KNEVELS, the same with *Kevels*.

KNIGHT, *Miles*, from the *Saxon Cnite*, signifies with us a Person that beareth Arms, and who for Valour and Martial Conduct is by the Sovereign, or his Authority, singled from the ordinary sort of Gentlemen, and raised to a higher Step or Dignity. This among almost all Nations takes his Name from the *Horſe*, because they used to serve in War on Horseback. Thus the *Romans* called them *Equites*; the *Italian* Word is *Cavallieri*; the *French*, *Chevaliers*; the *Germans*, *Reyters*; the *Spaniards*, *Gavallares*, &c. It appears by the *Stat. 1 E. 2. c. 1.* That formerly a Gentleman having a full Knights-Fee, and holding his Land by Knight-Service, might be urged by Distress to procure himself to be made Knight when he came to full Age: But by *17 Car. 1. 20.* no Man can be compelled to take that Order on him. The Manner of making Knights, *Cambden*, in his *Britannia*, shortly expresses in these Words: *Noſtri vero Temporibus qui Equeſtrem Dignitatem ſuſcipit, flexis genibus educto Gladio leviter in humero percutitur; Princeps his Verbis Gallice effatur: Sois Chevalier au nom de Dieu.*

KNIGHTS Bannerets: See Bannerets in this Vol.

KNIGHTS of the Bath, are an Order of Knights made within the Lits of the Bath, and girded with a Sword in the Ceremony of their Creation. They are spoken of in *8 Edw. 4. c. 2.* For their Antiquity and Manner of Creation, see *Dugdale's Description of Worcestershire*. They take Place of Knights Batchelors, and come after Baronets.

KNIGHTS-FEE, is so much Inheritance as is sufficient yearly to maintain a Knight with convenient Revenue; which in *H. III's* Time was *15 Pounds*, *Cambd. Brit. p. 111.* But *Sir Tho. Smith*, in his *Repub. Anglor. lib. 1. c. 18.* rateth it at *40 Pounds*. And in *1 E. 2. c. 1.* it appears that such as had *20 Pound* in Fee, or for Term of Life, might be compelled to be Knights; but this is now repealed by *17 Car. 1.* *Stow* in his *Annals* saith, "There were in England at the Time of the Conquest *60211* (others say *60215*) Knights-Fees; whereof the Religious Houses, before their Suppression, were possess'd of *28015*." Some say a Knight's-Fee contained *8*, others *12 Plough-lands*, or *600 Acres*.

KNIGHTS of the Garter, are an Order first created by King *Edw. III.* after the Acquisition

of many great and glorious Victories. He fought out of his own Kingdom, and all over Christendom, for a Number of most excellent and noble Persons, to each of which he gave a blue Garter deck'd with Gold, Pearls, and precious Stones, with a Buckle of Gold, to be worn only on the left Leg; a Kirtle, Crown, Cloak, Chaperon, a Collar, and other stately and magnificent Apparel. The Number was *26*, of which the King and his Successors were ordain'd Sovereigns, and the others Companions, or Brethren of the most Noble Order of the Garter.

This most Honourable Society is now a College or Corporation; having a Common Seal belonging to it; having, besides the Sovereign, which is Guardian of the Order, and who governs it by himself, or Deputy; and besides the *25 Companions*, or *Knights of the Garter*, *14 Secular Canons*, that are Priests, or must be within a Year after their Admission; *13 Vicars*, which must also be Priests; and *26 poor Knights*, that have no other Subsistence or Means of Living but the Allowance of this Order. The Bishop of *Winton*, for the Time being, is called *Prelate of the Garter*; the Bishop of *Sarum*, *Chancellor of the Garter*; the Dean of *Windsor*, *Register of the Garter*. The Principal King at Arms is called *Garter*, who is to manage and marshal their Solemnities at all Installations and annual Feasts. The *Usher of the Garter* is also *Usher of the Black-Rod*. By Order of King *Charles I.* all the Companions of the Garter are to wear on the left Side of their upper Garment the Cross of England, encircled with the Garter and Motto, and with Rays of Silver issuing from thence every way like a Star; whence 'tis usually called the *Star and Garter*.

KNIGHT-Marshal, is an Officer in the King's House, having Jurisdiction and Cognizance of any Transgression within the King's House and Verge; as also of Contracts made there, whereof one of the House is Party.

KNIGHTEN Gylde, was anciently a Guild in London, consisting of nineteen Knights, founded by King *Edgar*; who gave then a Portion of waste Ground, lying without the Walls of the City, which is now called *Port-Soken-Ward*. *Stow's Annals*, p. *151.*

KNOCKING-Mill, is the same with a Stamp-ing-Mill, which see, and also the Word *Tin*.

L A B

LABEL, in the Law, is a narrow Slip of Paper or Parchment affixed to a Deed or Writing, in order to hold the appending Seal: So also any Paper, annex'd by way of Addition or Explication to any Will or Testament, is called a *Label* or *Codicil*.

LACERTA, is a Word used in *Doomsday-Book*, and signifies a *Fathom*.

LACHES, in the Law-sense, seems to signify *Slackness* or *Negligence*, as appears from *Littleton*, Fol. 403 and 726, where *Laches* of Entry is nothing else but a Neglect of the Heir to enter; and so perhaps comes from our *English* Word to *Lack*; unless from the French *Lascher* or *Lasche*.

LACHRYMATORIES, were small Earthen Vessels, wherein the Tears of the weeping Friends that survived, were repositied and buried with the Ashes and Urns of the Dead.

LADA, is a *Lade* or *Lath*, from the Saxon *Laethian*, signifies an Assembly or Court of Justice; and from hence the annual Court at *Dym-Church*, by *Romney-Marsh* in *Kent*, for the Election of a Bailiff and other Officers, is call'd *Dym-Church-Lath* to this Day.

LADA, from the Saxon *Ladian*, also signifies a Purgation by Trial; and in the Laws of King *Ethelred* there is frequent Mention of the *Lada Simplex*, *Triplex*, and *Plena*.

LAFORDSWICK, in the old Saxon, is the betraying of, or Infidelity to a Lord and Master. 'Tis mentioned in the Laws of *Canutus*, c. 61. and those of *Henry I.* c. 13.

LAGA, is a Word used for Law in *Magna Charta*: And hence comes *Dane Lage*, *Saxon Lage*, *Mercen Lage*, &c. as also

LAGEDAYUM or *Lagb-day*, that is, a Law-day, or Day of open Court: Hence also a *Lage-Man* is *Homo Legalis*; and this Word *Lage-Man* is frequently used in *Doomsday-Book*, and in the Laws of *Edward the Confessor*.

LAGEN, *Lagena*, in ancient Times was a Measure containing six *Sextarii*. Vid. *Fleta*, l. 2. c. 8, 9. and *Charta Ed.* 3. m. 25. n. 82.

LAGON or *Lagan*, is a parcel of Goods thrown out of a Ship in a Storm, &c. and because they would else sink, they are fastened to a Buoy or Cork, in order to be found again. If the Ship be wreck'd, the Goods are called *Lagan* or *Ligan*, *quasi a Ligando*: and so long as they continue in the Sea they belong to the Admiral; but when cast ashore they become a *Wreck*, and belong to him that hath the *Wreck*, as appears in *Co. l. 5. fo. 106*.

LAHSLITE, *Lag slite*, *Lagb slite*, is used in the Laws of *Hen. I.* c. 13. for a Transgression of the Law; and sometimes for the Punishment thereunto belonging.

LAMMAS-DAY, *quasi Lamb-mas*, is our first of *August*; and on this Day the Tenants which formerly held Lands of the Cathedral Church in *York*, were bound by their Tenure to bring a *Lamb* alive into the Church at High-mass.

LAND-BOC, was anciently a Charter or Deed, whereby Lands or Tenements were given or held.

LAND-CHEAP, was an old customary Fine paid either in Cattle or Money at every Alienation

L A T

of Land, lying in some peculiar Manor, or Liberty of some Burgh. This Custom yet remains in *Malden* in *Essex*.

LAND GABLE or *Gavel*, was anciently a Tax or Rent issuing out of Land: 'Tis called in *Doomsday Census Prædialis*; and *Spelman* saith, it was a Penny for every House, being, as we now speak, a kind of *Quit-Rent* or *Ground-Rent*.

LANDIRECTA, in the *Saxons* Time, were such Services and Duties as were laid on those that held Land. These were three Obligations, which from their Number were called *Trinoda Necessitas*, and were *Expedition*, *Burgh-bote*, and *Brig-bote*. These were not called *Servitia*, because not Feodal Services arising from the Condition of the Owners; but by this Name *Landirecta*, Rights that charged the very Land, whether possesst by Churchman or Layman.

LAND-TENANT, in the Law, is he that actually possesses the Land, and who hath it in his manual Occupation. The same with *Terre-Tenant*.

LANO-NIGER, was a kind of base Coin in Use about the Time of *Edw. I.*

LAPSE, is the Omission of a Patron to present to a Church within six Months after voidable; on which Neglect, Title is given to the Ordinary to *Collate* to the said Church.

LASHITE, was a common Forfeiture in the time of the *Danes*; it was 12 Ores, each Ore was about 6 d. Sterling. Vid. *Selden Hist. Tythes*. Tho' some say, the Ore was in Value about 16 Pence, and that 15 of them made the *Libra* or Pound.

LAST, in general signifies a Burden, and particularly a certain Weight or Measure: As a Last of Pitch, Tar, or Ashes, is 14 Barrels; a Last of Hides or Skins is 12 Dozen; a Last of Codfish is 12 Barrels; a Last of Herrings is 20 Cades, or ten Thousand; a Last of Corn is 10 Quarters; a Last of Wool is 12 Sacks; a Last of Leather is 20 Dickers, and every Dicker is 10 Skins; a Last of unpack'd Herrings is 18 Barrels.

LAST, in the Marshes of the *East* of *Kent*, also is a Court held by 24 Jurats, and summoned by the two Bailiffs thereof, wherein they make Orders, lay and levy Taxes, &c. for the Preservation of the Marshes.

LASTAGE or *Lestage*, is a Custom exacted in some Fairs and Markets, to carry Things where one will, saith *Rastall*; but sometimes 'tis taken also for the Balast of a Ship; and, as some say, 'tis properly a Custom paid for Wares sold by the Last.

LAST-HEYRE, is he to whom the Land comes by *Escheat*, for want of lawful Heirs; which is sometimes the Lord of whom the Land is held; and sometimes the King.

LATCHES, in a Ship, are the same with *Laskets*.

LATHE (*Læstium*) is a great part of a County or Shire, containing three or four Hundreds, as in *Kent* and *Sussex*. Whence the

LATHE REEVE, or *Leid-grede*, or *Tything-Reeve*, was an Officer in the *Saxon* Government, who had Authority over the third Part of the Country;

Country, or over three or more Hundreds or Wapentakes; whose Territory was called a *Tithing*, or a *Leid* or *Leithen*. Perhaps the *Ridings* in *Yorkshire* are so called corruptly from *Tithings* or *Tridings*, as 'tis sometimes written. Matters that could not be determined in the Hundred Court, were brought to the *Trithing*, where the principal Men of three or more Hundreds, being assembled by the Authority of the *Latb Reeve* or *Trithing Reeve*, did decide and determine it; but if they did not, it went further to the County Court.

LATITUDE of a Place, is found at Sea by having the Sun's or any Star's Declination (by the Tables) and his Meridian Altitude; and that is found by a Quadrant or Astrolabe. Now from the Horizon to the Zenith being 90° ; if from 90° you take the Sun's Meridian Altitude, the Remainder will be the Sun's Distance from the Zenith. When therefore by Observation the Sun's Meridian Altitude is found, you are to consider whether the Sun hath any Declination or not: If he hath none, but moves in the Equinoctial that Day, then the Elevation of the Equator will be equal to his Meridian Altitude; and consequently his Meridian Altitude is the Co-Latitude: Subtract therefore that from 90 , the Remainder is the Latitude of the Place, which will be North, if the Sun be on the South Part of the Meridian, and South when the Sun comes to the North of the Meridian. 'Tis the same thing with any Star in the Equator. When the Sun or Star hath any Declination, the Zenith Distance with that will give the Latitude; for if the Meridian Altitude and Declination be both the same way, i. e. both North or both South, the Difference between them will be the Latitude of the Place, or the Pole's Height: Only observe, that if the Zenith Distance exceed the Declination, the contrary Pole will be elevated. V. gr. If the Declination be $23^\circ. 30'. N.$ and the Zenith Distance $8^\circ. 30'. N.$ the Latitude will be $15^\circ. N.$ But if the Zenith Distance be $71^\circ. 30'. S.$ and the Declination $20^\circ. S.$ the Difference will be $51^\circ. 30' =$ to the Latitude, as before; only it will be North, because the Zenith Distance exceeds the Declination. If the Declination be North, and the Meridian Altitude South, or vice versa, i. e. one contrary to the other, then the Sum of the Declination and the Zenith Distance is the Latitude of the Place. Indeed sometimes the Sun or Star may have two Meridian Altitudes; as when the Altitude and Declination being the same way, the latter exceeds the former; and then the Sum of the Co-declination and the Meridian Altitude is the Height of the Pole towards which the Declination is. And you must observe, that whether the Meridian Altitude be North or South, if that and the Co-declination together be less than 180° . the Sun or Star will have two Meridian Altitudes in 24 Hours.

LATROCINIUM, in some old Charters, is used for the Liberry of *Infang-thief*, or the Privilege of adjudging and executing Thieves.

LATTA, is a *Lathe* or *Tithing*.

LAUDIMIUM, in the Civil Law, is the 50th Part of the Value of Land or Houses paid by the Proprietor to the new Tenant, by way of *Emphyteusis*, as an Acknowledgment upon Investitures, or for being put into Possession.

LAUDUM, was formerly used for an Arbitration or decisive Sentence of any chosen Judge or Arbitrator.

LAUNDER, is a Trench cut in the Floor 8 Foot long and 10 Foot over, with a Turf for a Stopper at one End, to let the Water (which comes along with the bruised Ore from the Coffers of a stamping Mill in the Tin-works) run away while the Ore sinks to the bottom. See *Tin*.

LAURETS, were pieces of Gold coined in the Year 1619, with the King's Head laureated on them. There was a 20s. Piece marked with xx; one of 10s. marked x, and one of 5s. marked v.

LAW. In England our Laws have been variable. (1.) We had the Laws of *Molmutius*, which were translated out of *British* into *English* by *Gildas*; of which there some remain in our present Laws. *Vid. Mag. Chart. c. 1. and 14.*

(2.) There was the *Merchen Lage*, mentioned in *Cambden's Brit. and Polyd. Hist. Angliæ, lib. 5.*

(3.) *West-Saxon-Lage*.

(4.) *Dane-Lage*; all which were reduced into one Body by *Edward the Confessor*.

At present the Law of England is divided into three Parts.

(1.) The Common Law, which is the most ancient and general.

(2.) Statutes, or Acts of Parliament.

(3.) Particular Customs. C. on L. fol. 15.

LAW hath also a special Signification, sometimes implying that which is Lawful with us, and not elsewhere, as *Tenant by Courtesy* of England, 13 E. I. 3.

To *Wage Law* (*Vadiare Legem*) is to put in Security: To *make Law* (*facere Legem*) at a Day assigned: And to *make Law*, is to make Oath that he owes not the Debt challenged at his Hands; as also to bring with him so many Men as the Court shall assign, to avow upon their Oath, that they believe in their Consciences he hath sworn truly.

And this Law is used in Actions of Debt without Specialty; as also, where a Man coming to the Court after such a Time, that his Tenements have been seized for Default, shall deny himself to have been summoned.

LAW of Arms, Jus Militare, is the allowed Rules and Precepts concerning War; to make and observe Leagues and Truces, to punish Offenders in Camps, &c.

LAW of Merchants, Lex Mercatoria, is a Privilege or special Law, differing from the Common Law of England, proper to Merchants, and summary in Proceedings. *Vid. 27 E. 3. Stat. 8, 9, 19, 20. 13 E. 1. Stat. 3. Cook on Littleton, fol. 182.*

LAW Spiritual, is the Ecclesiastical Law, allowed by the Laws of this Realm, so far as it is not contrary to the Common-Law, nor the Statutes and Customs of the Realm. According to this the Ordinary or other Ecclesiastical Judges do proceed in Causes within their Cognizance. *Cook on Littleton, fol. 344.*

This was called the *Law Christian*, and the Court the *Court Christian*; and the Rural Dean, who was Judge or President of the Court within his own District, was called hence *Decanus Christianitatis*; and in Contradistinction to this, the Common-Law was by some called *Lex Mundana, Terrena, &c.*

LAW of the Staple, is the same with the Law of Merchants.

LAW of Marque, (see *Reprisals*.) This Word is used 27 E. 3. Stat. 2. c. 22. and comes from the German Word *March*, which is a Bound or Limit; and those who are driven to Reprisals, are forced to take the Ship and Goods of the Injurer, since they

they cannot meet him at Home to have ordinary Justice.

LAW-day, is otherwise called the *View of Frank Pledge* or *Court-Leet*; and is used for the County Court, 1 E. 4. c. 2. and indeed the *Lage-day* or *Law-Day*, formerly was any Day of open Court; and was commonly used for the more solemn Courts of a County or Hundred.

LAW-less Court. On *King's Hill* at *Rochford* in *Essex* on *Wednesday* Morning next after *Michaelmas-day*, at Cock-crowing, is held a Court so called, because 'tis held at a lawless or unlawful Hour: They whisper, and have no Candle; nor any Pen and Ink, but only a Coal: And he that owes Suit or Service and appears not, forfeits double every Hour he is missing. This Court belongs to the Honor of *Raleigh*, and to the Earl of *Warwick*.

LAWES, are round Heaps of Stone, being a kind of rude Monument for the Dead. They are so called on the Borders between *England* and *Scotland*.

LAYMAN, among the Painters, is a Statue of Wood, whose Joints are so made, that it may be put into any Posture; and its chiefest Use is for the casting and adjusting of *Draperies* for the cloathing of Figures.

LEA of Yarn. By Stat. 22, 23 Car. 2, c. — a Lea of Yarn at *Kidderminster* is appointed to contain 200 Threads, on a Reel which is four Yards about.

LEAD. The Lead Mines in *Somersetshire* are at *Mendip*, which is a Place all mountainous, but the Hills are of unequal Heights; 'tis barren and cold, and in some Places rocky: the Ridges of the Hills run confusedly, but most *East* and *West*, and not many parallel one with another. The Surface is heathy, ferny and furzy; it feeds Sheep all the Year, and young Beasts, Horses and Colts at Spring and Fall. The Soil is red and stony, but no way *Claiy*, *Marley* or *Chalkey*. The Stones are either of the Nature of Fire-stones or Lime-stones. The Trees have their Tops burnt, and their Leaves and their Out-fides discoloured and scorched with the Wind; and they grow to no considerable Bigness. The Stones which are wash'd out by the Brooks and Springs are reddish and ponderous. The Country is more troubled with Thunder and Lightning, Storms, nocturnal Lights and fiery Meteors, than other Parts of the County.

When they have gotten the Ore, they beat it small, then wash it clean in a running Stream, and then sift it in Iron Rudders, after which they make an *Hearth* or *Furnace* either of Clay or Fire-stone, which they set in the Ground, and upon it build their Fire which is lighted with Charcoal, and continued with young oaken Gadds: 'Tis blown with Bellows by Men's treading upon them, and after the Fire is lighted, and the Fire-place hot, they throw their Lead Ore upon the Wood which melts down into the Furnace; and then with an Iron Ladle, they take it out, and on Sand cast it into what Form they please. *Phil. Transf.* N^o 28.

In *Phil. Transf.* N^o 39, you have this further Account.

The Veins of Lead have been found to run up into the Roots of Trees without apparently altering them. White, yellow, and mix'd Earth, are *Leaders* to the Country or Place where the Ore lies; and changeable Colours do always encourage their Hopes. Sometimes they dig 12 Fathom deep before they meet with any Stones; other while when

a *stony Reak* is at top, they meet Ore just under the *Swerd* or Surface of the *Grass*: which Ore hath gone down 40 Fathom. A *black Stone* is an ill Sign, and leads to *Jam*, as they call it, that is, a thick Bed of Stone that hinders their Work; a grey, clear, and dry one they account the best. They seldom meet with any *Damps*. If in sinking they come to wet moorish Earth, they expect a *Jam*, and to be closed up with Rocks. Their Nearness to the Ore they guess by short brittle Clay; for they don't think or find a tough Clay to be *leading*, as they call it; that is, directing towards Ore.

Sometimes the Ore lies *Shale* or shallow, and then it is 14 or 20 Fathom, more or less, before they hit it. They follow a Vein inclining to some Depth, when it runs away in little flat *Binnis*.

When the Stones part it, then they find a Vein again. Their Draughts are 14 or 16 Fathom, till they come to a Stone, where they cast a *Side-Draught*, called a *Cut*. Then they sink *plumb* again 4 or 5 *Cuts* one under another; They find Ore at 50 Fathom. Their best *Reaks* are North and South; East and West are good, tho' not so deep. The *Groove* is 4 Foot long and 2½ Foot broad, till they meet with Stone, and then they carry it as they can. The *Groove* is supported by Timber; a Piece as big as one's Arm will support 10 Tun of Earth. The Timber there lasts long; they have known it lie 200 Years, and after that it will serve in new Works; it is tough and black, and being exposed a few Days to the Sun and Wind grows so hard that an Ax will scarce cut it.

For the supply of Air, they have Boxes of *Elm*, exactly closed, of about 6 Inches in the Clear, by which they carry it down 20 Fathom and more; but when they come at Ore, and need an *Air-shaft*, they sink it 4 or 5 Fathom distant, of the same Fashion with a *Groove*, to draw as well Ore as Air.

They make use of *leathern Bags*, holding 8 or 9 Gallons a piece, to free them from Water, which are drawn up with Ropes. If they find a *Swallet*, they drive an *Adit* upon a level till it is dry. If they cannot cut the Rock, they use Fire to *anneal* it, laying on Wood and Coal, and contriving the Fire so that they can leave the Mine before Operation begins; and they find it dangerous to enter again before it be quite cleared of the Smoak, which hath killed some.

Their Beetles, Axes, and Wedges, &c. unless so hardened as to make a deep Impression on the Head of an Anvil, are not fit for their Use; and yet they sometimes break them in an Hour; others last three or four Days, as it happens. They work in Frocks and Waistcoats, by Candle-light (of Tallow) 14 or 15 to the Pound, each of which lasts three Hours, if they have Air enough. A Vein being lost, they drive two or three Fathom in the *Breast*, as the Nature of the Earth directs them. They hand out their Materials in *Elm Buckets* drawn by Ropes; the Buckets hold about a Gallon. Their Ladders are of Ropes.

The Ore sometimes runs in a Vein, and sometimes is dispersed in *Banks*; it lies often between Rocks: Some of it is hard, some milder. Many times they have *branched Ore* in the *Spar*. About the Ore there is a *Spar* and Chalk, and another Substance which they call *Crootes*, which is a meally white Stone matted with Ore, and soft. The *Spar* is white, transparent and brittle like Glass. The Chalk white, and heavier than any Stone.

Stone. The Vein lies between the Coats and is of different Breadths; it breaks off sometimes abruptly in the Earth, which they call a *deading Bed*; and after a Fathom or two may come again to keep the same Point. It terminates sometimes in a Rock called a *Fire-stone*, and sometimes in a dead Earth, Clayie without either *Croote* or *Spar*. The clearest and hardest Ore is the best, of which 36 hundred Weight makes about a Tun of Lead.

The Hearth for melting the Ore is about 5 Foot high, set on Timber, to be turned about as a Wind-mill, to avoid the Smoak on a shifting Wind; it holds half a Bushel of Ore and Coal: There is a Sink on the side of the Hearth into which the Lead runs, and it holds about $1\frac{1}{2}$ Hundred. They have a Bar to stir the Fire, a Shovel to throw it up, and a Ladle heated red hot to cast out the melted Metal. Once melting is enough, and the best, which is the heaviest, melts first. There is a *Flight* (as they call it) or Steam in the Smoak, which falliing on the Grass, poisons those Cattle that eat of it. The Workmen find the Taste of it (when the Smoak flies in their Faces) to be sweet upon their Lips; brought home and laid in their Houses it kills Rats and Mice. What of this *Flight* falls upon the Sand, they gather up to melt on a *Flag-Hearth*, and make *Shot* and *Sheet Lead* of it.

LEAD, at Sea, signifies a Plummet of that Metal of about a Foot long, and six or seven pound Weight, which is hung at the End of a long String to sound the Depth of the Sea withal: Therefore their Word is, *Heave the Lead*, that is, sound the Depth of the Water, to know whether it be safe for the Ship to venture in any further or not.

LEAD-NAILS, are such as are commonly used to nail down Lead, Leather, or Canvas to hard Wood.

LEDGERS, are long Pieces of Timber fastened horizontally to the Poles in the Scaffolds belonging to any Wall or Building, on which the outermost Ends of the Putlogs do rest.

LEE-WAY, of a Ship at Sea, is the Angle made by the Line on which the Ship should run, according to her Course or the Point of the Compass steered upon, and the real Line of the Ship's Way; for all Ships are apt to fall a little to *Lee-ward* or to make some *Lee-way*. Wherefore in casting up the Log board, something must always be allowed for *Lee-way*; and they give such Rules as these, 1. If the Ship be upon a Wind you must allow one Point for *Lee-way*. 2. If the Wind blow hard, so that you are forced to take in one Top-sail, allow two Points for the *Lee-way*. 3. If it blow so hard that both Top-sails must be taken in, and the Sea runs high, then allow three Points for the *Lee-way*. 4. If her Fore-sail being furled, she Try under a Main-sail and Mizzen, she will make her Way four Points before the Beam. 5. If she Try with a Main-sail only, she will make her Way near three Points before the Beam. But, 6. If under a Mizzen only, she will make her Way about two Points before the Beam.

LEGACY, *Legatum*, is usually any particular Thing given in a last Will and Testament; for if the whole Estate be so given, 'tis *Hereditas*. But in the Ecclesiastical Sense it was formerly a *Soul-Seat*, or a Legacy given to the Church, or accustomed Mortuary.

LEGION. In the time of the Romans first War in Sicily, Polybius, lib. 1. saith, that the Roman Legion consisted of 4000 Foot and 300 Horse; af-

terward L. *Æmylius* and C. *Atilius Coff.* their Legion (in the great Preparations they made against the Gauls) consisted of 5200 Foot and 300 Horse.

After this, some Time before the Battel at *Canna*, the Roman Legion had in it 5000 Foot and 300 Horse, to which was added an equal Number of Latin Auxiliary Foot, and for the most part thrice the Number of Horse. *Polyb. lib. 3.*

LEVANT, in Geography, is properly the Eastern Side of any Continent or Country, or that on which the Sun rises. But now with our Seamen it signifies the Mediterranean Sea, and especially the Eastern Part of it; and our Trade thither is called the *Levant Trade*; and a Wind that blows from thence out of the *Streights Mouth* is called a *Levant Wind*.

LEVEL: In *Phil. Transact.* N^o 141. there is an Account of a new Level by Mr. *Butterfield*, which he saith is done by a Tube with Glasses, and a Thread hanging between four Points, with a Weight in a Box; so contrived, that as soon as the Instrument is set down, you have the Point of Horizon with a great deal of Exactness; and he said he was then making another which plaid on the Point of a Diamond. But I have never heard any thing of this since, and Mr. *Butterfield*, Instrument-Maker to the French King is now dead.

In *Phil. Trans.* N^o 74. p. 2217, is an Account of a Book, then publishing, about the Art of Levelling by Mr. *Mariotte*; but whether it was ever actually published, I know not. Capt. *Halley*, Geometry Professor at Oxford, from his Observations of the Height of the Mercury in the Barometer, at the Top and Bottom of *Snowdon Hill* in Wales (where at the Top it sunk three Inches eight Tenths lower than its Height at the Foot of the Hill) concludes, that one of our new portable Barometers, would be accurate enough to take the Levels for bringing Water from distant Places, and would be much less subject to Error than the common Levels, there being $\frac{1}{30}$ of an Inch for every 30 Yards; which may be divided into many Parts evidently. See *Phil. Transact.* N^o 229. And Mr. *Derham*, by Observations of this nature made at the Foot and Top of the Monument, allows $\frac{1}{8}$ of an Inch to 82 Foot of perpendicular Ascent, when the Mercury standeth at 30 Inches.

There is a Book written on the Subject of Levelling by Mr. *De la Hire*, but I have not seen it. And there is a Description of a new levelling Instrument, by Mr. *Couplet*, in the French Memoirs for 1699.

LEVELLING, is the Art of finding a true horizontal Line, or the Difference of Ascent or Descent between any two Places, in order to drain Moors, Marshes, and Morasses, &c. or to convey Water from Place to Place. The Instruments made Use of you will find under the Word *Level* in Vol. I. and *Pendulous Level* in Vol II.

The Method of proceeding in the Art of Levelling is, or may be much the same, let the Instrument be the common Water Level, that of *Spirit of Wine*, or the new *Pendulous one*. The most commodious and expeditious Way is to provide two Station Staves of square Deal, like Rulers, about 8 or 10 Foot in Length. Let every Foot be divided into 10 Parts, and each of those into 10 more; so each small Division will be the 100th part of a Foot. On each of these Staves there must be a Vane to slide up and down, and with a Screw in the back Part to fasten it to any Height on the Staff

Staff. The fore-side of the Vane or Sight should be painted white, or covered with white Paper, with a black Line drawn across it lengthways. Having then two Assistants to hold these Staves upright, and to slide the Sights up and down, supposing you were to find the Difference of the Heights of any two Places, as of *A* and *B*: If one Station will do, place the Level in the middle between the Places, and having by the Bubble or otherwise set it truly Horizontal, look back to the first place, till your Assistant sliding the Vane up and down for you there on the Staff, you can see the black Line thereon cut or covered by the cross Hair in the Telescope; and then let him mark the Height of that black Line above the Ground on the Divisions on the Staff. Then turn the Telescope about and look towards your other Assistant at *B*, till you can see the Black Line on the Vane or Sight on his Staff coinciding with the cross Hair in the Telescope; and let him also note how high his Black Line is above the Ground: If his Number be the same with the former, the Places are on a level, or of the same Height; otherwise that where the greatest Number is, is the highest; and the Difference between the Numbers shews how much.

But if the Places are so far asunder, or have Obstacles interposing, that you can't do it at one Station, as is usually the Case; then you must do it at as few more than one as you can; and you must keep an Account of the Numbers on the Staves at all your Stations, putting the Back Station in one Column, and the Fore Station in another, with a Column for the Number of their Stations in the middle; in this, or such like Form.

Back ^d .	St.	Forw ^d .
029	1	132
178	2	201
199	3	295
221	4	256
6.27		8.84
		627
		2.57

Where all the Back Stations make together 6.27. or six Foot and .27 of a Foot, and all the Fore Stations make 8.84. or 8 Feet and .84 of a Foot; and the Difference between those two Numbers being 2.77. or 2 Feet .77 of a Foot, is the Excess in height of the last place above the first.

N. B. In levelling of Rivers, you must set the Black Line of the Sight in the first Backward, and in their last

Fore Station, just to the Edge of the Water: And then you may take the Intermediate Stations, any where, a Mile off from the River, &c. in the Meadow adjoining, for it will all come right at last.

LEVITATION, is a Word I've met with no where but in Dr. Hook's *Opera Posthuma*; and he means by it a Property directly contrary to that of Gravitation towards the Sun: And in his Discourse of Comets, p. 168, he saith he hath by many Observations discovered, that tho' there be a Descent of the Steams from the Nucleus of the Comet towards the Sun, yet they also quickly returned and went contrary and opposite to the Sun, and that sometimes to a prodigious Extent. And perhaps where the Power or Force of Gravitation ceases, some such contrary Force may begin: Of which there seem to be many Instances in the Gravitations or Attractions of the Particles of Matter toward one another. (See *Attraction*.) This Force in

Vol. II.

such Cases Sir Is. Newton calls *Vis Repellens*; and it appears plainly to be one of the Laws of Nature, or a Branch of the Will of our Creator in the Material World; and without it I think there can be no possible Account of Rarefaction, and some other Phenomena of Nature. Dr. Hook, p. 170. takes notice also, that there is as vast an Acceleration in the Motion of Levitating Bodies, as there is in Gravitating ones.

LIBERA, anciently signified a Livery or Delivery of so much Grass or Corn to a Customary Tenant, who cuts down or prepares the said Grass or Corn, and receives some Part or small Portion of it as a Reward or Gratuity.

LIBERTAS Ecclesiastica, was the usual Phrase in our old Writings to express Church Liberty and Ecclesiastical Immunities. At first this was only the Right of Investiture; but afterwards it grew very great, extending so far under some weak Governments as to a Pretence of Exemption of the Persons and Possessions of the Clergy from the Civil Power and Jurisdiction.

LIBERTINE, in the Civil Law, is a Person who is manumised, and made free from Bondage, to which he was born.

LIBRA. See Pound.

LIBRA, a Mechanick Power. See Balance in Vol. I.

LIBRATA Terra, was anciently a Quantity of Land containing 4 Ox-gangs, and every Ox-gang 15 Acres.

LICENTIA Transfretandi, is a Writ or Warrant directed to the Keepers of the Ports, willing them to let some pass quietly beyond Sea, who have formerly obtained the King's Licence thereunto.

LIGHT. In the French Memoirs of the Academy of Sciences, A. D. 1699, there are some Reflections about the Nature of Light and Colours; and of the Generation of Fire, by Mr. Malebranche; in which he endeavours to support his Notion before communicated in his *Recherches de la Verité*, and in his *Metaphysicks*, viz. That Light and Colours do consist only in the various Pulses or Vibrations of the Ethereal or Subtile Matter.

Dr. Hook, in his *Op. Posthuma*, p. 54. considering the exceeding Hardness of a Diamond, and its wonderful Property of emitting Light or shining in the Dark, upon being rubbed or struck, thinks that there is this one Essential Property necessary only to the Existence of Light, viz. a very quick vibrative Motion; for in this Experiment there is neither Combustion nor Flame, as in Fire; nor Moisture and Putrefaction, as in Fish, Flesh of Veal, rotten Wood, &c. nor a Motion of the Animal Spirits, (which some think to be the Cause of the Light in Glo-worms, the Eyes of Cats, &c.) essentially necessary to the Production of this Quality.

The same Author thinks that Aristotle's Definition of Light, *φῶς ἐστὶν ἡ ἐνέργεια τῆς διαφανούς*, That it is the inworking of the Diaphanous Body, or of the Medium, or the Internal Action of the Pellucid or Transparent Body, is the Light of which we are sensible, or which moves our Eye: So that he makes Light in the Luminous Body to be a peculiar Motion of it, which the Lucid Body can communicate to the Transparent Medium, or to such a Body as is fit to propagate it. And Light in the Eye is this Motion impressed on it; by which the Soul becomes sensible of it.

C c c

P. 114.

P. 114. The Doctor asserts, That the Power or Force of Light decreases in a quadruplicate Ratio of the Distances reciprocally taken, or as the squared Squares of the Distances reciprocally; and consequently the Effect of Light, or the Motion it causes in other Bodies, will be in subduplicate Proportion of the Powers; and therefore only in duplicate Proportion of the Distances reciprocally taken.

P. 118. The Length of the Strokes of the Pulses of Light are in duplicate Proportion of the Distances reciprocally. P. 121. Suppose then that the Length of the Pulse from the Centre outwards at the Body of the Sun should be one Inch, the Length of the Pulse of Light here with us would not be the 1000000th part of the thickness of a Hair: and yet is that amazing Organ, the Eye, so wisely contrived, as that the Strength of the Pulse, which was destroyed by so vast a Distance, is restored again to a good part of its first Power; for as in diverging Rays, the Length of the Pulse decreases in a duplicate Ratio of the Distance; so in converging Rays, it increases in that Ratio, and in a contrary Order.

I had before, in Vol. I. shewn from Sir Is. Newton, that Light is propagated in Time; and he then supposed about 10 Minutes were taken up in its Passage from the Sun to us: But in his Opticks he determines this Matter more accurately. Romer first, and after him others, had observed that the Eclipses of Jupiter's Satellites happen about 7 or 8 Minutes sooner than they ought to do by the Tables, when the Earth is interposed between the Sun and that Planet; but as much later, when the Earth is beyond the Sun in respect of Jupiter: the Reason of which is, that the Light of the Satellites hath farther to go in the latter Case, than in the former, by the Diameter of the Earth's Orbit. Some Inequalities of Time indeed may arise from the Eccentricities of the Orbits of the Satellites; but these can't answer in all the Satellites, and at all times, to the Position and Distance of the Earth from the Sun. The mean Motion of Jupiter's Satellites is also swifter in his Descent from his Aphe- lium to his Perihelium, than in his Ascent in the other half of his Orb. But this Inequality hath no respect to the Position of the Earth, and in the three Interior Satellites is insensible; as he found by Computation from the Theory of their Gravity.

After this Sir Isaac advances this Proposition, which is the 12th of Part 3. of the 2d Book of his Opticks, viz.

Every Ray of Light in its Passage thro' any refracting Substance is put into a certain Transient Constitution or State, which in the Progress of the Ray returns at equal Intervals, and disposes the Ray at every Return to be easily transmitted thro' the next refracting Surface, and between the Returns to be easily reflected by it. This is manifest from his 5, 9, 12 and 15th Observations. Whence it appears, that one and the same sort of Rays, at equal Angles of Incidence on any thin transparent Plate, is alternately reflected and transmitted for many Successions, according as the Thickness of the Plate increases in Arithmetical Progression of the Numbers 0, 1, 2, 3, 4, 5, 6, 7, 8, &c. (See Colours.) And this alternate Reflection and Transmission, he found by his 24th Observation, continues for above 100 Vicissitudes; nay, as he proves afterwards, to many thousands; being propagated from one Surface of a Glass Plate to another, tho' the Thickness of the Plate be $\frac{1}{4}$ of an Inch and more. So that this

Alternation seems to be propagated from every refracting Surface to all Distances without End or Limitation. He shews also, that this alternate Reflection and Refraction depends on both the Surfaces of every thin Plate, because it depends on their Distance; but that it is performed at the second Surface. It is also influenced by some Action or Disposition propagated from the first to the second; because otherwise at the second it would not depend on the first; And this Action or Disposition, in its Propagation, intermits and returns by equal Intervals. What kind of Action or Disposition this is; whether it consist in a vibrating or a circulating Motion of the Ray, or of the Medium, or something else, the Author does not inquire: But he allows those, that are averse to all new Discoveries which they can't explain by Hypotheses, at present to suppose, That as Stones by falling upon Water put it into an undulating Motion, and all Bodies by Percussion excite Vibrations in the Air; so the Rays of Light, by impinging on any refracting or reflecting Surface, excite Vibrations in the refracting or reflecting Medium; and by so doing do agitate the solid Parts of the refracting or reflecting Body, and by that Agitation cause the Body to grow warm or hot: That the Vibrations thus excited are propagated in the refracting or reflecting Medium or Substance, much after the manner that Vibrations are propagated in the Air for causing Sound; and that they move faster than the Rays, so as to overtake them; and that when any Ray is in that part of the Vibration which conspires with its Motion, it easily breaks thro' a refracting Substance; but when it is in a contrary part of the Vibration, which impedes its Motion, it is easily reflected; and consequently, that every Ray is successively disposed to be easily reflected or transmitted by every Vibration which overtakes it. Whether this Hypothesis be true or false he doth not consider at present, contenting himself with the Certainty of the Fact, That he hath discovered the Rays of Light by some Cause or other to be thus alternately disposed to be reflected or refracted for many Vicissitudes. The Returns of this Disposition of any Ray to be reflected, he calls *Fits of easy Reflection*; and those of its Disposition to be transmitted, he calls *Fits of easy Transmission*; and the Space it puts between every Return and the next Return, he calls the *Intervals of its Fits*. Then at Prop. 13. he shews, that the Reason why the Surface of all thick transparent Bodies reflect part of the Light incident on them, and refract the rest, is that some Rays at their Incidence are in Fits of easy Reflection, and others in Fits of easy Transmission. This appears from his 24th Observation; where the Light reflected by thin Plates of Glass and Air, which to the naked Eye appeared evenly white all over, did thro' a Prism appear waved with many Successions of Light and Darknes, made by alternate Fits of easy Reflection and easy Transmission; the Prism severing and distinguishing the Waves of which the white Light was composed.

And hence 'tis plain, Light is in its Fits of easy Reflection and easy Transmission before its Incidence on any transparent Body: And probably it is put into such Fits at its first Emission from Luminous Bodies, and continues in them during all its Progress. For these Fits are of a lasting Nature; as appears by what he proves elsewhere.

He supposes here the Transparent Bodies to be thick; because if the Thickness of the Body be much less than the Interval of the Fits of easy Reflection and easy Transmission of the Rays, the Body loseth its reflecting Power. For if the Rays, which at their entering into the Body are put into Fits of easy Transmission, arrive at the farthest Surface of the Body, before they be out of those Fits, they must be transmitted. And this is the Reason why Bubbles of Water lose their reflecting Power when they grow very thin, and why all Opake Bodies, when reduced into very small Parts, become Transparent.

He shews also, that those Surfaces of Transparent Bodies, which, if the Rays be in a Fit of Refraction, do refract it most strongly, if the Ray be in a Fit of Reflection, do reflect it most easily.

After this he gives several other curious Propositions; from whence he shews, that 'tis easy to collect the Intervals of the Fits of easy Reflection and easy Transmission of any sorts of Rays refracted in any Angle into any Medium, and thence to know, whether the Rays shall be reflected or transmitted at their subsequent Incidence on any Pellucid Medium.

By the Experiments and Observation about the Inflection of the Rays of Light (See *Inflection*) he makes it plain, that Bodies act on Light at a distance, and by that Action bend the Rays of it; and that this Action is strongest at the least distance. He shews also, that Rays which differ in Refrangibility differ also in Flexibility; and by their different Inflections it is that they are separated one from another, so far as after Separation to make the three Fringes of Colours mentioned in those Experiments: And 'tis probable the Rays of Light, in passing by the Edges and Sides of Bodies, are bent several times backwards and forwards with a Motion like that of an Eel; and that the said coloured Fringes of Light arise from three such Bendings. 'Tis probable also that the Rays of Light which fall upon Bodies, and by that means are reflected or refracted, begin to bend before they arrive at the Bodies; and that Light is reflected, refracted and inflected, by one and the same Principle acting variously in various Circumstances.

'Tis probable also, that Bodies and Light act mutually on one another: Bodies upon Light, in emitting, reflecting, refracting and inflecting it; and Light on Bodies, by heating them, and putting their Parts into a vibrating Motion, wherein Heat consists.

All fix'd Bodies, when heated beyond a certain degree, do emit Light and shine; and this Shining and Emission of Light is probably caused by the vibrating Motions of the Parts; and all Bodies abounding with Earthy Particles, and especially when they are sulphureous, when their Parts are sufficiently agitated, do emit Light; whether this Agitation be caused by Attrition, by Percussion, by Putrefaction, or a vital Motion in an Animal Body, &c. or any other way. Thus the Seawater shines in a Storm; Quicksilver when shaken in Vacuo; a Cat's Back, or a Horse's Neck, rubb'd by the Hand in the dark; Wood, Flesh and Fish, when putrified.

The same admirable Author, in the new Queries annexed to the Latin Edition of his *Opticks*, thinks it probable, that there are yet some other congenite Properties of the Rays of Light besides those above described; one of which the Refraction of that

strange Body *Island Chrystal* acquaints us with. This was first taken notice of by *Erasmus Bartholinus*, but afterwards more accurately described by *Huysens* in his Book of *Light*, written in *French*. This Chrystal is a pellucid and fissil Stone, equaling Rock Chrystal or clear Water in Transparency; 'twill bear being white hot in the Fire, and after that will lose its Transparency: By a very violent Heat it's reduced to a *Calx*, but will not melt nor run: Being macerated for a Day or two in Water, it also loses its natural Politure; on rubbing, it discovers an Electric Quality, and with *Aqua fortis* makes an Ebullition. It seems to be a kind of Talk. If a piece of this Chrystal be laid on the Leaf of a Book, each Letter seen thro' the Chrystal, by a kind of double Reflection, appears double: And if any Ray of Light fall on any of its Surfaces, either perpendicularly or obliquely, it is always divided by a double Refraction into two Rays; each of which is of the same Colour with the Incident Ray, and they appear equal to one another as to the Quality of Light. One of these two Refractions is conformable to the known Laws of Opticks; viz. That the Sine of the Incidence out of Air into the Chrystal is to the Sine of Refraction: as 5 is to 3. But the other, which may be called the *Unusual Refraction*, is made thus: Let A D B C be the Surface of the Refracting Chrystal, C the greatest solid Angle belonging to that Surface: Let G E H F be the opposite Surface, to which the Line C K is perpendicular: This Perpendicular with the Line C F representing the extrem Edge of the Chrystal contain an Angle of $19^{\circ}. 3'$. Join K F; in which take K L so, that the Angle K C L may be of $6^{\circ}. 40'$. but the Angle L C F of $12^{\circ}. 23'$. This being done, let the Line S T represent any Incident Ray of Light in the Point T; let T V be the refracted Ray; and what that is may be found by the given Ratio of the Sines of 5 to 3, according to the common Laws of Opticks. Then draw V X parallel and equal to K L, and so posited that it may lie the same way towards V, as L doth in respect of K. Join T X; and that Line T X shall be the *unusual Refracted Ray*, being carried by the new Refraction from T to X. If then the Incident Ray S T fall also perpendicularly on the Refracting Surface, those two Rays T V, and T X, into which by Refraction it is divided, will become parallel to the two Lines C K and C L: and the other Ray will be transmitted perpendicularly, according to the common Laws of Opticks; and the other (viz. T X) diverging by this unusual Refraction from the Perpendicular, will make with it the Angle V T X of about 6 degr. as is found by Experience.

And hence the Plane T V X, and such like similar Planes, which are parallel to the Plane C F K, may be called the *Planes of Perpendicular Refraction*; and that Part, Side or Place towards which the Lines K L and V X tend, and which are drawn from the Points K. and V. may be called the *Part, Place, or Side of Unusual Refraction*.

In like manner *Rock Chryſtal* hath a double Refraction; but the Difference between the two Refractions is leſs and leſs conſpicuous, than in the *Iſland Chryſtal*.

When the Ray *ST*, which falling on the firſt Surface of the *Iſland Chryſtal*, is divided into the two Rays *TV*, and *TX*; and thoſe two Rays come to the latter Surface of the ſaid Chryſtal; then the Ray *TX*, which in the firſt Superficies is refracted in the *unusual Ratio*, will be again refracted entire with the ſame *unusual Ratio*, ſo that theſe two Rays will emerge out of the ſecond Surface in Lines parallel to the firſt incident Ray *ST*. For the ſame will happen alſo as to the Ray *TV*, which being refracted in the firſt Surface with the *uſual Ratio*, will alſo be again refracted at the ſecond with the *uſual Ratio*.

And if of two pieces of *Iſland Chryſtal*, one be ſo placed after another, that all the Surfaces of the latter be reſpectively parallel to thoſe of the former: Now alſo thoſe Rays, which in the firſt Surface of the firſt Chryſtal were refracted with the *uſual Ratio*, ſhall in all the latter Surfaces be refracted with the ſame *uſual Ratio*; and thoſe Rays, which in the firſt Surface of the former Chryſtal were refracted with the *unusual Ratio*, ſhall in all the latter Surfaces be refracted with the *unusual Ratio*: And the ſame thing will come to paſs when the Surface of the two Chryſtals are inclined one to another, ſo their *Planes of Perpendicular Refraction* be but parallel.

There is therefore ſome *congenite Difference* in the Rays of Light, that occasions, as in this Experiment, ſome of them to be refracted in the *uſual Ratio* always, and others always in the *unusual Ratio*; for if it were not *congenite*, but did ariſe from ſome *new Modifications* impreſſed on the Rays in the firſt Refraction, then that would be changed by the ſame kind of new Modifications in the three following Refractions. But no ſuch thing happens: But the Property continues always the ſame, and hath the very ſame Effect in the Rays in all thoſe Refractions: Wherefore this *unusual Refraction* muſt depend on ſome *congenite Property* in the Rays of Light. And 'tis very well worth while to enquire, whether there may not be other ſuch, as yet unobſerved and unknown.

For one would ſuſpect that there are *divers Sides* of the Rays of Light, and thoſe endued with *divers congenite Properties*: For if the *Planes of Perpendicular Refraction* of the ſecond piece of Chryſtal be placed at Right Angles with the *Planes of*

Perpendicular Refraction of the firſt Chryſtal; then will the Rays, which in their Projection thro' the firſt Chryſtal were refracted with the *uſual Ratio*, in paſſing thro' the ſecond be refracted with the *unusual Ratio*; and thoſe Rays, which in paſſing thro' the firſt Chryſtal were refracted with the *unusual Ratio*, ſhall in paſſing thro' the ſecond be refracted with the *uſual Ratio*. Wherefore there are not two divers kinds of Rays in their own Nature different; of which one ſort are always and in all Poſitions refracted with the *uſual*, and others with the *unusual Ratio*: But theſe two kinds of Rays, as mentioned in the laſt Experiment, did only differ in this, that the Rays, according to their different Poſition, did with their different Sides reſpect the *Place, Region or Side of unusual Refraction* in the Chryſtal: For in the preſent Experiment, one and the ſame Ray is refracted one way with the *uſual*, the other way with the *unusual Ratio*, according to the Poſition of its Sides to thoſe of the Chryſtal. If the ſame Sides of any Ray look towards the ſame Parts of each Chryſtal, then will that Ray be refracted with one and the ſame Ratio in each Chryſtal; but if that Side of the Ray, which is turned towards the *Place of unusual Refraction* in the former Chryſtal, be diſtant 90° . from that Side of the ſame Ray which looks towards the *Place of unusual Refraction* of the ſecond Chryſtal (which may be done, by ſo turning the ſecond Chryſtal, that it ſhall look towards the former Chryſtal, and conſequently the Rays of Light themſelves in a different Poſition) that Ray will now be refracted in different Ratios in the different Chryſtals. So that you may determine, whether the Rays, which fall on the ſecond Chryſtal, will be refracted in the *uſual* or *unusual Ratio*. And for this there is nothing more required, than that the ſecond Chryſtal be ſo turned about, that its *Place or Region of unusual Refraction* be accordingly poſited on this or that Side of the Ray.

Wherefore every Ray may be conſidered as having four Sides; two of which being directly oppoſite to one another, cauſe that the Ray be always refracted in the *unusual Ratio*, whenever either of thoſe Sides is turned towards the Side or Place of *unusual Refraction* in the Chryſtal: But the other two Sides, as often as either of them is turned towards the Side of *unusual Refraction* in the Chryſtal, do yet cauſe the Ray to be refracted with the *uſual Ratio*. The two former Sides of the Ray therefore may be called the *Sides of unusual*, the two latter of *uſual Refraction*. And becauſe theſe *Diſpoſitions* were in the Rays before they fell on the 2d, 3d, and 4th Surface of the 2 Chryſtals, nor were they at all changed by the Refraction of the Rays in their Paſſage thro' thoſe Surfaces, but the Rays were refracted by one and the ſame Law in every one of the four Surfaces, it ſeems that theſe *Diſpoſitions* are properly *congenite* to the Rays of Light, and were not at all changed by the firſt Refraction; but that it is on the account of theſe *Diſpoſitions* in the Rays, that they were refracted in their Incidence on the firſt Surface of the firſt Chryſtal, ſome in the *uſual*, and ſome in the *unusual Ratio*, according as their Sides of *uſual* or *unusual Refraction* at that time reſpected the Sides or Place of *unusual Refraction* in that Chryſtal.

All the Rays of Light therefore have two oppoſite Sides, in which the Property is *congenite*, on which the *unusual Refraction* depends; and the

other

other two Sides are without any such Property. And it requires yet further to be considered, whether there be not even other Properties of Light, by which the Sides of the Rays differ, and are distinguished from one another.

After this he shews, that in an Oblique Incidence of the Rays upon the first Chrystal, the same Difference between them appears, as when they fall perpendicularly to the former Properties.

From the whole therefore may be very justly concluded, That all those Hypotheses are false and precarious which have been yet advanced, in order to explain the Phenomena of Light by new Modifications of the Rays; for they do not depend on any such Modifications, but on congenite and immutable Properties, essentially inherent in the Rays.

And equally erroneous also are those Hypotheses, which attempt to explain the Phenomena of Light by any Pressure or Pulse impressed upon the fluid Medium by Motion; for these at long run depend upon the new and different Modifications of the Rays, and so fall in with the other.

But further, if Light consisted only in a Pressure upon the Medium, it must be either without any local Motion; and then 'tis impossible to account for the Agitation and Heat produced in Bodies by the Refraction and Reflection of the Rays: Or if it be supposed to consist in Motion propagated to all Distances in an Instant, to that must be required an infinite Force acting every Moment, and in each lucid Particle. But did Light consist in a Pressure or a Motion propagated thro' a fluid Medium, whether it propagated instantaneously, or in time, it could not be done in Right Lines, but must inflect back upon itself in a Shadow; for Pressure or Motion in a fluid Medium, whenever it meets with any Obstacle which may impede Part of its Motion, cannot be propagated in Right Lines, but must be inflected back towards itself, and diffused every way throughout the quiescent Medium which lies beyond the Obstacle.

The Force of Gravity tends downwards; and yet the Pressure of the Parts of Water, which arises only from the Force of Gravity, tends with an equable Force every way, and is propagated with equal Ease by crooked Lines as by strait. Waves, on the Surface of Water, where they fall on the Surface of any large Obstacle, inflect back upon themselves, and are dilated and diffused gradually in the quiescent Water lying beyond that Obstacle. The Waves, Vibrations, or Pulses of Air, in which Sounds consist, are manifestly inflected, tho' not so much as those of Water; for the Sound of a Bell, or of a great Gun, can be heard over a Hill, interposed between the Ear and Eye, and sounding Body: And we find that Sound is propagated as easily by crooked as strait Tubes; whereas Light is never observed to move in curve Lines, nor to be inflected back so as to shadow itself. Indeed there is a kind of Inflection of the Rays of Light, as hath been before mentioned; but that is not *ad Umbram*, but a contrary way, and is only found in a Ray's passing by and very near the extream Edge of some Body; and then as soon as it is past the Body, it goes on strait again.

The Rays of Light are therefore certainly little Particles, actually emitted from the Lucent Body, and refracted by some Attraction, by which Light, and the Bodies on which it falls, do mutually act upon one another; for such Particles or Cor-

puscles thro' uniform Mediums will be transmitted in right Lines without any Inflection in *Umbram*, as we find the Rays of Light are: They may have also divers Properties, and which they may preserve immutable in their own Passages thro' divers Mediums; which agrees with the Nature of the Rays of Light. *Pellucid Bodies* act upon the Rays of Light at some Distance, when they refract, reflect and inflect them; and the Rays of Light reciprocally act upon them, at some little Distance also, by agitating and heating their Particles. And this *Action* and *Re-action*, which is performed at some Distance, is mighty like what we call the Force of Attraction, or Gravity, in other Bodies. And if the Cause of Refraction be the Attraction of the Rays, he shews in his admirable *Principia*, that the Sines of Incidence must be to the Sines of Refraction in a given Ratio; as in Fact we find the thing to be. The Rays of Light, in passing out of Glass into a Vacuum, are inflected towards the Glass, and, if they fall too obliquely, will revert back again to the Glass, and be totally reflected. Now the Cause of this Reflection cannot be attributed to any Resistance of the Void or Vacuum, but entirely to some Force or Power in the Glass, which attracts or draws back again the Rays as they are passing into the Vacuum. And this appears from hence, That if you wet the posterior Surface of the Glass with Water, Oil, or liquid and clear Honey, or with a Solution of Quicksilver; then the Rays, which would otherwise have been reflected, will pass into and thro' that Liquor. Which plainly shews, that the Rays are not reflected till they come to that posterior Surface of the Glass, nor till they begin to go out of it too. But if at their going out they fall into any of the aforesaid Liquors, they will then not be reflected, but go on in their former Course; the Reason of which is, that the Attraction of the Glass is counter-balanced by the Attraction of the Parts of the Liquor which adhere to its Surface. And this appears yet plainer in the Experiment of two Glass Prisms, or the Object Glasses of two long Telescopes, one of which shall be plane (on one side), the other a little convex, and then compressing them so that they do neither quite touch one another throughout, and yet have their Surfaces very near; for then that Light which falls on the hinder Surface of the first Glass, and in that Place where the Glasses are not distant one from another above $\frac{1}{1000}$ of an Inch, will be totally transmitted thro' that Surface and the interjected Air or Vacuum, and will enter into the second Glass (as he shews in his 1st, 4th, and 8th Observations of the first Part of his 2d Book of his *Opticks*). But if the second Glass be moved a little farther off, then the Light, coming out of the hinder Surface of the first Glass into that Air or Vacuum, will be turned back again towards the Glass, and reflected. Wherefore 'tis plain, that the Rays are drawn back by some Force that is inherent in the first Glass, since there is nothing else that can occasion it.

To account also for that odd Phenomenon of the Rays of Light, which he calls their *Fits of easy Transmission and Reflection*, he judges that there is nothing more required, than that the Rays should be very small Corpuscles of Matter, which either by their Attraction, or some other Force, do excite certain Vibrations in the Bodies on which they act;

act; which Vibrations, being *swifter* than the Motion of the Rays, do successively outstrip or get before them, and so agitate them as alternately to increase or diminish their Velocity; and therefore produce those *Fits* in the Rays of Light.

And he thinks it very likely, that the *Unusual Refraction*, discovered to be in the *Island Chrystal* above-mentioned, is caused by some *Attracting Force*, which is inherent in certain *Sides* of the Rays and of the *Particles* of the Chrystal. For if there were not some such *Force* or *Virtue* in some Part of the Chrystal, and not in the others, in order to distort and bend the Rays towards the Sides or Parts of *Unusual Refraction*, it could not be, that the Rays, which fall perpendicularly upon the Chrystal, should both in their Ingress and Egress be so refracted one way rather than another, as that they should also perpendicularly emerge by a now contrary Position of the *Place* or *Region* of *Unusual Refraction* in the Surface of the second Chrystal; the Chrystal plainly acting upon the Rays *after* they have passed thro' it, and are got into the Air, or into a *Vacuum*.

And because the Chrystal, by that *Force*, doth not act on the Rays, but when the proper corresponding Sides of the Rays of Light are turned towards the Places or Parts of *Unusual Refraction* in the Chrystal, it appears that there is also some *Force* or *Virtue* in the Sides of the Rays themselves, corresponding to that *Force* inherent in those Parts of the Chrystal, almost after the same manner as the two Poles of the Magnet answer to one another. Which *Virtue* in the Magnet, as it is capable of being increased and diminished, and is not any where to be found but in the Magnet and in Iron; so this *Virtue* of the refracting Rays which fall perpendicularly upon it, is greater in the *Island* than in the *Rock Chrystal*, and is as yet found no where else.

Not that he thinks this *Virtue* to be *Magnetical*; for it seems to be of a different Nature. But let it be what it will, it can scarce be conceived that the Rays of Light, unless they be allowed to be really Corpuscles or Particles of Matter, can have any such permanent *Force* in two of their Sides, and not have any such thing, at the same time, in their two other; and this without any regard to the *Position* with which they respect the Space or *Medium* thro' which they pass.

And yet tho' Light be certainly a Body, it is almost impossible to conceive the Smallness of its Corpuscles. But however, that they are exceeding minute, may be gathered from these Considerations: (1.) That they freely pervade all transparent Bodies, such as Chrystal, Glass, several Pebbles and Gems; and almost all Fluids, but Mercury; and pass where no other Fluid, how thin soever, can enter; and yet no Eye hath ever been able to discover the constituent Particles of the grossest Fluid. (2.) It may be propagated from innumerable different *Luminous Bodies*, without any considerable Opposition to one another, as Dr. *Cheyne* shews by this Experiment: Suppose a Plate of Metal, having at the top the smallest Hole that can be made, were erected perpendicularly on an *Horizontal Plane*, and that about it were set innumerable *Luminous Objects* of about the same Height with the Plate, at an ordinary Distance from it; then will the Light, proceeding from every one of these Objects, be propagated thro' this small Hole, without interfering. This will appear by applying a dark Object, in

a strait Line, against the luminous Body; for the Light of this Body will thro' the Hole be received upon the dark Body. Now it is impossible that so many different *Streams* of Light could be transmitted thro' so small a Hole, were not the Particles of Light extremely little. To which may be added, (3.) That if they were not very minute Corpuscles, their amazing Velocity is such, that they would pierce thro' all Kinds of solid Bodies almost as easily as they do Vacuities; whereas we see the Rays of Light to be regularly reflected from some Bodies. (4.) We find also that innumerable different Spheres of Light may be propagated from their several luminous Centres within our Horizon, without interfering. How many Millions of Candles and Flambeaus, sending all out their Tides of Light, is it possible for the Eye to see together, without their being confounded one with another? Which shews both the exceeding Smallness of the Particles of Light, and also the Largeness of the Vacuities between the Particles of Air and other Bodies.

How extremely swift the Particles of Light move, may be gathered from the Experiment of Mr. *Romer*; wherein he finds that the Rays of Light pass from the Sun to us in about 10 Minutes of Time: And Mr. *Hugens* hath proved in his *Cosmotheoros*, that a Bullet discharged from the Mouth of a Cannon, and not abating of its first Velocity, would be 25 Years before it reach the Sun. Now the *Via percursa* being the same in both, the Velocities will be reciprocally as the Times; that is, the Velocity of Light to that of a Cannon-Bullet, will be to that of a Cannon-Bullet, persisting in its greatest Swiftness, as 25 Years to 10 Minutes; or as 1314700 is to one, nearly: So that the Motion of Light is above a Million of times swifter than that of a Cannon Ball.

Moreover, the Distance between the Sun and Earth is at least 12000 Diameters of the Earth; but suppose it but 10000, then will Light run 1000 Diameters in a Minute, or 16 $\frac{2}{3}$ Diameters in a Second; that is, at least 130000 Miles in one Second; which is Motion almost incredibly and really amazingly swift. But the extraordinary Effects of Light and Heat seem to require all this; and we see how powerfully it acts (being congregated) on the most compact solid Bodies; and we never find any Abatement of its Force arising from a Diminution of its Velocity.

See Mr. *Hawksbee's* Experiments about the Production of Light in *Vacuo* by the Attrition of Bodies, in *Phil. Trans.* No 304, and in No 307; and by the Effluvia of one Glass falling on another in Motion, *Phil. Trans.* No 309, 310.

LIGHTS. Ships of War are in the Night-time very well distinguished by the Lights that they hang out; for in a Fleet the Admiral carries three Lights on the Poop, and one on the Main-Top; the Vice-Admiral hath two on his Poop, and one on his Main-Top; the Rear-Admiral hath but one on his Poop, and one on his Main-Top; the Vice-Admiral of each particular Squadron hath only two on his Poop, but none on his Main-Top; the Rear-Admiral of each Squadron hath only one on his Poop. But when the whole Fleet carry their Lights, then the Rear-Admiral is distinguished by carrying two Lights, the one hoisted a Yard above the other, on the Ensign-Staff; and in case of foul Weather and a dark Night, every Ship must carry a Light.

LIGULA,

LIGULA, in our *Latin Law* signifies a Copy, Exemplification, or Transcript of any Court Roll or Deed.

LIMBERS, in *Gunnery*, are a kind of Train joined to the Carriage of a Cannon upon a March. It is composed of two Shafts wide enough to receive a Horse between them (which Horse is called the *Fillet Horse*.) These Shafts are joined by two Bars of Wood and a Bolt of Iron at the end, and have a pair of small Wheels: On the Axle-tree rises a strong Iron Spike, on which the Train of the Carriage is put upon a March: But when a Gun is on Action, these *Limbers* are run out behind her.

LINE of the *True Place* } of a Planet, is a right
Apparent }
 Line drawn from { *Earth's Centre,* } thro' the
 { *Eye of the Spectator* } Planet, and continued as far as the fixed Stars.

LINE of *Measures*, in the *Stereographick Projection* of the Sphere in *Plano*, is that Line in which the Plane of a great Circle, perpendicular to the Plane of the Projection and that oblique Circle which is to be projected, intersects the Plane of the Projection. Or it is the common Section of a Plane passing thro' the Eye Point, and thro' the Centre of the Primitive, and at right Angles, to any oblique Circle which is to be projected, and in which the Centre and Pole of such Circle will be found.

Line of *Direction*, of the Earth's Axis in the *Pythagorean System* of Astronomy, is the Line connecting the two Poles of the Ecliptick, and of the Equator, when they are projected on the Plane of the former.

LINE of the *Section*, in *Perspective*, is the Intersection or Contact of the Plane to be projected with the *Glass* or *Diaphanous Plane*.

LINE of *Lines*, on the *Sector*, is a Scale of equal Parts on each Leg, and running from the Centre. This is divided actually into 100 equal Parts, and sometimes into more, when the Instrument is large. There are only the Figures 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, placed on the Lines; and therefore they sometimes stand for themselves alone, and sometimes signify ten times, or an hundred, or a thousand times themselves, according as the Matter shall require.

The Uses of the *Line of Lines*.

1. To increase or diminish a Line of any given Length, according to any Ratio required.

Suppose the Line were 6 $\frac{1}{2}$ Inches in length; apply it into the *Sector* by way of parallel Entrance, so that each Foot of the Compasses stand in 6 $\frac{1}{2}$ in *Line of Lines*, and then let the *Sector* be kept at that Angle. Then if you wou'd have it increased in the Proportion of 9 $\frac{1}{2}$ to 6 $\frac{1}{2}$; or diminished in the Proportion of 2 $\frac{3}{4}$ to 6 $\frac{1}{2}$, &c. let the *Sector* lie, and take with the Compass the parallel Distances between those Points of 9 $\frac{1}{2}$ and 9 $\frac{1}{2}$; or of 2 $\frac{3}{4}$ and 2 $\frac{3}{4}$, in the *Line of Lines* of each Leg, and that will give you the Length required.

2. To divide a given Line into any Number of Parts; as suppose into 9.

Apply the Line over from 9 to 9 in the *Line of Lines*; and keeping the *Sector* of that Angle, take the Distance between 1 and 1, and that will be $\frac{1}{9}$ Part of the Line.

3. To find what Proportion two or more Lines bear to one another.

Apply the greater or greatest over from 10 to 10 at the ends of Lines; and then taking any of the other, and applying it over parallel to the former, it will mark out such Numbers as shall express its Proportion to the greatest Line: as suppose the Compasses pointed to 30 and 30; then will the greatest Line be to it as 100 is to 30. &c.

4. To work Proportions with the *Sector*, proceed just as you do in finding a 3d or 4th Proportional to 2 or 3 Lines given Geometrically. See *Proportion*, Vol. I.

LINEA Celerrimi Descensus, is that Curve which a Body would describe in its Descent, if it moved the swiftest possible: The Investigation of which was first, I think, proposed as a Problem by Mr. *John Bernoulli*, and hath been solved by his Brother *James*, and several others; and very easily thus, by Mr. *John Craig*, in *Phil. Trans.* N. 268.

Suppose BC, CD, two infinitely small Parts of the Curve sought: Then, since the Nature of the Curve is to be such, that the Descent of the Body from B to D,

after its Fall from the Horizontal Line AQ, is to be in the least time possible; we must find in the Line RS (drawn parallel to AQ so, that the Differences between any two Ordinates to the Curve, as of GC, DE, may be equal) a Point in which this must happen.

Now the Velocity of the Body in the Point C is $\sqrt{LC}$; and its Velocity in the Point D, as

$\sqrt{QD}$. Wherefore $\left(\frac{BC}{\sqrt{LC}}\right)$ is = to the Time

of the Descent thro' BC, as $\frac{CD}{\sqrt{QD}}$ = to the

Time of the Descent thro' CD. by *Prop. 54. Newton. Princ.* Wherefore the Point C must be such, as

that $\frac{BC}{\sqrt{LC}} + \frac{CD}{\sqrt{QD}}$ must be a Minimum, or

the least possible. Suppose then the Points B and D to be fix'd; let GC (= DE) = m : LC = b , and QD = p , all invariable Quantities: and let the flowing Quantities BG = u : and CE = z .

Wherefore $\frac{\sqrt{m^2 + u^2}}{\sqrt{b}} + \frac{\sqrt{m^2 + z^2}}{\sqrt{p}} =$ to a

Mini-

Minimum. And consequently $\frac{uu}{b\sqrt{m^2+u^2}} + \frac{zz}{p\sqrt{m^2+z^2}} = 0$. But $u = -z$ (because $u + z =$ to an invariable Quantity.) Wherefore $\frac{u}{b\sqrt{m^2+u^2}} = \frac{z}{p\sqrt{m^2+z^2}}$: Wherefore 'tis plain that $\frac{u}{b\sqrt{m^2+u^2}} =$ to an invariable Quantity. Let then the *Abscissa* $AL = x$; the *Ordinate* $LC = y$: And therefore $BG = x$. $GC = y$. $BC = \sqrt{xx+yy}$. and let a be any invariable Line. Then will $\frac{x}{y\sqrt{xx+yy}} = \frac{1}{\sqrt{a}}$.

Wherefore $x\sqrt{a} = y\sqrt{xx+yy}$. But in every Curve x is to $\sqrt{xx+yy}$, as the Subtangent to the Tangent: Wherefore the Nature of this Curve is such, that the Subtangent is to the Tangent as $\sqrt{a}$, is to the $\sqrt{y}$. which is known to be the Property of the Cycloid; where the Tangent is parallel to the Chord of a Conterminous Ark in the generating Circle, whose Diameter is a , and its Vertex downward.

LINES of Solids. See Solids.

LINES of Surfaces or Surfaces. See Surfaces.

LINES of Chords. See Chords.

LINES of Tangents. See Tangents.

LINES of Secants. See Secants.

LINSTOCK, is a short Staff of Wood about 3 Foot long, having at one End a piece of Iron divided into 2 Branches, each of which hath a Notch to hold a piece of Match, and a Screw to fasten it there. The other End of the Staff is shod also with Iron, and pointed to stick into the Ground. 'Tis used by the Gunners in firing Cannon.

LIQUID, is a Word used by the Civilians in this Sense, for a Thing's being apparently proved, as they say: A Creditor would be injur'd, should a Debt which is clearly due be stop'd, on the Pretence of another Debt that is not Liquid, or apparently proved.

LIQUIDUM Nervorum, is that Juice or Fluid which Nerves carry in their Canals, and is usually called the Nervous Juice.

LIVER. See Hepar.

LOAD, is the Miners Word, especially in the Tin Mines, for a Vein of Ore.

LOCAL Colours, in Painting, are such as are natural and proper for each particular Object in a Picture; and they are so called to distinguish them from the *Claro-Obscuro*: Which see.

LOCATIO-Conductio, in the Civil Law, is a Contract of the Law of Nations, whereby the Use of a Thing, or the Service and Labour of a Person, is gained for some Time for a certain Reward.

LOCUS Resolutus, according to Pappus's Account of it in *Libr. 7^{mo} Mathem. Coll.* is, That it is a proper peculiar Matter, after the common Constitution of the Elements of Geometry, contrived for such Persons as would obtain a ready and easy Method of solving such Problems as shall be proposed to them. (See Resolution in Vol. I.) On this Subject Euclide, Apollonius Pegasus, Eratof-

thenes and Aristæus Senior, are the only Writers among the ancient Geometers. Euclide's Tracts are *Datorum Liber Unus*; *Locorum ad Superficiem Duo*; *Porismatum Tres*. Apollonius, *de Sectione Rationis* (lately put out at Oxon by Mr. Halley) *Libri Duo*: *De Sectione Spatii Libri Duo*; *Tactionum Libri Duo*: *Inclinationum Duo*; *Planorum Locorum Duo*: *Conicorum Ocho*. Of Aristæus, there were *Locorum Solidorum Libri Quinque*. And of Eratosthenes, *Duo Libri de Medietatibus*.

There are two Kinds, saith Pappus, of this Resolution; one, where bare Truth in Theory only is pursued; which therefore he calls the *Contemplative Method or Theoretic*: and the other, where we investigate something which we propose to have done; and this is called the *Problematic Method*. What this Resolution or Analysis of the Ancients was, you may see in the Learned Mr. Halley's Edition of *Apollonius de Sectione Rationis* above-mentioned; and a good Attempt towards its Restoration in a Modern Spanish Author, *Hugo de Omerique*, his *Analysis Geometrica*, printed at Cales 1698.

LODEMANAGE, was anciently the Term for the Hire of a Pilot, when he conducted a Ship from Place to Place.

LODE-SHIP, was formerly the Name of a small fishing Vessel. *Vid. 31 E. 3. Stat. 3. c. 2.*

LOGARITHMICK-Spiral, is a Curve generated by the equable Motion of the Radius of a Circle thro' equal Arks of the Circumference; while at the same time a Point in that Radius is supposed to move from the Ark towards the Centre, with a Retardation of Motion in a Geometric Proportion. As suppose there be a Quadrant of a Circle, as BCA , and any equal Divisions in the Ark, as $AF = Ff = ff$, &c. with 5 corresponding Radii, suppose as CA, CF, Cf , &c.

whose Parts or Portions $C1, Ca, Ca$, &c. are Geometrically proportional; then if a Line, as x, a, a, b, d, C , be drawn thro' those Points, it will be the Logarithmick-Spiral. *Vid. Guido Grand. Theorem. Hugon. Cap. 1.*

LOGARITHMS. The Learned and Ingenious Mr. Halley, Savilian Professor of Geometry in Oxon. and F.R.S. hath in *Phil. Transact.* N^o 216. and since that, in *Sherwin's Mathematical Tables*, published a most compendious and easy Method of constructing the Logarithms; and this exemplified and demonstrated from the Nature of Numbers, without any regard to the Hyperbola, or any other Curves: Together with a speedy Method of finding the Number answering to any given Logarithm. See the Preface to *Sherwin's Math. Tables*, p. 14, &c.

A
TABLE
OF
LOGARITHMS

For Numbers increasing orderly from 1 to 10000,
with their Differences.

*Whereby the Logarithm of any Number under
10000 may be readily taken.*

The End of the Table of PROPORTIONAL PARTS.

A N
ACCOUNT
OF THE
Origine, Nature, Construction, Uses,
AND
Application of the preceeding TABLES
OF
LOGARITHMS.

THE Invention of the Logarithms is justly esteemed one of the most useful Discoveries in the Art of Numbers, and accordingly has had an universal Reception and Applause. And the great Geometricians of this Age have not been wanting to cultivate this Subject, with all the Accuracy and Subtily as a Matter of that Consequence doth require; and they have demonstrated several very admirable Properties of these Artificial Numbers, which have render'd their Construction much more facile, than by those operose Methods, at first used by their truly Noble Inventer, the Lord Neper; and our Worthy Country-Man Mr. Briggs.

But some Account however of the first Invention of these most useful Tables, 'tis proper to introduce here.

Logarithms (saith Dr. Wallis in his Algebra) were first of all invented, without any Example before him that I know of, by John Neper, Baron of Merchiston in Scotland, and by him published at Edinburgh, A. D. 1614. and soon after by himself (with the Assistance of Henry Briggs, Professor of Geometry, first at London in Gresham-College, and afterwards at Oxford) reduced to a better Form and perfected.

The Invention was greedily embraced (and deservedly) by Learned Men.

Mr. Briggs upon the first Publication of it, was so pleased with it, that he presently repaired into Scotland, to consult the Author's Advice about it, and be assistant to him in the perfecting of it, and in calculating Tables for it; which was a Work of great Labour, as well as subtile Invention.

And it was embraced and promoted abroad by Benjamin Ursinus, John Kepler, Adrian Vlacq, Petrus Cragerus, and others.

And at home, by Henry Gellibrand, who perfected the *Trigonometria Britannica*, which Mr. Briggs began, but died before he had finished it.

So that in a short time it became generally known, and greedily embraced in all Parts, as of unspeakable Advantage; especially for Ease and Expedition in Trigonometrical Calculations.

Vol. II.

In the former Volume I have briefly shewn the Nature and Construction of Logarithms in general, which therefore I shall not repeat here; but go on with their History, and the several Improvements which have been made in this Science, some of which are only barely hinted at there.

A. D. 1614. The Lord Neper published the first Tables of Canon, or Natural and Artificial Sines for each Degree and Minute of the Quadrant.

And whereas it was at his Choice to give to what Number he pleased the Logarithm 0, and whether to proceed by Way of Increase or Decrease, he chose to make 0 the Logarithm of the whole Sine 10000000, that so the Multiplication or Division by the whole Sine (frequent in Trigonometrical Calculation) might be dispatched without Trouble, requiring here but the Addition or Subtraction of 0.

And because the Use of lesser Sines and Numbers less than the Radius or whole Sine, were likely to be of more frequent Use, than Tangents, Secants, and other Numbers greater than the Radius; he chose to give to those lesser Numbers Affirmative Logarithms (increasing the Logarithms from 0, as the Sines decrease) which he calls *Abundants*: And consequently Negative Logarithms (which he calls *Defectives*) to greater Numbers. Designing those by +, these by —.

And by this means he directs how the Table of Sines (with the Differences there inserted) may serve also for a Table of Tangents, and of Secants; so that this Canon is a compleat Canon, of Natural Sines, and of Logarithmical Sines, Tangents, and Secants.

He shews also how this Table may be applied to the Logarithms of Absolute Numbers; but because with some Trouble, he reserves the fuller Account hereof to a farther Treatise.

In the Year 1619, the Lord Neper being then dead, the same was again published by his Son Robert Neper; with some posthumous Treatises of his Father concerning the Construction of this Logarithmical Canon, and concerning his Design

The Use of the Table of Logarithms.

sign (after Communication had with Mr. Briggs) of changing the Form of his Logarithms, making 0, to be the Logarithm of 1, (of which he had before given Notice in the Preface to his *Rabdo-logia*, published in the Year 1617;) and concerning some things pertaining to Trigonometry; with some Lucubrations of Mr. Briggs on the same Subject.

But the Lord Neper being dead the whole Work was devolved on Mr. Briggs, who (according to their joint Advice) making the Logarithm of 1 to be 0; and of 10, 100, 1000, &c. to be 1, 2, 3, &c. which he calls *Indices*, or *Characteristicks*, and which we may repute as Integer Numbers, with fourteen Cyphers annexed, and esteem or value as so many Places, or Decimal Fractions, below the Place of Units, or of the Characteristick: And between these he sets the intermediate Logarithm for the Intermediate Numbers.

And consequently the Logarithm of 1 being 0, the Logarithm of Fractions less than 1, or of Numbers intermediate, between 1 and 0, must be Negative Numbers, or Numbers less than 0, which he calls Defective Logarithms, denoted by — (the Note of Negative) prefix'd.

Now these Defective Logarithms may be two ways expressed; either so as that the Note of Negation shall affect the whole Logarithm, or so as to affect only the Characteristick, (leaving the Rest of the Logarithm to be understood as Affirmative.)

As for Example; The Fraction $\frac{3}{8}$, or (which is equivalent) 0.375. This Fraction supposeth the Numerator 3 to be divided by the Denominator 8, which in Logarithms, is to be performed by Subtracting the Logarithm of 8, from that of 3, and the Remainder will be the Logarithm of $\frac{3}{8}$, which will be then the Negative Number, —0.4259687.

Log. 3.	0. 4771213.
Log. 8.	0. 9030900.
Log. $\frac{3}{8}$.	— 0. 4259687.

Or thus; For as much as the Logarithm of 375, (supposing it to be an Integer Number) is 2. 5740313, And the depressing this to the First, Second or Third, or farther Place of Decimal Fractions, doth (without altering the Figures) divide the Value by 10, 100, 1000, &c. which in Logarithms is done by subtracting 1, 2, 3, &c. from the Characteristick, or Place of Integers (1, 2, 3, &c. in that Place being the Logarithms of 10, 100, 1000, &c.) such Alteration of the Value (the Figures remaining) is done by altering the Characteristick of the Logarithm, without varying the other Figures, in this Manner:

Log. 3750=3.	5740313
Log. 375=2.	5740313
Log. 37 5=1.	5740313
Log. 3 75=0.	5740313
Log. 0 375=1.	5740313
Log. 0 0375=2.	5740313

Which two Forms, tho' they seem different, and some may rather chuse the one, some the other; or in some Cases the one, and in some Cases the other; yet they are in Substance and Value the

same. For, by sudducting the lower Number from the upper.

$$\begin{array}{r} -1. 0000000 \\ +0. 5740313 \\ \hline \text{is} = -0. 4259687 \end{array}$$

And every one is left to his Liberty whether of the two Ways (or what other Equivalent thereunto) he shall please to use.

In this Method Mr. Briggs hath calculated a Table of Logarithms (published in the Year 1624) for 20 Chiliads of Absolute Numbers (from 1 to 20,000;) and again for 10 more (from 90,000 to 100,000) and one Chiliad supernumerary (*viz.* the Hundred and First Chiliad) that is, 31 Chiliads in all.

Before which is prefix'd a large Account of the Nature and Construction of the Logarithmical Canon, and the Uses thereof; and directing how to supply the intermediate Chiliads, which are here wanting. The whole intituled *Arithmetica Logarithmica*.

The same was again published in 1628, by *Adrian Vlacq* (or *Flack*) with a Supplement (as Mr. Briggs directed) of the Chiliads before omitted; that is, in all of 100 Chiliads, with one Supernumerary.

But in shorter Numbers extended but to 10 Places below that of the Integers, or Characteristick. And he subjoins also a Logarithmical Canon of Sines, Tangents, and Secants (for Degrees and Minutes of the Quadrant) of as many Places.

Mr. Briggs proceeded to calculate a Trigonometrical Canon, Logarithmical, suited to that for Absolute Numbers to the Logarithms extending (as in that other) to 14 Places besides the Characteristick. And having before calculated a Table of Natural Sines, Tangents, and Secants (for Degrees and Centesims of Degrees) in Number extending to 15 Places, he fitted thereunto a Canon of Logarithmical Sines, and Tangents (because those of Secants might be spared;) and a Treatise prefixed concerning the Construction thereof, with other Things pertinent thereunto; intending a further Treatise concerning the Use of it.

But dying before this last was finished, or the rest published, Mr. *Henry Gellibrand* supplied this latter, and published the whole with the Title of *Trigonometria Britannica*, in the Year 1633. To which is subjoin'd another Canon of Logarithmical Sines, and Tangents, by *Adrian Vlacq*, for Degrees, Minutes, and Tenth Seconds, extending (as his former did) to 10 Places besides the Characteristick; and Mr. Briggs 20 Chiliads for Logarithms of Absolute Numbers.

So that the whole Doctrine of Logarithms was by this time sufficiently perfected, with convenient Canons or Tables fitted thereunto in large Numbers: Of which also *Petrus Cragerus* gives an Account in the Preface to his *Trigonometria Logarithmica*, Printed in the Year 1634, with his Logarithmical Tables, but in short Numbers.

And the Table of Logarithms above-mentioned, (for 100 Chiliads of Absolute Numbers, and of Sines and Tangents to Degrees and Centesims) were the same Year (1633) contracted, into a lesser Form and more manageable (but in shorter Numbers, the former not extending to above 7 Places,

The Use of the Table of Logarithms.

Places, beside the *Characteristick*, but the latter to 10) by *Nathanael Row*; with Directions for the Use of them (in *Trigonometry*, *Geometry*, *Astronomy*, *Geography*, and *Navigation*) by *Edmund Wingate*.

In the mean time, *Benjamin Ursinus*, did also publish Tables of Logarithms in the Year 1618; and *Claudius Batschius* about the same Time, or soon after. And again *Benjamin Ursinus* in the Year 1625, in his *Trigonometria*; and *Johannes Keplerus* also in the Year 1624, in his *Chilias Logarithmorum* (which he applies also to his *Rudolphine Tables*, published in 1627;) and *Claudius Batschius* about the same Time, or soon after: And *Georgius Ludovicus Frobenius* in the Year 1634, (and perhaps some others.)

But all or most of them in short Numbers, and conformable to the Lord *Neper's* first Design; not to that Form which upon second Thoughts he and Mr. *Briggs* agreed upon as most *Eligible*, and which hath since been received in common Practice.

Thus far Dr. *Wallis*: What follows is the easie and compendious Method of Mr. *Edm. Halley*, Savilian Professor of Geometry in *Oxon*, for constructing Logarithms; which was mentioned in the former Volume.

The Invention, saith that excellent Geometer, of the Logarithms, is justly esteemed one of the most useful Discoveries in the Art of Numbers, and accordingly has had an universal Reception and Applause: And the great Geometricians of this Age have not been wanting to cultivate this Subject, with all the Accuracy and Subtilty which a Matter of that Consequence doth require; and they have demonstrated several very admirable Properties of these artificial Numbers, which have rendered their Construction much more facile, than by those operose Methods, at first used by their truly noble Inventor, the Lord *Neper*, and our worthy Country-man Mr. *Briggs*.

But notwithstanding all their Endeavours, I find very few of those, who make constant Use of Logarithms to have attained an *Adequate Notion* of them; to know how to make or examine them, or to understand the Extent of the Use of them; contenting themselves with the Tables of them, as they find them, without daring to question them, or caring to know how to Rectify them, should they be found amiss; being I suppose under the Apprehension of some great Difficulty therein.

For the Sake of such, the following Tract is principally intended, but not without hopes however, to produce something that may be acceptable to the most knowing in these Matters.

But first, it may be requisite to premise a *Definition* of Logarithms, in order to render the ensuing Discourse more clear; the rather because the Old one *Numerorum proportionalium equi-differentes comites*, seems too scanty to define them fully.

They may much more properly be said to be *Numeri Rationum exponentes*: Wherein we consider *Ratio* as a *Quantitas sui generis*, beginning from the *Ratio* of Equality, or 1 to 1 = 0; being *Affirmative* when the *Ratio* is *Increasing*, as of Unity to a greater Number, but *Negative* when *Decreasing*: And these *Ratios* we suppose to be measured by the Number of *Ratiunculae* contained in each.

Now these *Ratiunculae*, are so to be understood,

as in a continual Scale of Proportions, infinite in Number between the two Terms of the *Ratio*; which infinite Number of mean Proportionals is to that infinite Number of the like equal *Ratiunculae*, between any other two Terms :: as the Logarithm of one *Ratio*, is to the Logarithm of the other: Thus, if there be supposed between 1 and 10, an infinite Scale of mean Proportionals, whose Number is 100000, &c. in *infinitum*; between 1, and 2, there shall be 30102, &c. of such Proportionals, and between 1 and 3, there will be 47712, &c. of them; which Numbers therefore are the Logarithms of the *Rationes* of 1, to 10, 1, to 2, and 1, to 3; and not so properly to be call'd the Logarithms of 10, 2, and 3.

But if instead of supposing the Logarithms composed of a Number of equal *Ratiunculae*, proportional to each *Ratio*; we shall take the *Ratio* of Unity to any Number, to consist always of the same infinite Number of *Ratiunculae*; their Magnitude in this Case, will be as their Number in the former. Wherefore, if between Unity and any Number proposed, there be taken an Infinity of mean Proportionals, the infinitely little *Augment* or *Decrement* of the first of those Means from Unity will be a *Ratiuncula*; that is, the *Momentum* or *Fluxion* of the *Ratio* of Unity to the said Number: And seeing that in these continual Proportionals all the *Ratiunculae* are equal; their Summ, or the whole *Ratio*, will be as the said *Momentum* is directly; that is, the Logarithm of each *Ratio*, will be as the *Fluxion* thereof. Wherefore if the Root of any infinite Power be extracted out of any Number, the *Differentioli* of the said Root from Unity, shall be as the Logarithm of that Number.

So that Logarithms thus produced may be of as many Forms as you please, to assume infinite Indices of the Power whose Root you seek: As if the Index be supposed 100000, &c. infinitely; the Roots shall be the Logarithms invented by the Lord *Neper*; but if the said Index were 2302585, &c. Mr. *Briggs's* Logarithms would immediately be produced. And if you please to stop at any Number of Figures, and not to continue them on, it will suffice to assume an Index of a Figure or two more, than your intended Logarithm is to have; as Mr. *Briggs* did, who, to have his Logarithms true to 14, places by continual Extraction of the Square Root, at last came to have the Root of the 140737488355328th Power; but how operose that Extraction was, will easily be judged by who so shall undertake to examine his *Calculus*.

Now though the Notion of an infinite Power may seem very strange; and (to those that know the Difficulty of the Extraction of the Roots of high Powers) perhaps *impracticable*; yet by the Help of that admirable Invention of Sir *Isaac Newton*, whereby he determines the *Uncia*, or Numbers prefixed to the Members composing Powers (on which chiefly depends the Doctrine of *Series*) the Infinity of the Index contributes to render the Expression much more easie: For if the infinite Power to be resolved be put (after Sir *Isaac Newton's* Method)

$$\frac{1}{m} \text{ or } \frac{1}{1-m}$$

$$p + p q, p + q, 1 + q$$

$$\frac{1}{m q + 2 m^2}$$

instead of $1 + \frac{1}{m} + \frac{1}{2 m^2} + \frac{1}{6 m^3} + \dots$

The Use of the Table of Logarithms.

$$1 - 3m + 2mm - 6m^3 + 11m^2 - 6m^3 + \dots$$

(which is the Root when m is Finite) becomes

$$1 + \frac{1}{m}q - \frac{1}{2m}q^2 + \frac{1}{3m}q^3 - \frac{1}{4m}q^4 + \dots$$

$\frac{1}{5m}q^5$, &c. m^2 , being Infinite, and consequently whatever is divided thereby vanishing. Hence it

follows that $\frac{1}{m}$ Multiplied into $q - \frac{1}{2}q^2 + \frac{1}{3}q^3 - \frac{1}{4}q^4 + \dots$ is the Augment of the First of our mean Proportionals between Unity and $1+q$, and is therefore the Logarithm of the Ratio of 1, to $1+q$; and whereas the Infinite Index m , may be taken at Pleasure; the several Scales of Loga-

rithms to such Indices will be as $\frac{1}{m}$; or reciprocally as the Indices. And if the Index be taken 10000, &c. as in the Case of Neper's Logarithms; they will be simple $q - \frac{1}{2}q^2 + \frac{1}{3}q^3 - \frac{1}{4}q^4 + \frac{1}{5}q^5 - \frac{1}{6}q^6$, &c.

Again, if the Logarithm of a Decreasing Ratio be sought, the Infinite Root of $1-q$, or $\frac{1}{1-q|m}$,

$$1 - \frac{1}{m}q - \frac{1}{2m}q^2 - \frac{1}{3m}q^3 - \frac{1}{4m}q^4 - \dots$$

$\frac{1}{5m}q^5 - \frac{1}{6m}q^6$ &c. whence the Decrement of the First of our infinite Number of Proportionals will be $\frac{1}{m}$ into $q + \frac{1}{2}q^2 + \frac{1}{3}q^3 + \frac{1}{4}q^4 + \frac{1}{5}q^5 + \frac{1}{6}q^6$, &c. which therefore will be as the Logarithm of the Ratio of Unity to $1-q$.

But if m , be put 10000, &c. then the said Logarithm will be $q + \frac{1}{2}q^2 + \frac{1}{3}q^3 + \frac{1}{4}q^4 + \frac{1}{5}q^5 + \frac{1}{6}q^6$, &c. Hence, the Terms of any Ratio be-

ing a and b , q becomes $\frac{b-a}{a}$, or the Difference divided by the lesser Term, when it's an Increasing Ratio; or $\frac{b-a}{b}$ when 'tis Decreasing, or as b to a .

Whence the Logarithm of the same Ratio may be doubly expressed; for putting x , for the Difference

of the Terms a , and b , it will be either $\frac{1}{m} \times \frac{x}{b}$

$$+ \frac{x^2}{2b^2} + \frac{x^3}{3b^3} + \frac{x^4}{4b^4} + \frac{x^5}{5b^5} + \frac{x^6}{6b^6}, \text{ \&c.}$$

$$\text{or } \frac{1}{m} \times \frac{x}{a} - \frac{x^2}{2a^2} + \frac{x^3}{3a^3} - \frac{x^4}{4a^4} + \frac{x^5}{5a^5} - \dots$$

$$\frac{x^6}{6a^6}, \text{ \&c.}$$

But if the Ratio of a to b , be supposed to be divided into two Parts, viz. into the Ratio of a , to the Arithmetical Mean between the Terms, and the Ratio of the said Arithmetical Mean to the other Term b ; then will the Summ of the Logarithms of those two Rationes be the Logarithm of

the Ratio of a to b ; and substituting $\frac{x}{2}$ in-

stead of $\frac{a}{2} + \frac{b}{2}$, the said Arithmetical Mean, the Logarithms of those Rationes will be by the foregoing Rule;

$$\begin{array}{cccccc} 1 & x & x^2 & x^3 & x^4 & x^5 \\ \text{into } & + & + & + & + & + \\ m & x & 2x^2 & 3x^3 & 4x^4 & 5x^5 \\ x^6 & & 1 & x & x^2 & x^3 \\ \text{---, \&c. and --- into ---} & & m & x & 2x^2 & 3x^3 \\ 6x^6 & & x^5 & x^6 & & \end{array}$$

$\frac{4x^4}{1} + \frac{5x^5}{2x} + \frac{6x^6}{2x^2} + \dots$, &c. the Sum whereof

$$\text{--- into ---} + \text{---} + \text{---} + \text{---} + \text{---}, \text{ \&c. will}$$

be the Logarithm of the Ratio of a to b ; whose Difference is x , and Summ x . And this Series converges twice as swift as the former, and therefore is more proper for the Practice of making of Logarithms: Which if performed, is with that Expedition; that whereas x , the Difference, is but the Hundredth-part of the Summ, the first

Step $\frac{2x}{x}$ suffices to seven Places of the Loga-

rithm, and the second Step to Twelve. But if Briggs's first twenty Chiliads of Logarithms be supposed to be made, as he hath very carefully computed them, to fourteen Places; the first Step above is capable to give the Logarithm of any intermediate Number, true to all the Places of those Tables.

After the same Manner may the Difference of the said two Logarithms be very fitly applied to find the Log. of Prime Numbers, having the Logarithms of the two next Numbers above and below them: For the Difference of the Ratio of a , to $\frac{1}{2}x$, and,

of $\frac{x}{2}$ to b , is the Ratio of a to b , to $\frac{x^2}{4}$; and half

of that Ratio is that of $\sqrt{ab}$, to $\frac{x}{2}$; or of the

Geometrical Mean to the Arithmetical. And consequently the Logarithm thereof will be the half Difference of the Logarithms of those Rationes viz.

$$\begin{array}{cccccc} 1 & x & x^2 & x^3 & x^4 & x^5 \\ \text{into } & + & + & + & + & + \\ m & 2x & 4x^2 & 6x^3 & 8x^4 & \end{array}$$

Which is a Theorem of good Dispatch to find the

Logarithm of $\frac{x}{2}$.

But the same is yet much more advantageously performed, by a Rule derived from the foregoing; and

The Use of the Table of Logarithms.

and beyond which in my Opinion, Nothing better can be hoped. For the *Ratio* of a to b , to $\frac{a^2}{4}$, or

$$\frac{a^2}{4} + \frac{ab}{2} + \frac{bb}{4}, \text{ has the Difference of its Terms,}$$

$$\frac{a^2}{4} - \frac{ab}{2} + \frac{bb}{4}, \text{ or the Square of } \frac{a}{2} - \frac{b}{2} =$$

$\frac{x^2}{4}$, which in the present Case of finding the Logarithms of Prime Numbers, is always *Unity*: and

calling the Sum of the Terms $\frac{a^2}{4} + ab = y^2$,

the Logarithm of the *Ratio* of $\sqrt{ab}$, to $\frac{a}{2} +$

$$\frac{b}{2}, \text{ or } \frac{y}{2} \text{ will be found } \frac{1}{m} \text{ in } \frac{1}{yy} + \frac{1}{3y^6} +$$

$\frac{1}{5y^{10}} + \frac{1}{7y^{14}} + \frac{1}{9y^{18}}, \text{ \&c. Which converges}$
very much faster than any Theorem hitherto published for this Purpose.

Here note, that $\frac{1}{m}$ is all along applied to adapt

these Rules to all Sorts of Logarithms. If m be 10000, &c. it may be neglected, and you will have *Neper's* Logarithms, as was hinted before; but if you desire *Briggs's* Logarithms, which are now generally received, you must divide your Series by

2.30258, 50929, 94045, 68401, 79914, 54684, 36420, 76011, 01488, 62877, 29760, 33328:

Or, multiply it by the *Reciprocal* thereof, *Viz.*

0.43429, 44819, 03251, 82765, 11289, 18916, 60508, 22943, 97005, 80366, 65661, 14454.

But to save so operose a Multiplication (which is more than all the rest of the Work) it's expedient to divide this Multiplier by the Powers of x , or y , continually; according to the Direction of the Theorem; Especially where x is Small and Integer, reserving the proper Quotes to be added together, when you have produced your Logarithm to as many Figures as you desire, of which Method I will give you a Specimen.

If the Curiosity of any Gentleman, that has Leisure, would prompt him to undertake to do the Logarithms of all Prime Numbers, under 100000 to 25 or 30 Figures, I dare assure him that the Facility of this Method will invite him thereto; nor can any Thing more easy be desired. And to encourage him, I here give the Logarithms of the first Prime Numbers under 20 to 60 Places, computed by the accurate Penn of Mr. *Abraham Sharp* (from whose Industry and Capacity) the World may expect in Time great Performances, as they were communicated to me by our common Friend Mr. *Euclid Speidall*.

N.	Log.
2	0.30102, 99956, 63981, 19521, 37388, 94724, 49302, 67681, 89881, 46210, 85413, 10427
3	0.47712, 12547, 19662, 43729, 50279, 03255, 11530, 92001, 28864, 19069, 58648, 29876
7	0.84509, 80400, 14256, 83071, 22162, 58592, 63619, 34835, 72396, 32396, 54065, 03635
11	1.04139, 26851, 58225, 04075, 01999, 71243, 02424, 17067, 02190, 46645, 30945, 96539
13	1.11394, 33523, 06836, 76920, 65051, 57942, 32843, 08297, 29188, 38706, 82718, 01191
17	1.23044, 89213, 78273, 92854, 01698, 94328, 33703, 00075, 67378, 42504, 63973, 80368

The next Prime Number is 23, which I will take for an Example of the foregoing Doctrine; and by the first Rules the Logarithm of the *Ratio* of 22 to 23, will be found to be either

$$\frac{1}{22} - \frac{1}{23} + \frac{1}{22^2} - \frac{1}{23^2} + \frac{1}{22^3} - \frac{1}{23^3} + \frac{1}{22^4} - \frac{1}{23^4} + \frac{1}{22^5} - \frac{1}{23^5} + \frac{1}{22^6} - \frac{1}{23^6} + \frac{1}{22^7} - \frac{1}{23^7} + \frac{1}{22^8} - \frac{1}{23^8} + \frac{1}{22^9} - \frac{1}{23^9} + \frac{1}{22^{10}} - \frac{1}{23^{10}} + \frac{1}{22^{11}} - \frac{1}{23^{11}} + \frac{1}{22^{12}} - \frac{1}{23^{12}} + \frac{1}{22^{13}} - \frac{1}{23^{13}} + \frac{1}{22^{14}} - \frac{1}{23^{14}} + \frac{1}{22^{15}} - \frac{1}{23^{15}} + \frac{1}{22^{16}} - \frac{1}{23^{16}} + \frac{1}{22^{17}} - \frac{1}{23^{17}} + \frac{1}{22^{18}} - \frac{1}{23^{18}} + \frac{1}{22^{19}} - \frac{1}{23^{19}} + \frac{1}{22^{20}} - \frac{1}{23^{20}} + \frac{1}{22^{21}} - \frac{1}{23^{21}} + \frac{1}{22^{22}} - \frac{1}{23^{22}} + \frac{1}{22^{23}} - \frac{1}{23^{23}} + \frac{1}{22^{24}} - \frac{1}{23^{24}} + \frac{1}{22^{25}} - \frac{1}{23^{25}} + \frac{1}{22^{26}} - \frac{1}{23^{26}} + \frac{1}{22^{27}} - \frac{1}{23^{27}} + \frac{1}{22^{28}} - \frac{1}{23^{28}} + \frac{1}{22^{29}} - \frac{1}{23^{29}} + \frac{1}{22^{30}} - \frac{1}{23^{30}} + \frac{1}{22^{31}} - \frac{1}{23^{31}} + \frac{1}{22^{32}} - \frac{1}{23^{32}} + \frac{1}{22^{33}} - \frac{1}{23^{33}} + \frac{1}{22^{34}} - \frac{1}{23^{34}} + \frac{1}{22^{35}} - \frac{1}{23^{35}} + \frac{1}{22^{36}} - \frac{1}{23^{36}} + \frac{1}{22^{37}} - \frac{1}{23^{37}} + \frac{1}{22^{38}} - \frac{1}{23^{343}} + \frac{1}{22^{344}} - \frac{1}{23^{344}} + \frac{1}{22^{345}} - \frac{1}{23^{345}} + \frac{1}{22^{346}} - \frac{1}{23^{346}} + \frac{1}{22^{347}} - \frac{1}{23^{347}} + \frac{1}{22^{348}} - \frac{1}{23^{348}} + \frac{1}{22^{349}} - \frac{1}{23^{349}} + \frac{1}{22^{350}} - \frac{1}{23^{350}} + \frac{1}{22^{351}} - \frac{1}{23^{351}} + \frac{1}{22^{352}} - \frac{1}{23^{352}} + \frac{1}{22^{353}} - \frac{1}{23^{353}} + \frac{1}{22^{354}} - \frac{1}{23^{354}} + \frac{1}{22^{355}} - \frac{1}{23^{355}} + \frac{1}{22^{356}} - \frac{1}{23^{356}} + \frac{1}{22^{357}} - \frac{1}{23^{357}} + \frac{1}{22^{358}} - \frac{1}{23^{358}} + \frac{1}{22^{359}} - \frac{1}{23^{359}} + \frac{1}{22^{360}} - \frac{1}{23^{360}} + \frac{1}{22^{361}} - \frac{1}{23^{361}} + \frac{1}{22^{362}} - \frac{1}{23^{362}} + \frac{1}{22^{363}} - \frac{1}{23^{363}} + \frac{1}{22^{364}} - \frac{1}{23^{364}} + \frac{1}{22^{365}} - \frac{1}{23^{365}} + \frac{1}{22^{366}} - \frac{1}{23^{366}} + \frac{1}{22^{367}} - \frac{1}{23^{367}} + \frac{1}{22^{368}} - \frac{1}{23^{368}} + \frac{1}{22^{369}} - \frac{1}{23^{369}} + \frac{1}{22^{370}} - \frac{1}{23^{370}} + \frac{1}{22^{371}} - \frac{1}{23^{371}} + \frac{1}{22^{372}} - \frac{1}{23^{372}} + \frac{1}{22^{373}} - \frac{1}{23^{373}} + \frac{1}{22^{374}} - \frac{1}{23^{374}} + \frac{1}{22^{375}} - \frac{1}{23^{375}} + \frac{1}{22^{376}} - \frac{1}{23^{376}} + \frac{1}{22^{377}} - \frac{1}{23^{377}} + \frac{1}{22^{378}} - \frac{1}{23^{378}} + \frac{1}{22^{379}} - \frac{1}{23^{379}} + \frac{1}{22^{380}} - \frac{1}{23^{380}} + \frac{1}{22^{381}} - \frac{1}{23^{381}} + \frac{1}{22^{382}} - \frac{1}{23^{382}} + \frac{1}{22^{383}} - \frac{1}{23^{383}} + \frac{1}{22^{384}} - \frac{1}{23^{384}} + \frac{1}{22^{385}} - \frac{1}{23^{385}} + \frac{1}{22^{386}} - \frac{1}{23^{386}} + \frac{1}{22^{387}} - \frac{1}{23^{387}} + \frac{1}{22^{388}} - \frac{1}{23^{388}} + \frac{1}{22^{389}} - \frac{1}{23^{389}} + \frac{1}{22^{390}} - \frac{1}{23^{390}} + \frac{1}{22^{391}} - \frac{1}{23^{391}} + \frac{1}{22^{392}} - \frac{1}{23^{392}} + \frac{$$

The Use of the Table of Logarithms.

by the Excellent Mr. James Gregory, in his *Exercitationes Geometricæ*; and since further prosecuted by the aforesaid Mr. Speidall, in a late Treatise, in English, by him published on this Subject. But the Demonstration, as I conceive, was never till now perfected, without the Consideration of the *Hyperbola*, which is a Matter purely Arithmetical, as this is, cannot so properly be applied. But what follows, I think I may justly claim as my own, *viz.* That the Logarithm of the *Ratio* of the Geometrical Mean to the Arithmetical between 22 and 24, or of $\sqrt{528}$ to 23, will be found to be either,

$$\frac{1}{1058} + \frac{1}{1119364} + \frac{1}{888215334} + \frac{1}{626487882248}, \text{ \&c. or, } \frac{1}{1057}$$

1057) 43429, &c.
 3 in 1117249) 41087, &c.
 5 in 1117249) 12258, &c.
 7 in 1117249) 65832, &c.
 9 in 1117249) 42088, &c.

$$\frac{1}{3542796579} + \frac{1}{659676558485285}, \text{ \&c.}$$

All these Series being to be multiplied into 0.4342944819, &c. if you design to make the Logarithm of Briggs. But with great Advantage with Respect of the Work, the said 4342944819, &c. is divided by 1057, and the Quotient thereof again divided by three Times the Square of 1057, and that Quotient again by $\frac{1}{3}$ of that Square, and that Quotient by $\frac{1}{3}$ thereof, &c. till you have as many Figures of the Logarithm as you desire. As for Example, the Logarithm of the Geometrical Mean between 22 and 24, is found by the Logarithms of 2, 3, and 11 to be

1.36131696126690612945009172669805
 41087462810146814347315886368
 12258521544181829460074
 6583235184376175
 4208829765
 2930

Summ 1.36172783601759287886777711225117

Which is the Logarithm of 23, to 32 Places, and obtained by five Divisions only, with very small Divisors; all which is much less Work, than simply multiplying the Series into the said Multiplier 43429, &c.

Before I pass on to the Converse of this Problem, or to shew how to find the Number appertaining to a Logarithm assigned, it will be requisite to advertise the Reader, that there is a small Mistake in the aforesaid Mr. James Gregory's *Vera Quadratura Circuli*, and *Hyperbolæ*, published at Padua, Anno 1667, wherein he applies his Quadrature of the Hyperbola, to the making of the Logarithms: In p. 48. he gives the Computation of the Lord Neper's Logarithm of 10. to 25 Places, and finds it 2302585092994045624017870, instead of 2302585092994045684017991; erring in the eighteenth Figure, as I was assured upon my own Examination of the Number I here give you, and by Comparison thereof, with the same wrought by another Hand, agreeing therewith to 57 of the 60 Places.

Being desirous to be satisfied how this Difference arose, I took no small Trouble of Examining Mr. Gregory's Work; and at length found that in the inscribed Polygon of 512 Sides in the eighteenth Figure was a 0, instead of 9, which being rectified, and the subsequent Work corrected therefrom, the Result did agree to a Unit with our Number. And this I propose not to cavil at an easy Mistake in managing of so vast Numbers, especially by a Hand that has so well deserved of the Mathematical Sciences; but to shew the exact Co-incidence of two so very differing Methods to make Logarithms, which might otherwise have been questioned.

From the Logarithm given to find what Ratio it expresses, is a Problem, that has not been so much considered as the Former, but which is solved with the like Ease, and Demonstrated by a like Process, from the same general Theorem of Sir Isaac Newton: For as the Logarithm of the Ratio of 1, to

$1 + q$, was proved to be $\frac{1}{m} \log(1 + q)$, and that of the Ratio of 1, to $1 - q$, to be $\frac{1}{m} \log(1 - q)$: So the Logarithm which we will from henceforth call L, being given $1 + L$, will be equal to $\frac{1}{m} \log(1 + q)$ in the one Case; and $1 - L$, will be equal to $\frac{1}{m} \log(1 - q)$, in the other: Consequently $\frac{1}{m} \log(1 + L)$ will be equal to $1 + q$, and $\frac{1}{m} \log(1 - L)$ to $1 - q$; that is, according to Sir Isaac New-

ton's said Rule, $1 + mL + \frac{m^2}{2} L^2 + \frac{m^3}{6} L^3 + \frac{m^4}{24} L^4 + \frac{m^5}{120} L^5$, &c. will be equal to $1 + q$,

and $1 - mL + \frac{m^2}{2} L^2 - \frac{m^3}{6} L^3 + \frac{m^4}{24} L^4 - \frac{m^5}{120} L^5$, &c. will be equal to $1 - q$: m, being any infinite Index whatsoever; which is a full and general Proposition from the Logarithm given to find the Number, be the Species of Logarithm what it will.

But

The Use of the Table of Logarithms.

But if *Neper's* Logarithm be given the Multiplication by *m* is saved (which Multiplication is indeed no other than reducing the other Species to his) and the Series will be more simple, *Viz.*

$$1 + L + \frac{L^2}{2} + \frac{L^3}{6} + \frac{L^4}{24} + \frac{L^5}{120} + \dots, \text{ \&c. or}$$

$$1 - L + \frac{L^2}{2} - \frac{L^3}{6} + \frac{L^4}{24} - \frac{L^5}{120} + \dots, \text{ \&c. This Se-}$$

ries especially in great Numbers converges so slowly, that it were to be wished to be contracted.

If one Term of the *Ratio*, whereof *L* is the Logarithm, be given, the other Term will be had easily by the same Rule: For if *L* were *Neper's* Logarithm of the *Ratio* of *a* the lesser to *b* the greater Term; *b* would be the Product of *a* into

$$1 + L + \frac{L^2}{2} + \frac{L^3}{6} + \frac{L^4}{24} + \frac{L^5}{120} + \dots, \text{ \&c.} = a + aL + \frac{aL^2}{2} + \frac{aL^3}{6} + \frac{aL^4}{24} + \frac{aL^5}{120} + \dots, \text{ \&c.}$$

But if *b* were given, *a* would be

$$\text{equal } b - bL + \frac{bL^2}{2} - \frac{bL^3}{6} + \frac{bL^4}{24} - \frac{bL^5}{120} + \dots, \text{ \&c. Whence by}$$

the help of the *Chiliads*, the Number appertaining to any Logarithm, will be exactly had to the utmost Extent of the Tables. If you seek the nearest, next Logarithm, whether greater or lesser, and call its Number *a*, if lesser, or *b* if greater; then the given *L*, and the Difference thereof from the said nearest Logarithm you call *l*; it will follow that the Logarithm *L*, answering to the Num-

ber, will be either *a* into $1 + l + \frac{l^2}{2} + \frac{l^3}{6} + \frac{l^4}{24} + \frac{l^5}{120} + \dots, \text{ \&c. or else } b$

into $1 - l + \frac{l^2}{2} - \frac{l^3}{6} + \frac{l^4}{24} - \frac{l^5}{120} + \dots, \text{ \&c. wherein as } l \text{ is less, the}$

Series will converge the swifter. And if the first 20000 Logarithms be given to fourteen Places, there is rarely Occasion for the three first Steps of this Series, to find the Number to as many Places.

But as for *Vlacq's* great Canon of 100000 Logarithms, which is made but to ten Places; there is scarce ever need for more than the first Step $a + al$, or $a + m al$, in one Case; or else $b - bl$, or $b - m bl$ in the other, to have the Number true, to as many Figures as these Logarithms consist of.

If future Industry shall ever produce Logarithmick Tables to many more Places than now we have; the aforesaid Theorems will be of more Use to deduce the correspondent natural Numbers to all the Places thereof.

In Order to make the first *Chiliad* to serve all Uses, I was desirous to contract this Series, wherein all the Powers of *l* are present, into one; wherein each alternate Power might be wanting, but found it neither so simple or uniform as the other; yet the first Step thereof is, I conceive, most commodious for Practice, and with all exact enough

for Numbers not exceeding fourteen Places, such as are Mr. *Briggs's* large Tables of Logarithms; and therefore I recommend it to common Use.

It is thus; $a + \frac{al}{1 - \frac{l}{2}}$, or $b - \frac{bl}{1 + \frac{l}{2}}$, will be

the Number answering to the Logarithm given, differing from the Truth by half the third Step of the former Series. But that which renders it yet more eligible, is that with equal Facility, it serves for *Briggs's*, or any other sort of Logarithms, with the only Variation of Writing, $\frac{a}{m}$ instead of *a*,

that is $a + \frac{al}{1 - \frac{l}{2}}$, and $b - \frac{bl}{1 + \frac{l}{2}}$, or $\frac{a}{m} + \frac{al}{m(1 - \frac{l}{2})}$, and $\frac{b}{m} - \frac{bl}{m(1 + \frac{l}{2})}$, which are easily resolved into Ana-

logies, *Viz.*

As 43429, \&c. $-\frac{l}{2}$: to 43429 $+\frac{l}{2}$:: so is *a* to the Number sought. Or,

As 43429, \&c. $+\frac{l}{2}$: to 43429 $-\frac{l}{2}$:: so is *b* to the Number sought.

If more Steps of this Series be desired it will be found as follows.

$$a + \frac{al}{1 - \frac{l}{2}} - \frac{\frac{1}{2}al^2}{1 - l} + \frac{\frac{1}{8}al^3}{1 - 2l}, \text{ \&c. As}$$

may easily be demonstrated by working out the Divisions in each Step, and collecting the Quotes, whose Summ will be found to agree with our former Series,

Thus, I hope, I have cleared up the Doctrine of Logarithms, and shewn their Construction and Use independent from the *Hyperbola*, whose Affections have hitherto been made Use of for this purpose; tho' this be a Matter purely Arithmetical, nor properly demonstrable from the Principles of Geometry; nor have I been obliged to have Recourse to the Method of Indivisibles, or the Arithmetick of Infinities; the whole being no other than an easy Corollary to Sir *Isaac Newton's* General Theorem for forming Roots and Powers.

How easily and compendiously Logarithms may be made according to this Method of Mr. *Halley's*, as also from the Quadrature of the *Hyperbola*; the Reader may be fully satisfy'd from Mr. *Hen. Sherwin's* Introduction to his *Excellent Mathematical Tables*, Lond. 1705. where also is a Method for computing the natural Sine, Tangent, or Secant of any Arch, immediately from having only the Length of the Arch given, \&c.

Some further Uses of the Logarithms not mentioned in Vol. I.

1. To find the Arithmetical Complement of a Logarithm.

Suppose 2.5065050 Begin at the
 Left-hand &
Its Compt. Arith. 7.49349410 write down
 under it the
Complement of each Figure to 9, but of the last
to 10.

N. B.

The Use of the Table of Logarithms.

N B. This is all one with subducting the Logarithm from 10.000000. And 'tis frequently of good Use to take the Complement Arithmetical of a Logarithm instead of the Logarithm it self; especially when there are Two or more Logarithms in any Case to be subtracted: For then adding their

Arithmetical Complements, will answer the End as truly as subtracting the Logarithms themselves.

As suppose in the double Rule of Three, you had this Question about Interest.

What is the Interest of 5173 *l.* for 321 Days at 6 *l. per Centum*?

Write down first the <i>Arith. Comp.</i> of the Logarithm of 100 =	8.0000000
Next under it the <i>Arith. Comp.</i> of the Logarithm of 365 =	7.4377071
The Logarithm of 6 =	0.7781512
The Logarithm of the Principal 5173 =	3.7137425
The Logarithm of the Days 321 =	2.5065050
The Summ of all is the Answer = 2.4361058	

For rejecting the first 2 in the Characteristick you will find the Number answering to the Logarithm 2.4361058 to be 272 *l.* 964. and Reason will direct you where to make your Decimal Points in the Number 272964; for the Interest in that Time can't be so much as 2729 *l.* nor so little as 27 *l.* As well as the Rule determines that Number to consist of 3 Places of Integers, whose Characteristick is 2.

Therefore the remaining Figures .964 are a Decimal of a Pound, expressing something more than 19 Shillings.

2. And indeed all Questions of Interest are very easily and expeditiously answered by the Logarithms.

As suppose; At 6 *l. per Cent.* what is the Interest of 15 *l.* 7 *s.* 6 *d.* for 12 Years?

Write down first the Logarithm of 1.06 which expresses the Rate of Interest.	= 0.0253058
--	-------------

Which Logarithm multiplied by 12 makes	= 0.3036696
--	-------------

Then write down the Logarithm of the Principal, <i>Viz.</i> of the Decimal 15.875	= 1.2007137
---	-------------

The Summ of which Two last Logarithms added into one Summ	= 1.5043833
---	-------------

which is a Logarithm answering to the absolute Number, a Decimal expressing 31 <i>l.</i> 18 <i>s.</i> 10 <i>d.</i> $\frac{1}{2}$ <i>q.</i> nearly.	= 31.94362
--	------------

3. It will be very necessary rightly to understand the Use of the Tables of Logarithms with regard to Decimal Fractions. For the Rule for finding the Logarithm of a Fraction being; To subtract the Logarithm of the Denominator, from the Logarithm of the Numerator, and to take the Remainder as the Logarithm of the Fraction required: That Logarithm of the Remainder, must always be the Logarithm of a Decimal Fraction, whose Value is the same with that of a Vulgar Fraction proposed.

Wherefore the most natural, easy, and useful Way to find the Logarithm of a Fraction is this:

Suppose the Index of the Logarithms of all Numbers from 1 to 10, to be 10 or 100, from 10 to 100, to be 11 or 101, from 100 to 1000, to be 12 or 102, from 1000 to 10000, to be 13 or 103, and so upwards: This being allowed, the Index of the Logarithm of a Number, one Place below Unity must be 9, or 99; if two Places below Unity, it must be 8, or 98; if three Places below Unity, it must be 7, or 97; if four Places below Unity, then the Index must be 6, or 96; the Latter of these Ways is often convenient to distinguish the Index of a whole Number, from that of a Decimal Fraction, and often necessary when the Power of the Root of a Decimal Fraction is required.

Example, The Logarithm of $\frac{3}{4}$ is found thus: 3 Log.	0.4771213
From which Subtract the Denominator, 4 Log.	0.6020600

The Remainder is the Logarithm of	.75 Log. — 9.8750613
-----------------------------------	----------------------

Note, That the Denominator of a proper Fraction, is always greater than its Numerator; so that supposing the Index of the Logarithm of 3, to be 10, or 100, the Index of the Remainder will be 9, or 99, (that is one Place below Unity) and the Rest of the Logarithms, except the Index, is found in the Table of Logarithms to answer to 75, 750, 7500, 075, 75, or any other

Number, whose two significant Figures are 75, and those which follow or preceed, all Cyphers. It was the former of these Ways by which Mr. Briggs and Mr. Gunter made the Characteristicks of their Tables of Logarithmetick Sines, and Tangents; where it may be noted, when the natural Sine or Tangent, is a Decimal Fraction only, the Index is under 10; but where it is a mixt Number,

The Use of the Table of Logarithms.

ber, there the Index is 10, or more : For *Example*. The Natural Tangent of 5 Degrees is .0874887, the Artificial 8.9419518 ; and the Natural Tangent of 85 Degrees, 11.430052, the Artificial is 11.0580482.

But it is needless to use these new Indices, except some Term given or sought, be less than an Unite.

4. To find the Logarithm of a Mixt Number.

Reduce the Number given into an Improper Fraction, then subtract the Logarithm of the Denominator, from the Logarithm of the Numerator, the Remainder is the Logarithm sought.

Example, Let $4\frac{2}{3}$ be the Mixt Number given; this reduced to an Improper Fraction is $\frac{14}{3}$.

The Logarithm of the Numerator, viz. 57, is 1. 7558748

The Logarithm of the Denominator, viz. 12, is 1. 0791812

The Loarithm of $4\frac{9}{12} = 4\frac{75}{100}$, whose Logarithm is 0. 6766936

If the Fraction annexed be a Decimal, seek for it as if it were a whole Number, observing to prefix to its Logarithm a suitable Index; which always is an Unit less than the Number of Places.

in the whole Number to which it belongs; which is further illustrated by the adjoining Table, where the Logarithms, except the Index, are the same in these Eight Examples.

The Index of the Logarithm of 47500 is 4, because the Absolute Number consists of 5 Places, for the same Reason in 475, the Index of its Logarithm is 2, in 47.5 it is 1; but the Index of a Proper Decimal Fraction is so many Units as the Cyphers before it wants of 9, or 99; so the Index of .0475 is 8, or 98, and of .00475 is 7, or 97.

<i>Numbers.</i>		<i>Logarithms.</i>
47500	4.	6766936
4750	3.	6766936
475	2.	6766936
47.5	1.	6766936
4.75	0.	6766936
.475	99, or,	9.6766936
.0475	98, or,	8.6766936
.00475	97, or,	7.6766936

Of raising Powers by Logarithms.

Multiply the Logarithm of the Number given by the Index of the Power required, the Product will be the Logarithm of the Power sought : So the Logarithm of 32 = 1.5051500 $\times$ 3 = 4.5154500, the Logarithm of 32768, which is the Cube of 32.

In the Multiplication, or Raising of Powers, viz. Squaring, or Cubing, &c. of any Decimal Fraction by Logarithms; the Index of the Logarithm of the Product or Power, must consist of so many Units, as the Number of Cyphers intercepted between the Place of Units, and the first significant Figure in the natural Number wants of 9, 99, 999, &c. only to the Index of the Logarithm of the Power (*i. e.* the Square, or Cube, &c.) there will be such a Figure prefix'd as wants an Unit of the Index of that Power, or Number, by which the Logarithm was multiplied: For

Example, Let the Cube of .009 be required ; the Logarithm of .009 is $7.9542425 \times 3 = 23.8627275 = .000000729$, the Cube of .009; and the Index of the Logarithm of the Power, or Product is 3 ; therefore 6 Cyphers must precede the first significant Figure of the natural Number ; and 2, is prefix'd since the Index or Number multiplying was 3. But when the Number of Cyphers, preceeding the significant Figures of the Power or Product exceeds 10, 'tis necessary to admit another Figure into the Index of the Logarithm, and make it the Complement to a Hundred : As suppose the 6 Power, or the

Cubo— Cube of the Sine of $0-1$ be requir'd its
Logarithm in the Table is 4637261 ; but in
Vol. II.

this Case must be 96.4637261, which multiplied by 6, the Index of the Power proposed, becomes 578.7823566, whose Index being 78, subtracted from 99, leaves 21 for the Number of Cyphers, that must preceed the first Figure of the natural Number or Power, which is .000000000000000000000000006058383. Here the Figures preceeding the Index, as the Result of the Multiplication is 5, less by an Unit than the Number multiplying, being 6, the Index of the Power.

This suggests a certain Rule for Extracting the Roots of Fractions by the Logarithms ; Viz. Prefix a Figure to the Index of the Logarithm of the Number whose Root is to be Extracted, less by an Unit than the Index proper to the Root required, which is to be the Divisor ; then Divide the whole Logarithm together with its Index and Number prefixed by that Index, the Quotient is the Logarithm of the Root desired. Ex. Gr. If the Cube—Cube Root or Root of the 6. Power of .0000000000000000000000006058383 , whose Logarithm is 78. 7823566, be demanded ; prefix 6—1, i. e. 5 to its Index, it is then 578. 7823566 ; which being divided by 6, the Index proper to the Root sought, the Quotient is 96. 4637261 , whose natural Number is .0002908882 ; 3 Cyphers preceeding the first Figure, because the Index 96, wants so much of 99. But when the Root of an absolute Number is required, there needs no Figure to be prefixed to the Index of its Logarithm ; since it is always supposed, that the Index of the Power (which must be the Divisor) preceeds it. Ex. Gr. If the Cube-Root of 6751269, whose Logarithm is 6. 82993854, be required ; it is an

K k k

indif-

The Use of the Table of Logarithms.

indifferent Thing, whether 3, the Index of the Root to be Extracted, be prefixed or not, since that alters Nothing: For 3)36. 82993854(Quotes 12. 2764618, the Logarithm of 189, the Cube-Root sought.

Another Method to Raise any Power of a Decimal Fraction.

Multiply the Arithmetick Complement of the Logarithm of the Fraction given by the Index of the Power required, the Arithmetick Complement of the Product is the Logarithm of the Power sought: For instance the .625 Power of .0032 is found to be .0275879.

.0032 Logarithm	7. 5051500
Arithmetick Complement	2. 4948500
Multiply by	.625
	124742500
	49897000
	149691000
Product	15592812500

Its Arithmetick Complement 8.4407187500

Note, That so many Cyphers must the Logarithm of .0275879, preceed the Fraction as the Index of its Logarithm wants Units of 9, or 99, which in this Example is one, and in the next 15,

being always the same Number with the Index of the Product.

Again, Let the 6. 25 Power of .0032 be sought: The Logarithm of .0032 (as before) is 7. 5051500, and its Arithmetick Complement 2. 4948500 $\times$ 6. 25 = 15. 5928125, its Arithmetick Complement is 84. 4071875, which answers to .00000, 00000, 00000, 25538, which is the 6. 25 Power of .0032.

To extract any Root of a Decimal Fraction.

Divide the Arithmetical Complement of the Logarithm of the Fraction given, by the Index of the Root required, the Arithmetical Complement of the Root sought: For instance, let the .625 Root of .0275879 be required, its Logarithm is 8.4407188, and its Arithmetical Complement = 1.5592812 Divided by .625, the Quotient is 2. 4948500, and its Arithmetick Complement is 7. 5051500 the Logarithm of .0032, which is the Root required.

Again, Let the 6. 25 Root of .00000, 00000, 00000, 25538 be required, its Logarithm is 84. 4071875, and its Arithmetick Complement is 15. 5928125, Divided by 6. 25, the Quotient is 2. 4948500, and its Arithmetick Complement is 7. 5051500, the Logarithm of .0032 the Root required.

LOGISTICA Linea, is that which is otherwise called the *Logarithmick Line*; where the Ordinates apply'd in equal Parts of the Axis are in Geometrical Proportion.

LOGISTICK Spiral. See *Logarithmick Spiral*.

LONGITUDE of a Place, is only the Distance counted in the Equator between its Meridian, and the first; or indeed between that and any other: It may be found by the Difference of Time between the coming of any Point in the Heavens first to one Meridian and then to the other. For every 15°. of the Equator answering to an Hour in Time, one Degree of it being 4 Minutes of Time, and one Minute of a Degree there being 4 Seconds of Time; and 15 Minutes one Minute of Time. The Difference of Time being turned into Degrees will truly give the *Longitude*, or *Vice Verso*. Hence several Ways have been thought of to find the Longitude at Sea; the great *Desideratum* of the Art of Navigation. As by the *Eclipse* of the Moon, her *Transit* over or *Appulse* to any eminent fix'd Star; the *Eclipses* of *Jupiter's Satellites*, &c. which are all true in Theory, and may be practised a-shore with the greatest Exactness. For the Time of any one of these *Phænomena* being truly calculated for the Meridian of *London* (suppose, or any other:) And Tables may be easily made of all of them, which the Navigator may carry to Sea with him. If then he could but observe the Time of the *Eclipse* or *Transit* at Sea with accurate Exactness, the Difference of Time of the *Eclipse* happening to him sooner or later than at *London*, would give him the exact Longitude of the Place of the Ship either East or West from the Meridian of *London*. But the Misfortune is, such an Observation of an *Eclipse*, and the exact Time of the Impression or Emerfion of the deficient Body into or out of the Shadow, is not to be made without Telescopes of such a Length as the Motion of the Ship will not permit to be used at Sea. Tho', by the by, if Ships were sent with good Instruments and Men that know how to use them, to do this at all the Capes and Head-lands of the World, it would be a Thing of the greatest Use; and by settling the Longitude of all those Places, would cut all long Voyages into many short ones, and afford means of continually rectifying the dead Reckoning at Sea. But to return: Others being fully satisfied of the Impracticableness of the Method of *Eclipses* for finding the Longitude at Sea; have happily thought of doing it by a Clock or Watch: Which if indeed it could be made to go right all the Time of a long Voyage, would infallibly give the Longitude at any Time when the true Hour of the Day or Night could be had under any Meridian or in any Place of the Earth: For the Clock going true for the Meridian it was first set at, will shew the true Hour exactly in that Place, and then the true Hour being found by the Sun or Stars in the Place where the Ship is, the Difference between that and the Clock's Hour, will be the Difference of Meridians in Time, or Longitude in Degrees. But no such Movement hath ever yet been made, and I fear scarce ever will, which will keep going, and going true in all Climates, and especially in some of the *Southern* ones, where the Dews are so great as to rust the Parts of it, and so retard, if not stop its Motion entirely, I don't mention the Inconvenience arising

from the Motion of the Ship, because I believe that may be obviated, and a Movement made to go true notwithstanding that, as perhaps the World may see in some Time, there being now some very ingenious and skilful Heads and Hands employing themselves that Way. But in the mean while, I judge the best Way would be to depend on the Movement only for 24 Hours; for if it will go true for so long by the Motion of the fix'd Stars, it may be rectify'd every Day to the Stars or Sun's Hour; and so will shew the Difference of Longitude the Ship hath gained in that Time. How the Seamen find their *Departure of Longitude* by Trigonometrical Calculation, you will find in *Plain and Mercators Sailing*.

LOOP, in the Iron Works at the Forge; is the Term for about $\frac{1}{2}$ of C. lb. of Iron which is melted and broken off from a Sow in the Fire of the *Finery*, and at last is brought into a *Bloom*. This Work they call *Shingling the Loop*.

LOOP-HOLES, are Holes made in the Comings of the Hatches of Ships, and in their Bulkheads, to fire Muskets thro' in a close Fight; and the same are they in the covert Defences of all Fortifications.

LOPHIA, a Term in Anatomy, for the upper Part of the *Cervix*, or back Part of a Humane Neck.

LOQUELA sine die, was formerly the Term for an Inparlance or a Respite in Law; or for a Demur to an Indefinite Time.

LOT, or *Lotbe*, is every thirteenth Dish of Lead in the *Derby-shire* Mine, which is a Duty paid to the King.

LOURGULARY, is a Word in *Statuto pro Stratis Lond.* printed A. D. 1573. Art. 43. and then signified, casting any corrupt Thing into it, to spoil or poyson the Water.

LUCRATIVE Interest, in the Civil Law, is such as is paid where there hath been no Advantage made by the Debtor, and no Delay nor Deceit in him. This is condemned by both the Civil and Canon Law.

LUNDRESS, did formerly signify a Silver Penny; or a *Sterling* or *Easterling* in a restrained Sense, and was so called, because coined only at *London* and not at the Country Mints.

LUNE or Lunula. In *Phil. Transf.* N. 265. you have a Way to find the Dimensions of the Solids, which will be formed by the Revolution of the *Lunes* of *Hippocrates* of *Scio*, by Mr. *Abr. de Moivre*.

LUNGS. These Organs of Respiration are seated in the middle of the Cavity of the *Thorax*; and divided into two *Lobes* by the *Mediastinum*, of which, the *left* is ordinarily subdivided into 2 more. The Figure of both *Lobes* together resemble the Foot of an Ox or Cow, being a little concave between the 2 *Lobes*, where they embrace the Heart; and behind, where they lie upon the *Vertebrae*: But before, where they touch the *Sternum* and *Ribs*, they are Convex.

The Colour of the Lungs in a *Fetus* is of a pale Red; but after the Air hath once entred into them they lose their Red, and remain always pale; yet in adult Persons, they are often variegated with the one and the other.

They are tied to the *Sternum* by the *Mediastinum* before, and to the *Vertebrae* by the *Plura* behind, when it rises from the *Vertebrae* to the Heart, by the *Vena* and *Arteria Pulmonaris*; and some-

times to the *Pleura*, where it covers the Ribs, particularly in the left Side, and especially after a Pleurisy.

The *Lobes* of the *Lungs* are covered with a double Membrane; of which the *External* is a Production of the *Pleura*: and the *Internal*, not only covers immediately the Substance of the *Lungs*, but its inner *Lamina* fill up the Interstices which are below the Bunches of the small *Lobes* with little vesicular Cells: The fine Capillary Blood-Vessels are so thick upon this Membrane, that it seems to be Nothing but a Net-work of Veins and Arteries.

The Substance of the *Lungs* is composed of an infinite Number of little *Lobes* of various Figures and Magnitudes; but their Surfaces are so adapted to one another, as to leave but very few, and those small Interstices.

These *Lobes* are disposed like so many Bunches of Grapes upon the Sides of the *Bronchia*. Each little *Lobe* contains within its own proper Membrane an infinite Number of little orbicular Vessels, which leave small Interstices between them; and which are full of small Membranes, like those which tie the *Lobes* together.

The Extremities of the Branches of the Wind-pipe open into the Cavities of Vesicles, which are probably formed by its Membranes; but the Capillary Blood-vessels are only spread upon the Vesicles like a Net, with frequent and large Inosculations.

The Vessels which enter the *Lungs* are the *Trachea* or *Aspera Arteria*, by which we draw in and expire Air: And the *Arteria Pulmonalis*, which comes from the *Right Ventricle*, and the *Vena Pulmonalis*, whose Trunk opens into the *left Auricle* of the Heart: Each of these divides into two Branches, for the two great *Lobes* of the *Lungs*, where they are subdivided into as many Branches as there are little *Lobes* or Vesicles in the *Lungs*. Where-ever there is a Branch of the *Trachea*, there is also a Branch of the Vein and Artery, and the *Trachea* is always in the middle.

On the Branches of the *Trachea* (which they call the *Bronchi* or *Bronchia*) runs a small Artery called by *Ruysh*, *Arteria Bronchialis*, and a small Vein, which *Somnichellius* calls *Vena Pneumonica*: The Artery comes from the *Aorta*, the Vein from the *Subclavian*.

The Blood in the *Arteria Pulmonalis* being of the Nature of Venal Blood, and all Secretion being performed in the Arteries, the Nourishment for the *Lungs* must be brought by the *Arteria Bronchialis*: And there is the same Contrivance for the Nourishment of the Liver.

Upon the *Bronchia*, even to their minutest Ramifications, run likewise the fine Thread of the eight Pair of Nerves.

Besides these, the *Lungs* have also *Lymphaticks*; which discharge themselves into the *Thoracick Duct*; but they are smaller, and make more frequent Inosculations, almost than any other.

This is the Passage of the Vessels thro' the *Lungs*; but because the *Trachea* hath a particular Structure, it demands a particular Examination.

The *Trachea* then, or *Aspera Arteria*, is a Canal situated in the first part of the Neck, before the *Oesophagus*; its upper End is called *Larynx*, from whence it descends to the 4th *Vertebra* of the Back, where it divides and enters the *Lungs*; this Canal is made of Annular Cartilages, at small

and equal Distances from one another: And these grow smaller still as they approach the *Lungs*; and those of the *Bronchi* are so close to one another, that in Expiration, the second enters with the first, and the third with the second, and so the following always enters into the preceeding.

Betwixt the *Larynx* and the *Lungs*, these Cartilages make not compleat Rings; but their hinder Part, which is contiguous to the *Oesophagus*, is membranous, that they may the better contract, dilate, and give Way to the Aliments, as they go down the *Oesophagus*. But the Cartilages of the *Bronchi* are compleatly Annular; yet their Capillary Branches have no Cartilages; but instead of them small circular Ligaments which are at pretty large Distances from one another. The use of the Cartilages is to keep the Passage for the Air always open; but in the Capillary *Bronchi*, they would hinder the subsiding of the Vessels.

These Cartilages are tied together by two Membranes, the one *External* the other *Internal*. The *External* is composed of circular Fibres, and covers the whole *Trachea* externally. The *Internal* is of exquisite Sense, and it covers the Cartilages internally. It is composed of three distinct Membranes: The first is woven of two Orders of Fibres; those of the first of which are *Longitudinal*, for the shortning of the *Trachea*, and these make the Cartilages approach to and enter one another. The other Order is of Circular Fibres, for the contracting the Cartilages. When these two Orders of Fibres act, they help, with the *External Membrane*, in Expiration, in Coughing, and in altering the Tone and Notes of our Voice.

The second Membrane is altogether Glandulous, and the Excretory Vessels of those Glands open into the Cavity of the *Trachea*, in order to moisten its Cavity by a Liquor which they separate; and to defend it from the Acrimony of the Air.

The third and last Membrane is a Net-work of Veins, Arteries and Nerves: The Veins are Branches of the *Cava*; the Arteries of the *Carotides*; and the Nerves of the *Recurrents*.

From the Structure of the *Lungs* thus described, Dr. *Piscain* hath deduced Mechanically the great effect, they by means of the Air produce upon the Blood. For while the *Fetus* is in the Womb, the Vesicles of the *Lungs* lying flat one upon another, compress all the Capillary Blood-vessels which are spread upon them; but as soon as it is born and alive, the Air rushes into the empty Branches of the *Trachea*, and blows up the Vesicles into their Spherical Figures; by which Means, the Pressure or Compression being taken off from the Blood-vessels, and they equally expanded with the *Lungs*, all the Blood hath a free Passage thro' the *Pulmonary Artery*. But when the Air is thrust out again by the Contraction of the Cavity of the *Thorax*, it being a fluid Body, compresses the Vesicles and Blood-vessels upon them every where equally. By which Compression the red Globules of the Blood, which thro' their languid Motion in the Veins, were grown too dry to circulate in the fine Capillary Vessels, are broken and divided again in the Serum, and the Blood made fit for Nutrition and Secretion.

This Pressure of the Air upon the Blood-vessels, Dr. *Keil* saith, he hath demonstrated to be equal to 100 lb. weight; and in Coughing or Crying, it may exceed 400 lb.

But tho' these are the necessary Consequents of Respiration, yet several Experiments incline him to think, that some Particles of the Air must likewise enter the Blood-vessels, and mix with the Blood in the Lungs.

For, *first*, he saith he is assured, from repeated Experiments, that Air will escape the Pores of any Number of Bladders, when compressed only by the Weight of the Water, into which it is sunk; and therefore the Pressure of 100 lb. Weight in ordinary Respiration, must thrust some Particles of it into the Blood-vessels.

2. The Honourable Mr. Boyle, in his *New Pneumatical Experiments*, shews us, That Animals cannot live when shut up in common Air, tho' by a Gauge he hath found it to retain its wonted Pressure; and tho' the Receiver hath been immersed in Water cooled with a Solution of *Sal Armoniac*. The same Experiments assure us, That Animals will live longer when shut up in compress'd Air than in common Air, and that when they are dying in the common Air, they may be revived by pressing in more fresh Air.

3. It may be demonstrated, (saith the same Dr. Keil) That the Difference between the Gravity of the Air in the City, and that of the Country, (which can be but very small, upon the Account of the *Effluvia*, as the *Barometer* shews it to be) can never be the Cause of that Difficulty of Breathing, which some have in the one and not in the other; for they are not near so sensible of the different Gravities of the Air in the same Place, as they are of a much smaller Difference in two distinct and remote Places, where the Contents of the Air are different.

The Lungs are compos'd of an infinite Number of little Lobes, of different Figures and Magnitudes, but yet so joyn'd as to leave but small Vacuities behind them. Each Lobe consists of an Infinity of small *Spherical Vesiculae* formed by the Coats of the small Branches of the *Trachea*; so that they may be consider'd, when blown up, as so many fine Tubes ending in fine hollow Spheres. On the Sides of these *Vesiculae*, the Blood-vessels are spread in a fine Net-work: But before the *Fetus* is brought to light, these *Vesiculae* lie flat on one another, and by their Pressure on the Blood-vessels hinder its Passage thro' them; but as soon as the *Fetus* enjoys the Benefit of the Air, that doth by its Weight and *elastick Force*, rush in thro' the Pipes of the *Trachea* into these *Vesiculae* and blows them up; whereby they stand erect on the Trunks of those like *Wind-pipes*, and give a free Passage to the Blood thro' these Vessels spread upon their Sides. And when by the Weight of the *Thorax*, and the Acts of its Muscles, together with those of the *Abdomen* and *Diaphragma*, this *Elastick Fluid*, the Air, is thrust out of those *Vesiculae* thro' the *Trachea* in Expiration, these *Vesiculae* pressing one against another, and the *elastick Fluid* acting on their Sides, and consequently on the Blood-Vessels thereon spread, separate the Globules of the Blood from one another, render it more capable of Circulation, in the narrow Passages of the Capillary Vessels.

And there seems to be a yet more considerable Use of this *Natural Function* behind; which is, to form those *Elastick Globules* of which the Blood principally consists. It is undoubted Fact and Observation, that the Blood consists of a *Lympha*, which is the common Vehicle, several Salts, Re-

menta of a thick Consistence (which is probably the unform'd Part of the Chyle and Aliment) and these Globules of which we are now speaking, tho' sometimes they are of different Colours, as *White, Blue, Purple*: This any one may discover with an ordinary Microscope. Now 'tis certain that these Globules may be burst, as in Obstructions; and all exhausted, as in violent Hemorrhages, and yet be all recovered and recruited again; wherefore they must be formed, somewhere in the Body, from the Chyle. And since 'tis certain that they are not solid Particles, as appears both by Ocular Inspection and Truth; also that they do actually change their Globular Figures into those of *Oblong Spheroides*, as they move thro' the Capillary Vessels; as therefore from their Colour, and from their being coagulated by Acids, and having their Figures destroyed; it is highly probable, that they may be little Bubbles blown from the viscid Part of the Chyle, by the Force of some more subtle *elastick Aura*. Now no Place in the Body can afford this *elastick Fluid*, but the Lungs; and this may be the Reason why the Chyle enters into those two Veins only, which are just returning into the Heart immediately to be sent into the Lungs. For since in our gross Element of Air, there is always lodged a finer *Elastick Fluid*, which is the principal Agent in all the subtle Effects commonly ascribed to the other: tho' the grosser Element cannot, yet this finer Fluid, (by the vast Force used in Expiration) may be thrust in thro' the Sides of these *Vesiculae*, to the Blood-vessels. And since these Blood Globules must be generated somewhere, and that there is no Place in the Body, this subtle *elastick Fluid* can be squeezed thro' with sufficient Force to get into the Blood thro' the Sides of the Blood-vessels, but in the Lungs: 'tis very probable these Globules are there formed, after this manner. The viscid Part of the Chyle being by the shortest and safest Course possible brought into the returning Part of the Blood, is sent from the right Ventricle of the Heart to the Lungs, and is spread upon the Sides of the *Vesiculae* thereof in little fine Tubes: this fine fluid *Elastick* being squeezed, in the Act of Expiration, thro' a Pore, continued thro' the *Vesicle* of the Lungs and the Side of the Blood-vessels, is forced into the viscid Part of the Chyle now running by in the Serum, and by its perpendicular Pressure on the Sides of that Cavity it forms, produces a little small Bubble, of a determinate Magnitude and Thickness of Shell, from whence it hath its Colour: After this, by the Force of the succeeding Fluid, this little Bubble is broken off from the Pore, and carried along the Artery; and the Cohesion of the Parts of the Shell of this Bubble being greater than the Force from without, whereby the thin Serum acts upon it, it is preserved in its Figure in all the various Motions of the compound Fluid of the Blood. And if it happen that these little Bubbles should be burst (as they most certainly are by 1000 Causes) whenever they come to the Lungs they are new formed again; whereby the Circulation is render'd constant and uniform. For should these Bubbles be all destroy'd, there must of Necessity rise a general Obstruction in all the Capillary Arteries. An Instance of the Formation of such kind of little Bubbles a Mixture of Oyl and Vinegar affords, for that look'd on thro' a Microscope, appears to be nothing but an Infinity of such like little Bubbles, formed by the Immission of the Air and Vinegar into little Shells

of Oyl. *Vid. Cheyne's Phil. Princip. of Natural Religion, p. 214.*

LUNI-SOLAR Year, in Chronology, is a Period made by multiplying the Cycle of the Moon (or 19) into that of the Sun, which is 28; which is 532: and in this space of Time 'twas thought, the Sun and Moon would come to be together again exactly.

LUSHBURG, was a base Sort of Coin used in the Days of King *Edw. III.* which was coined beyond Sea to counterfeit the *English Money*; wherefore by a Statute in 25 *Ed. 3. c. 2.* it was made Treason for any one designedly to bring them into the Kingdom.

LUTHERNS, a sort of Windows in the Roof of a House. See *Dormers.*

LYE under the Sea, is the Mariners Term for a Ship, which having her Helm lash'd fast *a-Lee*, lies so *a-Hull*, that the Sea breaks upon her Bow, or Broadside.

LYEF-YELD or *Leff-Silver*, was formerly a small Fine or pecuniary Composition, paid by the Customary Tenant to his Lord, for Leave to plow and sow.

LYMPHÆDUCTS, are slender pellucid Tubes, whose Cavities are contracted at small and unequal Distances by two opposite Semi-lunar Valves, which permit a thin and transparent Liquor to pass through them towards the Heart, but which are shut up like Flood-gates on its returning. They rise in all Parts of the Body, but after what Manner needs no great Dispute; for without Doubt all the Liquids in the Body, excepting the Chyle, are separated from the Blood in the fine Capillary Vessels by a different Pipe from the common Channel in which the rest of the Blood runs: But whether this Pipe be longer or no longer than the Thickness of the Coat of the Blood-vessel, whether

it be visible or invisible, it is still a Gland whilst it suffers some Parts of the Blood to pass thro' it, denying a Passage to others. Now the Glands that separate the *Lympha* are of the smallest kind, being invisible to the finest Microscopes; but their Excretory Ducts, the *Lymphatick Vessels*, unite with one another, and grow larger as they approach the Heart; yet they do not open into one common Channel, as the Veins do; for sometimes we find 2 or 3 more Lymphæducts running one by another, which only communicate by short intermediate Ducts, or which unite and immediately divide again. In their Progress they always touch at one or two conglobate or vesicular Glands, into which they discharge their *Lympha*. Sometimes the whole Lymphæduct opens at several Places into the Glands, and sometimes it sends in only two or three Branches whilst the main Trunk passes over and joyns the Lymphæducts arising from the opposite Side of the Glands, exporting again the *Lympha* to their common Receptacles. The Glands of the *Abdomen* which receive the Lymphæducts from all the Parts which it contains, as likewise from the lower Extremities, are the *Glandula Inguinales, Sacrae, Lumbares, Mesentericae, and Hepaticae*; all which send out new Lymphæducts which pour their *Lympha* into the *Receptaculum Chyli*, as those of the Chest, Head and Arms do into the *Ductus Thoracicus*, Jugular and Subclavian Veins. The Design of the Lymphæducts emptying themselves into the conglobate Glands seems to be, that the slow *Lympha* may receive a new Velocity from the Elastick Compression of the Fibrous Cells of those Glands, whose Fabrick resembles that of the Spleen; and therefore they are improperly called Glands, because they separate no Liquor from the Blood. See *Keill's Anatomy. p. 52.*

MAG

MACE-GRIEF, alias *Macegrefse, Machearii*; are such as willingly and knowingly buy or sell stollen Flesh.

MAGAZINE or *Arsenal*, is the Place in Fortified Towns, &c. where all sorts of Stores are kept, and where Carpenters, Wheel-Wrights, Smiths, &c. are employed in making all things needful to furnish out a Train of Artillery.

MAGBOTE, was formerly a Recompence made in Money, or otherwise, for slaying or murdering one's Kinsman; for sometimes the Corporal Punishments in such Cases due were transmuted into Pecuniary Fines; when the Friends or Relations of the Party slain, were so content. *Leg. Canuti Regis T. 1. c. 2.*

MAGNETISM. See Mr. *Derham's* Experiments and Reasonings on this Subject in *Phil. Trans. N. 304.* where he acquaints us, That he found (as *Grimaldi* and *De la Hire* had in Part done before) that a Piece of very well touched Iron Wire would, upon being bent round into a Ring, or coil'd round upon a Stick, &c. most times quite lose its Verticity, and always have it much diminished thereby. But yet that if the whole

MAG

length of the Wire were not entirely bent, so that the Ends of it, tho' but for the length of one tenth of an Inch, were left strait; then the Vertice would not be destroyed in those Parts or Ends; tho' it would every where else. He found also, on repeated tryals, that tho' coiling or bending the Wire as abovesaid, would always in the Day-time diminish and most times destroy the Verticity of a touch'd Wire; yet it would not do it in the Evenings: And he saith, he knows very well, that the Orb of the Activity of Magnets is larger or less at different times; which is confirmed by what is found in Fact to be true of our noble large Loadstone which is kept in the Repository at *Gresham College*; for that will keep a Key or other Piece of Iron suspended to another, sometimes, at the Distance of 8 or 10 Foot from it; but at other Times, not beyond the Distance of four Foot.

He found also, that twisting the Wire would considerably diminish, and sometimes destroy the Verticity; which in some Tryals made, on twisted Wire, was so confused and disordered, that he found by drawing one of the Poles of a Loadstone along near the Sides of the Wire, in some Places it would attract

attract, in others repell, and so *attract* and *repell* all along the Wire; and he fancy'd in some places, that one side of the Wire would be attracted and the other repelled by one and the same Pole.

After this he try'd what *splitting* or *cleaving* the Wire would do; and in particular, whether split Wires would have the same Properties as *Loadstones* cut asunder, and he found the *Phænomena* of this Experiment very odd; for sometimes the Poles of the Wire so split would be quite chang'd; so that the South Pole would become the North, in all Respects: Sometimes one half of the Wire would retain its Magnetism which it had before its splitting, and the other half would have it quite changed, &c.

He observed also one thing to be very surprizing in these split Wires; which was, *That laying one, or the other Side of the Half uppermost*, would cause a great Alteration in its Tendency or Aversion to the Poles of the Magnet: But if you lay the contrary side of that half uppermost, the same End shall be attracted by one and repelled by the other Pole. In other Pieces where the Ends are regularly attracted or repelled, only in an inverted Order (as if new touched) if it lay with the round side uppermost at that time, and be then turned upside down, *viz.* the flat cleft side uppermost; it is ten to one, he saith, that one of the Ends is either attracted by both the Poles, or repelled by both; or else attracted and repelled by one, and in Hesitation by the other.

He touched a Wire from End to End with only one Pole of the Magnet; which gave it so vigorous a Verrue, that he is almost of Opinion, 'tis the *best Way of touching*; the Consequence was, that the End where he began always turned contrary to the Pole that touched it: He then touched the same Wire (and others likewise) with the other Pole of the same Magnet, from the same End, and then that End turned the contrary Way. For Instance, mark one end of the Wire for the North End, and touch that Wire by drawing the North Pole of the Magnet divers times along the Wire from the North to the South End: This Wire so touched shall have a vigorous Verticity; but the North End shall stand South. But if you touch that or another Wire, (for it is all one, the latter Touch destroying the former) by drawing the North Pole of the Magnet from the South to the North End of the Wire, then this North End will turn North: And so it will be if you touch with the Southern Pole from the North to the South.

He found also, that if he touc'd an Iron Wire exactly in the Middle with but one Pole of the *Loadstone*, without drawing it backwards or forwards, in that Place would be the Pole of the Wire; and the two Ends would be the contrary Pole of the Wire, and were accordingly repelled or attracted by the Poles of the Magnet; and the middle, and about an Inch more on each side, was attracted only by the Pole that touched it.

MAILE, was anciently a Kind of Money, as some think; for *Mailes* were Half-pence in Henry the Fifth's Time; being the half of the Silver *Sterling* or Penny: But more largely it seems to have been any Proportion of Grain, or any other *Rent*. This latter in the North is called *Black-mail*. See *Black-mail* in Vol. I.

MAIN BODY, of Troops in an Army, is that which marches between the *Advance* and the *Rear*

Guard; and in a Camp, that which lies between the two Wings.

MALETENT, or *Maletolte*; in the Statute called the *Confirmation of the Liberties*, 25 Ed. 1 c. 7. is interpreted to be a Toll of 40 s. for every Sack of Wooll; and in the Statute *de Tallagio non concedendo* in the 36th Year of the same King Edw. 1. 'tis appointed, that Nothing for hereafter shall be taken of Sacks of Wooll, under the Pretence of *Maletent*. It seems to come from *malum Telonium*.

MAL-VOISIN, was formerly the Name of a warlike Engine used in battering of Walls to cast Stones, &c. It was so called, because it was an ill or dangerous Neighbour.

MAN-BOTE, was formerly a Recompence for Homicide, or a pecuniary Compensation for killing a Man.

MANCA, was formerly a square Piece of Gold, commonly valued at 30 Pence; and *Mancusa* was as much as a Mark of Silver. See *Canute's Laws*. 'Twas called *Mancusa*, quasi *Manu cusa*.

MANCUSA. See *Manca*.

MANCIPLE, a Caterer; there was anciently an Officer in the Temple called by this Name, now the *Steward*. And the Name and Office is retained still in our Colleges, in both our Universities.

MANNER; besides what hath been said about *Manner*, I must take notice that they say in *Architecture*, That an Order Heroically and Gigantically designed; where the Division of the principal Members is put into a few Parts; but those having all a bold and ample *Relievo*, is after the *Grand Manner*. As for Example, in a *Corniche*, if the *Gola* or *Cimatium* of the *Corona*; the *Coping*, the *Modillions* or *Dentelli* make a noble Appearance by the Gracefulness of their Projectures; and that we see none of that ordinary Confusion which results from those little Cavities, *quarter Rounds* of the *Astragal*, and such little Ornaments as produce no effect in great and massy Works, and which do impertinently juggle out the graceful and principal Members; then will the *Manner* of this *Corniche* appear solemn and great, and approve it self to be performed after *La Grand Maniere*. In Mr. Evelyn's Parallel of Ancient and Modern *Architecture*, Chap. 5. p. 25. you have a fine Draught of this *Grand Manner*, in an ancient Dorick Pillar which was found at *Albano*, joining to the Church of St. Mary near Rome.

MANSE, is a Parsonage or Vicarage-House for the Incumbent to live in, and was originally, and is now, an essential Part of the Endowment of a Parish-Church, together with the Glebe and Tithes.

MANUALIA *Beneficia*, were formerly such daily Distributions or Portions of Meat and Drink, as were allotted to the Petty Canons and other Members of Cathedral Churches for their ordinary Subsistence.

MANUMISSION, is the Term for making a Slave or a Bondman free: You have the Form of this as it was used in the Conquerour's Time, in *Lambert's Apxavopia*, Fol. 126. The Terms of the Law make two Kinds of *Manumission*; one expressed, and the other implied. That expressed was by Deed, or *Publick Declaration*: That implied was when the Lord made an Obligation for Payment of Money to his Villain at a certain Day; or sued him when he might enter without Suit; or

or when he granted him an Annuity or Leased Land to him for Years, or for Life, &c.

MANU-OPERA, are stolen Goods taken up on a Thief apprehended in the Fact.

MANU-PASTUS, in the Law Dialect is often used for a Domestick Servant, one fed as it were by the Hand of his Master.

MANU-PES, is used in the Charter of Richard the Third for a Foot of full and legal length.

MANU-PRISOR, one who was Bail-pledge or Security for another Person.

MANUS, was anciently used both for an Oath and him that took it. If a Man swore alone in the Court, he was said to do it *propria manu*; but if he brought 3 or more Witnesses to swear for him, he was said *tertia manu jurare*.

MARCHET } *Mulieris*, the same with *Mer-*
MARCHETA } *chetum*.

MARCHES, are now the Bounds between England and Wales, or England and Scotland; and the Marches of Scotland are divided into *West* and *Middle Marches*. The Word *Marches* is used also in Stat. 24. H. 8. 12. for the Borders of the King's Dominions in general, as being derived from the *Germ. March*, which signifies a Bound or Limit; and those Noblemen who lived near these *Marches* are frequently in our Statutes called *Marchers*.

MARITAGIUM *habere*, signified formerly to have the free Disposal of an Heiress in Marriage, which was a Favour granted by the King, who was the Guardian of all Wards or Heirs in Minority, to some special Favourite or Friend.

MARITAGIUM *Liberum*, *Frank Marriage*; was when a Baron, Knight, or Free-holder granted such a Part of his Estate with a Daughter to her Husband, and the Heirs of his Body, to hold without any Homage or Service to the Donor.

MARK, the Saxons called it *Mancus*, *Mancusa*, and *Mearc*; and among them it contained 30 Pence, which of their Money was six Shillings. 'Tis not certain when the *Mark* came to be valued as at 13 s. 4 d. But *M. Paris*, in the Life of *Guarinus* Abbot of St. *Albans*, tells us, that a *Mark* (A. D. 1194.) was of this precise Value. Since the Conquest there was never any Coin of this Name struck, as appears; but probably there might be such before in the Saxons Time, and with some *Mark* or Stamp upon it, as may be concluded from the Word *Mark*. *Stow* in his *Annals*, p. 32, and 691, saith, a *Mark* of Gold was eight Ounces, twelve *Mark* of Gold Troy was 200 l. of English Money; after which Rate each *Mark* weighed 16 l. 13 s. 4 d.

Skene de Verb. signif. saith, a *Mark* signifies an Ounce Weight, whereof the Drachm is the eighth Part, as the Ounce is the eighth of the *Mark*.

MARQUIS or } is now a Title of Honour next
MARQUESS } before an Earl, and next after a Duke. The Name seems to be derived from the *Germ. March*, a Bound or Limit; and therefore was as much as *Custos Limitis*, or *Comes sibi Praefectus Limitis*. Among the old Britains it was the Custom, and after them of the Saxons, to give the Title of *Reguli* to all the Lords that had the custody and charges of their *Marches* or Bounds; as *Selden* shews in his *Mare Clausum*, Lib. 2. c. 19. But in Richard 2. his Time, the Title of *Marquesses* instead of *Lords Marches* came to be given to such as were Governours of the *Marches*.

MARS. Mr. *Flamstead* and *Cassini* have by accurate Observation found the Horizontal Parallax

of this Planet to be about 25 Seconds, and certainly not greater; a large Account of the Method of observing and finding which, you will find under the Word *Sun* in this Vol.

MARTYROLOGY, was anciently a Register kept in the Religious Houses, wherein they set down the Donations of their Benefactors, and the Day of their Deaths, that so on each Anniversary they might commemorate and pray for them: And therefore several Benefactors made this a Condition in their Charters. *Kennet's Paroch Antiq.*

MASSES, in Painting, are the large Parts of a Picture containing the great Lights and Shadows.

MASTER of the Mint: In the second Year of H. 6. that was the Title of him that now is called the *Warden of the Mint*, whose Office it is to receive the Silver and Bullion that comes to the Mint to be coined, and to take Care thereof.

MASTER of the Court of Wards and Liveries; was the chief Officer and Judge of that Court of Wards, kept the Seal of it, and was named and assigned by the King. But this Court and all its Officers, Members, Power, and Appurtenances, is taken away by a Statute made the 12th of Car. 2. c. 24.

MASTER of the Horse, hath the Rule and Charge of the King's Stable: This Officer is very honourable, and usually a Nobleman, is mentioned in 39 Eliz. 7. and 1 E. 6. 5.

MASTER of the Posts, was an Officer of the King's Court that had the appointing, placing and displacing of all such as provided Post-Horses to carry the King's Messages and other Business. He also was to pay them their Wages, &c. This Officer is mentioned in 2 Ed. 6. 3. but now by a Statute made 12 Car. 2. c. 34. he is appointed by the King's Letters Patent, with Rates and Rules prescribed in the said Act.

MASTER of the Armory, is an Officer mentioned 39 Eliz. c. 7. and hath the Care of the King's Armour in any standing Armories; with Power of putting in and out all inferior Officers.

MASTER of the Jewel House, is mentioned in 39 Eliz. c. 7. and is an Officer of the King's Household of great Credit; being allowed *Bouge of Court*, that is, Diet for himself and the Clerks of the Office, and hath a Lodging in the Court. He hath Charge of all the Gold and Silver Plate used at the King's Table, or belonging to any Officer of Account attending the Court; and of all Plate remaining in the Tower of London, as also of Chains and loose Jewels not fixed to any Garment.

MASTER of the Household. This Officer is called *Grand Master*, &c. and *Lord Steward of the King's Household* in 32 H. 8. 39. And in the first of Q. M. and ever since he is called *Lord Steward*, &c. and under him there is a principal Officer called by this Name of the *Master of the Household*.

MASTER of the Ordnance, mentioned in 39 Eliz. 7. and is a great Officer, to whose Care all the King's Ordnance and Artillery is committed.

MASTER of the Faculties, is an Officer under the Archbishop of Canterbury, who grants *Licenses* and *Dispensations*; he is mentioned in the Statute of laying Impositions at Law of 22, 23. Car. 2.

MASTER of the Wardrobe, is a great Officer at Court; having his Habitation or Dwelling-House belonging to that Office, called the *Wardrobe* near *Puddle-*

Puddle-wharf in London. He hath the charge and custody of all former Kings and Queens Robes remaining in the Tower of London, and of all Arras and Tapestry Hangings, Bedding, &c. and the Charge and Delivery out of all Scarlet Liveries belonging to the King or Queen. He is mentioned in 39 *Elix.* 7.

MATERIA Subtilis, in the Cartesian Philosophy is what is produced by the grinding or rubbing one against another of the Particles of the second Elements; and so these compose what he calls his first Element. See *Cartesian Syst. of the World* in this 2d Vol.

MATHEMATICKS. Besides the mention of such Authors as have written on the several Parts of this noble Science, and of which you have an Account under each particular Head; these that follow have written on Mathematicks more generally.

Ozanam's Cours de Mathematique, in 8vo.

MATRICULA, anciently was the Word for a Register. Thus in the Church there was the *Matricula Clericorum*, which was a List or Catalogue of the officiating Clergy, and *Matricula Pauperum*, a Catalogue of the Poor to be received: and Vol. II.

to this Day being Registered as a Member in the University of Oxon is called *Matriculation*.

MATROSSES, are Soldiers in the Train of Artillery, next below the Gunners: Their Duty is to assist the Gunners in Travelling, Spunging, Firing, and Loading of Guns, &c. They carry Fire-locks, and march along with the *Store-Waggons*.

MAUND, was anciently a Measure of Capacity with us, being a kind of great Basket or Hamper containing 8 Bales, or 2 Fatts. See the Book of Rates, Fol. 3.

MAXY, is the *Tin-miners* Term for a *Weed*, as they call it, of the *Marchasite* kind, from whence *Maxy* seems to be a Corruption. When the Load or Vein of Oar degenerates into this or anything else that is not Tin, they call it a *Weed*.

MEASURES of Capacity. These (with us) both liquid and dry, were first made from Troy Weight. See 9 H. 3. 51 H. 3. 12 H. 7. &c. wherein it is enacted, that eight Pound Troy Weight of Wheat, gathered from the middle of the Ear, and well dried, should make one Gallon of *Wine Measure*, and that there should be but one Measure for Wine, Ale, and Corn throughout the Kingdom. See 14 Ed. 3. and 15 Rich. 2. But Custom in time hath prevailed against this, having altered Measures as well as Weights; no other but *Troy Weight* being appointed by our Laws to be used. (See 14 and 17 of Ed. 3.) we having now three different Measures; viz. one for Wine, one for Ale and Beer, and one for Corn. See the Table of them under Measures, Vol. I.

Only let me add further from Mr. John Ward's Arithmetick. p. 34. That tho' the common Wine Gallon sealed at *Guild-Hall* in London, by which all Wines, Brandies, Spirits, Strong-waters, Mead, Perry, Sider, Vinegar, Oyl, Honey, &c. are measured and sold, is supposed to contain 231 Cubick Inches; and from thence, the Tierce will contain 9702 Cub. Inch. the Hogshead 14553, the Puncheon 19404, the Butt or Pipe 29106, and the Tun 58212. Yet it hath been accurately experimented, that the Wine Gallon at *Guild-Hall* doth hold but 224 Cubick Inches; as indeed Dr. Wybald had before taken Notice of in his *Tactometry*, p. 289. But yet in May 25, 1688, when an Experiment was made for the Lord Mayor of London and the Commissioners of the Excise, in Confirmation of the Truth of the Account above, of the Capacity of the Standard Gallon; viz. that it is but 224 Cub. Inches: yet it was then thought fit to continue the common supposed Contents of 231 Cub. Inches for the Wine Gallon, and that all Computation in Gauging should be made from thence; and so I suppose it yet stands.

The Beer and Ale Gallon is larger than the Wine Gallon, in Proportion to the Excess of the common Pound *Averdupois* above the true Pound Troy: that is, as 12. 231 :: 50 14 2/3 to 281 1/2, which is very near the Cubick Inches in the Ale Gallon. The Ale Quart contains 70 7/8 Cubick Inches; the Gallon will be 282.

Dry Measure seems to stand still in Proportion to the old Wine Gallon of 224 Cub. Inches. The common received Content of the Corn Gallon being 272 1/4. for as 12. 14. 1 2/3 :: 224. 272 1/4. and yet by an Act of Parliament made A. D. 1697, it is appointed, that every round Bushel with a plain and even Bottom, being made 18 Inches and 1/2 wide throughout, and 8 Inches deep, shall be esteemed a legal

legal Winchester Buskel, according to the Standard in his Majesty's Exchequer. Now a Vessel thus made will contain 2150.42 Cubick Inches; and consequently the Corn Gallon can be but 268 $\frac{1}{2}$ Cub. Inches.

MECHANICAL Philosophy, was that which the most ancient of the Phœnician and Greek Philosophers have adhered to for the Explication of the Phænomena of Nature; and these made use originally of no other Principles, than the Consideration of Empty Space, the Doctrine of Atoms, and in particular, the Gravitation of Bodies. These silently attributed the Cause of Gravity to something which was plainly distinct from Matter; and this Cause our most modern Natural Philosophers, in their Enquiries into Nature, did by no means take into Consideration. They have happily avoided aiming at any Hypothesis to explain the Phænomena of natural Effects, and leaving the Philosophy of Causes to Metaphysicks, they have rightly considered that it is the chief End, Design, and Business of Natural Philosophy to consider Effects; and by reasoning upon them and their various Phænomena, to proceed regularly at last to the Causes of Things; and especially to the Knowledge of the First Cause. And certain it is, that all true Progress and Proficiency in this Kind of Natural Philosophy, if it don't immediately lead us to the Knowledge of the First Cause, yet will surely bring us still nearer and nearer to it; and therefore is a most noble, excellent, and valuable Study. *Vid. Newt. Opt. Lat. Ed. p. 315.*

MEMBRETTO, in Architecture, is the Italian Term for a Pilaster, that bears up an Arch. These are often fluted, but not with above 7 or 9 Channels. They are frequently used to adorn Door-Cases, Gallery Fronts, and Chimney-Pieces, and to bear up the Cornishes and Freezes in Wainscot.

MEMORY. Dr. Hook, in his *Op. Posthum.* p. 139, 140, &c. supposes Memory to be as much an Organ as the Eye, Ear, Nose, &c. and to have its Situation some where near the Place where the Nerves from the other Senses concur and meet; and he thinks, that the Memory being both improveable and impairable, appears from thence to be plainly Organical; and that it is a Kind of Repository of Ideas formed partly by our Senses, and chiefly by the Soul her self.

MENSALIA were such Personages or Livings as were united formerly to the Tables of Religious Houses; and therefore are by Canonists called *mensal Benefices*.

MERCHEN-LAGE; was one of those 3 Laws out of which *W. the Conqueror* framed our Common Laws, with a Mixture of the Laws of Normandy; and was the Law of the Mercians when they governed a third Part of this Land; for it was divided in the Year 1016. See *Cambden's Britannia*, p. 94.

MERCHETUM, *Merchet*, in Scotch Marchet, was anciently a Commutation of Money or Cattle given to the Lord to buy off that old impious Custom of the Lord's lying the first Night with the Bridal Daughter of a Tenant; and after it was used for the Fine or Composition which the Tenants paid to have leave to marry their Daughters: Also no Baron or military Tenant could marry his sole Daughter or Heir, without Licence from the King *pro maritanda Filia*.

MERCURIAL Phosphorus, is a Light arising from the shaking of Mercury in *Vacuo*; of which see several Experiments in *Philos. Trans.* N. 303. See *Phosphorus*.

MERCURY, is the Term the Chymists gave and is now generally used for that ponderous Fluid, *Quick-silver*: The Texture of which seems to consist of exceeding small, smooth, solid, spherical or spheroidical Particles; because Mercury is never so small a Quantity, is by no means transparent, but opaque, and will let none of the Rays of Light pass thro' its Pores: And therefore since 'tis probable that Light passes not through the solid Parts of transparent Bodies, but only thro' their Pores, 'tis plain, if the Particles of Mercury be Spherical (as it appears those of all Fluids are) then their Diameters cannot be much greater than those of the Rays of Light; for the Interstices between the Particles are as the Cubes of the Diameters of the Globules by whose meeting they are formed; and therefore seeing Light cannot pass thro' these Interstices, it is plain, that the Diameters of the Corpuscles of Mercury cannot be much greater than those of Light: And if these Particles should

should be oval or spheroidal, their shortest Diameters must be of the Length of those of the Particles of Light, or not much greater.

The Solidity of the Corpuscles of *Mercury*, and the Smallness of the Interstices left between them, accounts for the wonderful specifick Gravity of *Mercury*, above all other Fluids; and the exceeding Smallness of its Parts, for its easie Ascent by Fire.

MERIDIAN Line, is a Line of ready Use in Practical Navigation. 'Tis always placed on the Foot, or 2 Foot *Gunter's Scales*, and sometimes on the Side of *Gunter's Sector*, (and on the Cross-Staff, &c.) and continued to its whole Length. 'Tis divided unequally towards 87 degr. (where of 70 gr. are about one half) in such manner as the Meridian in *Mercator's Chart* is divided and numbered.

Its Uses are many: For, 1. It serves them to graduate a *Sea Chart* according to the true Projection. 2. Being joined with a Line of Chords, it serves for the Protraction and Resolution of such Right-lined Triangles as are concerned in Latitude, Longitude, Rhumb, and Distance in the Practice of Sailing; as Mr. *Gunter* shews, p. 15. of his Book of the *Cross-Staff*; as also in pricking the Chart truly at Sea.

MESOLABIUM, See *Renati Tran. Flusii Mesolabium; cui accessit pars altera de Analyfi & Miscellanea. Leodii Eburonum, 1668. 4to.*

MESSENGER of the Exchequer: The four Pursuivants in that Court are called by this Name, and their Duty and Office is to attend the Lord Treasurer, and to carry his Letters, Precepts, &c.

MESSUAGE, is a Dwelling-House, with some Land assigned for its Use; and by this Name a Garden, Shop, Mill, Chamber or Cellar may pass, saith *Plowden, Fol. 169.* In *Scotland* it is what we call the *Mannor-House*, the principal Dwelling-House within any Barony.

METALS Lines: On *Gunter's Sector* are sometimes placed two Lines called the *Lines of Metals*; they are noted with the Characters of the 7 Metals, $\odot$, ϵ , φ , h , φ , δ , and π ; and their Use is to give the Proportions between the several Metals in their Magnitudes and Weight, and by them such Problems as these are solved.

1. In Bodies of the same Figure of different Metals, by the Magnitude of one given, to find the Magnitude of the rest.

Take the Magnitude given out of the Lines of Solids, and open the Sector till it be applied right in its proper Points; then will the Parallels taken between the corresponding Points of the other Metals, and measured on the Solids, give their several Magnitudes.

2. In Bodies of different Metal, but equal Magnitude, having the Weight of one, to find that of the rest.

This Probl. is the Converse of the former, but not in direct but reciprocal Proportion; apply the Weight given, taken out of the Lines of Solids into the Sector in its proper Points belonging to the Metals of the other Body, so the Parallel taken from the Point's belonging to the Body given, and measured in the Lines of Solids, shall give the Weight of the Body required.

3. A Body being given of any one Metal, suppose a Sphere of Lead of 16 d. and whose Diameter is a (let d and a signify any Magnitudes or Lengths) to make another like it and of equal Weight, but of another Metal, as suppose Iron.

Take out the Diameter a , and apply it in the Lines of Metals in the Points of h belonging to Lead; then will the Parallel between the proper Points in δ , be the Diameter of the Iron Sphere required: And this compared with the other Diameter in the Line of Solids, will give 23 d. for the Magnitude of the Body required.

4. A Sphere of Lead being given, whose Diameter is a , to make another Sphere of any other, as of Iron, whose Weight shall be determined; v. gr. that shall weigh thrice as much.

Apply the Diameter a over in the proper Points of h ; and then the Parallel between the proper Points of δ will give the Length of the Diameter of an equal Sphere of Iron; and this tripled will be the Diameter required.

See *Webster's Metallographia. Lond. 1670. 4to.*

Sir John Bettus's Fleta minor; or, the Laws of Art and Nature, in knowing, judging, finding, refining, &c. the Body of confined Metals.

Georgius Agricola de Re metallica. Fol.

METOPS; the same with *Metopa*.

METTESHIP, *Metteschep, Mettenscep*, seems to have been anciently a Fine or Penalty paid by the Tenant to his Lord for his Neglect or Omision of doing his customary Service. Perhaps it should be written *Mittenscep* from the *Saxon Mitten*, to measure, and *ceap*, Goods or Chattels.

MICROGRAPHY, is the Description of the Parts and Properties of such very small Objects as are only discernable by Means of the Microscope. On this Subject the late Dr. *Hook* hath written designedly in his *Micrography*, as hath also Dr. *Pow-er*; and *Leuenhoeck* in 2 Vol. in *Quarto, Lat.* in which, as well as scattered up and down in many other Books written on other Subjects, a very noble Treasure of useful Discoveries is to be found, and all made by means of the Microscope.

MICROMETER. In *Philos. Trans. N. 25*, you have from Mr. *Richard Townley*, an Account of the Micrometer invented by Mr. *Gascoigne*; and by this Instrument he found the Moon's Distance and Parallax from two Observations of her meridional and horizontal Diameter, before Mr. *Auzout* took this matter into Consideration: Which Micrometer Mr. *Townley* had, and is described by Dr. *Hook*, in *Phil. Trans. N. 29.* and the manner how it is to be applied to a Telescope shewed. And Mr. *Flamstead* in *N. 96.* saith, that by the Micrometer and a Telescope of but 14 Foot he could take the Diameters of the Planets and their Distances from the fixed Stars, to a Second almost. This Instrument is now brought to very great Perfection and ready use by our excellent Math. Instrument-maker Mr. *John Rowley*, under St. *Dunstan's Church* in *Fleetstreet*. See its Use in finding the Sun's Horizontal Parallax, under the Word *Sun* in this Volume.

MICROSCOPE: By those excellent Observations and Experiments which the admirable Sir *Is. Newton* hath made on Colours, he shews Ways to conjecture very accurately of the *Sizes* of the component Particles of Bodies by their Colours; and in the Description of those, he tells us, (*Book 2. Part 3. p. 64.*) he hath been the more particular, because it is not impossible but that Microscopes may (if not done already) at length be improved to that Perfection, as to discover the Particles of Bodies on which their Colours depend. For, saith he, if those Instruments are or can be so far improved, as with sufficient Distinctness to represent Objects five or six hundred Times bigger than at a Foot Distance they appear to the naked Eye, I should hope that we might be able to discover some of the greatest of these Corpuscles; and by one which would magnifie 3 or 4 Thousand Times, perhaps they might all be discovered, but those which produce Blackness. And if this could be attain'd to, (*viz.* by Glasses to discover the constituent Particles of Bodies) he fears it would be the utmost Improvement of the Sense of *Seeing*; for it seems impossible to see the most secret and noble Works of Nature *within* the Corpuscles, because of the Transparency of these Corpuscles.

The same Gentleman in *Philos. Transf.* N. 88. from the Difference he had found between compounded and simple Colours, takes Occasion to communicate a Way for the Improvement of Microscopes by Refraction; *viz.* by illuminating the Object in a darkened Room with Light of any convenient Colour not too much compounded; by which Means the Microscope will with Distinctness bear a deeper Charge and a larger Aperture.

And in N. 80, he saith, that he hath sometimes thought of making a Microscope which should have, instead of an Object Glass, a *Reflecting Piece of Metal*. For these Instruments seem as capable of Improvements as Telescopes; and perhaps more, because but one Piece of reflecting Metal is requisite in them; as is plain from this Figure; where

the other Focus of the Metal in which the Object is placed.

The Description and Use of Mr. *Wilson's* Sett of Pocket-Microscopes, &c. mentioned in the Preface of Vol. I.

This Sett of Microscopes has Nine different Magnifying-Glasses; Eight of which may be used with two different Instruments, for the better applying them to various Objects: One of these Instruments is represented Fig. I. A A A A, and is made of Ivory, it hath 3 thin Brass Plates, E E, and a Spring of Steel H within it; to one of the thin Plates of Brass is fixed a Piece of Leather F, with a small Furrow G both in the Leather and Brass to which it is affixed: In one End of this Instrument there is a long Screw, D, with a *Convex-Glass* C, placed in the End of it: In the other End there is a hollow Screw, o o; wherein any of the Magnifying-Glasses M, are screwed when they are to be made use of. The 2 different Mag-

nifying-Glasses are all set in Ivory, 8 of which are set in the manner express'd at M. The greatest Magnifier is marked upon the Ivory wherein it is set with N^o 1, the next N^o 2, and so on till N^o 8. The 9th Glass is not marked, but set in the Manner of a little Barrel Box of Ivory, as in Fig. II.

e e A flat Piece of Ivory, whereof there are 8 belonging to this Sett of Microscopes, (tho' any one who has a Mind to keep a Register of Objects may have as many of them as he pleases) in each of which there are three Holes f f f, wherein three or more Objects are placed between two thin Glasses, or Talks, when to be used with the greater Magnifiers.

The other Instrument Fig. III. is made of Brass or Prince's Metal, with Joints P P P, to turn easily any Way with a small Pair of Tongs G G, which open at the Points K, by pressing together the two Heads of the Pins I I for taking up of Objects: At the other End of these Tongs G G, is screwed on a round Piece of black Wood H, with a Piece of Ivory let into it, for placing Opaque Objects on, according to their Difference of Colour,

Upon the End L there is a Screw, into which the Glass set in the Barrel Box may be screwed; when the others are to be used, there is a Ring R of Brass to be screwed on the End L, into which Ring all the other Glasses M, may be screwed: So when any Object is taken up in the Points of the Tongs K, or laid upon the other End H, it may very easily (as one who sees the Instrument will perceive) be applied to the true Distance of any of the Glasses M, by the Help of the Joints P P P, and by means of the Screw C, with the Wheel D, Fig. III. which will bring the Object to the Exactness of the Centre or true Distance, being regulated by a Spring N.

The Use of the first mention'd Instrument, Fig. I. A A A A is thus: Take one of your flat Pieces of Ivory e e, or *Sliders*, (if you please to call them so) and slide it in betwixt the two thin Plates of Brass E E, in the Body of the Microscope; so that the Object you intend to look upon be just in the middle, remarking that you put that Side of the Plate e e, where the Ring is, farthest from your Eye: Then you are to screw into o o, (the hollow Screw in the End of the Body of your Microscope) the 3d, 4th, 5th, 6th, or 7th Magnifying-Glass M; which being done, while you are looking through your Magnifying-Glass upon the Object, you are to screw in or out, the long Screw D, Fig. I. in the other End of the Body of your Microscope, till you bring your Object into the true Distance, which you will know by seeing the Object clearly and distinctly: But seeing that in the greater Magnifiers you can see but a small Part of the Object. *viz.* the Legs or Claws of a Flea; while you are looking upon any Part of the Object, if ye take hold of the End of the Plate or Slider, e e, whereon the Object lies, and move it gently, you may see the whole Object successively, or any Part of the Object you please; and if that Part of the Object you design to look upon be out of the true Distance, remember your End Screw D, Fig. I. can always bring it in, by screwing it nearer or farther off.

After

This Plate must be placed at C the Word Microscope.

Fig. I.

Fig. II.

The Tail of a Small living Fish while the Blood is Circulating in it by 6th Glass.

The Conjunction of the Extremities of the Blood Vessels in the Lungs of a Frog.

W. M. Wilson's Microscope described in the Philosophical Magazine, Vol. 10, p. 100.

After this manner may be seen all transparent Objects, Dust, Liquids, Chrystals of Salt, small Insects, such as Fleas, Mites, &c. If they be *Insects* that will creep away, or such Objects as one intend to keep, they may be placed between the two *Register-Glasses* f f. For by taking out (with the Point of a Penknife or small Pliers) the Ring that keeps in the *Glass* f f, where the Object lies they will fall out of themselves; so you may lay the Object between the two hollow sides of them, and put the Ring in as it was before: But if the Object be Dust or Liquids, a small Drop of the Liquid, or a little of the Dust laid on the outside of the *Glass* f f, and applied as before, will be seen very easily.

As to the First, Second, and Third *Magnifying-Glasses*, being marked with a $\boxplus$ upon the Ivory wherein they are set, they are only to be used with those *Plates* or *Sliders* that are also marked with a $\boxplus$, wherein the Objects are placed between two thin Talks, because the Thickness of the *Glasses* in the other *Plates* or *Sliders*, hinder the Object from approaching to the Centre or true Distance of these greater Magnifiers. But the manner of using them is the same with the former. Only remember to be careful when you put in or pull out the *Plate* or *Slider* e e, whereon the Object lies, or move it from one Object to another, not to let it rub your *Magnifying-Glass*, which is done by unscrewing a little the End Screw D, Fig. I. when ye put in or pull out your *Plate*, or move it from one Object to another.

For seeing the *CIRCULATION* of the *BLOOD* at the Extremities of the *Arteries* and *Veins*, in the transparent Parts of *Fishes*, *Eels*, &c. There are two *Glass Tubes*, the one bigger, and the other lesser, is express'd at g g, wherein the *Fish* is to be put; when these *Tubes* are to be used, you are to unscrew the End Screw D, Fig. I. in the Body of the *Microscope*, until the *Tube* g g, can be receiv'd easily into that little Cavity G of the *Brass-Plate*, fastened to the Leather F, under the other two thin Plates of Brass E E: When the Tail of your *Fish* lies flat to the *Glass Tube*, set it opposite to your *Magnifying-Glass*, and by screwing in or out your End Screw D, Fig. I. as is said before, you may easily bring it to the true Distance, and see the Blood circulate with great Pleasure.

If you would see the *Blood circulate* in a *Frog's Foot*, chuse such a *Frog* as will just go into your *Tube*, then with a little Stick, &c. expand the *Hinder Foot* of the *Frog*, and apply it close to the Side of the *Tube*, observing that no Part of the *Frog* hinders the Light coming on its *Foot*, and when you have it at the just Distance, by Means of the Screw D, Fig. I. as above said, you will see the rapid Motion of the *Blood* in its *Vessels*, which are very numerous in the transparent thin Membrane that's between the *Frog's Toes*: For this Object the 4th and 5th *Magnifiers* will do very well; but you may see the Circulation in the Tails of *Water-Newts* with the 6th and 7th *Glass*, by reason the Globules of the Blood of those *Newts* are as big again as the Globules of the Blood of *Frogs* or small *Fish*, as has been taken Notice of in N. 280 of the *Philosophical Transactions*, Page 1184.

N. B. The *Circulation* cannot be so well seen by the First, Second, and Third Magnifiers, because the Thickness of the *Glass* wherein the *Fish* lies, hinders the Approximation of the Object from the true Focus of the *Glass*.

S, Fig. I. is a little Ivory Screw, upon which the Handles of the *Brass Instrument* W, Fig. III. may be screwed, and serve for a Handle to this Ivory one also.

The *Glass*, plac'd in the Manner of a Barrel Box, Fig. II. is only to be used when the *Brass Instrument* (or in your Hand) being the least Magnifier, for greater Objects, such as Flies and common Insects, &c. A Hole being made in the Side of this Box, Fig. II. whereby it may be screwed on the Point L, Fig. III. of the *Brass Instrument*, remembring to put the End b next to your Eye, and the other to the Object; so if you take up an Insect in the Point of the Tongs K, or lay any opaque Object on H the other End, you may approach them to the true Distance by means of the Joints and Screws spoken of before C, D, P, N, Fig. *Ibid.*

In the viewing of *Objects*, one ought to be careful not to hinder the Light from falling upon them, by the Hat, Peruke, or any other Thing, especially when they are to look upon opaque Objects: For nothing can be seen with the best of *Glasses*, unless the Object be in a due Distance, with a sufficient Light.

The best Lights for the *Plates* or *Sliders*, where the Object lies between the two *Glasses*, is a clear Sky-light, or where the Sun shines on any white thing, or the Reflection of the Light from a Looking-glass. The Light of a Candle is likewise good for the viewing of very small Objects, though it be a little uneasy to those who are not practis'd in *Microscopes* to find out the Light of the Candle.

By what is here said, it's hop'd that the Use of this *Microscope*, easy of its self, will be much easier to those that use it; yet it cannot be doubted of this, as of all other Instruments of this Nature, but that *Usus plura docebit*.

For the Conveniency of those who would Draw, or make any Sketches or Designs after *Microscopical* Objects, they may also have a Pedestal to fix the two Instruments above described, and make them stationary to any convenient Light. This Pedestal may be plac'd on a Table, &c. and after the Object and Light are fixed, as many Persons as please may view the Object, without any Trouble or Difficulty in finding the Light.

The rest of the annexed Figures were drawn by this *Microscope* from several Objects.

A the Artery, B, the Vein, C their communicant Canal, by which the Blood is seen passing from the former to the latter, in the Tail of the *Fish*, express'd at g g.

D the *Animalcula* in *Semine masculino*, by the first *Glass*,

E one of the *Farina* of the Flower of *Mallows*, which magnified is the *Area* represented at D.

F the Branch of an Artery, G that of a Vein. The intermediate Spaces shew the Manner they communicate unto one another, in the Sides of the Lungs of *Frogs*, *Newts*, &c.

H one of the Feathers of a *Moth's* Wing.

MIDDLE Latitude, in Navigation, is half the Summ of any two given Latitudes; as suppose the two Latitudes were $50^{\circ} 30'$ and $45^{\circ} 20'$ the middle Latitude will be $47^{\circ} 55'$.

There is a Method of working the several Cases of Sailing by *Middle Latitude*, which nearly agrees with *Mercator's* or *Wright's* way; and it is performed without the Table of Meridional Parts, either by the Tables of *Logarithms* or by *Gunter's* Scales. Of this Method you have a short *Synopsis* in *Mr. Jones's Navigation*, p. 71.

MID-SHIP-MEN, are Officers aboard a Ship, whose Station when they are on Duty, is some on the Quarter-Deck, others on the Poop, &c. Their Business is to mind the *Braces*, to look out, and to give about the Word of Command from the Captain and other superior Officers. They do also assist on all Occasions both in sailing the Ship, and in storing and rummaging the Hold. They are usually Gentlemen, who having served their Time as *Voluntiers*, are now upon their Preferment.

MILIARES Glandulae, are those very small and infinitely numerous Glands which secrete the Sweat and the Matter that exudes in insensible Perspiration. See *Skin*.

MILLAINS, according to *Mr. Wingate*, are the third Subdivision of the Primes in *Gunter's* Line, and express the 1000th Parts of such Primes.

MINIUM or *Read Lead*. *Mr. Ray* at the End of his Collect. of *Engl. Words*, gives this Account of the making of *Minium*. First they take Lead and waste it in an Oven or Furnace; by bringing it to a Substance almost like *Litharge*, and by stirring about with an Iron Rake or Hoe. Then they take it out and grind it with two Pair of Stones, which deliver it from one to another; and there is a Mill which moves at once six Pair of these Stones. When 'tis thus reduced to a Powder, they wash it, and then put it into an Oven or Reverberatory Furnace, where by continual stirring with a Rake or Hoe of Iron, it comes to its Colour in 2 or 3 Days. But the Fire must not be violent, for then it will clod and change Colour. The Iron Rake is hung or poised by a Hook, else it would be too heavy to be moved by one Man.

MINT, is the Place where the King or Queen's Coin is formed, be it of Gold or Silver: The chief Mint of *England* is in the Tower of *London*; of which the present Officers are (1.) The *Warden*, who is the chief, and is to receive the Bullion, and oversee all the other Officers. (2.) The *Master Worker*, who receives the Bullion from the *Warden*, causes it to be melted and delivered to the *Moniers*, and takes it from them again when coined. (3.) *Comptroller*, who is to see that the Money be made to the just Assize, and to oversee and controll the Officers, if the Money be not as it ought to be. (4.) The *Assay Master*, who weighs the Silver and Gold, and sees whether it be Standard. (5.) The *Auditor*, who takes all the Ac-

counts. (6.) The *Surveyor of the Melting*, who is to see the Silver cast out, and that it be not alter'd after it's deliver'd to the *Melter*; which is after the *Assay-Master* hath made Trial of it. (7.) The *Clerk of the Irons*, who is to see that the Iron be clean and fit to work with. (8.) The *Graver*, who graveth the Dies and Stamps for the Coinage of the Money. (9.) The *Melters*, who melt the Bullion before it comes to coining. (10.) The *Blanchers*, who anneal, boil, and cleanse the Money. (11.) The *Porters*, who keep the Gate of the Mint. (12.) The *Provost of the Mint*, who provides for all the *Moniers*, and oversees them. And lastly, The *Moniers*, some of which shear the Money, some forge it, and some stamp or coin it, and some round it and mill it.

MITRE, in Architecture, is the Workmens Term for an Angle that is just 45 Degrees, or half a right one; and if it be a Quarter of a Right Angle, they call it a *Half Mitre*: And they have an Instrument made to this Angle which they call the *Mitre Square*, with which they strike *Mitre Lines* on their Quarters or Battens; and for Dispatch they have a *Mitre Box*, as they call it, which is made of two Pieces of Wood, each about an Inch thick, and one is nailed upright upon the Edge of the other; the upper Piece hath the *Mitre Lines* struck upon it on both Sides, and a Kerf to direct the Saw in cutting the *Mitre Joints* readily, by only applying the Piece into this Box.

MITRED Abbots, were formerly Governours of such Religious Houses, as had obtained from *Rome* the Privilege of wearing the Mitre, Ring, Crozier, and Gloves of a Bishop. It hath been a vulgar Error, that these *Mitred Abbots* were all the same with those *Conventual Prelates* who were summoned to Parliament as *Spiritual Lords*; but some of those summoned to Parliament were not *mitred*; and some that were *mitred* were not summoned; the Summons to Parliament not any way depending on their *Mitres*, but on their receiving their Temporals from the King. *Cowel's Interpreter*.

MITTA, was anciently a *Saxon* Measure containing 16 Bushels.

MIXT Tythes. See *Tythes*.

MOAT; the Brink of the Moat next the Rampart in any Fortification, is called the *Scarp*, and the opposite one the *Counterscarp*.

MODEL, is an original Pattern which any Workman proposes to imitate; 'tis variously made of Wood, Stone, Plaster, &c. and should be (in Architecture, for Instance) made by a Scale, where an Inch or half an Inch represents a Foot, for the more exact compleating of the Design.

MOLMUTAN or *Molmutin Laws*, were the Laws of *Dunwallo Molmutius*, sixteenth King of the *Britains*; they were famous here till the Time of *William the Conqueror*. *Molmutius* was the first that published Laws in *Britain*; and these Laws, with those of *Queen Mercia*, are published in Latin by *Gildas*, out of the *British Tongue*.

MONIERS. See *Mint*.

MONOCHORD. See the accurate Division of the *Monochord*, in *Phil. Trans.* N. 238. by *Dr. Wallis*.

MONOPOLIZERS, are such Persons as combine together to engross, and to raise the Price of Goods.

MONSOONS, are shifting Trade Winds in the *E. Indian Ocean*, which blows periodically, some for

for half a Year one way, others but for 3 Months, and then shift and blow for 6 or 3 Months directly contrary.

MOON. The Reason why the ☾ always shews the same Face towards us, is because she revolves round her Axis in the Time of her Periodical Month.

For if in moving in her Orbit round the Earth she did not do so, but that the Horizon of the Disk *ab* kept always parallel to it self in all Positions, 'tis plain, that as the Moon moves on in her Orbit, new Parts of the former dark Hemisphere will begin to be enligned (or rendred visible to us;) as appears plain from the Figure annexed. For suppose the Moon to have moved in her Orbit from 1 to 2, and that her Diameter *ab* keeps parallel to its self in its first Situation; then her visible Hemisphere will be, not as before *adb*, but *egf*: and when she comes into Position 3, her visible Hemisphere will be *cad*, instead of *adb*, as at first: And lastly, when the Moon is at 4, her visible Hemisphere will be *acb*, which in the first Position was totally invisible. And this can't be otherwise, if the Moon in her Revolution round the Earth, don't also revolve round her own Axis in the same exact Space of Time: But if you suppose her so to turn round her Axis, that the Diameter *ab* shall always be in a Normal Position to the Line *EC*; as in the 2d and 3d Positions *ef* and *cd* are; 'tis plain the Moon must by such a Motion round her Axis, always shew the same Face to you, as in Fact (abstracting from her Vibrations, &c.) she really doth.

The annual Regression of the Moon's Nodes is 25 Degrees, and the Nutation of her Orbit about 20 Minutes.

The Phænomena of the Moon, on which, as Foundations, the Lunar Astronomy is built, are such are these

1. That the Moon moves daily from *West* to *East*, and almost in the same Line with the Earth, or nearly in the Ecliptick.

For all the Secondary Planets describe lesser Orbits round their Primary, as *they* do round the Sun; and the Plains of their Orbits are not very different from that of the Ecliptick, and these Secondary Planets do also move the same Way as the Primary ones.

2. But yet the Moon doth not move accurately in the same Plane of the Ecliptick, deviating sometimes a little to the *North*, and sometimes to the *South*; as is apparent from her Meridian Altitudes. The Plane of her Orbit being inclined to that of the Ecliptick, and intersecting it in two Points, which are called the Moon's Nodes.

3. The Phases of the Moon are continually changing; sometimes she cannot be seen at all, then she appears horned, bisected, gibbous, and at last round or full: And so on again in an inverse Order.

For being a spherical opaque Body, and receiving all her Light from the Sun; tho' he will always illuminate one Hemisphere of her, yet in the New-moon, when that Hemisphere is entirely turned from you, and her Body between the Sun and their Eye, 'tis impossible for her to appear visible: But as soon as by her Motion forward in her Orbit, Part of that Hemisphere comes to be obverted to the Earth, she will begin to appear *falcated* or with Horns of Light, and when she is got to be 90 degr. from the Sun, she will shew just one half of her illuminated Hemisphere, &c.

4. The Eclipse of the Sun happens only at the New-moon, tho' not at every one; and that of the Moon only when she is at the Full, tho' not at every Full-moon; as is plain from the Reason and Nature of Eclipses.

5. That obscure Part of the Moon's Body which the Sun's Rays do not illuminate, when she is Horned or Gibbous, or even in a Solar Eclipse, is not totally invisible, but appears with a reddish dirty coloured Light; and that Light seems to come to the Moon by Reflection from the Earth.

For when the Moon is at New to us, the Earth is at Full to the Lunar Inhabitants; and the Light of the Earth being about 15 times greater than that of the Moon, and the Moon so little as not to obscure above a 20th Part of the Earth, the Light from the Earth may easily be supposed to render her a little visible in even solar Eclipses.

6. The Eclipses of the Sun and Moon don't happen always in the same Places in the Zodiack, but in others moving still gradually backward, or in *Antecedentia*.

The Reason of which is, that the Moon's Orbit is different from that of the Ecliptick, intersecting it but in one Line, whose extreme Points are called the Nodes, and which Nodes do annually move backward or in *Antecedentia*: But the Eclipses cannot happen but when the two Luminaries are in or near these Nodes; wherefore, &c.

7. There is a very sensible Difference in the apparent Length of the Moon's Diameter, at different Times.

For the Moon's Orbit being Elliptical, her Distance from the Earth will be very different, as she is in different Parts of that Ellipsis; and 'tis found that her apparent Diameter is nearly reciprocally proportional to her Distance, which Distance is both *greatest* and *least* in the Syzygies, because the Excentricity of the Ellipsis is there greatest.

8. The

8. The apparent Motion of the Moon is not always equal, but greater and less by Turns, and that very sensibly.

Which Phenomenon arises from several Causes concurring together. The first Cause of which is some Inequality even in the mean Motions of the Moon; for in the Earth's *Perihelia* the Moon is carried something slower than in the *Aphelia*.

The next Cause is the Elliptick Figure of the Lunar Orbit, from whence the Moon must move faster in her *Perigaeum* than in her *Apogaeum*; as is the Case of all the Planets.

A 3d Cause, is the continual changing of the Excentricity of the Moon's Orbit; from whence must arise a greater Difference of her Velocity in her *Perigaeum*, and of her Tardity in her *Apogaeum* in the Syzygies of the *Apses* than in the Quadratures.

To all which we may add, that the Moon's Motion it self is a little retarded from the Syzygies to the Quadratures, and then accelerated a little again from thence to the Syzygies, in every Lunar Month.

9. The monthly Motion of the Moon in the Ecliptick is swiftest (*ceteris paribus*) when she is in the Syzygies, and slowest when she is in her Quadratures to the Sun.

The Reason of which is to be had, not from any System of Astronomy, but from the Physical Principles of the *Newtonian* Philosophy.

10. That Place where the Moon appears least, and where her Motion is slowest, doth not keep always in the same Degree of the Ecliptick, but moves sensibly forward, or *in Consequentia*.

For tho' her *Apogaeum* go forward in the Syzygies, and backward in the Quadratures, yet because the former Motion is near twice as swift as the latter, the Excess in the whole Revolution of the *Apses* must be forward, and consequently the *Apogaeum* will move on *in Consequentia*, as by Observation 'tis found it really doth.

11. The Latitude of the Moon is moveable or changeable, being sometimes greater and sometimes lesser (according to the various Position of her Orbit to the Sun) even in the same Degree of proper Longitude.

This Difference of Latitude arises from the various Inclination of the Plane of the Moon's Orbit to that of the Ecliptick. For, as was said above, there is an Inequality even in that Inclination; when the Line of the Nodes is in the Syzygies, the Angle of the Inclination is greatest, and least when that Line is in the Quadratures, and of a mean Quantity in the intermediate Positions.

12. The Moon's Orbit is more or less circular according to its various Position in Respect of the Sun.

And so it must be, since as was shewn above, the Excentricity of her Orbit is greater when the Line of the *Apses* is in the Syzygies, than when it is in the Quadratures, by almost half the least Excentricity.

13. The Motion of the Moon is very unequal, and dissimilar to its self, whether you consider it in different Parts of the same Month, or in the similar Parts of different Months.

Nor is this strange, if you consider the various and dissimilar Mutations above-mentioned.

14. The Light of the Moon reflected to us is so weak, that even in the Full-moon, it will by no Burning-Glass be brought to afford the least Degree of Heat.

The Rays of Light have their Force decreased, (at least) as the Square of their Distance; and consequently the Force of the Sun's Rays reflected to us from the Moon, to those that come to us directly, is decreased, at least in the Proportion of the Square of the Moon's Distance from the Earth, to the Square of the Moon's Semi-diameter; and by Calculation it will be found, that the Light of the Moon brought hither, will be in Force but the fifty thousandth Part of that which comes hither directly from the Sun.

15. The same Face of the Moon nearly, is always turned towards the Earth.

The Reason of which is, that she turns round her own Axis, in the Time of her menstrual Motion round the Earth, as I have demonstrated above.

16. And yet there are some Librations of this Face, so that some more Eastern and Western Parts of it, and sometimes some more Northern and Southern do alternately appear.

The Reason and Cause of which libratory Motion, Sir *Is. Newton*, I think, first discovered or communicated.

Dr. *Hook*, *Op. Post.* p. 80, 81. accounting for the Reason why the Moon's Light affords no visible Heat, saith, that the Quantity of Light which falls on the Hemisphere of the Full-moon, is rarified into a Sphere about 288 times greater in Diameter than the ☾ before it arrive to us; and consequently, that the Moon's Light is 104368 weaker than the Light of the Sun: Wherefore it would require 104368 Full-moons to give a Light equal to that of the Sun at Noon.

1. To find the Moon's Age.

To the Day of the Month (at any Time) add the *Epact* (see that Word) for that Year, and the Months from *March* (including both Months) together, the Sum, if under 30, is the Moon's Age; if above 30, subtract thirty out of it, the Remainder is the Age of the Moon.

N. B. If the Month have but 30 Days, you must subtract but 29 instead of 30.

Example, May 26, 1708.

Epact	18
Days in May	26
Months from March	3
	—
	47
Deduct	30
	—

The Moon's Age 17 Days.

If the Time proposed had been between *Jan. 1.* and *March* the first, you must have used the *Epact* for the Year before.

2. To find the Moon's being upon the Meridian or Southing.

Multiply her Age by 4, and divide the Product by 5, the Quotient will give the *Hours*, and the Remainder multiplied by 12 will give the *Minutes*, when the Moon is less than 15 Days old; but when more than that, you must subduct 15, and work with the Remainder, as before.

Example. May 26. 1708.

Moon's Age 17 Days.
Deduct 15

2
Multiply by 4

Divide by 5) 8 (1 hour, 36 m.

3
Multiply by 12

36 Minutes.

3. To find the Time of the Moon's Shining.

Multiply her Age by 48, and divide the Product by 60; the Quotient shall be the *Hours*, and the Remainder the *Minutes*: That is, if the Moon be under 15 Days old; but if above, subtract the Time of her Shining, found as above, from 24 Hours, the Remainder will be the Time of her Shining in the Morning.

Example. May 26. 1708.

Moon's Age 17 Days
48

136
68

60) 816 (13 h. 36 m.

From 24 Hours

Subtract 13 h. 36 m.

Remains the }
Time of her } 10 h. 24 m.
Shining. }

36

4. To find how many Signs and Degrees the Moon is departed from the Sun since her last Conjunction with him, or since the last New-moon.

Double the Moon's Age, and divide the Product by 5, the Quotient is the Signs, and the Remainder (multiplied by 6) are the Degrees.

Example. May 26. 1708.

The Moon's Age 17 Days.

2

5) 34 (6 Signs.

30

Remains 4

Multiply by 6

Therefore the Moon is gone from 24 Degrees. the Sun 6 Signs, and 24 Degrees.

Vol. II.

MOON's Parallax. There are two Ways of finding the Moon's Parallax.

1. From the Astronomical Tables, the Moon's Place must be accurately had for the Moment of the Observation; and then you must find by Calculation and by the Tables of Refractions, how many Degrees and Minutes the Centre of the ☾ is elevated above the Rational Horizon. At the same Time also exactly, by a large Astronomical Quadrant, Sextant, &c. adjusted with Telescopical Sights, &c. the Elevation of the Moon's Centre above the Horizon of the Observer must be taken in Degrees and Minutes. The Difference between those two Altitudes will be the Parallax of the Moon at the Moment of the Observation, and for that particular Place of the Moon; which being found, the *Horizontal Parallax* may be had by this Analogy; As the Cosine of the Moon's Altitude to Radius :: so is the Quantity of the present Parallax, to the Moon's Horizontal Parallax.

2. Without Astronomical Calculation, the Moon's Parallax may be thus found: Let her Diameter be accurately taken by a good Telescope and Micrometer, when she is on or near the *Meridian*, and when near the *Horizon*, the same Night; the meridian apparent Diameter will be the greatest; the Difference of these two apparent Diameters, being given, in the same Night, you may determine the entire Difference between the Horizontal and Vertical Diameter by the former Analogy. And from this Difference, which is proportional to the Earth's Semi-diameter, both the Moon's Distance and her Parallax may be found by an easie Calculation. And by the best Observation, the Moon's mean Horizontal Parallax hath been found to be about 57 Minutes, and consequently her mean Distance from the Earth about 60 Semi-diameters of the Earth; or about 24000 Miles *English*.

MOORS: The Lords Bayliffs in the Isle of Man are called by this Name; their Office is to summon the Courts for the several *Sheadings*.

MORAL Philosophy, or moral Discipline, is what is usually called *Ethicks* in the Schools, being a practical Science which explains the Nature and Reason of, and withal teaches and instructs us how to acquire that Felicity or Happiness which is agreeable to Humane Nature.

MORAL Actions or Acts, are such as render the Rational and Free Agent good or evil, and consequently rewardable and punishable, because he doth them.

MORESK-Work or *Morisko-Work*, is a kind of Antick-work in Painting or Sculpture, after the Manner of the *Moors*, consisting of several *Grotesco's*.

MORSUS *Diaboli*, is the Term which some Anatomists give to the outer Ends (*i. e.* those next the *Ovaria*) of the *Tubæ Fallopiana*; because their Edges there appear jagged and torn.

MORTARS of Mr. *Cochorn*, are made of Hammer'd Iron of about 4 Inches Diameter at the Bore, ten Inches and a half long, and nine Inches in the Chase. They are fixed at an Elevation of 45° on a Block of Oak of about 20 Inches long, and 10 1/2 broad, and about 4 thick. These like Hand-Mortars, throw Hand-Grenadoes. They are used chiefly in the bottom of the Trenches, where they are placed about a Yard Distance one from another, having each a Soldier to attend it; and there is an Officer to every 40 or 50 of them.

M m m

They

They fire sometimes 60 or 70 of these together, which throw their Shells into the Covertway, &c, and make a very terrible Slaughter.

MORTISE or *Mortaise*, is the Workmens Word in Architecture for the Hole made in one Piece of Timber to receive the Tenon of another Piece.

MORTMAIN Statute : There was a Statute made in 7 Ed. 1. *de Terris in manum mortuam non ponendis*; to restrain the Donation of any Lands or Tenements to Religious or pious Uses, where they lay in a *Dead Hand*, without Succession or due Service to the Lord and the King. After which Statute the Lands so given away were forfeited to the King, if the immediate Lord of the Fee made not his Claim within a Year after such Alienation.

When the King by special Licence dispensed with the *Statute of Mortmain*, there was a previous Inquisition *ad quod Dampnum*, and a Return upon Oath that it would be no Prejudice to the Dignity and Revenues of the Crown. This Law is now relaxed by Stat. 39 Eliz. c. 5. of giving Lands to Hospitals; and by 14 of Car. II. c. 9. about purchasing Lands and Tenements for the Poor within London and Westminster.

MOSAIC Work, is corruptly so called; it should be *Musaick*; in Latin *musivum Opus*, and sometimes 'tis called also *Pavimenta Tessellata*.

MOTION : From the first of Sir Is. Newton's three Laws of Motion or Nature mentioned under this Word *Motion* in Vol. I. by way of Corollary may be inferred, (1.) That no Particle of Matter, or any Combination of such (that is, no Body whatever) can either move of it self, or alter the Direction of its Motion, because 'tis entirely passive and indifferent as to Motion or Rest; so that neither Motion or Rest are essential to Matter. (2.) 'Tis plain also from hence, that naturally of it self, no Body can ever move in a Curve Line; for since all Motion is originally and naturally rectilinear, 'tis impossible that any Body can move in a Curve or Line that is not strait of it self; because then it must of it self continually alter the Direction of its Motion, which cannot be, by the former Corollary; wherefore the Motion of the Heavenly Bodies in Circles or Ellipses cannot be accounted for by the natural Laws of Motion; but it is owing to the Will of the great Creator that they are kept in their Orbits by an attractive Force.

From the second of the three Laws of Motion, it follows, that all Effects will always be proportional to their *Adequate Causes*; and thus if any Degree of any Force will produce any Degree of Motion, a double Degree of the same Force will produce a double Degree of Motion, a Triple, a Triple, and so on in any Ratio whatsoever. And this Motion must proceed on in the same Direction with that of the moving Force, because 'tis from *That* only that the Motion arises; and Bodies once in Motion, cannot change their Direction of themselves.

And if a Body be already in Motion, the Motion arising from a Force impress'd, if it be in the same Direction with that of the former Motion, it will increase it in Proportion to its Power; but if it be impress'd in a contrary Direction, it destroys the former Motion either totally or in part, that is, equal to the Force of the Impression. And when it hath a Direction any way oblique to that of

the former Motion, it is either added to, or subtracted from it, according as a Motion arising from a Composition of those two, is determined.

MOUNT-EGG; after Tin from the burnt Ore is melted down and remelted, there will sometimes remain a different Slugg in the Bottom of the Float, this they call *Mount-Egg*; and tho' of a Tin Colour, yet is of an Iron Nature, as hath been found by applying a Magnet to it.

MUD-SUCKERS, *Limifugæ*, are a Sort of Water-Fowl which suck out of the Mud of Channels, &c. some oily Juice or Slime with which they are nourished; hence they are always delicate Flesh, and their very Guts uncleaned from the Excrements are usually eaten, as those of *Wood-cocks*, &c. These *Mudsuckers* have therefore very long Bills, and broad near the Tip.

MULIER, a Term used in our Common Law; some think to be a Corruption either from the Latin *Melior*, or the French *Meilleur*, and signifies the *Lawful Issue* preferred before an elder Brother born out of Matrimony. Others will have it to be derived, *quasi ex muliere natus & non ex concubina*; and so they use the Word *Filius mulieratus*, in Opposition to a Bastard; and in this Sense the Scotch also use the Word, and therefore this last Etymology is most probable.

MULTA or *Multura Episcopi*, was formerly a Fine or Mulct paid to the King, that a Bishop might have Power to make his last Will and Testament; as also to have the Probate of other Mens, and the granting Administrations.

MULTIPLICATION : It often happens that 'tis needless to express at large all the Figures of the Product, especially where the *Factors* have each many Places of Decimal Parts; and therefore the following Compendium is as useful as 'tis curious.

Suppose 3.141592 were to be multiplied by 52.7438; and that a Product which should have 4 Places of Decimals, would be enough for the present Purpose. First write down the *Multiplacand*, and set the *Place of Unites* in the *Multiplier* under that Figure of the *Multiplacand*, whose Place you intend to keep in the Product. Thus let 3.141592 be the *Multiplacand*, and you would have but 4 Places of Decimals in the Product; place therefore 2, the Place of Units in the *Multiplier*, under 5 the 4th Place of Decimals in the *Multiplacand*. Thus,

3.141592	
8347.25	
After this place all	157 0796
the other Figures of	62832
the Multiplier in a	2 1991
contrary Order; viz.	1257
the 5 Tens in 52 to	94
the Right-hand in the	25
Place of Unites, and	
all the Decimal Parts	
to the Left-hand, as	165.6995

The Product with 4 places of Decimals only.

you see in the Example. Then in multiplying begin always at the Figure in the *Multiplacand* that stands over the Figure you multiply by; setting down the first Figure of each particular Product, directly underneath one another, only you must have Regard to the Increase which would have arisen out of the multiplication of the two next Figures, which stand to the Right Hand of that Figure in the *Multiplacand*, which you begin with.

Thus

Thus, say 5 times 9 is 45, and one which would arise from 5 multiplying 2, makes 46; therefore write down 6 and go on as in common Multiplication.

Then with the next Figure 2, say twice 5 is 10; which with the Increase that would arise from 2 multiplying 9; will be nearly two Tens to be put down instead of the Cypher. Then say, twice 1 is 2, and one to be added from the twice 5 is 3; therefore write down 3, and go on as usually.

Next go on with 7, and say, 7 times 1 is 7, but from the Consideration of 7 being multiplied into the two Figures 5 and 9, which stand to the Right Hand of the 1, there will be 4 to be added; so 7 and 4 make 11, write down 1 and carry 1, &c.

Another Example will make all plain.

Let 257.356 be to be multiplied by 76.48, and the Product to be entirely consisting of Integers without Decimal Parts.

First write down	257.356	
the Multiplicand, and	84.67	
then set 6, the Place of		
Units, in the Multi-	180 15	
plier under 7 the Place	15 44	
of Units in the Mul-	1 03	
tiplicand (because you	20	
are to have no Deci-		
mal Parts) and write	19682	The Product
down the other Fi-		clear of Frac-
gures in a contrary		tions.
Order, as above di-		
rected; proceeding also with each single Figure,		
as is there taught.		

MULTONES *Auri*, were formerly Pieces of Gold Coin imprest with the Figure of a Sheep or Lamb (perhaps the *Agnus Dei*) from whence they had this Name, *Multo* being then used for a Sheep, as *Mutto* and *Muto* was also, whence our Word *Mutton*. This Coin was more common in France; but that it was sometimes used also in England, appears by a Patent of 33 Ed. 1.

MUNDICK, is a Marchasite found in the *Tin-mines*, of a Colour white, yellow, or green. They sometimes call it *maxy*; it seems to be a Kind of *Sulphur*, because Fire only separates it from the *Tin*, and it evaporates into Smoke. The *mundick* Ore is easily known by its brown sad-coloured glittering, and by its soon colouring your Fingers. Some say this nourishes the *Tin*, and yet they say also, where much *Mundick* is found there is little or no *Tin*; and 'tis certain, that if there be any *Mundick* left in melting the *Tin*, it makes it thick and *cruddy*, as they speak; that is, it is not so ductile as otherwise it would be.

MUNIONS, in Architecture, are the short upright Posts or Bars that divide the several Lights in a Window Frame.

MUSCLE; a Muscle is only a Bundle of *Fibres*, which being closely compacted at each End, make the two Tendons, each of which is inserted into some fixt Parts of the Body. Every one of these *Fibres* consists of a prodigious Number of lesser *Fibrille*, which are so many very slender *elastick Canals* bound about by small transverse parallel Threads, which divide these hollow *Fibrille* into so many *elastick Cysts* or *Vesiculae*, which are orbicular, being formed of two concave Segments of a Sphere. Into every one of these *Vesiculae*, an Artery, Vein, or Nerve enter; the first to bring

and carry back the Blood; the last to carry thither the *Liquidum Nervorum* or Nervous Juice, which mingling in the *Vesiculae*, with the Blood, doth very probably (it having an acid Taste, and therefore consisting of Particles which are pointed and so qualified to prick and break the Globules of the Blood) let out the imprisoned *elastick Air* which before was contained in the Globules, into those little *Vesiculae*, whereby the *elastick Cells* of the *Fibres* will be blown up, and thereby their *Longitudinal Diameters*, from Cell to Cell straitened; and this must contract the Length of the whole Fibre, and so move that Organ, to which one of the Tendons is fixt. This, saith Dr. *Cheyne, Phil. Prin. Natural Religion*, p. 221, is undoubtedly the true manner of *muscular Motion*.

He thinks also, that the broken Shells of these Globules are carried back by the Veins to the Lungs to be new formed; which is the Reason that muscular Motion is so constantly and uniformly performed, as long as the Blood Globules and Animal Spirits are in sufficient Plenty.

MUSCULUS *Tubæ novæ Valsalvæ vel Palato-Salpingæus*, a Muscle arising broad and tendinous from the Edge of all the lunated Part of the *Os Palati*, several of its *Fibres* being spread upon the Membrane that covers the *Foramen Narium*, then growing into a small thin Tendon, it is reflected about the Hook-like Process of the inner *Ala* of the *Processus Pterygoideus internus*, and is inserted carnosus into all the membranous, fleshy, and cartilaginous Parts of the Tube. Its Use is to dilate and keep open this Channel. *Myogr. comparatæ Specim.* p. 47.

MUSCULUS *Auriculæ Anterior*, is a new (5th) Muscle of the *Auricle*, and added to the four before discovered by *Casseri*, by the Discoverer of it *Valsalva* in his Treatise of the Ear.

It arises from the investing Membrane of the Temporal Muscle, above that Part of the *Zygoma* which proceeds from the *Os Temporis*; thence running strait down, it parts into two; one of which is inserted to the Fore Part of the upper Cavity of the *Concha*; and the other a little higher, into the Fore Part of the Cavity of the *Scapha*. He describes there also two new Muscles more, which from their Situation he gives these Names to.

MUSCULUS *Tragi*, and **MUSCULUS** *Anti-Tragi*, but in lean emaciated Bodies he owns these are not to be seen.

MUSICK. What follows is a brief Account of the *Elements of Musick*, communicated by the ingenious Mr. *John Perks*.

The Thing considered in Musick is *Harmonical Sound*, or Sound so manageable, as to please the Ear and Fancy of the Hearers.

The Sense of Sound is caused in us by the trembling motion of the Air, excited by the Percussion of some solid Body, as a Bell, String, Pipe, &c.

This Trembling of the Air is quick or slow, according to the Impression given by the Voice or Instrument. The quicker the Trembling is, the more acute and sharp is the Sound; and the slower, the more grave and flat,

The same Degree of Quickness of the Trembling or Pulses of the Air being continued, the same Sound or Note is continued also. Hence a sounding String keeping the same Note to the last, shews, that its Vibrations are in equal Time from the greatest to the least Ranges of its motion.

The shorter a musical String is, *ceteris paribus*, the quicker are its Vibrations, and the more acute its Note: And, contrariwise, the longer a String is, the more slow are its Vibrations, and the more grave its Note.

Hence the Proportions of the Degrees of *Acuteness* and *Gravity* of Notes are computed from the Divisions of a *Monochord*, or strained musical String.

The Proportion of *Quickness* in the Vibrations of two Strings, and also of the Pulses of the Air excited thereby, is *Reciprocal* or *Counter* to the Lengths of the Strings; so *twice* the Length gives (*ceteris paribus*) *half* the Quickness of Pulses (or *half* the Number of Pulses in the same time,) If the Lengths are as 3 to 2, the Velocity of Pulses is as 2 to 3, &c. Hence the Relation or Proportion of musical Notes is determined as follows.

Fig. 1. Let A B represent a musical String (suppose a *Bass Viol*) strained so as to give a clear Sound. Let it be divided into two equal Parts at C. Stop the String at C, and the Part C B (being struck) will sound an *Octave* or *Eighth* to the Note of the whole String A B when unstop'd. C B is in length to A B as 1 to 2; and the *Vibrations* of C B to those of A B (in the same Time) as 2 to 1. Hence the Proportion of an *Octave* or *Diapason* is *Dupla*, Double, 2 to 1.

Fig. 2. Let the String A B be divided into three equal Parts, of which A C is one. If the String be stop'd in C, the Part C B will sound a *Fifth* to the Note of the whole String. C B is to A B (in length) as 2 to 3, and the *Vibrations* of C B are to those of A B as 3 to 2 in Quickness. Hence the Proportion between the two Notes of a *Fifth* (*Diapente*) is *Sesquialtera*, 3 to 2.

Fig. 3. Let A C be a Quarter of the whole String A B. Stop in C, and the Part C B will sound a *Fourth* to the Note of the whole String A B. Hence the Proportion between the Notes of a *Fourth* (*Diateffaron*) is *Sesquitercia*, 4 to 3.

Fig. 4. Let A C be a Fifth Part of the String A B. Stop in C, so will C B sound a *Greater Third* to the Note of the whole String A B. The Proportion therefore of the Notes of a *Greater* or *Sharp Third* is *Sesquiquarta*, 5 to 4.

Fig. 5. Let A C be the sixth Part of A B. Stop in C, so will C B sound a *Lesser* or *Flat Third* to A B, whose Proportion is therefore *Sesquiquinta*, 6 to 5.

If D B (Fig. 4) be $\frac{2}{5}$ of A B, B D will sound a *Greater Sixth* to A B.

If C B (Fig. 6.) be $\frac{1}{8}$ of A B, C D will sound a *Lesser Sixth* to A B.

From what hath been said it follows, that

If	<	5	>	Note be	<	4	>	Note	>	}	An Eighth or Octave.
		6		equal in	<	5		the Con-	>	}	A Fifth.
		5		Time	<	3		cord is	>	}	A Fourth.
		8		to	<	5			>	}	A greater Third.
					<	3			>	}	A lesser Third.
					<	3			>	}	A greater Sixth.
					<	5			>	}	A lesser Sixth.

When two Notes in any of the precedent Proportions one to another, are founded together; their Sounds are agreeable and pleasing to the Ear, and are therefore called *Concords*. Of these the Eighth and Fifth are called *Perfect Concords*; Thirds and Sixths are called *Imperfect Concords*: The Fourth (anciently accounted a *Concord*) is by modern Musicians accounted a *Discord* to the *Bass* in *Confort-Musick*, as wanting a Fifth under to compleat the Harmony.

The above-mentioned are all the Simple *Concords* that the Ear allows of. If the Proportion between any two Notes be *compounded* of the Proportion of an *Octave* with that of any other *Concord*, it retains the *Name* and *Nature* of the added *Concord*. So a *Tenth*, that is, an *Eighth* and *Third*, is accounted but a *Third*; and so of the rest.

All other Proportions between 2 Notes sounding together produce *Discords*, or Sounds harsh and unpleasing to the Ear, the Coincidencies of the Pulses being too remote one from the other.

By this it appears, that *Commensurability* in the Quickness of the Vibrations is necessary to *Concordance*; and the *smaller* the Numbers are that express the Proportion of the Pulses in the same Time, or the *nearer* their Coincidencies, the more *perfect* is the Harmony. And consequently if their Pulses be of *Incommensurable Velocities*, the *Discord* will be in the *highest Degree* harsh and displeasing.

From this Account of *Concords* and *Discords* may a Reason be given of several *Phænomena* of Sounds, as particularly why two Strings of a *Bass Viol* that are *Unisons* or *Octaves* one to the other, if one be struck, the other will tremble so as to be sensibly perceived if a small Bit of Paper be laid on it. For the String that is struck putting the Air into a certain Degree of trembling, which being the same, or next Degree of proportional Quickness to that of the unstruck String, sets it a trembling also. This Experiment, (and others of like Nature) Dr. Holder very well illustrates by the Instance of a *Pendulum*, which if you blow into Motion, and continue to blow uniformly as it begins to go from you, it may be continued in Motion as long as you please; but if you blow irregularly (sometimes as it goes and sometimes as it comes) its Motion will be check'd, and at last cease.

Being once in a Room where was a *Bass Viol*, and striking one of the Strings, a loose Quarry of Glafs in the Window jarr'd every Time that String was struck, which it would not do upon striking any of the other discording Strings. The Reason of which seem to be, that the Times of the Vibrations of the loose Quarry were equal (or in near Concordance) to those of the String.

From the foregoing Proportions may those of all other musical Intervals be computed by *Compounding* or *Dividing*. I'll give a few Instances, and for more refer to Dr. Holder's *Grounds and Principles*

Principles of Harmony, where all Things are more fully treated of.

Let it be required to find what Proportion the extreme Notes will have of *Fourth* and *Fifth* added together. The Proportion of the Notes of a Fifth is express'd by $\frac{3}{2}$, that of a Fourth by $\frac{4}{3}$: Compound these Proportions, so $\frac{3}{2} \times \frac{4}{3} = \frac{12}{6} = \frac{2}{1}$, which is the Proportion of an *Octave*: Whence it appears that a Fourth and Fifth added together make an Eighth. Again, to find the *Difference* between a Fifth and a Fourth; Divide $\frac{3}{2}$ by $\frac{4}{3}$ [$\frac{3}{2} \div \frac{4}{3} = \frac{9}{8}$] it gives $\frac{9}{8}$, which is therefore the Proportion of a greater Tone by which a Fifth and Fourth differ.

To find the Difference between a Greater Sixth and a Fifth; Divide $\frac{3}{2}$ (the Proportion of a Greater Sixth) by $\frac{3}{2}$ (that of a Fifth) it gives $\frac{16}{9}$ [$\frac{3}{2} \div \frac{3}{2} = \frac{16}{9}$] which is the Proportion of a *Lesser Tone*.

To find the Difference of a Fourth and Greater Third, Divide $\frac{4}{3}$ by $\frac{3}{2}$ [$\frac{4}{3} \div \frac{3}{2} = \frac{8}{9}$] it gives $\frac{8}{9}$, which is therefore the Proportion of a *Semi-tone* (or lesser gradual Interval) by which a greater

Third and Fourth differ. In like manner may other Intervals be compared.

In a gradual Series of 8 Notes, there are contained 5 Tones, (or whole Notes) 3 Greater and 2 Lesser, and 2 *Semi-tones* (or half Notes) whose Order among themselves is different according to the Key.

The *Key* is the Principal or Fundamental Note of a Tune, to which the rest have proper Relations, and with which the Bass always concludes.

The *Key* is called *Flat* or *Sharp*, not as to the Key-Note it self, but with Respect to the *Third*, *Sixth*, and *Seventh* above it. A *Flat Key* is that which hath above it (and reckoning from the Key) a *Lesser Third*, *Sixth* and *Seventh*; and a *Sharp Key* is that which hath a *Greater Third*, *Sixth* and *Seventh*; the 2d, 4th, and 5th being the same Intervals in both Keys.

The annexed Figures shew how a String is to be divided to express the Notes in a *Flat* or *Sharp Key*.

Fig. 1. A H is the whole String, whose Sound gives the Key-Note; B, C, D, &c. shew the Divisions (or Stops) to express the Notes of a Flat Key.

The Numbers set to each little Part of the Line, shew the Proportions of the next immediate Notes

one to another, and also of the Length of Strings from these Divisions to H: So $\frac{16}{9}$ standing between D and E, shews, that DH is to EH as 10 to 9; and so of the rest.

Upon the Arched Lines is express'd the Relation of the several Notes to the Key, and also of the sounding

founding Part to the whole String. So E H is $\frac{2}{3}$ of a whole String, and sounds a Fifth to the Key. In like manner Fig. 2. shews the Divisions in a Sharp Key.

Suppose A H (Fig. 1.) be a Line 24 Inches long, then will A B be $2\frac{2}{3}$ Inches; A C 4 Inches, A D 6 Inches, A E 8 Inches, A F 9, A G $10\frac{2}{3}$ Inches, A a 12 Inches.

To express the Notes of a Sharp Key, let A H (Fig. 2.) be a Line 24 Inches long. then is A B $2\frac{2}{3}$ Inches, A C $4\frac{1}{3}$ Inches, A D 6 Inches, A E 8 Inches, A F $9\frac{1}{3}$, A G $11\frac{1}{3}$, A a 12 Inches.

If a middle-fiz'd Gut-string be strained over a Line thus divided at about a fifth Part of an Inch Distance from the Line, the Divisions mark'd in the Line will shew where to stop the String so as to express the several Notes.

Above and below the Eighth the Notes ascend and descend in the same order repeated, and therefore all Eights are called by the same Names, and (in the Gamut) signed with the same Letters of the Alphabet.

I cannot here omit two Observations that have been made relating to what has been said: The first by Sir Isaac Newton in his Treatise of Light and Colours, where considering the Colours produced by the Sun's Light passing through a Triangular Glass Prism, and measuring the Space that each of the seven Colours (Red, Orange, Yellow, Green, Blue, Indico, Violet) take up, he found the Divisions of the whole Length of the coloured Image, to be the same with that of a Monochord into the Tones and Semitones of an Octave. See pag. 92. of his Opticks.

The other Observation is concerning the Proportions of the Notes in a full Close upon an Organ or Harpsichord, viz. That they are as the Numbers 1, 2, 3, 4, 5, 6, in order, beginning from the Bass, as is here prick'd down.

All the Notes commonly used in Musick are compriz'd in their Order in a Scale which is call'd

The G A M U T.

Ela	f a	
Dla sol	d e	
C sol fa	c

C fa ut	c	
B mi	b	
Are	a	
Gammut	G	

Sometimes Ledger Lines are added above and below, as Occasion requires.

In the first Column are set the Names by which the Keys, or Notes, are commonly called, as Gamut, Are, &c. In the second Column are set the 7 Letters belonging to the several Lines and Spaces. The third Column contains the Cliffs, and shews how many Degrees, or Notes, they are one above or below the other; which being known, the other Degrees of Distance are easily computed.

Five of these Lines, with their Spaces, are commonly sufficient for the pricking of a Tune; therefore is the whole Scale divided into 3 Systems or Staves, compassed in by arched Lines. Of these the lower 5 belong to the Bass, and are distinguish'd by this Mark B upon the Line of F. The uppermost 5 Lines contains the Treble Part, which hath for its Cliff G or G upon the Line of G. The Tenor, or middle Part, hath for its Cliff this Mark T upon the Line of C, which only is its proper Line, the other 4 being borrowed from the Treble and Bass.

Of Sol-fa-ing, and Tuning Notes when prick'd down.

In learning to sing, it is necessary that the Notes Names, Places, and Difference in Sound from each other be well known, and a Habit got (by Practice) of naming and turning them right at Sight.

The Names in Use are but these 4 Monosyllables, sol, la, mi, fa; which yet must (and has been) own'd incongruous; for seven distinct Notes should certainly have as many Notes to distinguish them by. I shall therefore, after I have given a short Account of the Use of those Names, propose another way of naming the Notes in Singing, which I judge (and have found by Experience) to be better.

In order to Sol-fa a Tune, (that is, to name and tune the Notes right) the Place of mi must be first known, which is B in the Scale, as being the next Note above three Tones immediately succeeding each other. In case of Flats (b) and Sharp (#) the Place of mi is found as in this Table.

When $\left\{ \begin{array}{l} B \text{ is} \\ B \text{ and E are} \\ B \text{ E and A are} \end{array} \right\}$ Flat, mi stands in $\left\{ \begin{array}{l} E \\ A \\ D \end{array} \right\}$

When $\left\{ \begin{array}{l} F \text{ is} \\ F \text{ and C are} \\ F G \& C \text{ are} \end{array} \right\}$ Sharp, mi stands in $\left\{ \begin{array}{l} F \\ C \\ G \end{array} \right\}$

The Place of mi being known, you ascend above mi by fa, sol, la, fa, sol, la; and descend below mi by la, sol, fa, la, sol, fa, calling all Eights by the same Name.

Mi in B.

Mi in A.

I'll now propose the other way of naming the Notes, that I mention'd before.

The seven musical Notes being express'd in the *Gamut* by the 7 first Letters of the Alphabet, *A, B, C, D, E, F, G*; let these Letters be their Names whereby to express them in Singing. Only, for better Sound's sake, and to accommodate them to the Variations by *Flats* and *Sharps*, let *A* and *E* be call'd *lA* and *lE*. Let *F* be call'd *Fa* (with a broader Sound as in the Word *Fall*.) *G* and *C* are to be pronounc'd *Ge* and *Ce*; so will the 7 Names be *lA, B, Ce, D, lE, Fa, Ge*. When *A* and *E* are mark'd to be flat at the Beginning of the Staff of Lines, let them be called *mA* and *mE*; when *B* is Flat call it *Be*, as in the Word *Benefit*. When *F* is mark'd to be a Sharp, let it be call'd *Fa*, as in the Word *Fatal*. When *C* is Sharp call it *Cee* (its proper Name.) In like manner, when *G* is Sharp, let it be call'd *Gee*, not *Ge*.

By this means the proper Letter expressing each Note is preserv'd, and also a Provision made for Variation of the Name, according as the Note is varied to Flat or Sharp.

Examples of the Notes Names.

To sing a Tune true according as it is prick'd, is best and soonest learnt by the Assistance of one skill'd in Musick; but where such cannot be had, a Person who has naturally a Musical Ear and Fancy, may, (by the Method I shall here direct) attain to a competent Skill in *Plain-Song*, at least. In order to which, I shall only suppose that he can sing the Tune of *Six Bells*, which (with us in *England*, where that Number of Bells is so common) is no great Thing to suppose in a capable Learner.

There being in every *Octave* six Tones and two *Semitones*, (as has been shewn) it is necessary to true Singing, that these Tones and *Semitones* should keep their proper Places. In Order therefore to know and distinguish Tones and *Semitones*, the Learner must observe, that in the Tune of Six Bells, the *Third* and *Fourth* Notes (or Bells) are distant a *Semitone*; all the rest are distant (each from its next) by a *Tone*. A good Ear will easily observe the *Third* and *Fourth* Notes to be nearer Sound than the rest.

To apply the Tune of Six Bells to Notes prick'd in the Treble Cliff.

In this Example (consisting of 3 Bars or Divisions) you have in the first Bar the Notes of Six Bells, beginning at the Leger-line above the Staff, which is the Place of *A*, (according to the Order in the *Gamut*.) Begin with your Voice pretty high (that you may after reach the lower Notes in the other Bars) and sing 3 or 4 times distinctly the first six Notes, calling them 1, 2, 3, 4, 5, 6. Then call them by their proper Names, (set under the Staff) *lA, Ge, Fa, lE, D, Ce*; fingering them in the same Tune that you did the Numbers 1, 2, 3, 4, 5, 6.

Proceed to the second Bar, but first sing your former six Notes once or twice over, holding out the Note *lE* a little longer than the rest; then repeating only the three last Notes of the first Six, begin at *lE* in the second Bar, and sing *lE, D, Ce, B, lA, Ge*, in the Tune of Six Bells, keeping the three first Notes of this Six in the same Tune with the three last of the former Six. So are you led gradually one Note above an *Octave*. If you stop at the lower *lA*, (one Note short of the last 6, you will have a compleat *Octave* from *lA* above to *lA* below, which is the Order of Notes in a Flat Key.

If your Voice will reach another six Notes, you may, in the Third Bar, repeat the two last Notes of the foregoing Six, and sing *lA, Ge, Fa, lE, D, Ce*, in the Tune of Six Bells.

In the 4th Bar, having sung the 6 Notes *lE, D, Ce, B, lA, Ge*, in the Tune of 6 Bells several times, try to sing them backward, as in the 5th Bar, *Ge, lA, B, Ce, D, lE*; which with a little heed may easily be done, as may also the other Six, beginning at *lA* in the 6th Bar.

Here note, 1. That the Tune of Six Bells may begin either at *lA* or *lE*, and no where else without altering the Property by Flats or Sharps, of which anon. 2. That the two *Semitones* lie, one between *B* and *Ce*, and the other between *lE* and *Fa*.

The

The same Directions will serve for the following Notes set in the *Bass Cliff*, and therefore I shall only set down the Notes.

Examples of rising and falling the Voice by Leaps in the *Treble Cliff*.

In the first Bar, sing the 6 Notes in order. In the 2d Bar, sing only the 3 first two or three times, then skipping the second Note D, sing 1E, Ce several times, and then upwards Ce 1E. In like manner proceed to the following Bars, singing the Notes in each Bar as they are prick'd, till you have learnt to raise and fall the Voice by the Leaps there set down.

In the 12th Bar, sing the 6 Notes, and in singing hold Ce the 3d Note, somewhat longer than the rest the better to hit it in beginning afterward at that Note: Then in the 12th Bar begin at Ce, and repeat Ce, B, 1A, Ge, several times, and then going 2 Steps back, sing Six from 1A to Ce, below, which will be an *Octave* to the Note Ce above.

Examples of raising and falling the Notes by Leaps in the *Bass Cliff*.

When Flats or Sharps (b, #) are set at the Beginning of the Staff by the Cliff, they alter the Places for beginning the 6 Notes, by removing the *Semitones* (one or both) from their original Places; the Flat [b] removing its Notes a *Semitone* lower; and the Sharp [#] removing then a *Semitone* higher. When there are no Flats and Sharps, the Tune of Six Bells begins at lE and lA only; in other Cases as follows.

When	{	Be is flat	{	begin the	lA & D.		
		Be and mE are flat				Tune of	Ge & D.
		mA, Be & mE are flat					
When	{	Fa is sharp	{	begin the	B & lE.		
		Fa and C are sharp				Tune of	B & Fa.
		Fa G & C are sharp					

An Example when B and E are flat.

It may be a good Way to give Learners a Notion of the Alterations made by Flats and Sharps; in the Distances of the Notes, to divide a Line into 12 equal Parts (which will do for this Purpose, tho' in Strictness they should not be all equal) as the Line A a is here divided. Provide 8 little square Papers with these 8 Letters, A, B, C, D, E, F, G, a, upon each, one; and place them as on the under side of the Figure, which shews their natural Order, and the Places of the *Semitones* between B and C, and between E and F. Suppose I should now see the Order of the Tones and *Semitones* when B and E are signed flat in the Staff thus, to do this, I remove the Papers mark'd with B and E, one Degree (answering to a *Semitone*) lower, or nearer to A; and then the Papers will stand in Order as above the Line, and the two *Semitones* are now between A, B, and D, E. In case of Sharps, the Letter design'd to be sharp must be removed one Degree (or twelfth Part) higher, or nearer to a.

Thus may all the Varieties be represented to the Eye, and the Reason of beginning the Six Notes as is directed, be also understood.

Of the Quantity of Notes as to Time.

Besides the giving to Notes their right Tune
Vol. II.

An Example when F and C are sharp.

By the Table above, and these two Examples, may be understood how to place the Six Notes in any other Case of Flats and Sharps, or in other Cliffs. The *Semitones* in all Cases, lie between the 3d and 4th Notes of the Six.

See more, with Application to *Psalmody*, in a Treatise called, *A New and Easy Method to learn to Sing by Book*; Printed for W. Rogers in Fleetstreet.

(according to their Places in the Staff of 5 Lines) Regard is also to be had to the *Length* or *Shortness* of Time they are express'd in, which is known by the Figure or Shape of the Character by which they are prick'd on the Lines.

The Names and Figures of the usual Notes in Respect of Time, and their correspondent Rests are as follow:

Breve, Semibreve, Minim, Crochet, Quaver, Semiquaver.

The Strokes or Marks set after each Note are called *Rests* or *Pauses*, and denote a Ceasing or Intermision of the Sound for the Time of the Notes they are join'd to.

The Proportion of the foregoing Notes, one to the other, is express'd in this Scheme.

One *Breve* is equal in Time to two *Semibreves*; one *Semibreve* to two *Minims*; one *Minim* to two *Crotchets*, &c.

When a Prick (.) is set after any Note, it increases its Quantity half as much more. So (.) is equal in Time to (.) a *Semibreve* and *Minim*.

A prick'd *Minim* (.) is equal in Time to (.) a *Minim* and *Crotchet*.

If the Words *one, two, three, four* be pronounced in a reading Tenor, the Time of pronouncing each Syllable may be accounted the Measure or Time of one *Crotchet*; and consequently, *one, two*, gives the Time of a *Minim*; *one, two, three*, of a prick'd *Minim*; *one, two, three, four*, of a *Semibreve*.

This may suffice for an Entrance, referring the Reader to Books for farther Information.

Of Singing in different Cliffs.

The Difference of Cliffs is what doth perplex Learners. They who can sing in the *Treble Cliff*, are at a Loss when they come to the *Tenor* or *Bass Cliffs*: I will therefore here give a Table, wherein all the usual Cliffs (or Positions of them) are so compar'd and order'd, that he who can sing readily in one Cliff, may sing in any other in the Table.

A Table whereby all the usual Cliffs may be reduced to any one Cliff desired.

VI.

VII.

This Table, consisting of 7 Staves or Classes, contains in each Class all those (usual) Cliffs wherein the *Semitones* lie in the same Places of the Staff; and consequently what is prick'd in any Cliff, may be sung (or play'd) as if it were prick'd in any other Cliff of the same Class.

E. G. Suppose a Person hath learnt to sing in the *Treble Cliff* only, and would sing Notes prick'd in the *Tenor Cliff* on the middle Line with *F#*, thus let him look for this Cliff in the Table and he will find it in the second Class, where, at the Beginning is that is, the *Treble Cliff* with *B flat*. If he therefore sing the Notes as if they were in the *Treble Cliff* with *B flat*, he'll sing them as true as if he had understood the *Tenor Cliff*.

Ge, lA, B, Ce, D, lE, Fa, Ge.

Examp. 

Fa, Ge, lA, Be, Ce, D, lE, Fa.

In this Example, the Cliff at the Beginning of the Staff, is that to which the Notes are prick'd, and the Names (as in the *Tenor Cliff*) are set above them. At the End is set the *Treble Cliff*, in which the Notes may be sung, and their Names (as accounted in the *Treble Cliff*) as set under.

Dr. Wallis, in *Phil. Transact.* N. 243. takes into Consideration the strange Reports we have of the Power of the ancient Musick; and tho' he judges they are in a great Degree Hyperbolical, if not Fabulous; yet he thinks too that some Account may be given of the great Effects it's said to have had, from these Considerations.

1. That Musick was then, if not now, a rare Thing; which the Rusticks, on whom it is reported to have had mighty Effects, had scarce ever heard before; and on such, a little Musick will do great Feats; as we find at this Day a Fiddle or a Bagpipe hath at a Country Morrice-Dance.

2. Their Musick was much more Simple and Plain than ours now: They had no Consorts of 2, 3, 4, or more Voices or Parts; but one single Voice or Instrument a-part; which to a rude Ear is much more taking than compounded Musick: That not exceeding their Capacity, whereas This confounds them quite, and is by no means distinguishable by them, so as to affect them with the Harmony of its Parts.

3. Musick, with the Ancients, was of a much larger Extent than what we now call by that Name; for Poetry and Dancing (i. e. comely Motion) were then accounted Parts of Musick when it had arriv'd to some Degree of Perfection. And we see that Verse of it self alone, if in good Measure, and moving Words, and this set to a Musical Tune, sung by a decent agreeable Voice, accompanied with soft Instrumental Musick only, if with any; i. e. such as doth not drown or obscure the emphatical Expressions (like what we call *Recitative Musick*, tho' I doubt not more justly managed; for I hope the

the same Tone did not serve with them for making Love, Fighting, and delivering Letters) will work strangely upon the Ear, and move all the Affections suitable to the Tune and Ditty, especially if attended with a *Gesture* and *Action* suitable; for we see that *suitable Action* alone doth on the Stage, give great Life and Force to Words; and therefore all this together might easily operate very strongly on the Fancies and Affections of ordinary People not used to such kind of Treatments: For if the deliberate reading of a Romance, (when well penn'd) will produce Mirth, Tears, Joy, Grief, Pity, Wrath or Indignation, suitable to the respective Intents of it, much more would it do, if accompanied with all these Attendants.

4. If it be ask'd, why may not all this be done now? I answer, no doubt it may: If the Address be made in proper Words, emphatically spoken, and in just Measures, with moving Arguments, pronounced by an agreeable Voice, and attended with a decent Gesture, and not drown'd by too much Musick, or over acted by apparent Affectation.

5. We should understand also, that the usual Design of what we now call *Musick* is very different from that of the Ancients; for that which we call so, was but with them the *Harmonick*, i. e. but one Part of their whole Musick, which consisted of Words, Verse, Voice, Tune, Instrument, and Acting.

6. When Musick arriv'd to good Perfection, it was applied by the Ancients to the exciting this or that particular Affection, Passion, or Temper of Mind; the Tunes and Measures being suitably adapted to such Designs, whereas those are now almost quite neglected in our present Musick; the chief Design being now to please the Ear, when by a sweet Mixture of different Parts and Voices, with just Cadences and Concords intermix'd, a grateful Sound is produced: But this only the Judicious Musician, or one a good while used to such Compositions and Performances can distinguish.

7. 'Tis true, that even this Compound Musick admits of different Characters; some is more brisk and airy, others more solemn and grave, as the different Subjects do require. But that which is most proper to excite particular Passions or Dispositions, is such as is more Simple and Uncompounded; such as a Nurse's languid Tone lulling her Babe to Sleep, or a continued Tale (as in *Ireland*) or reading in an even Tone; or the soft Murmur of a little Rivulet running upon Gravel or Pibbles inducing a quiet Repose to the Spirits: and on the other Hand, the Briskness of a Jig, &c. on a Violin exciting to Dance; for these are more operative for such Ends than elaborate Compositions of full Musick.

The same excellent Author in N. 249. hath a judicious Discourse about the Imperfection of that noble Instrument an *Organ*; where he observes, That each Pipe is designed to express a distinct Sound at such a Pitch, or at such a determinate Degree of Gravity or Acuteness, i. e. as it is now called of Flatness or Sharpness; and the Relative or Comparative Consideration of the two or more such Sounds or Degrees of Flatness or Sharpness is the Ground of what we call *Concord* and *Discord*; that is, a soft or harsh Coincidence. Concerning which there was among the ancient Greeks two Sects of Musicians; the *Aristoxenian* and Py-

thagorean: But both agreed thus far, that *Diatessaron* and *Diapente* do together make up *Diapason*; i. e. a *Fourth* and a *Fifth* make up an *Eighth*. And the Difference of these two, of a 4th and a 5th they agreed to call a *Tone*; which we now call a *whole Note*. Such is that in our present Musick of *la mi*; for *la, fa, sol, la*, or *mi, fa, sol, la*, is a perfect 4th, and *la, fa, sol, la, mi*, or *la, mi, fa, sol, la*, is a perfect *Fifth*. The Difference of which is *la, mi*; and this the Greeks called the *Diazeutick Tone*, which disjoins two *Fourths* on each Side of it; and being added to either of them, makes a *Fifth*; which was That, in their Musick from *Mese* to *Paramese*, or in *Ours* from *A* to *B*, supposing *mi* to stand in *B fa B mi*, which is accounted its natural Position.

Now in order to this *Aristoxenus* and his Followers took that of a 4th, as a known Interval, by the Judgment of the Ear, and that of a *Fifth* likewise, and consequently that of an *Octave*, as the Aggregate of both, and that of a *Tone* as the Difference of those two. And this of a *Tone* (as a known Interval) they took as a common Measure by which they estimated other Intervals: And accordingly they accounted a *Fourth* to contain two Tones and $\frac{1}{2}$, a *Fifth* three Tones and $\frac{1}{2}$, and consequently an *Eighth* six Tones, or five Tones and two half Tones; and at this Rate our practical Musicians talk of *Notes* and *half Notes* at this Day; supposing an *Octave* to consist of twelve half Notes.

But *Pythagoras* and those that follow'd him, not taking the Ear alone to be a competent Judge in a Case so nice, chose to distinguish these, not by *equal Intervals* but by *due Proportions*. And this is followed by *Zarlino*, *Kepler*, *Cartes*, and other Writers on *Speculative Musick*, in this and the last Age. Accordingly they accounted an *Octave* to be, when the Degree of Gravity or Acuteness of one Sound to another is *double*, or as 2 to 1. That of a 5th when 'tis *Sesquialteral*, or as 3 to 2. That of a 4th, when 'tis *Sesquitercian*, or as 4 to 3; accounting that the sweetest Proportion which is express'd in the smallest Numbers; and therefore next to an *Unison* they accounted the *Octave*, or of 2 to 1. Then that of a 5th, or of 3 to 2, and then that of a 4th, or of 4 to 3. And thus that of a 4th and 5th do together make an 8th, for $\frac{4}{3} \times \frac{3}{2} = \frac{4}{2} = 2$: Or the Proportion of 4 to 3, compounded with that of 3 to 2 is the same with that of 4 to 2 or 2 to 1, and consequently the Difference of these two, which is that of a *Tone* or full Note, is that of 9 to 8; for $(\frac{4}{3})^2 = \frac{16}{9}$: Or if out of the Proportion of 3 to 2 you take that of 4 to 3, the Result is that of 9 to 8. Now according to this Computation 'tis plain, that an *Octave* is something less than 6 full Notes; for as hath been demonstrated by *Euclid*, and some others since, the Proportion of 9 to 8 being 6 times compounded is something more than that of 2 to 1, for $\frac{9}{8} \times \frac{9}{8} \times \frac{9}{8} \times \frac{9}{8} \times \frac{9}{8} \times \frac{9}{8} = \frac{9^6}{8^6} = \frac{531441}{262144}$ which is more than $\frac{2}{1} = \frac{524288}{262144}$. And this being the Case they allowed to the *Diazeutick Tone*, *la, mi*, the full Proportion of 9 to 8, as the unalterable Difference between the *Fifth* and the *Fourth*. All the Difficulty was how the remaining *Fourth*, viz. *mi, fa, sol, la*, should be divided into three Parts, so as to answer pretty near the *Aristoxenians* two Tones and an half; and might all together make up the Proportion of 4 to 3, which is that of a *Diatessaron* or *Fourth*.

Many Attempts were made to this Purpose, and according to these, they gave Names to the different Kinds of Musick, viz. the *Diatonick*, *Chromatick*, and *Enharmonick*, with the several *Species* or lesser Distinctions under these *Generals*.

The first was that of *Euclid*, (which obtained generally for many Ages) and which allows to *fa*, *sol*, and to *sol*, *la*, the full Proportion of 9 to 8; and therefore to *fa*, *sol*, *la*, which we now call the greater *Third*, that of 81 to 64; for $\frac{9}{8} \times \frac{9}{8} = \frac{81}{64}$, and consequently to that of *mi*, *fa* (which is the Remainder to a *Fourth*) that of 256 to 243; for $(\frac{81}{64})^4 = \frac{256}{243}$, i. e. if out of the Proportion of 4 to 3, we take that of 81 to 64, the Result is that of 256 to 243. To this they gave the Name of *λείμμα*, that is, the Remainder (over and above two Tones.) But in common Discourse, when we don't aim at speaking exactly, nor desire to be so understood, 'tis usual to call it an *Hemitone* or *half Note*, as being very near it; and the other two whole Notes: And this is what *Ptolemy* calls *Diatonum Ditonum*, (or the *Diatonick* Kind with two full Tones.) Against this it is objected, That the Numbers of 81 to 64, are too great for that of a *Ditone* or greater *Third*; which is not harsh to the Ear, but is rather sweeter than that of a single Tone, whose Proportion is that of 9 to 8. And in that of 256 to 243 the Numbers are yet greater much; whereas there are many Proportions (as $\frac{5}{4}$, $\frac{6}{5}$, $\frac{7}{6}$, $\frac{8}{7}$) in smaller Numbers than that of 9 to 8, of which in this Division there is no Notice taken, and consequently this Division is not the most convenient.

To rectify this, there is another Division thought more convenient; which is *Ptolemy's* *Diatonum Intensum*, of the *Diatonick* Kind, but more *Intense* or *Acute* than the other; and this instead of two full Tones for *fa*, *sol*, *la*, assigns what we now call a *Greater* and a *Lesser* Tone; and this seems to have been more followed by the nicer Musicians of this and the last Age. To *fa*, *sol*, they assign the Proportion of 9 to 8, which is their greater Tone, and to *sol*, *la*, that of 10 to 9, which they call the lesser Tone; and therefore to *fa*, *la*, the *Ditone* or greater *Third*, that of 5 to 4; for $\frac{9}{8} \times \frac{10}{9} = \frac{10}{8} = \frac{5}{4}$, and consequently to *mi*, *fa*, which is remaining of the *Fourth*, that of 16 to 15. for $(\frac{5}{4})^4 = \frac{16}{15}$; that is, if out of that of 4 to 3 you take that of 5 to 4, there remains that of 16 to 15.

Omitting to speak of the other Ways of Division, this $\frac{16}{15}$ is what we now call an *Hemitone* or *half Note* in *mi*, *fa*: $\frac{9}{8}$ is that of the greater Tone in *fa*, *sol*; and $\frac{10}{9}$ that of the lesser Tone in *sol*, *la*.

Only with this Addition, That each of these Tones is now, on Occasion, by *Flats* and *Sharps* divided into *Hemitones* or *half Notes*; which answers to what the *Greeks* called the *Change of Mood*; and which is now done by removing *mi* to another Key, viz. $\frac{9}{8} = \frac{18}{16} = \frac{18}{17} \times \frac{17}{16}$: and $\frac{10}{9} = \frac{20}{18} = \frac{20}{19} \times \frac{19}{18}$.

This by the Help of *Flats* and *Sharps*, as they are now called, (dividing each whole Note by its greater or lesser into two *half Notes*, or such as we call so.) The whole *Octave* is divided into 12 Parts or *Intervals*, contained in an Organ between 13 Pipes; and these are commonly called *Hemitones* or *half Notes*: Not that each is precisely an half Note, but somewhat near it, and so called. I say by *Flats* and *Sharps*, because sometimes one and sometimes the other is used: As for Instance, a Flat in *D* or a Sharp in *C*, do either of them denote a midling Sound (tho' not precisely in the

middle) between *D* and *C*, flatter than *D*, and sharper than *C*.

According to this, supposing *mi* to stand in *B fa B mi* (which is accounted its natural Place) the Sound of each Pipe is to bear these Proportions one to another, viz.

And so in each *Octave* successively following: And if the Pipes in each *Octave* be fitted to Sounds in these Proportions of Gravity and Acuteness, it will be supposed according to this Hypothesis, to be perfectly proportioned.

But instead of these successive Proportions for each *Hemitone*, it hath been found necessary (if I do not mistake the Practice) so to order the 13 Pipes containing the 12 Intervals or *Hemitones*, as that their Sounds, as to Gravity and Acuteness, shall be in continual Proportion (that is, each to its next following in one and the same Proportion) which altogether shall compleat that of the *Octave* or *Diatason*, or as 2 to 1, whereby it comes to pass, that each Pipe doth not express its proper Sound, but very near it, tho' something varying from it: And this they call *Bearing*, which is somewhat of Imperfection in this noble Instrument the Organ, the Top of all.

It may be ask'd, Why may not the Pipes be so ordered as to have their Sounds in just Proportion as well as their Bearing?

I answer, it might very well be so, if all Musick were compos'd to the same Key, or as the *Greeks* call it, the same *Mode*; as for Instance, if in all Compositions, *mi* were always in *B fa B mi*, then the Pipes might be ordered in such Proportions as I have now design'd. But Musical Compositions are made in great Variety of *Modes*, or with great Diversity of the Pitch. *Mi*, is not always placed in *B fa B mi*, but sometimes in *E la mi*, sometimes in *A la mi re*, &c. And indeed there is no one of these *B* Pipes but may be made the Seat of *mi*; and if they were exactly to any one of these Cases, they would be quite out of Order for all the rest. As for Instance. if *mi* be removed from *B fa B mi* (by a Flat in *b*) to *E la mi*, instead of the Proportions but now designed, they must be thus ordered.

Where it is manifest, that the Removal of *mi* doth quite alter the whole Series of the Proportions. And the same would again happen if *mi* be removed from *E* to *A*, by another Flat in *E*: and again if removed from *A* to *D*, and so perpetually. But the *Hemitones* being made all equal, they do indifferently answer all the Positions of *mi* (tho' not exactly to any) yet nearer to some than to others;

M U S

others; whence it is that the same Tune stands better in one Key than in another.

Nor can this ever be remedied, but only in Part, by making the Imperfection something less by the Interposition of *quarter* or *half quarter Notes*, &c. for it hath been long since demonstrated, that there is no such thing as a *just Hemitone* practicable in Musick (and the like holds for the Division of a *Tone* into any other Number of equal Parts) for supposing the Proportion of a *Full Note* or *Tone* to be $\frac{9}{8}$ or as 9 to 8; that of the half Note must be, as $\sqrt{9}$. to the $\sqrt{8}$. that is, as 3 to the $\sqrt{8}$. or 3 to 2 $\sqrt{2}$. which are incommensurable Quantities: and that of a Quarter Note will be as $\sqrt[4]{9}$. to $\sqrt[4]{8}$. which is yet more incommensurable. And the like for any other Number of equal Parts; which therefore will never fall in with the Proportions of Number to Number.

So that this can never be perfectly adjusted for all *Keys*, without something of *Bearing*, by multiplying the Pipes. Unless for every *Key*, or for every different Place of *mi* there be a different Set of Pipes, of which this or that is to be used, according as (in the Composition) *mi* is supposed to be in this or that Place. Which vast Number of Pipes for every *Octave*, would greatly encrease the Charge, and after all, make the whole impracticable.

MUTUUM, in the Civil Law, is a *Loan* simply so called ; or a *Contract* introduced by the Law of Nations, in which a Thing that consists in Weight, (as suppose Bullion) in Number, as Money : or in Measure, as Corn, Wine, Oil, &c. is given to another upon Condition that he shall return another Thing of the same Quantity, Nature, and Value, upon Demand.

So that this is a Contract without Reward, and admits, properly speaking, of no Recompence. And therefore where Use and Interest is agreed on, they arise from some distinct particular Argument, or by Custom of the Country.

NATURE. Besides the three Senses of this Word mentioned in Vol. I. it is sometimes used for this vast Machine of the *Universe*, the wise Production of *Almighty God*, consisting of a great Number of *lesser Machines*, every one of which is adjusted by the same Wisdom in Number, Weight and Measure.

Laws of Nature, signify those Laws of Motion by which natural Bodies are governed in all their Actions upon one another, and which they inviolably observe in all the Changes that happen in the

the natural State of Things. An Account of these Laws see in Motion.

Sir Isaac Newton at the End of his excellent *Opticks*, (Lat. Edit.) observes, That *Universal Nature* is very *Simple* and *Uniform* in its Operations. All the Motions of the heavenly Bodies are caused by that *Attracting Force*, Impulse or Power which we call *Gravitation*; and which is mutual amongst all those Bodies. All the *lesser Motions* of the Particles or Corpuscles of Matter whereby Bodies act on one another, are effected also, by some *attracting* and *repelling Force*; which is mutual and reciprocal amongst them.

The *Vis inertiae*, is a Principle *purely passive*, by which Bodies persist in their State of Rest or Motion, whereby they receive Motion from others equal or proportionable to the *moving Force*; and whereby they *resist* as much as they are *resisted*. But from this Principle alone there never could have been any such Thing as *Motion*, any where in the Universe. There is a Necessity of supposing some other Principle to be the Origin of Motion, and its Constitution too: For from the various Compositions of two Motions, 'tis plain that there cannot be always the same Quantity of Motion in the World, for if two Globes, connected together by a slender Thread, be supposed to revolve with an uniform Motion round their common Centre of Gravity; and at the same Time that Centre should move on Uniformity also in a Right Line coincident with the Plane of the Globes Orbits: Then will the *Summ* of the Motions of those two Globes, whenever they happen to be both in the Right Line described by the common Centre of Gravity, be *greater* than the *Summ* of their Motions can be, when they are in a Line at Right Angles to that. By which Instance 'tis apparent, *that Motion is producible and destructible*. But from the *Tenacity* and *Attrition* of the Particles of Fluid Bodies, and the Imbecility of the *Elastick Force* in solid Bodies, we may conclude, that the course of *Nature* tends more to the *Destruction* than the *Production* of Motion; and indeed it is continually decreasing, for Bodies that are either so perfectly *hard*, or thoroughly *soft*, as to have no *Elasticity*, cannot be reverberated back from one another, and from their *Impenetrability* only it would follow that their Motion would stop, and terminate. If therefore there were any such things as the *Imaginary Vortexes* of *Des Cartes*, their Motion must be continually decreasing, and at last must quite cease. Since therefore Motion is thus continually decreasing in the Universe, we must have Recourse to some *active Principles*, to increase and preserve it; *viz.* to such as the *Cause of Gravity* and *Fermentation*: By the former of which the Planets and Comets perpetually move in their Orbits, and Bodies by descending gain a great Velocity or large Quantity of Motion; and by the latter, the Heart and Blood of Animals is preserved in Motion and Warmth: The internal Parts of the Earth are perpetually getting Heat, many Bodies burn and shine, *Volcanoes* and *Earthquakes* are produced, and the Sun it self preserves his Light and Heat, and warms and cherishes all Things: For we find very little Motion in the World (except what is voluntary in free Agents) but what depends on these active Causes.

So that after well considering and understanding these Things, our admirable Author, (whose Piety and Goodness is as eminent as his profound

Mathematick Learning and Penetration into Universal Nature) concludes, that our perfectly good, most wise, and Almighty Creator, did in the Beginning of the World, create Matter so as that its original Particles, from whence all corporeal Natures were to arise, were *solid, firm, impenetrable*, perfectly passive and moveable; and that they were made of such *Magnitudes* and *Figures*, and endued with such Properties, and in that Number and Quantity as was proportionable to the Space in which they were afterwards to move, in order to the most effectual obtaining of those Ends and Purposes for which they were created.

And these original primary Particles being perfectly solid, must be much more hard and firm than any Bodies that can be made out of them with Pores, hidden *Meatuses*, or Vacuities interspersed; that is, so perfectly hard and firm, that they can never be worn away or diminished; for 'tis not reasonable to suppose that there should be any Force or Power in the *ordinary Course* of Nature, that can divide *that* into more Parts, which God in the first *Creation* of Things, hath made *one*. As long therefore as these original Particles remain entire, there may for ever be Bodies made or composed of them; which shall have the same *Nature* and *Texture*: But if these can be broken, worn away, or diminished, then the Nature of corporeal Things which is dependent on these might be changed. Earth and Water composed of either such Particles as have been worn or broken, or of their Fragments, could not have at this Day, the same Nature and Texture, that original Earth and Water which was composed of these Particles when they were sound and entire. Wherefore that the Nature of Things should last, and their Natural Course continue the same; all the Changes made in Bodies must arise only from the various Separations, new Conjunctions and Motions of these original Particles. For mix'd or compound Bodies are broken or destroyed, not by the breaking to Pieces of their solid original Particles, but by separating them one from another, and disposing them in those Places where they touch'd one another but in a little Part of their Surface. And these Original Particles, seem not only to have in them the *Vis Inertiae* and all those *Passive Laws of Motion* which necessarily arise from thence; but receive also *Motion continually* from certain *Active Principles*; *viz.* such as *Gravity* the *Cause of Fermentation* and of the *Cohesion* of the Parts of Matter. And these Principles are not to be considered as *occult Qualities* which are feigned to arise from the *Specifick Forms* of Things, but as the *Universal Laws of Nature* by which Things themselves are formed. For that there are really *such Principles*; the various Phænomena of Nature do demonstrate, tho' what their *Causes* are hath not yet been explained: For to assert that the *several Species* of Things are endued with *Specifick Occult Qualities*, by which they have a certain Force or Power in acting, is in Reality to say Nothing. But from the Phænomena of Nature to derive two or three *general Principles of Motion*; and from thence to explain how the Properties and Actions of all Corporeal Things may be deduced from those Principles, would be a very great *Progress* in Natural Philosophy, although the Causes of those Principles should be yet undiscovered.

NAVAL Architecture. See Shipping.

NAVE, in Architecture, signifies the main Body of a Church.

NAVEL-STING. See *Umbelical Vessels*.

NEALING of Steel, is heating of it in the Fire to a Blood-red heat, and then taking it out and letting it cool gently of it self. This is done to make it softer, in order to engrave or punch upon it.

NEAR, at Sea, when the Conner commands, the Man at the Helm to set the Ship full to Leeward, his Word is *No-near*.

NEBULOUS Stars, seen thro' good Telescopes appear to be Clusters of small Stars : as appears by the Observations of *Cassini* and *Flamsteed*. See *Philos. Trans.* N. 123.

NECYDALUS, the same with *Nympha*, a Term used in the Natural History of *Insects*. See *Nympha*.

NEIFE, *Nativa* ; is a Bond-woman. *An. 1 E. 6. 3.* and *9 R. 2. cap. 2.* But if she married a Freeman she was thereby made free ; and when once made free and discharged of all Bondage cannot be *Neife* after, without some special Act done by her ; as Divorce or Confession in a Court of Record. Nor shall a Free-woman be bound by taking a Villain to her Husband ; but their Issue shall be Villains after their Father. There was also anciently a *Writ of Neifty*, whereby the Lord claim'd his *Neife* ; but all this is now out of Doors.

NEWEL, in Architecture, is the upright Post that the Case of winding Stairs turns round about.

NITRE. See *Clark's Natural History of Nitre*. Lond. 1670. in 8vo. Mr. Boyle's Tract about the Redintegration of Salt Petre.

NOBLE ; there hath not been any Piece of Gold (or Silver) of this Name coined with us since 9 H. 5. They were first coined by E. 3. 1344. The Noble contained 80 Pence ; its half, which was then called *Obolus* 40 d, its 4th Part the *Quadrans* or *Farthling* in these Days 20 d.

NOCTURNAL. There are several Sorts of *Nocturnals*, of which some may be Projections of the Sphere ; such as the Hemispheres or Planispheres on the Plane of the Equinoctial ; but the Seamen use only two, and the Manner of using either is the same. One of them is fitted for the Pole-Star and the first of the Guards of the Little Bear ; and the other for the Pole-Star and the Guards or Pointers (as some call them) of the Great Bear.

The Instrument consists of three Parts or Pieces ; the largest of which hath a Handle to hold it by when you would observe ; and opposite to the Handle there is a small Tooth or Point, which (if it be made for the Little Bear) stands against the 25th of April ; but if for the Great Bear, against the 17th of February ; which are the Times of the Year when those Stars come to the Meridian at 12 at Night. On this bigger Part or Piece then are two Circles described ; the outermost hath the Months and their Days, and the innermost hath the 24 Hours of a Natural Day ; on the backside of this Piece also are the 32 Points of the Compass designed, and marked with their initial Letters.

The second Part of the *Nocturnal* hath two Circles described on it ; of which the outermost is divided into $29\frac{1}{2}$ equal Parts, for the Days of the Moon's Age ; and in the innermost into 24 Hours : And at the Beginning of the Days of the Moon's Age, and at XII, there is a Tooth to be set to the Day of the Months in the upper Part.

The third Part is an Index with a Fiducial Edge issuing from the Centre ; and must be so long, that a good Part of it may extend beyond the outermost or biggest Piece. These three Parts are so ordered, that by Means of a small hollow Brass Socket they are made to move about the Centre of the Instruments. See the Fig. annexed.

The Uses of this Instrument are ;

1. To find the Hour of the Night.

To do which, set the Tooth to the middle Part of the Day of the Month, and then turning the foreside of the Instrument towards you, hold it up towards the North, and incline the upper Part toward you, till thro' the Hole in the Middle you can see the Pole-Star ; there hold it fast, and turn the long Index about, till by its Edge you can see either the first of the Guards of the Little Bear, or the Pointers of the Great Bear, (according as the Instrument is made) and then shall the Edge of the

the Index or Ruler, in the innermost Circle of the middle Part shew you the true Hour of the Night.

2. To find on what Point of the Compass the Guards are.

This will appear on the backside of the Nocturnal, after you have found the Hour of the Night, as above; for the Index will be on the same Point of the Compass as the Guards really are.

3. To find at what Hour the Moon will be full South on any Day of her Age.

Seek the Moon's Age in the outermost Circle of the middle Piece, and then right against it in the innermost Piece, is the Hour required.

Thus if the Moon be 11 Days old, you will find she will be on the Meridian at 8 Hours 48 min.

NODATED Hyperbola: So Sir *Is. Newton* calls a peculiar kind of Hyperbola, which by turning round decussates or crosses it self. See *Curves*.

NOMINATION; this Word as well by the Canonists as common Lawyers, is used for a Power that a Man hath by vertue of a Mannor or otherwise, of appointing or naming a Clerk to a Patron of a Benefice, to be by him presented to the Ordinary.

NORROY, or *North-Roy*, i. e. the Northern Kings; is the Title of the Third of the three Kings at Arms in the Heralds-Office. His Province lies on the North-side of *Trent*.

NOTARY, is mentioned in 27 E. 3. 1. and is a Scribe or Scrivener, which makes short Draughts of Writings or Instruments. At this Day we call him a *Notary* or *Notary Publick*, that attests Deeds or Writings to make them authentick in another Country; and chiefly in Business relating to Merchants.

NOVATION, in the *Civil Law*, is a transferring the first Obligation given by a Debtor to a Creditor, into another.

NUMBRING Rods, the same with *Neper's Bones*.

NUMMATA Terra, a Term formerly used in some old Grants, and thought to be the same with the *Denariatus Terra*; and is supposed to be an Acre of Land.

NUTRITION. The Course or Process of the *Aliment* in order to the Nourishment and Support of an Humane Body, is thus performed. The Meat we eat being grossly divided and ground by the Teeth, is in that Action mingled with the *Saliva*, which helps to ferment and dilute it. Thence thro' the *Oesophagus* or Gullet by the Constriction of its Fibres 'tis thrust down into the Stomach; where being further softened and swell'd by the Juices contained in the Glands of the Stomach, its Parts are farther broken and the intimate Cohesion

of them destroyed, and they divided one from another, by the perpetual Motion of the Coats of the Stomach and by the Muscles of the *Midrif* and *Abdomen*. By this Pressure also of the Sides of the Stomach upon the contained Aliment, that is thrust down into the Intestines; at its Entry into which it is mix'd with the Bile and Pancreatick Juice, the one to sweeten, the other to dilute the Chyle. By the *Peristaltick Vermicular* Motion of the Guts, (arising from the Alternate Action of their Spiral and Longitudinal Fibres) and by the Pressure of the *Dyaphragm*, and the Muscles of the *Abdomen*, the grosser Parts of the Chyle are derived downwards to be thrust out of the Body; while the finer are squeezed into the narrow Orifices of the *Lacteal Veins*, which opens into the Intestines; from whence in slender Channels they are carried into the Glands of the Mesentery; where they receive a fine thin *Lympha* from the *Lymphatick Ducts*, which further dilates it and scours its containing Vessels; which Vessels going from those Mesenterick Glands unite into larger Channels, and those into still larger, and at last pass directly into the common Receptacle of the Chyle; which is a kind of Basin formed for it in the Union of these *Lacteal* and *Lymphatick* Vessels. From thence in one Duct it ascends into the *Thorax*, and sometimes dividing about the Heart, it immediately unites again, and creeping along the Gullet, it passes on to the left *Subclavian Vein*, where in one or two Months it pours in its Contents, and there mixes with the poor Venal Blood returning from all Parts of the Body. And thus doth the Blood receive its Supply and Nourishment.

But if you take *Nutrition* in the Sense which some do, of the Blood nourishing the several Parts of the Body: Then will that kind of Nutrition be performed by a *Secretory Duct* arising from the Termination of an Artery, and carrying a suitable Portion of the Blood to every Part to be nourished; so that every Point of the Body must be the Termination of a *Secretory Duct* thro' which a proper Part of the Blood is brought in order to supply that Part of the Body.

NYMPHA, in such Insects as undergo a Transformation, is the very first Change of the *Eruca*, or of the *Vermiculus Prior*, or Maggot; or indeed, as *Swammerdam* hath proved (in his *Hist. Insect. general.*) rather the Growth and Increase of the *Eruca*, whereby the Figures of the succeeding Animal is beginning to be expressed by the Explication of its Members, which before lay involved up in the *Eruca* (like a Plant in its Seed;) so that in Reality it is only the Animal under that imperfect Form is called the *Nympha*, the Word being taken from *Aristotle* in his *Hist. Anim. Lib. v. c. 19.* where he uses it for the first Rudiment of an Insect. This *Nympha* is sometimes called *Chrysalis*, sometimes *Aurelia*, and sometimes *Necydalus*; all which Terms signify the same Thing.

O The Seven *Antiphones* or Alternate Hymns of Seven Verses, &c. sung by the Choir in the Time of *Advent*, was formerly called *O*, from their Beginning with such an Exclamation.

OATH, in the Law-Sense, is an Affirmation or Denial by any Christian of a Thing lawful and honest, before one or more that have Authority to give the same; for the Advancement of Truth and Right, calling Almighty God to witness that his Testimony is true. 'Tis called sometime *his Corporal Oath*, because he toucheth with his Hand some part of the Holy Scripture of the *New Testament*, and most usually of the Four Gospels (whence the Phrase for lawful swearing is *Sacro-sanctis Testis Evangeliiis*.)

OBEDIENTIA, was anciently used as a Term for Rent; but in the Common Law 'Tis taken for an Office, or for the Administration of an Office; and thereupon

OBEDIENTIALES, is used in the Provincial Constitutions for those that have the Execution of any Office under their Superiors.

OBIT, signifies an Office for the Dead or a Funeral Solemnity: The Anniversary of any Person's Death was also called an *Obit*. And in Religious Houses, &c. they had formerly an

OBITUARY, which was a Register or Calendar wherein they enter'd the Obits or Obital Days of their Founders or Benefactors.

OBLATA; were formerly Gifts made (tho' properly Offerings) to the King by any of his Subjects; and were so carefully taken Notice of by *K. John* and *Hen. 3.* that they were enter'd in the Fine Rolls under this Name of *Oblata*.

OBLATÆ; were the Consecrated Wafers or Hosts distributed to the Communicants in the Mass or Sacrament of the Altar; and sometimes the customary Treats in Religious Houses have been called by this Name of *Oblata*.

OBLATIONS of the Altar, were customary Offerings from the Parishioners to their Priest, which were solemnly laid upon the Altar; of which the Mass or Sacrament Offerings were usually Three-pence at *Christmas*, Two-pence at *Easter*, and a Penny at the two other principal Feasts. The customary Dues also for *Sacramentalia* or Christian Offices, were comprehended under this Title; and also all little Sums for saying Masses for the Souls of Persons deceased.

OBLATIONES Funerales, were the *Soul Scent* or Offerings to expiate the Omissions or Defaults of the Party deceased in paying Tythes or other Ecclesiastical Dues: At first this was an Oblation at the Funeral, and was often the best Horse of the Defunct, led before the Corps, and delivered at the Church-Gate or Grave, for the Use of the Parish-Priest.

To this Custom we owe the Original of Mortuaries. If the Corps were buried any where else, the Offerings were due to the Parish-Priest where the Party died.

At the Burial of the Dead, it was a Custom for the surviving Friends to offer liberally at the Altar, for the pious Use of the Priest, and the good Estate of the Soul departed; and the Reliques of

this superstitious Custom do still remain in *North-Wales*, where at the Rails of the Communion-Table, there is a Tablet or flat Board fixed, to receive the Money, which at most Funerals is offered by the surviving Friends, according to their own Ability and that of the Deceased. *Dr. Kennet's Glossary.*

OBLIGATION, by the Civilians, is defined to be a *Cause of Action*, and a legal Bond or Tie which compells by Action to give or to do according to the *Roman Law*. And they divide Obligations into *Natural*, *Civil*, and *Mix'd*: a *natural Obligation* is what arises only from meer natural Equity; and this they distinguish into *Effectual* and *Ineffectual*: The former of which, tho' there is not Ground enough for Action by the *Roman Law*, yet may bar by *Plea* and *Exception*; but the latter hath no Assistance from any positive Law, but consists meerly in the Conscience or Pleasure of the Party. A pure *Civil Obligation* owes its Original or Birth to the Strictness of a positive Law, without Natural Equity. A *Mix'd Obligation* is a Legal Bond, having its Strength both from Natural and Civil Laws.

OBLIQUE Force, is that whose Line of Direction is not at Right Angles with the Body on whom it is imprest. The *Ratio* which such an *Oblique Force* to move a Body, bears to a *Direct* or *Perpendicular Force*, will by this Diagram be easily understood to be always as the *Sine of the Angle of Incidence is to the Radius*. Let *a b* be the

Side of any Body on which an *Oblique Force* falls, with the Direction *d a*; draw *d c* at Right Angles to *d b*, a Perpendicular let fall from *d* to the Body to be moved, and make *a d* the Radius of a Circle. 'Tis plain, that the *Oblique Force d a*, by the Laws of Composition and Resolution of Motions will be resolved into the two Forces *d c* and *d b*; of which *d c* being parallel to *a b*, hath no Energy or Force to move that Body; and consequently *d b* expresses all the Power of the Stroke or Impulse upon the Body to be moved. But *d b* is the Right Sine of the Angle of Incidence *d a b*; wherefore the *Oblique Force d a*, to one falling perpendicularly is as the Sine of the Angle of Incidence to Radius. Q. E. D.

OBLIQUITY of the Ecliptick. 'Tis well known that the Plane of the Terrestrial Equator is inclined to that of the Ecliptick in an Angle of 23 Degr. 30 Min. or rather more accurately 23°. 29'. And this Angle (allowing for a very small Nutation of the Earth's Axis, which tho' necessarily deducible from the Principles of the *Newtonian Astronomy*, need not here be considered) hath always yet continued the same: As any one may find if they will on the two Solstitial Days observe the Sun's Meridian Altitudes, and then freeing them from Refractions, Parallax, &c.

subtract the Winter from the Summer Altitude ; for then half the Difference between them will be found to be $23^{\circ}.29'$. the Quantity of the Angle of the Inclination or Obliquity of the Ecliptick to the Plane of the Equator.

OBOLUS, tho' now taken to signify our Half-penny, anciently signified the *Half Noble*. The Noble or *Floren* being called a Penny, and its quarter part a *Farthing* : And indeed in the old Histories and Accounts of Coin, you are to understand by the Word *Denarius*, the whole Coin, be it *Angel*, *Rial*, &c. and by *Obolus* its half ; and by *Quadrans* its fourth part.

OBSERVATION. The Seamen call an *Observation* the taking the Sun or any Stars Meridian Altitude, in order thereby to find their Latitude ; and how they do this you will find under that Word : And they call finding the Latitude by the Name of *Working an Observation*.

OCCIPITO-Frontalis, is a Muscle of the Skin of the *Occiput* and *Os Frontalis*, which is usually called *Occipitalis* ; it arises fleshy from the transverse Line of the *Occiput*, opposite to part of the superior Termination of the *Mastoidæus*, and part of the Beginning of the *Trapezius* next it, and then tendinous from the rest of the Line backwards, arising after the same Manner on the other side ; from thence it goes strait up, and soon becoming all tendinous, it covers the two *Parietal Bones*, and the *Ossa squamosa* above the *Temporal Muscles*, its outer Edge being fastened to the *Os Zygale* on each Side. This broad Tendon near the *Coronal Suture* grows fleshy, and descends with streight Fibres as low as the *Musculi Orbiculares*. It is inserted into the Skin at the Eyebrows having sent down between them a narrow fleshy Slip or Elongation which is continued over the *Ossa Nasi*, as far as its Cartilaginous Parts, where its Fibres run off on each Side, and terminate in the Skin above the *Musculus Nasi proprius*. When this Digrastrick Muscle, which covers all the upper Part of the Skull like a Cap, acts, it pulls the Skin of the Head backwards, and at the same time draws up and wrinkles that of the Forehead, and is antagoniz'd by the *Corrugator*.

OCCUPANCY, in the Civil Law, is the Possession of such things as at present belong to no private Person, but however are capable to be made so ; as by seizing or taking of Spoils in War, of things wild by Nature, as Birds and Beasts for Game, &c. or by finding things before undiscovered, or truly lost, or lost by their proper Owners.

OCCUPIERS of Walling, are certain annual Officers in the *Cheshire Salt-works*, who see Right done between Lord and Tenant, and all Persons concerned ; they appoint also how many Houses shall work at a Time, &c. and order a Cryer to proclaim the Time of kindling the Fires, &c. See *Salt*.

OCEAN, is the vast Collection or Union of all the Seas which compass round the whole Earth, and in which the two great Continents of *Europe*, *Asia*, and *Africa* on one side of the Northern, and Southern *America* on the other, are but like two large Islands. This great and universal Ocean, is sometimes by Geographers divided into 3 Parts ; as 1. The *Atlantick* and *European Ocean*, lying between Part of *Europe*, *Africa*, and *America*. 2. The *Indian Ocean*, lying between *Africa*, the *E. Indian Islands*, and *New Holland*. 3. The great *South Sea*

or the *Pacifick Ocean*, which lies between the *Philippine Islands*, *China*, *Japan*, and *New Holland*, on the West, and the Coast of *America* on the East. Sometimes also with Regard to *Europe*, they call that the *Hyperborean Ocean* which encloses it on the North ; and that which encloses it on the West, the *Western Ocean*. That Sea which encloses *Asia* on the North and East is often called the *Tartarean*, and sometimes the *Chinese Ocean* ; and on the South *Asia* is bounded by three Seas, which are called the *Indian*, *Persian*, and *Arabian Ocean*. Also the great Sea on the East of *Africa*, is called the *Oriental Ocean*, as is also that vast Sea which encloses *America* on the East.

OCTAVES, in old *English* the *Uta's* were eight Days after any eminent Festival ; and such Festivals are enumerated in the Laws of *Edward the Confessor*.

OCTO Tales. See *Tales*.

ODIO and *Atia*, was an old Writ mentioned in the Statute of *Westminster* 1. and made 3 E. 1. cap. 11. It was directed to the Sheriff, to enquire whether a Man committed to Prison for a Suspicion of Murder, be committed on just Cause, or only upon Malice : If the latter were the Cause, then another Writ came to the Sheriff to Bail him. But now this Course is taken away by 28 E. 3. cap. 9.

OECONOMICUS, was formerly used for the Executor of a last Will and Testament, as the Person who had the Oeconomy or Fiduciary Disposal of the Deceased's Goods.

OFFERTORIUM, formerly was used for a Piece of Silk or fine Linnen, to receive and wrap up the Oblations or occasional Offering in any Church.

OGEE, *Ogive*, and as it is often written O—G— is a sort of Moulding in Architecture, consisting of a Round and a Hollow. *Vitruvius* makes it two quarter Circles. *Scamozzi* and some others, make the Arches flatter. 'Tis almost in the Form of an S, and is the same with what *Vitruvius* calls *Cima*. *Cima reversa* is an O—G— with the Hollow downwards, as some define it.

OLERON Laws, are so called, because made when King *Richard I.* was there (i. e. at *Oleron*, an Island in the Bay of *Aquitain* in France) they have Respect to Maritime Affairs.

OPACITY. Sir *Is. Newton*, *Opticks*, Book 2. shews that the Opacity of all Bodies ariseth from the Multitude of Reflections caused in their Internal Parts : And he shews also, that between the Parts of the opaque and coloured Bodies, there are many Spaces either empty or replenished with Mediums of other Densities ; and he shews the true or principal Cause of Opacity to be this Discontinuity of their Parts ; because some opaque Bodies become transparent by filling their Pores with any Substance of equal or almost equal Density with their Parts. Thus Paper dipp'd in Water or Oil, the *Oculus Mundi* Stone steep'd in Water, Linnen Cloth oil'd or varnished, and many other Substances soaked in such Liquors as will intimately pervade their little Pores, become by that Means more transparent than otherwise ; as on the contrary, the most transparent Substances may, by evacuating their Pores or separating their Parts, be render'd sufficiently opaque ; as Salts or wet Paper, or the *Oculus Mundi* Stone by being dried, Horn by being scrap'd, Glass by being powder'd or flaw'd, Water by being form'd into small Bubbles,

Bubbles either alone in the Form of Froth, or by shaking it together with Oil of Turpentine, or some other convenient Liquor with which it will not perfectly incorporate.

But however, to render Bodies opake and coloured, their Interstices must not be less than of some definite Bigness; for the most *opacous* Bodies that are, if their Parts be subtilly divided (as when Metals are dissolved in acid Menstruums) become perfectly transparent. And on this ground it appears, why Water, Glass, Salt, and some Stones are transparent, for they are as full of Pores and Interstices as the Bodies are; but yet their Parts and Interstices are too small to cause Reflections in their common Surfaces: Wherefore white Metals become opake not from their Density alone, but from their Parts being of such a bigness as fits them to reflect the White of the first Order. And as he shews, that the White of the first Order is the strongest which can be made by Plates of transparent Substances, so it ought to be stronger in the denser Substances of Metals than in the rarer ones of Air, Water and Glass. And he thinks that metallick Substances of such a Thickness as may fit them to reflect the White of the first Order, may by reason of their great Density reflect all the Light incident upon them, and so be as opake and splendent as 'tis possible for any Body to be. See *Colours*.

OPENING of the Trenches; is the first breaking Ground of the Besiegers, in order to carry on their Attacks against the Town. The Difference between this and *carrying on the Trenches*, is, that *this* is only the Beginning of the Trench: It is begun by a small Foss or Ditch which the Pioneers make in the Night on their Knees, usually about a Musket-shot from the Place, but if there be no hollow nor rising Ground to favour them, they begin farther off. This small Foss is afterwards enlarged by the next Pioneers which come behind the first; and so 'tis dug deeper by Degrees till it be about 12 Foot broad and 5 Foot deep. The Earth that is dug out is thrown up as they go along, and serves them for a Parapet to save them from the Fire of the Town. The Place where the Trenches are opened, is called the End of the Trench.

OPPOSITE Sections. If a Cone be cut by a Plane through its Vertex, and afterwards by a second Plane parallel to the former, this latter Plane produced through the opposite Cone, will there make the opposite Sections. See *Conick Sections*.

OPTICK Pyramid, is made by Rays coming from the several Angles of the superficial Base of any Object, and united in a Point in the Eye of the Spectator. Thus if A B C D E be the Base of the Eye in O, the Optick Pyramid O A B C D E O. And when the Base is a Right-Line, as suppose A E or C D, then the Triangle O A E or O C D is called the

OPTICK Triangle, as the Angle A O E or C O D, is called the *Optick Angle*.

OPTICKS, taken properly and simply, is that Science which teaches the Properties of Direct Vision; but in a larger Sense it may comprehend

the whole Doctrine of Light and Colours, and all the Phænomena of visible Objects. In this large Sense our incomparable Sir *Is. Newton* calls his Book of Light and Colours, *Opticks*; and from thence the following Brief Introduction to this Science is taken.

DEFINITIONS.

DEFIN. I.

By the Rays of Light I understand its least Parts, and those as well successive in the same Lines as contemporary in several Lines. For it is manifest that Light consists of Parts both successive and contemporary; because in the same place you may stop that which comes one Moment, and let pass that which comes presently after; and in the same time you may stop it in any one place, and let it pass in any other. For that Part of Light which is stoppt cannot be the same with that which is let pass. The least Light, or part of Light, which may be stoppt alone without the rest of the Light, or propagated alone, or do or suffer any thing alone, which the rest of the Light doth not or suffers not, I call a Ray of Light.

DEFIN. II.

Refrangibility of the Rays of Light, is their Disposition to be refracted or turned out of their Way in passing out of one transparent Body or Medium into another. And a greater or less Refrangibility of Rays, is their Disposition to be turned more or less out of their Way in like Incidences on the same Medium. Mathematicians usually consider the Rays of Light to be Lines reaching from the luminous Body to the Body illuminated, and the Refraction of those Rays to be the bending or breaking of those Lines in their passing out of one Medium into another. And thus may Rays and Refractions be considered, if Light be propagated in an Instant. But by an Argument taken from the *Æquations* of the times of the Eclipses of *Jupiter's Satellites* it seems that Light is propagated in time, spending in its passage from the Sun to us about seven Minutes of Time: And therefore I have chosen to define Rays and Refractions in such general terms as may agree to Light in both Cases.

DEFIN. III.

Reflexibility of Rays, is their Disposition to be turned back into the same Medium from any other Medium upon whose Surface they fall. And Rays are more or less reflexible, which are turned back more or less easily. As if Light pass out of Glass into Air, and by being inclined more and more to the common Surface of the Glass and Air, begins at length to be totally reflected by that Surface; those sorts of Rays which at like Incidencies are reflected most copiously, or by inclining the Rays begin soonest to be totally reflected, are most reflexible.

DEFIN. IV.

The Angle of Incidence, is that Angle which the Line described by the incident Rays contains with the Perpendicular to the reflecting or refracting Surface at the Point of Incidence.

DEFIN. V.

The Angle of Reflexion or Refraction, is the Angle which the Line described by the reflected or refracted Ray contained with the Perpendicular to the reflecting or refracting Surface at the Point of Incidence.

DEFIN. VI.

The Sines of Incidence, Reflexion, and Refraction, are the Sines of the Angles of Incidence, Reflexion, and Refraction.

DEFIN. VII.

The Light whose Rays are all alike Refrangible, I call Simple, Homogeneous and Similar; and that whose Rays are some more Refrangible than others, I call Compound, Heterogeneous, and Dissimilar. The former Light I call Homogeneous, not because I would affirm it so in all respects; but because the Rays which agree in Refrangibility, agree at least in all those their other Properties, which I consider in the following Discourse.

DEFIN. VIII.

The Colours of Homogeneous Lights, I call Primary, Homogeneous and Simple; and those of Heterogeneous Lights, Heterogeneous and Compound. For these are always compounded of the Colours of Homogeneous Lights; as will appear in the following Discourse.

AXIOMS.

AX. I.

The Angles of Incidence, Reflexion, and Refraction, lie in one and the same Plane.

AX. II.

The Angle of Reflexion is equal to the Angle of Incidence.

AX. III.

If the refracted Ray be returned directly back to the Point of Incidence, it shall be refracted into the Line before described by the Incident Ray.

AX. IV.

Refraction out of the rarer Medium into the denser, is made towards the Perpendicular; that is, so that the Angle of Refraction be less than the Angle of Incidence.

AX. V.

The Sine of Incidence is either accurately or very nearly in a given Ratio to the Sine of Refraction.

Whence if that Proportion be known in any one Inclination of the incident Ray, 'tis known in all the Inclinations, and thereby the Refraction in all Cases of Incidence on the same refracting Body may be determined. Thus if the Refraction be made out of Air into Water, the Sine of Incidence

of the red Light is to the Sine of its Refraction as 4 to 3. If out of Air into Glass, the Sines are as 17 to 11. In Light of other Colours the Sines have other Proportions; but the Difference is so little, that it need seldom be considered.

Suppose therefore, that RS represents the Surface of stagnating Water, and C is the point of Incidence in which any Ray coming in the Air from A in the Line AC is reflected or refracted, and I would know whether this Ray should go after Reflexion or Refraction: I erect upon the Surface of the Water from the point of Incidence the Perpendicular CP and produce it downwards to Q, and conclude by the first Axiom, that the Ray after Reflexion and Refraction, shall be found somewhere in the Plane of the Angle of Incidence ACP produced. I let fall therefore upon the Perpendicular CP the Sine of Incidence AD, and if the reflected Ray be desired, I produce AD to B, so that DB be equal to AD, and draw CB. For this Line CB shall be the reflected Ray; the Angle of Reflection BCP and its Sine BD being equal to the Angle and Sine of Incidence, as they ought to be by the second Axiom. But if the refracted Ray be desired, I produce AD to H, so that DH may be to AD as the Sine of Refraction to the Sine of Incidence, that is, as 3 to 4; and about the Center C and in the Plane ACP with the Radius CA describing a Circle ABE I draw parallel to the Perpendicular CPQ, the Line HE cutting the Circumference in E, and joining CE, this Line CE shall be the Line of the refracted Ray. For if EF be let fall perpendicularly on the Line PQ, this Line EF shall be the Sine of Refraction of the Ray CE, the Angle of Refraction being ECQ; and this Sine EF is equal to DH, and consequently in Proportion to the Sine of Incidence AD as 3 to 4.

In like Manner, if there be a Prism of Glass (that is, a Glass bounded with two equal and parallel Triangular Ends, and three plane and well polished Sides, which meet in three parallel Lines running from the three Angles of the one End, to the three Angles of the other End) and if the Refraction of the Light in passing cross this Prism be desired.

Let $A B C$ represent a Plane cutting this Prism transversely to its three Parallel Lines or Edges

there where the Light passeth through it, and let $D E$ be the Ray incident upon the first side of the Prism $A C$ where the Light goes into the Glass; And by putting the Proportion of the Sine of Incidence to the Sine of Refraction as 17 to 11 find $E F$ the first refracted Ray. Then taking this Ray for the Incident Ray upon the second side of the Glass $B C$ where Light goes out, find the next refracted Ray $F G$ by putting the Proportion of the Sine of Incidence to the Sine of Refraction as 11 to 17. For if the Sine of Incidence out of Air into Glass be to the Sine of Refraction as 17 to 11, the Sine of Incidence out of Glass into Air must on the contrary be to the Sine of Refraction as 11 to 17, by the third Axiom.

Much after the same Manner, if $A C B D$ represent a Glass spherically convex on both Sides (usually called *Lens*, such as is a Burning-glass, or Spectacle-glass, or an Object-glass of a Telescope) and it be required to know how Light falling upon it from any lucid Point Q shall be refracted, let $Q M$ represent a Ray falling upon any point M of its first spherical Surface $A C B$, and by erecting a Perpendicular to the Glass at the point M , find the first refracted Ray $M N$ by the Proportion of the Sines 17 to 11. Let that Ray in going out of the Glass be incident upon N , and then find the second refracted Ray $N q$ by the Proportion of the Sines 11 to 17. And after the same Manner may the Refraction be found when the *Lens* is convex on one side, and plane or concave on the other, or concave on both Sides.

Cas. 1. Let $A C B$ be a reflecting or refracting Plane, and Q the Focus of the incident Rays, and $Q q C$ a Perpendicular to that Plane. And if this Perpendicular be produced to q , so that $q C$ be equal to $Q C$, the Point q shall be the Focus of the reflected Rays. Or if $q C$ be taken on the same side of the Plane with $Q C$ and in proportion to $Q C$ as the Sine of Incidence to the Sine of Refraction, the point q shall be the Focus of the refracted Rays.

A X. VI.

Homogeneous Rays which flow from several Points of any Object, and fall almost perpendicularly on any reflecting or refracting Plane or Spherical Surface, shall afterwards diverge from so many other Points, or be parallel to so many other Lines, or converge to so many other Points, either accurately or without any sensible Error. And the same thing will happen, if the Rays be reflected or refracted successively by two or three or more Plane or Spherical Surfaces.

The Point from which Rays diverge, or to which they converge, may be called their *Focus*. And the Focus of the incident Rays being given, that of the refracted or reflected ones may be found by finding the Refraction of any two Rays, as above; or more readily thus.

Cas. 2. Let $A C B$ be the reflecting Surface of any Sphere whose Center is E . Bisect any Radius thereof (suppose $E C$) in T , and if in that Radius on the same Side the point T you take the Points Q and q , so that $T Q, T E$, and $T q$ be continual proportionals, and the point Q be the Focus of the incident Rays, the point q shall be the Focus of the reflected ones.

Cas. 3.

Case 3. Let BCB be the refracting Surface of any Sphere whose Center is E . In any Radius thereof EC produced both ways take ET and Ct severally in such Proportion to that Radius as the lesser of the Sines of Incidence and Refraction hath to the difference of those Sines. And then if in the same Line you find any two Points Q and q , so that TQ be to ET as $E t$ to tq , taking tq the contrary way from t which TQ lieth from T , and if the Point Q be the Focus of any incident Rays, the Point q shall be the Focus of the refracted ones.

And by the same means the Focus of the Rays after two or more Reflexions or Refractions may be found.

Case 4. Let $ACBD$ be any refracting Lens, spherically convex or concave or plane on either side, and let CD be its Axis (that is, the Line which cuts both its Surfaces perpendicularly, and passes through the Centers of the Spheres,) and in this Axis let F and f be the Foci of the refracted Rays found as above, when the incident Rays on both sides the Lens are parallel to the same Axis; and upon the Diameter Ff bisected in E , describe a Circle. Suppose now that any Point Q be the Focus of any incident Rays. Draw QE cutting the said Circle in T and t , and therein take tq in such proportion to tE as tE or TE hath to TQ . Let tq lie the contrary way from t which TQ doth from T , and q shall be the Focus of

the refracted Rays without any sensible Error, provided the Point Q be not so remote from the Axis, nor the Lens so broad as to make any of the Rays fall too obliquely on the refracting Surfaces.

And by the like Operations may the reflecting or refracting Surfaces be found when the two Foci are given, and thereby a Lens be formed, which shall make the Rays flow towards or from what place you please.

So then the Meaning of this Axiom is, that if Rays fall upon any plane or spherical Surface or Lens, and before their Incidence flow from or towards any Point Q , they shall after Reflection or Refraction flow from or towards the Point q found by the foregoing Rules. And if the incident Rays flow from or towards several Points Q , the reflected or refracted Rays shall flow from or towards so many other Points q found by the same Rules. Whether the reflected and refracted Rays flow from or towards the Point q , is easily known by the Situation of that Point. For if that Point be on the same side of the reflecting or refracting Surface or Lens with the Point Q , and the incident Rays flow from the Point Q , the reflected flow towards the Point q and the refracted from it; and if the incident Rays flow towards Q , the reflected flow from q , and the refracted towards it. And the contrary happens when q is on the other Side of that Surface.

A X. VII.

Where-ever the Rays which come from all the Points of any Object meet again in so many Points after they have been made to converge by Reflexion or Refraction, there they will make a Picture of the Object upon any white Body on which they fall.

So if PR represent any Object without Doors, and AB be a Lens placed at a Hole in the Window-shut of a dark Chamber, whereby the Rays that come from any Point Q of that Object are made to converge and meet again in the point q ; and if a Sheet of white Paper be held at q for the

Light there to fall upon it: The Picture of that Object PR will appear upon the Paper in its proper Shape and Colours. For as the Light which comes from the Point Q goes to the Point q , so the Light which comes from other points P and R of the Object, will go to so many other corresponding

spendent Points p and r (as is manifest by the sixth Axiom;) so that every Point of the Object shall illuminate a correspondent Point of the Picture, and thereby make a Picture like the Object in Shape and Colour, this only excepted that the Picture shall be inverted. And this is the Reason of that vulgar Experiment of casting the Species of Objects from abroad upon a Wall or Sheet of white Paper in a dark Room.

OPTION; when a new Suffragan Bishop is consecrated, the Archbishop of the Province, by a customary Proclamation, claims the Collation of the said vacant Benefice, and signifies in that See, according as he shall think fit, which Choice is therefore called the Archbishop's Option.

ORA or OR, in the time of the Saxons, according to Sir H. Spelman, signified an Ounce, and he thinks, that it was so used of Money, in value to Pence; and the Judgment of the Author of the Customary, concerning that when we find Mention made of 12 Ounces a Pound, then the Ounce is 12 Pence; and whenever there is said to be 12 Ounces a Pound, the Ounce is 12 Pence, in which he agrees with Somner.

ORANDO, for Regere; was a Word formerly (before there was any Colled purposely appointed) requiring the Bishops and Clergy, to pray for the peace and good Government of the Kingdom; and for a good Understanding between the King and his Parliament.

ORBIT. The Orbit of the Planets are not all in the same Plane with the Equick of the Earth's Orbit round the Sun; but variously inclined to it, and to one another at different Angles: But the Plane of the Equick intersects the Plane of the Orbit of every Planet in a Right Line, which passes thro' the Sun. The Orbits of the Inclinate ones of the Planets, the Orbits of the Primary Planets, are as follows. That

of Saturn is inclined to the Plane of the Equick at an Angle of 1 Degree 30 Minutes. That of Mars is a little more than 2 Degrees.

In like manner when a Man views any Object PQR , the Light which comes from the several Points of the Object is so refracted by the transparent Skins and Humours of the Eye, (that is, by the outward Coat EFG called the *Tunica Cornea*, and by the crystalline Humour AB which is beyond the Pupil mk) as to converge and meet again at so many Points in the Bottom of the Eye, and there to paint the Picture of the Object upon that Skin (called the *Tunica Retina*) with which the Bottom of the Eye is covered. For Anatomists, when they have taken off from the Bottom of the Eye that outward and most thick Coat called the *Dura Mater*, can then see through the thin-

ner Coats the Pictures of Objects lively painted thereon. And these Pictures propagated by Motion along the Fibres of the Optick Nerves into the Brain, are the Cause of Vision. For accordingly as these Pictures are perfect or imperfect, the Object is seen perfectly or imperfectly. If the Eye be tinged with any Colour (as in the Disease of the *Jaundice*) so as to tinge the Pictures in the Bottom of the Eye with that Colour, then all Objects appear tinged with the same Colour. If the Humours of the Eye by old Age decay, so as by shrinking to make the *Cornea* and Coat of the *Crystalline Humour* grow flatter than before, the Light will not be refracted enough, and for Want of a sufficient Refraction will not converge to the Bottom of the Eye, but to some Place beyond it, and by Consequence paint in the Bottom of the Eye a confused Picture, and according to the Indistinctness of this Picture the Object will appear confused. This is the Reason of the Decay of Sight in old Men, and shews why their Sight is mended by Spectacles. For those Convex-glasses supply the Defect of Plumpness in the Eye, and by encreasing the Refraction, make the Rays converge sooner, so as to convene distinctly at the Bottom of the Eye, if the Glass have a due Degree of Convexity. And the contrary happens in short-sighted Men whose Eyes are too plump. For the Refraction being now too great, the Rays converge and convene in the Eyes before they come at the Bottom; and therefore the Picture made in the Bottom, and the Vision caused thereby, will not be distinct, unless the Object be brought so near the Eye, as that the Place where the converging Rays convene may be removed to the Bottom, or that the Plumpness of the Eye be taken off, and the Refractions diminished by a Concave-glass of a due Degree of Concavity; or lastly, that by Age the Eye grow flatter till it come to a due Figure: For short-sighted Men see remote Objects best in Old Age, and therefore they are accounted to have the most lasting Eyes.

A X. VIII.

An Object seen by Reflection, or Refraction, appears in that Place from whence the Rays after their last Reflection or Refraction diverge in falling on the Spectator's Eye.

If the Object A be seen by Reflexion of a Looking-glass mn , it shall appear, not in its proper Place A , but behind the Glass at a , from whence any Rays AB , AC , AD , which flow from one and the same Point of the Object, do after their Reflexion

Reflection made in the Points B, C, D, diverge in going from the Glass to E, F, G, where they are incident on the Spectator's Eyes. For these Rays do make the same Picture in the Bottom of the Eyes as if they had come from the Object really placed at *a*, without the Interposition of the Looking-glass; and all Vision is made according to the Place and Shape of that Picture.

In like Manner the Object D seen through a Prism appears not in its proper place D, but is thence translated to some other place *d* situated in the last refracted Ray F G drawn backward from F to *d*.

And so the Object Q seen through the Lens AB, appears at the Place *q* from whence the Rays diverge in passing from the Lens to the Eye. Now it is to be noted, that the Image of the Object at *q* is so much bigger or lesser than the Object it self at Q, as the Distance of the Image at *q* from the Lens A B is bigger or less than the Distance of the Object at Q from the same Lens. And if the Object be seen through two or more such Convex or Concave-glasses, every Glass shall make a new Image, and the Object shall appear in the Place and of the Bigness of the last Image. Which Consideration unfolds the Theory of Microscopes and Telescopes. For that Theory consists in almost Nothing else but the describing such Glasses as shall make the last Image of any Object as distinct and large and luminous as it can conveniently be made.

I have now given in Axioms and their Explinations the Summ of what hitherto hath been treated of in Opticks. For what hath been generally agreed on I content my self to assume under the Notion of Principles, in Order to what I have further to write. And this may suffice for an Introduction to Readers of quick Wit and good Understanding not yet versed in Opticks.

Authors on this Subject are such as these;

Sir Is. Newton's Opticks, Engl. and Lat.

Physico-Mathesis de Lumine, Coloribus, & Irade. per Fr. Mar. Grimaldi. Bononiæ. 1665. 4to.

Cogitationes Physico-Mechanicæ de Natura Visionis. Per J. Ott. Schaphusam. Heidelberg. 1670. 4to.

Synopsis Optica per Honorat. Fabrum, Lugduni. 1667.

L' Occhiale all' Occhio overo Dioptrica Practica. del Carlo Ant. Mancini. Bolognæ. 1660. 4to.

Lectiones 18 Cantabr. in Scholis Habite in quibus Opticorum Phenomena genuina Rationes investigantur & exponuntur. Per D. Is. Barrow. Lond. 1669. 4to.

La Dioptrique Oculaire, par le Pere Cherubin D'Orleans. Paris. 1671. Fol.

A Treatise of Dioptricks, by Will. Molineux, Esq; F. R. S. 4to.

Catoptrica & Dioptrica Elementa. Per D. Gregorium, M. D. Oxon. 1695. 8vo.

Alhazeni & Vitellionis Optica. Fol.

Aguillonii Optica. Antv. 1613. Fol.

L' Optique & Catoptrique du Pere Mursennes, a Paris. 1651.

Christ. Scheineri Optica. Lond. 1632.

Jacobi Gregorii Optica. Lond. 1663.

Joan. Baptist. Porta de Refractione Optices. 15.

Mr. Leibnitz his one Universal Principle of Opticks in Act. Erud. Lipsi. Jun. 1682.

OPTION; when a new Suffragan Bishop is consecrated, the Archbishop of the Province, by a customary Prerogative, claims the Collation of the first vacant Benefice or Dignity in that See, according as he shall choose; which Choice is therefore called the *Archbishop's Option*.

ORA or *Ore*, in the Time of the Saxons, according to Sir H. Spelman, signified an Ounce, and he saith, that it was also a piece of Money, in value 16 pence; and the judicious Author of the *Chronicon Pretiosum*, concludes, that when we find Mention made of 12 Ora in a Pound, then the Ora is 20 pence; and whenever there is said to be 15 Ora in a pound, then the Ora is 16 pence, in which he agrees with Mr. Somner.

ORANDO pro Rege & Regno; was a Writ formerly (before there was any Collect purposely appointed,) requiring the Bishops and Clergy, to pray for the peace and good Government of the Realm, and for a good Understanding between the King and his Parliament.

ORBIT. The Orbits of the Planets are not all in the same Plane with the Ecliptick of the Earth's Orbit round the Sun; but variously inclined to it and to one another at different Angles: But the Plane of the Ecliptick intersects the Plane of the Orbit of every Planet in a Right Line, which passes thro' the Sun. The Quantities of the Inclinations of the Planes of the Orbits of the Primary Planets to that of the Ecliptick are as follows. That of Saturn is an Angle of 2 Degr. $\frac{1}{2}$. That of Jupiter is an Angle of 1 Degr. 20 Min. That of Mars is almost 2 Degr. Venus is a little more than 3 Degr. 20'. And that of Mercury is a little more than 7 Degr.

ORDEAL, was the old Judicial Custom of proving the Guilt, or attesting the Innocence of parties accused; chiefly by Water or Hot Iron. This Ordeal was simply call'd *Judicium*, in Opposition to *Bellum*, which was Duel or Combat Fight, the other customary purgation. Neither of these Trials were taken away by William the Conquerour, as Sir W. Temple asserts. Ordeal might be undergone by Servants or Deputies in the Cause and Name of their Masters; especially of those Lords who were Bishops and Ecclesiastical Men. Dr.

Kennett's

Kenner's Glossary at the End of his Parochial Antiquities.

ORDINANCE of the Forest, is a Statute made about Forest Causes in the Thirty Fourth Year of Edw. I. See *Affize*.

ORDINATE Figures (in Geometry) are the same with Regular ones; that is, they are *Equilateral* and *Equiangular*.

ORDONANCE, in Painting or Sculpture, is the just and elegant Composition of the whole Piece by a proper, natural, and agreeable Disposition of the Figures, so as to answer the Design of the History.

ORGANICAL Description of Curves, is the Method of Describing them on a Plane by the Regular Motion of a Point. See some excellent short Theorems for this, invented by Sir *Is. Newton*, under the Word *Curves*.

ORIGINALIA, is the Term for Records or Transcripts sent out of the Chancery into the Lord Treasurer's Remembrancer's Office in the Exchequer: These are distinguished from *Recordæ*, which signify the Judgments and Pleadings in Suits try'd before the Barons of that Court.

OSTINEÆ, so some Anatomists call the Entrance into the Cavity of, or the Mouth of the *Matrix*, where it joins the upper End of the *Vagina*, and makes a little Protuberance in the Form of Lips.

OVARIA: The *Ovaria* in Women are about half as big as the *Testicles* in Men; their Surface is smooth and equal in Virgins, but in Women of Years unequal and wrinkled. They are covered with a proper Membrane, which sticks close to their Substance, and with another common from the *Peritonæum*, which covers also the *Spermatick* Vessels. The Substance of the *Ovaria* is composed of Fibres and Membranes, which leave little Spa-

ces, in which there are several small Vesicles, round, full of Water, and which when boiled, harden like the Whites of Eggs; they have each of them two proper Membranes, on which there are several small Twigs of Veins, Arteries and Nerves. These Vesicles are called *Eggs*. The *Ovaria* have Nerves also from the Intercostals, and Lymphatics, which discharge themselves into the common Receptacle of the Chyle.

OVOLO or *Echinus*, in Architecture, is a part of the Ornaments or Mouldings of the Cornish of a Pillar; which in the Tuscan and Dorick Orders is turned like a *Scimæ* or *Cymatium*, and is substituted for the Support of the *Corona*; in the *Dorick* Order it usually hath a slender *Regula* above it, and in the *Corinthian* both above and below too, where it is likewise carved and adorned with a broad *Welt* like a *Plinth*.

OUSTER *la main*, in a legal Sense, denotes a Judgment given for him that sued or traversed a *Monstrans le Droit*; and is indeed a Delivery out of the King's Hands; for when it appeareth on the Matter discussed, that the King hath no Right or Title to the Thing seized, then Judgment shall be given in the Chancery, that the King's Hand be *amoved*, and thereon an *Amoveas Manum* or *Ouster la main* shall be awarded to the Escheator; which is as much as if Judgment were given that he should have his Land again. Now, all Wardships, Liveries, Premier Seisins, and *Ouster la mains* are taken away by 12 Car. 2. c. 24.

OUTFANGETHF, was a Privilege granted to some Lords of Mannors from the Crown, to try Foreigners or Strangers apprehended for Theft within their own Fee.

O YES, is a Corruption from the French *Oyez*! hear ye! being the Form used by our Criers in Courts, &c. to make Proclamation of any Thing.

P A I

PACK of Wool, is a determinate Quantity of 17 Stone and two Pound Weight, being a common Horse Load.

PACTUM *Commissorium*, in the Civil Law, is an Agreement between Buyer and Seller, but on this Condition, that if the Price contracted for be not paid before a certain Day, that then the Bargain shall be void.

PAINTING. Books treating of this Art, and of the Eminent Artists, are as follow.

An Idea of the Perfection of Painting: Originally written in French by Rowland Treart, Sieur de Cambray, and rendred English by J. Evelyn, Esq; F. R. S. Lond. 1668. 8vo.

A General Idea of the Art of Painting, and a Relation of 7 Conferences held at Paris in the Academy Royal for the Improvements of the Arts of Painting and Sculpture.

Optique de Portraiture & Peinture, contenant la Perspective Speculaire & Pratique Accomplie. &c. per Gregoire Huret de l'Academ. Royale de Peinture & Sculpture, a Paris. 1670. Fol.

Vol. II.

P A L

Entretiens sur les Vies & sur les Ouvrages des plus Excellens Peintres Anciens & Modern, per M. Felibien.

PALATO-*Salpingæus*, a Muscle of the *Tuba Eustachyana*. See *Musculus Tube Novus*.

PALATO-*Staphilinus*, is a Muscle of the *Voula*, arising fleshy from the middle of the *Os Palati*, near its juncture with its Fellow of the other Side, and running strait forwards, it is inserted near the Extremity of their duplicated glandulous Membrane called the *Gargareon*: Its Use is to pull it forwards and downwards. Dr. *Dowglas*, *Myogr. Comp. Spec.*

PALLIFICATION, in Architecture, is the Piling the Ground-work, or strengthening it with Piles or Timber driven into the Ground, when they build upon a *Moist* or *Marshy* Soil. *Builders Dictionary*.

PALLISADES *turning*, are an Invention of Mr. *Coehorn's*, for in Order to preserve the *Pallisades* of the *Parapet* from the *Besiegers* Shot; he orders them so, that as many of them as stand in the length of a Rod, or in about 10 Foot, turn up and

P P P

and down like a Trap ; so that they are not in Sight of the Enemy, but only just when they bring on their Attack ; and yet are always ready to do the proper Service of Pallisades.

PALLS, *Pallia*, were Vestures made of Lambs Wool (25. H. 8. 20.) about 8 Fingers broad, and with two Labells hanging down before and behind: These the Pope gives or sends to Archbishops and Metropolitans, who wear them about their Necks at the Altar above their Ornaments. We retain something of the Figure of it, in what the Heralds call a *Cross Pall*.

PANEL; some say is a little Part of any Thing; others, as *Spelman*, say it signifies a Schedule or little Page; which seems truest, for hence comes our Law Word to Empennel a Jury, *i. e.* to write the Names in a Pannel or Schedule of such Jurors as the Sheriff returns to pass upon any Trial.

PANNAGE, *Pannagium* ; signified formerly both the running and feeding of Hogs within a Forest, and also the Price that was paid for their so running. *Pannagium Liberum*, or *Free Pannage*, was a Liberty of free running for Swine within the Limits of such Forests or Woods ; and was sometimes a Privilege granted to some private Persons, and to several Religious Houses. If this Pannage were not duely paid, there was a *Process* from the *Exchequer* and a *Destraint* by the *Sheriff*. The Title of *Pannage* was sometimes alienated from the Parish Priest to the Appropriators. *Dr. Kennet's Paroch. Antiq.*

PAPILLÆ *Pyramidales*, are the Extremities of all the Nerves of the Skin, and serve more immediately for the Sense of Feeding and Touching; about them there is a Web of Nerves and other Vessels all covered with a Mucous Substance, to moisten them and keep them in good Order. Under these *Papillæ Pyramidales* lie the *Glandulæ Miliæres*, which see. See also the word *Skin*.

PAR, in Exchange of Money, is a certain Number of Pieces of the Coin of one Country, which contain in them an equal Quantity of Silver to that in another Number of Pieces of the Coin of another Country. v. g. Suppose 36 Shillings of *Holland* to have just as much Silver in them as 20 Shillings *English*; then Bills of Exchange drawn from *England* to *Holland* at the rate of 36 Shillings *Dutch* for each Pound Sterling is according to Par.

PARABOLA. To draw a Tangent to the *Para-*
bola in a Point assign'd.

Let the Point assigned be M , and the Parameter $= p$.

Then the Equation expressing the Nature of the Curve is $|px = yy|$

Suppose the Tangent
found and all Things drawn
as in the Figure;

'Tis required to determine the Subtangent TO ; now the Δ 's $m R M$ and MOT being similar, let the former be noted with its proper Fluxionary Letters, and then this Proportion will arise;

$y \cdot x^2 : y \cdot \frac{xy}{y} (= O T)$. and the Equation of
the Curve being $\overline{px=yy}$ the Fluxion $(px=2yy$

and dividing all by p ; $\frac{xy}{p} = x$. and substituting

$\frac{2yy}{p}$ instead of x , in the Quantity $\frac{x}{y} = OT$, you

will find that $\frac{2yy}{p} =$ is also equal to OT . Then

substituting px instead of yy , you will have $\frac{2x^2}{p}$
or $2x = OT$: That is, in the common *Parabola*,
The Subtangent is always = to twice the Abscissa.

N. B. In any *Parabola* if the Parameter be supposed = 1. and m be the Index of the Power of y , and a positive Number, whole or broken, then will $y^m = x$ express the Nature of all *Parabola's*,

The Subtangent TO in the *Parabola* being equal to $2x$: and $\square MO = (yy) = px$. by Reason of the similar Triangles MOT and MOQ : $OT (=2x) \cdot y :: y \cdot \frac{yy}{2x} = OQ$, and then putting

for yy its equal px it will be $\frac{p_x}{2x} = 0Q$ or $\frac{p}{2} = 0Q$

which gives you a very remarkable Property of the common *Parabola*: *viz.* That the *Sub-normal*, as the Line *OQ* is called, is always equal to half the Parameter of the Axis, and consequently a standing Quantity.

Wherefore 'tis a very ready Way to draw a Tangent to the Parabola, to set off half p from O the Foot of any Ordinate downwards in the Axis, and from Q , draw MQ : And to it at Right Angles MT : For that shall be the Tangent required.

PARABOLICK *Spiral*. See *Helicoid Parabola*.

PARABOLOIDS, are Paraboliform Curves in Geometry; whose Ordinates are supposed to be in a Subtriplicate, Subquadruplicate, &c. Ratio of their respective *Abfiffæ*; and putting x for the *Abfiffa*, y for the *Ordinate*, and p for the *Parameter*, the Equation for the *Cubical Paraboloid* will be $ppx=y^3$ In the *Biquadrical Paraboloid*, the Cube of the *Parameter* into the *Abfiffa* is equal to the *Biquadrate* of the *Ordinate*; that is, $p^3x=y^4$; and so of other *Paraboloids ad infinitum*.

But there is also another Species of the *Paraboloids*; v. gr. 1. Suppose the Parameter multiply'd into the Square of the Abscissa to be equal to the Cube of the Ordinate; that is, $pxx=y^3$. Then the Curve is called a *Semicubical Paraboloid*. And,

2. When $px^2 = y^4$, then 'tis called a *Semi-biquadratic Paraboloid*.

PARACENTRICK *Motion of Impetus*, is a Term in the New Astronomy, for so much as the Revolving Planet approaches nearer to, or recedes farther from the Sun, or Centre of Attraction.

Thus

Thus if a Planet in A move to B, then is SB—SA $\propto$ BB, the Paracentric Motion of that Planet.

Hayes. p. 293.

PARACENTRICK Solicitation of Gravity, or Levity (which is all one with the *Vis Centripeta*) is in Astronomy expressed by the Line AL drawn from the Point A parallel to the Ray SB (infinitely near SA) until it intersect the Tangent BL.

PARADIGRAMMATICE, is the Art of making all sorts of Figures in Plaster. The Artists in this are called *Gypsochi*.

PARALLAX, in the *Leipsick Acts* for October, 1685, there is an Account of the *Cassinian Method* of finding the *Parallaxes* and *Distances* of the Planets from the Earth; practised at Rome by the Abbot *Fran. Blanchinus*.

PARALLAX Diurnal of the Sun. How to find it, see under *Sun* in this Vol.

PARALLEL Sailing in Navigation, is sailing under a Parallel of Latitude: of this there are but 3 Cases. 1. Given Departure and Distance. Required Latitude.

The Canon is, As Diff. of Longitude to Rad. :: so is Distance, to Cosine of the Latitude.

2. Given Diff. of Longitude between two places under the same Parallel; required their Distance.

The Canon is, As Rad. to Diff. Longitude :: so is the Cosine of Lat. to Distance.

3. Having the Distance between two places in the same Latitude, required their Difference of Longitude.

The Canon is, As the Co-sine of Lat. to Distance :: so is Rad. to Diff. Longitude.

PARASTÆ, in Architecture, are the same with *Pilasters*; the *Italians* call them *Membretti*.

PARCEL-makers, are two Officers in the Exchequer that make the parcels of the Escheators Accompts, wherein they charge them with every thing they have levied for the King's Use within the Time of their Office, and deliver the same to one of their Auditors of the Court, to make an Accompt with the Escheator thereof. See the *Practice of the Exchequer*, p. 99.

PARCELLING of the Seam of a Ship, is after it is caulked, to lay over it a narrow piece of Canvas, and then pouring on it hot Pitch and Tar.

PARGETING or *Parging*, is the Workmens Word for plastering of Walls.

PARHELII and *Parbelia*, or such Phenomena as we call *Mock-Suns*, are the Representations of the Face or Figure of the True Sun, by way of Reflection in the Clouds.

PARLIAMENT, comes from *parler* to Speak, and *Ment*, Mind, in Fr. And the Writ which summons our Parliament runs, *ad consulendum*, &c. *de arduis Regni Negotiis*. And therefore signifies a solemn Conference of all the Estates of the Kingdom, summoned together by the King or Queen's

Authority to treat of the weighty Affairs of the Realm. The ancient *Britains* seem to have had no such Assemblies; but that the *Saxons* had something like it, appears from King *Ina's* Laws, who flourish'd An. 712. *W. the Conqueror* divided the Land amongst his Followers, in such manner, that every one should hold of him *in Capite*; and these distributed part thereof among their Friends and Servants; who for the same owed them *Suit* and *Service* in their Courts. The chief of these were called *Barons*, who thrice every Year assembled at the King's Court, viz. at *Christmas*, *Easter*, and *Whitsontide*: and then the King was wont to come amongst them in his Royal Robes, and with his Crown on his Head, to consult about the publick Affairs of the Kingdom. But some say, this ancient Custom was changed by *H. 1.* who in the 16th Year of his Reign, summoned the Commons to the great Council at *Salisbury*. *Cowell's Interpreter*.

PARODICAL Degrees in an Equation in Algebra, are the several Regular Terms in a Quadratick, Cubick, Biquadratick Equation, &c. the Indexes of whose Powers ascend or descend orderly in an Arithmetical Progression, as $z \times z^m + z^r = S$ is a Cubick Equation where no Term is wanting; but having all its *Parodick Degrees* the Indexes of the Terms regularly descending thus, 2, 3, 1, 0.

PARTICLES, are the very small parts of which any natural Body is supposed to be compounded; and these are often called the *constituent* or *component Particles* of any Natural Body. That these are almost infinitely small, the continual Effluvia which some Bodies do continually emit, and this without any sensible Diminution of their Bulk or Weight, as well as some other Experiments and Observations do plainly shew. But how to make any Conjecture at the several Sizes of these component Particles of Bodies, whether they are all equal in Bulk, or which are greater, and how much they are so, than others, is what *Philosophers* have hardly yet had *Data* or Discoveries enough to determine. But the wonderful Sir *Isaac Newton*, in his excellent Book of *Opticks*, hath opened a Door into this new World, and hath given some very good Rules whereby to guess at the Bigness of the Component Parts of Natural Bodies. For he having shewn in *Prop. 5. Book 2. Part 3.* That the transparent parts of all Bodies do most probably exhibit the same Colours with thin plates of Glass, or thin Bubbles of Water, and on the same Grounds; provided they are of the same Thickness and of the same Density with them. And since their Parts seem for the most part to have the same Density with Water or Glass, as by many Circumstances 'tis obvious to collect. To determine the Sizes of those Parts, you need only have Recourse to the Tables in the aforesaid Book for this purpose, in which the Thickness of Water or Glass exhibiting any Colour is express'd. Thus if it be desired to know the Diameter of a Corpuscle, which being of equal Density with Glass, shall reflect Green of the 3d Order, (as he distinguishes it) by looking into the Table, you will

find that the Number 16 $\frac{1}{2}$ shews it to be ———

parts of an Inch. In the general he proves also, That the Parts of Bodies on which their Colours depend are denser than the Medium, which pervades their Interstices. *Prop. 6. B. 2. part 3.*

He shews also at the End of his *Latin Opticks*, That the Component Particles of all Bodies must be hard or solid, or else *Fluid Bodies* could not congeal; which 'tis certain that *Water*, *Oyl*, *Vinegar*, and Spirit or Oyl of *Vitriol* will do by Cold; Quicksilver by the Fumes of Lead; Spirit of Nitre and Quicksilver together by dissolving the Mercury, and then evaporating the *Flegm*: Spirit of Wine, or Urine, by first well dephlegmating them, and then mixing them together, and the Spirit of *Urine* and of *Salt*, by subliming them together to make *Sal Armoniac*. Nay, the very Particles or Rays of Light seems to be hard Bodies, otherwise they could not in their different Sides have different Properties, as he hath shewn that they have (see *Light*.) *Hardness* therefore ought to be accounted as the Property of all simple Matter in the Universe; for all Bodies which we know, are either hard, or may be made so. And if there are many hard Bodies, as we know is the Case of most, that have Pores interspersed, or *Meatus* placed between their Particles; those Particles themselves that are devoid of any such Vacuities must needs be much harder.

'Tis probable that the most small Particles of Matter do attract one another, and adhere together with the greatest Force; and that these may combine into larger Particles, whose attracting Force is weaker; and many of these latter cohering together may form yet greater Particles of Bodies, whose attracting Force shall be yet weaker. And so on by a continual Series, 'till you come to the greatest of those Particles, on which the *Chymical Operations*, and the *Colours* of Bodies depend (see *Attraction* and *Colour*) and these cohering into *Masses* may form Bodies of sufficient Magnitude to become perceptible by Sense.

It hath been discovered of late by the wonderful Sir Isaac Newton, Mr. J. Keil of Oxon, and such others as have proceeded on his Principles, That there is a Power in Nature, by which each Particle of Matter attracts every other Particle with a Force that increaseth in a greater Proportion than that by which the Squares of the Distance decrease; viz in a Reciprocal Triplicate, or Quadruplicate Ratio of the Distances. For, were it not so, the Attraction of these small Particles would not be much greater at the Point of Contact, than at some determinate Distance from it; as is evident in the Case of the Gravity of greater Bodies, whose power of Attraction is only reciprocally as the Square of the Distance; for we find that Bodies are of the same Weight, when at the Earth's Surface, or when at 100 Feet Distance. But when a little Salt is dissolved in a large Quantity of Water, there is no Attraction of the Particles towards one another, till by evaporating part of the Water, they are brought within a due Distance; and then they presently run towards one another, unite, and form Chrystals, whose Parts have a strong Cohesion. (See *Attraction* in this Vol.)

'Tis plain also, that the attractive Force in these Particles is (cæteris paribus) proportionable to their Solidity; for it must be compounded of the Sums of all the Parts of each Particle, and those parts will be most numerous in such Particles as are most solid; i. e. in such as have fewest and least Pores or Interstices between their Parts. For Particles or Corpuscles may be so compounded, that the most solid and compact Particles may constitute the lightest Corpuscle: That is, if the interspersed

Vacuities between the Particles of Matter be large, so that few of them may be diffused thro' a large Space. And such a Corpuscle, tho' consisting of Parts endued with a strong attractive Power, may yet be specifically lighter than another, which may consist of Particles not so solid, but yet much closer put together.

And because this *Natural Philosophy* of Particles is of the greatest Use to be fully understood, I shall here give you (from Dr. Keil's *Book of Animal Secretion*, &c.) some further Propositions about this matter. I say then, That if any Particles of Matter attract each other with a Force that is in a Triplicate or yet greater Reciprocal Proportion of their Distances: The Force by which a Corpuscle is drawn to a Body, made up of such attractive Particles, is infinitely greater at the Contact, or extremely nearer it, than at any determined Distance from it.

Suppose the Sphere *AHB* composed of Particles that attract any Particle, as *P*, with a Force reci-

procally proportionable to the Cubes of their Distances. Draw the Tangent *PH*, and from *H* let fall the Perpendicular *HI*: Bisect *PI* in *L*, and raise the Perpendiculars *LL*, *Aa*, *Ss*, *Bb*; and make *Ss* = *SI*. Then with the Asymptotes *LB*, *Ll* thro' *s* describe the Hyperbola *b s a*; and then the Area *a A B b* — $\frac{1}{2} 2 AS \times SI$; will represent the Attraction of the Corpuscle *P* by Prop. 81. of Sir Isaac Newton's Princip. But when the Corpuscle *P* comes to touch the Sphere in *A*, then the Points *P*, *L*, *A*, *I* and *H* will all coincide; and *Aa* becomes the Asymptote of the Hyperbola, and the Area *a A B b* becomes infinite; and the Rectangle $2 AS \times SI$ being finite, the Area *a A B b* — $2 AS \times SI$, will be infinite; and consequently the Force by which the Corpuscle *P* is attracted by the Sphere, when it touches it in *A*, will be likewise infinite.

If

If the Sphere consists of Particles that attract in a quadruplicate Proportion of their Distances reciprocally, the Force by which a Corpuscle will be drawn to the Sphere will be $\frac{I}{PS^3 \times PI}$.

But when the Corpuscle comes to touch the Sphere, PI becomes $=0$, and consequently whatever is divided by it becomes infinite, and therefore the attractive Force at the Point of Contact being proportional to $\frac{I}{PS^2 \times PI}$, will be infinite.

Prop. IV. If a Body consists of Particles attracting with a Force that is in a reciprocal Proportion to the Cubes of the Distances, or in a greater; and if this Force is not infinitely greater than the Force of Gravity at the Point of Contact, or extremely near it, at any determined Distance from the Point of Contact, it must be infinitely less than the Force of Gravity.

This is clear by the last Proposition: For in that Case, the Force of Attraction in a Corpuscle removed from the Contact is infinitely less than at the Contact, or extremely near it; but at the Contact it is not infinitely greater than the Force of Gravity by the Supposition: therefore the Force, by which a Particle removed at a determined Distance from the attracting Body is attracted, is infinitely less than the Force of Gravity.

Prop. V. The Force, by which the Particles of Matter attract each other, when extremely near the Contact, is not infinitely greater than the Force of Gravity.

This is evident; because in the strongest Cohesion of Particles touching one another, we find that the Weight of some Bodies will pull the Particles asunder, tho' that Body may be prodigiously greater and heavier than the Particles united. Sir Isaac Newton calculates from the Inflection of the Rays of Light, that this Force near the Contact is 10000 0000 0000 0000 greater than the Force of Gravity.

Corol. Particles removed at a determined Distance from the Body attracting, are not acted upon by it; because this Force must then vanish, or which is the same Thing, be infinitely less than the Force of Gravity.

Prop. VI. A large Particle attracts not more strongly than a small one at the same Solidity, but a

Diversity of Figures causes different Degrees of Attraction in Particles, that are otherwise the same.

This attractive Power acts only on such Particles as are extremely near; and therefore of a large Particle, the remotest parts conduce Nothing to Attraction: And for the same Reason the attractive Force varies, according as the Particles are Cones, Cylinders, Cubes, or Spheres: And, *ceteris paribus*, a Spherical Particle has the strongest attractive Power.

Prop. VII. If Particles swimming in a Fluid, attract one another more strongly than they do the Particles of the Fluid, the Force, by which they come to each other, will be that by which their attractive Force, exceeds the attracting Force of the Fluid.

For the Particles of the Fluid, that lie directly between the attracting Particles, being more pressed than the other ambient Particles; they will from the Nature of Fluidity, with that Excess of Pressure, drive the other Particles out of their Places, and make way for the attracting Particles to come together.

Prop. VIII. If Particles swimming in a Fluid are more attracted by the Fluid, than by one another, they will recede from one another, with a Force that will be equal to the Difference of their mutual Attraction, and the Attraction of the Fluid.

For the Ambient Particles of the Fluid attracting more strongly, will with their Excess of Force draw the other Particles to themselves and make them to recede from one another.

Prop. IX. The Force, by which Particles attracting one another cohere, is greater, *ceteris paribus*, where the Contact is greater.

For the Parts that are farther remov'd from the Contact, conduce Nothing to the Force of the Cohesion; and a greater Power must be requisite to separate two Particles, which cohere in two Points, than two Particles which cohere only in one Point, if the Degree of Cohesion be equal in each Point. Thus two polished Marble-stones (suppose a Foot square) adhere more strongly than any other two Bodies of a Foot square, which are not so solid, but have more Pores and Interstices between their Parts, and which will not receive so good a polish, by which the parts come to a close contact with one another.

Prop. X. If the attracting Corpuscles are elastick, they must necessarily produce an intestine Motion, greater or lesser, according to the Degrees of their Elasticity and attractive Forces.

For after meeting they will fly from one another with the same Degree of Velocity (abating the Resistance of the Medium) that they met together with; but when they approach other Particles in their Resilition, their Velocity must increase, because they are afresh attracted, and therefore meeting a second time, they will recede with a greater Velocity than they did at their first Concurfion: And so their Velocities will be increas'd by every Concurfion and Resilition, which must necessarily produce a sensible intestine Motion; and the stronger their attractive Force, and the greater their Elasticity, their Concurfions and Resilitions will be the more sensible.

Prop. XL

Prop. XI. Particles attracting one another in a Fluid, moving either with a swift or slow progressive Motion, attract one another just the same, as if the Fluid was at rest, if all the Particles move equally; but an unequal Velocity of the Particles does mightily disturb their Attractions.

The Particles do all by Hypothesis move equally, and consequently the progressive Motion of the Fluid does not alter their Distances, that is to say, it does not repel them from one another; and consequently they must attract one another with the same Facility as if the Fluid was at rest. But if some Particles move faster than others, some must change their Position in Respect to each other, and those parts, which by the force of Attraction would have come together, will by this unequal Motion be carried from one another. Thus Salts do not cristallize, nor the terrestrial Particles of Urine attract one another, and unite, till the Water, in which they are dissolved, is almost cold; and the intestine Motion of its Particles, caused by heat, is quieted.

Mr. J. Keil of Oxford in Phil. Transact. N. 315. advances these other Theorems about the small Particles of Matter.

1. That the least Particle of Matter assignable, may so fill any large assigned Space, that the Diameters of the Pores, Interstices, or Meatus between its Parts may be all less than any given Right Line; or, so that all the Parts of such a Particle, shall be nearer to each other than any given Right Line. See his Lecture De Divisibilitate Materiae, in his Lectiones Physicae.

2. Two Bodies may be assigned or given equal in Bulk, but yet any how unequal in Specific Gravity, or in the Quantity of Matter in each; so that the Sums of the Pores or Meatus in each, shall be nearly equal.

V. gr. Let there be a Cubick Inch of Gold and another of Air: Tho' the Quantity of Matter in the former may be 20000 Times as great as that in the latter: Yet the Vacuities in the Gold, may be to those in the Air, as 999999 to 1000000; i. e. very nearly equal.

3. Those Particles which constitute Water, Air, or any other Fluid, (if they touch one another) are not absolutely solid; but are compounded of other Particles, which do contain within them many Pores or Vacuities.

And he thinks that such Particles of Matter as are the least of all others, and which are perfectly solid and devoid of all interspersed Vacuities, may be called The First or Primary component Particles of Matter, or Particles of the first Composition.

Such Molecules as are compounded by the Coalescence of any of these first Particles (only) may be called Particles of the 2d Composition. And such Moles as are compounded of these second Molecules by several of them coalescing together may be called Particles of the third Composition: And so on till you come to Particles out of which the last Composition of Bodies is made, and into which they are primarily dissolved.

4. If a Particle of Matter touch any Body, the Force with which it tends toward the Body, or by which it adheres to it, is proportionable to the Quantity of the Contact, for such Particles as lie remote

from the Place of Contact add Nothing to the Cohesion.

And therefore according to the several Degrees or Quantities of the Contact of Particles, there will arise several Degrees of the Firmness or Cohesion of Bodies. And the greatest Force or Degree of Cohesion, will be when the Surfaces of the cohering Particles are perfectly plane; for there the Force by which any Corpuscle adheres to another, will (*ceteris Paribus*) be as the Parts of the Superficies which do adhere to, or touch one another.

And from hence, and I believe hence only, can that hitherto difficult Problem, about the Cause of the Cohesion of the Parts of Matter in solid and firm Bodies be solved.

5. Those Corpuscles or Particles of Matter are most easily separable one from another, whose Contacts with other Particles are fewest and least; as will be the Case of exceeding Particles of a Spherical Figure.

And from hence, and hence only, can the True and Primary Reason of Fluidity arise.

6. If the Texture of a Body be such, that its Particles of the last Composition (see Prop. 3.) can be moved a little from their primary State of Cohesion or Contact by some external Force (such as the Weight and Compressure, or the Stroke or Shock of some other Body.) But yet so as that the Particles of the Body don't by this Pressure or Stroke, run into any new Contacts or Cohesions; Then, I say, they will recover again their former Contacts, by the Power of Attraction, or by a Force that will make them tend towards one another: And consequently, such a Body, will, after the Pressure or Stroke, recover again its former Figure and Position of its Particles.

And this is the Reason of the Elasticity of Bodies.

7. But if the Texture of a Body be such, that when its Particles are by some external Force removed from their former Contacts and Cohesions, they go immediately into others of the same Degree; that Body cannot recover its former Figure and Position of Parts.

And this is the Texture of such Bodies as are soft, and herein the Reason of their Softness consists.

8. As Particles which are perfectly solid will attract one another the most strongly; and as in all other Particles the Power of their Attraction is proportionable to their Density or Solidity; so that the attractive Forces of even Particles perfectly Dense or Solid, depend much upon their Figures.

For if a small Particle of Matter be supposed to be formed into an indefinitely small Plate or Lamina, of a Figure perfectly circular; and if another Particle of Matter be supposed to be in a Right Line passing thro' the Centre of that Plate, and at Right Angles to its Plane: Then if you suppose that Particle to be distant from the circular Plate a tenth Part of the Radius of that Circle; I say, the Force by which that Corpuscle is attracted by the Plate is 30 Times less than if the attracting Matter had coalesced into a Spherical Figure: So that the Virtue of the whole Particle had been diffused, as it were from one Physical Point.

But yet this circular Plate will more strongly attract the Particle than any other Particle of the same Weight with it, that shall be formed into a long and slender Cylinder.

9. Salts

9. Salts are Bodies, whose Particles of the last Composition are endowed with a very great attractive Force: But yet between those Particles, there are very many Pores or Meatus, which are pervious to the Particles of the last Composition of Water; which aqueous Particles being strongly attracted by the Saline ones, do rush towards them with an Impetuosity, do disjoyn their mutual Contact, and dissolve their Cohesion.

10. A Body specifically heavier than Water, may have its Magnitude so diminished, that it shall be suspended by or swim in Water, and not descend by its own Weight.

And this is the Reason that the small Particles of Salts and Metals will swim in such Menstruums as will dissolve those Metals, &c.

10. Greater Bodies attract one another with a less Force than lesser ones do.

For the Force with which the Bodies *A* and *B* attract one another, exerts it self only in those Particles which are near one to another, the remote ones having no such Force; wherefore there is no greater attractive Force required to move the Bodies *A* and *B* towards one another, than to move *c* and *d*. But the Velocity of Bodies moved by the same Force, are reciprocally proportional to those Bodies: Wherefore the Velocity by which *A* tends towards *B*, will be to the Velocity with which the Particle *c*, apart from the Body, tends towards *B*: as the Particle *c* to the Body *A*; much less therefore is the Velocity of the Body, than that of *c* would be, if it were separated from it.

From hence it comes to pass, that the Motion of the greater Bodies is naturally so slow and gentle, that 'tis usually impeded by an ambient Fluid or other Bodies round about them. But in lesser Bodies, this attractive Force is very active and vigorous, and is the Cause of a great many noble Effects.

12. Two Particles of Matter, tho' they do not touch, may yet come so near one to another, as that their mutual attractive Force shall much exceed the Force of Gravity.

13. If a Particle placed in a Fluid be equally attracted every where by all the ambient Particles of the Fluid, no Motion of the Particle will arise from thence: But if it be attracted by some Particles more, and by others less, it will move that way where the Attraction is greatest, and the Motion produced will be answerable to the Inequality of the Attraction; (i. e.) it will be greater where there is a greater Inequality, and lesser where there is less.

14. If a Body be placed in a Fluid, and its Particles do more attract the Particles of the Fluid, than the Particles of the Fluid do one another; and if there be also in that Body any Pores or Meatus, pervious to the Particles of the Fluid; then the Particles

of the Fluid will soon diffuse themselves through those Meatus: And if the Cohesion or Connection of the parts of the Body be not so strong, but that it may be surmounted by the Impetus of the Particles of the Fluid rushing upon it, and every way into its Pores; there will arise from thence a Dissolution of that Body.

And from hence you may see the Reason of the Dissolution of Bodies in Menstruums: In order to which, Three Things are always necessary.

1. That the Particles of the Body to be dissolved do more strongly attract those of the Menstruum, than those of the Menstruum do one another.

2. That the Bodies have Pores pervious to the Particles of the Menstruum.

3. That the Cohesion of the Constituent Particles of the Body be not so strong, but that it may be broken by the violent Action of the Particles of the Menstruums upon it.

15. If Particles mutually attracting each other do also mutually touch one another, no Motion can arise; for they can come no nearer to each other: But if they are separated from one another a very small Distance, a Motion must arise from their mutual Attraction. Tho' if they are farther from one another than that they cannot attract one another more than they will the Particles of the Fluid in which they are, and so no Motion also will be produced.

From these Principles all the Phenomena of Fermentation, and of all Effervescences do proceed. And from hence you may see the Reason why Oyl of Vitriol when mingled with a little Water, hath so great an Effervescence and Ebullition: For by the Infusion of the Water, the Saline Particles are a little disjoined from their mutual Contact; but since they do much more attract one another than they do the Particles of the Water, and since they are not every way equally attracted, a considerable Motion must from thence arise.

And from hence also you may see the Reason why so great an Ebullition arises from putting Filings of Steel or Iron into the former Mixture of Oyl of Vitriol with a little Water; for the Particles of the Steel have a very great Degree of Elasticity, and from thence a strong Reflection must arise. And from hence also 'tis that some Menstruums act with a greater Force, and will sooner dissolve Metals, when mingled with a little Water, than when pure and without such Mixture.

16. If the Particles which do mutually attract each other have no Elasticity, then they are not reflected back from one another, but will form Congeries, Moleculas, Aggregates or Lumps of Particles; from whence what we call a Coagulation arises: And if these Lumps exceed in Specific Gravity that of the Fluid, and are large enough, a Precipitation will succeed, Tho' a Precipitation may also arise from the Specific Gravity of the Menstruum in which the Particles swim, its being diminished or increased.

17. If the Figure of Particles mutually attracting each other, when swimming in a Fluid be such, that there is a greater attracting Force in some of their given Parts than in others, as also a greater Contact there; then those Particles will coalesce into Bodies having given Figures; and this way all Chrystallizations arise; and you may by Geometry determine the Figures of the Component Particles from having the Figure of the Chrystals given.

18. If

18. If between two Particles of a Fluid, another shall interpose, whose two opposite Faces or Sides have very great attractive Forces; this interposing Particle will glew or fasten the other two to its self; and when this is done throughout the whole Fluid, that Fluid will be frozen or turned into Ice.

19. If a Body of some Bulk emit a large Quantity of Effluvia, and the Particles of such Effluvia have a very great attracting Force, then will these Effluvia, when they come near any lesser or lighter Body, by their attracting Force, surmount the Gravity of those Bodies, and lift them up to the Bodies from whence they flow: And since the Effluvia are much more copious and thick at lesser Distances from the emittent Body, than at greater; the light Body will be attracted by still more and more dense Effluvia, and at last be brought to adhere to the emittent Body.

And this way most of the Phenomena of Electricity may be solved.

PARTING, is one of the Refiners Ways to separate Gold and Silver; 'tis done by *Aqua fortis*, which how to make, and the whole Manner of the Operation, see under *Refining*.

PARTY Jury. See *Half Tongue*.

PASCHA Clausum, is the Octaves of Easter or Low-Sunday, which closes or concludes that Solemnity; and *die (tali) post Pascha Clausum*, is a Date in some of our old Deeds; and the first Statute of Westminster is said to have been made *Landesmain de la Close de Pasche*, i. e. The Munday after Easter-Week.

PASNAGE, or Pannage, was anciently used in a double Sense for the running or feeding of Swine within a Forest, and for the Price or Rate of it. If the Pasnage were not duly paid, there was a Process from the Exchequer, and a Distress by the Sheriff. Dr. Kennet.

PASS, a Frame of Boards consisting of 2 or 3 Bottom Boards, and two Side ones, set slope-wise, thro' which the Ore slides down into the Coffin of the Stamping-Mill for the Tin-works, is called by the Workmen the *Pass*.

PASSAGE, *Passagium*, 'twas a Tribute or Toll paid by Passengers or Travellers for the Repair or Maintenance of some Road or Passage.

PAVIMENTA Tessellata. See *Tessellata*.

PAY, the Seamen say, *Pay more Cable*, that is, let out more Cable; and *pay cheap*, that is, at the turning the Anchor out of the Boat, to turn it over-board faster.

PECTEN, in Anatomy, is the same with the *Regio Pubis*, or lower part of the *Hypogastrium*.

PEDIMENT, in Architecture, is a Triangular Frame with Cornish raised over the Front of a House, and sometimes over Doors, &c.

PEERS, in Architecture, are a kind of Pilasters or Buttresses, for Support, Strength, and sometimes Ornament.

PEERS, *Pares*, in our Common Law, are those that are empannelled on an Inquest upon any Man for the convicting or clearing him of any Offence for which he is call'd in question; and the Reason thereof is, because 'tis the Course and Custom of our Nation, that every one shall be tried by his Peers or Equals. The Word is used also for the Nobility of this Realm, and Lords of the Parliament, who tho' distinguished as to degrees of Nobility, yet are equal in all publick Actions, as in

Votes of Parliament, in passing Tryals on Noblemen.

PENNY, *Denarius*, was the first coined piece of Silver we have any account of; and for many Years the only one. In the Reign of H. 1. there were Half-pence. A Penny was so much the whole of the current Coin of the Kingdom, that *Denarius* signified the same thing with *Nummus* or Money. Dr. Hicks in his *Dissertatio Epistolaris*, p. 109. saith, that the Anglo-Saxons had but one Silver Coin amongst them, and that was a Penny; and Camden and Spelman, and most of our good Antiquaries agree in this. The old Penny before 1279 was struck with a double Cross, so that it might easily be broken in the middle, or into four Quarters; and so made into Half-pence or Farthings, saith Mr. Stow; on which it was then ordered, that Half-pence and Farthings should be made or coined round, as the Penny was before. The Penny was called *Sterling*, which see.

PENNY-Weight, formerly every Pound contained 12 Ounces, and each Ounce was divided into 20 parts, called *Twenty-penny-weight*; for then Twenty-penny-weight weighed an Ounce: and tho' the Penny-weight be altered, the Denomination still continues.

PENSA; formerly there were three ways of paying a Pound of Money into the Exchequer. 1. Payment of a *Pound de Numero*, which was just 20 Shillings in Tale. 2. Payment of a *Pound ad Scalum*, which was 6 d. over and above the 20 s. 3. *Ad Pensam*, which was paying the full Weight of 12 Ounces.

PENTECOSTALS, were, and are still in some few Dioceses, Whitson-Contributions paid to the Bishops, of which probably the first Occasion were certain pious Oblations made to the Cathedral Church at Pentecost or Whitson-tide. They were also made by the Parishioners to their Parish Priest, and sometimes by inferior Churches or Parishes to their Mother-Church. These Parish Pentecostals were called *Whitson-Farthings*, and their Sum was divided into four parts, of which one went to the Priest, one to the Poor, one towards the Repair of the Parish Church, and one to the Bishop. See Stephens of Procurations and Pentecostals, and Dr. Kennet's *Parochial Antiquities in Glossary*.

PERCH, *Pertica*, is an English Measure of 16 Foot and a half in Length, called also a Pole and Rod. Forty such Perches in Length, and four in Breadth, make what we call an Acre of Ground. This is the common *Statute-Perch*; but in some Counties in England its Length is different; as in Staffordshire it is 24 Foot, in the Forest of Sherwood 25 Foot. In Herefordshire, tho' a Perch of Walling be but 16½ Feet, yet a Perch of Ditching is 20 Feet: In the Forest of Canke 'tis 25; in the Forest of Clarendon 20. *Skene de verborum significatione sub. verb. Perticata Terra*, saith, *Perticata Terra* is a Rood of Land. There are also some other Measures mentioned which are now out of use. He saith three Feet and one Inch make an *Elne*; six *Elnes* make a *Fall*; which he saith is the common lineal Measure. Six *Elnes* long and six broad make a *Square*, and *Superficial Fall* of Land measured; and 'tis to be understood, he saith, that a *Raip*, a *Rod* and a *Lineal Fall* of Measure, are all one; only a Rod is a Staff or Pole of Wood, and a *Raip* is made of Tow or Hemp. Also ten *Falls* in Length and four in Breadth make an Acre: This is the Measure of Scotland.

PERI-

PERICARDIUM. Dr. Keil in *An. Secretion*, p. 32, 33. shews, that the Liquor in the *Pericardium* is the most fluid of any that is separated from the Blood; because the Particles of it unite first, and are secreted first; and those Particles which unite first will have the greatest attractive Force; and such must have their Corpuscles of a most spherical Figure, and must be most solid; so that their Contact will be the least that can be.

PERIOPHTHALMIUM, is a thin Skin which Birds can draw over their Eyes to defend them, without shutting their Eye-lids. The same with the *Membrana Nictitans*.

PERISTERNA, in Anatomy, are the lateral parts of the *Thorax*,

PERITONÆUM: The external Surface of this soft thin *Membrane* is unequal where it adheres to the transverse *Muscles*; the internal is very smooth. It hath a Number of small Glands which separate a Liquor which supplies the Intestines, and facilitates their Motion; and when these Glands are obstructed the *Peritoneum* grows thick, as in several Dropsies. The *Peritoneum* is a double *Membrane*, containing in its Duplication the Umbilical Vessels, the Bladder, Ureters, Kidneys, and Spermatick Vessels, to all which it gives a *Membrane*, as also to the Liver, Spleen, Stomach, Intestines and Womb.

Its external *Lamina* hath two Productions, like to two Sheaths, which pass thro' the Rings of the oblique and transverse *Muscles* in the Groin, for the passage of the Spermatick Vessels in Men; and for the round Ligaments of the Womb in Women. These Productions being come to the Testicles in Men, dilate and form the *Tunica Vaginalis*. The Internal *Lamina*, which is very thin here, having accompanied the external Productions a little way, cleaves close to the Spermatick Vessels and round Ligaments of the Womb. The *Peritoneum* hath Veins and Arteries from the *Phrenica*, the Mammary, the Epigastrick, and often from the Spermaticks. Its Nerves are of those which are distributed in the *Muscles* of the *Abdomen*; it hath likewise a few Lymphaticks which discharge themselves into the *Iliack Glands*. By the Elasticity of its Fibres it easily dilates and contracts in Respiration, and in Conceptions. If it breaks it causes a Rupture either in the Navel or Groin. Its Use is to contain the Bowels of the *Abdomen*, and to give to each of them an outer Coat.

PERMUTATION of Quantities. See *Variation* and *Combination*.

PERNANCY: Taking or receiving Tythes in Pernancy, is taking such as are or may be paid in kind.

PERPETUAL Motion; by this Term ought to be meant an uninterrupted Communication of the same Degree of Motion from one part of Matter to another, in a Circle, (or such like Curve returning into itself) so that the same Quantity of Matter shall return perpetually undiminished upon the first Mover: And perhaps if Men had rightly understood that this is the true meaning of a perpetual Motion, abundance of Expence both of Money and Reputation might have been saved by the vain Pretenders to this piece of impossible Mechanism. For since by the second Law of Nature or Motion, (see Motion) The Changes made in the Motions of Bodies are always proportional to the impress'd moving Force, and are produced in the same Direction with it, no Motion can be communicated to any Engine or

Machine greater than that of the first Force impressed; and therefore since on our Earth, all Motions are performed in a Fluid which resists them, it must of Necessity retard them; and consequently a considerable Quantity of the Motion must be spent upon the resisting Medium; so that 'tis impossible the same Quantity of it can return undiminish'd on the first mover; which yet is absolutely necessary for the Continuance of the same Motion perpetually. Besides, in no Engine or Machine whatsoever, can all Friction be avoided, there being in Nature no such thing as exact Smoothness or perfect Congruity: The manner of the Cohesion of the Parts of Bodies, the small Proportion the solid matter bears to the Vacuities between them, and the Nature of those constituent Particles not admitting it; wherefore this Friction will also sensibly in time diminish the impressed or communicated Force, so 'tis not possible the Motion can be perpetual; which Effect can indeed never follow, unless the communicated Force be so much greater than the generating Force, as to recompense the Diminution made therein by all these Causes, in order to the Motion's returning undiminished upon the first Mover. But *nil dat quod non habet*, the generating Force cannot communicate a greater Degree of Motion, than it hath it self, and consequently, the perpetual Motion is demonstratively impossible.

Besides, it being certain that a Body cannot move constantly in any Orbit with the same Degree of Motion from one single Impulse; since that Degree of Motion and Velocity arising from such a single Impulse, must by that means continually decrease, and so at last be quite spent and extinct: From hence it will follow also, that there can be no perpetual Motion in any Engine from one single Impulse; for this Motion, that it may return again upon the first Mover, must be propagated in an Orbit; and consequently must by Degrees cease and stop.

Per Quæ Servitia, in Law, is a Writ Judicial issuing from the Note of a Fine, and lieth for Cognisee of a Mannor, Seignory, Chief Rent or other Services; to compel him that is a Tenant of the Land at the Time of the Note of the Fine levied, to attorn unto him.

PERQUISITE, in the Law-sense, is any thing gotten by a Person's own Industry, or purchased with his own Money, different from that which descends to him from his Father or Ancestors.

PERQUISITES of Court, are such Profits as grow to a Lord of a Manſor by Virtue of his Court-Baron, over and above the yearly certain Profits of his Land; as *Fines of Copyholds, Herriots, Amerciaments, Waifes, Strayes, &c.*

PERSONAL Services. See *Services*.

PERSPECTIVE: The Foundation or Ground of Perspective, may be thus conceived. Suppose there be a Point, as *o*, which is seen by the Eye at *n* (whose Height above the Horizon is *nm*) thro' the Glass or transparent Plane *xxk*, which in Perspective is called the Table: And it be required to find the true Representation of this Point in Perspective; from *m* the point of the Horizon perpendicularly under the Eye at *n* draw at Right Angles to *nm* (the height of the Eye) the Line *mz*; at *z* in the Table erect the Perpendicular *zu* equal to *nm*, and at Right Angles to it, from the Point *u*, draw also *uy* equal to *mz* the Distance of the Eye from the Table. From *o* let fall a Perpendicular to the Base of the Table, as *og*.

and

and draw the Line qu . Take $qs = to qo$, draw sy cutting uq in the point t , so is t the point required.

On this Foundation is the primary Rule of all *Perspective* built, and all its Practices established, *v. gr.* Suppose an Equilateral Triangle (as mno) or any other Geometrical Plane Figure were to be represented in *Perspective*. Between the Eye and the Triangle draw somewhere the Right-line ab , which they call the *Fundamental Line*; then draw zv representing the perpendicular Distance of the Eye above that Line, be it what it will, and thro' v draw, at Right Angles to zu , or parallel to ab , the *Horizontal Line* vy ; then will the Plane lying between those Parallels represent the *Table or Transparent Plane*. Then in order to find the perspective Point for o , one of the Angles of the Triangle omn , draw oq perpendicular to the *Fundamental Line ab , and make qs equal to qo . Take uy equal to uz , and then from y draw sy ; draw also vq , whose intersection with qs will find the point o , which will be the true Representation of o in *Perspective*; proceed after the same manner with the Points M and N , and drawing the Lines on , nm , mo , the Triangle onm will be the true Representation of the Triangle MNO . And thus proceeding with the Angular Points of any Figure, whether regular or irregular, you may draw any thing truly in *Perspective*; only in Practice, several compendious Methods will arise, which every one will discover on frequent Tryals.*

And if the Scenographick Appearance of any Solid were to be represented, as suppose of a Triangular Prism whose Base is the Triangle MNO in the second Figure; you need only find the upper Surface of it after the same way as you found the lower or the Base, and then joining the corresponding Points by Right-Lines you will have the true Representation of the Solid in *Perspective*.

So that the Work is the same as before, only you take a new *Fundamental Line*, as much higher than the former, as is the Altitude of that Solid whose Scenographick Representation you would delineate.

But there is yet a more commodious Way of doing this, as follows; Having found, as above, the Base, or *Ichnographick Plane* mno ;

Let Perpendiculars be erected to the *Fundamental Line*, from the three angular points, which will express the Altitudes of those Points. But because these Altitudes, tho' equal to one another in the Body or Solid it self, will appear unequal in the Scenographick View, for those that are further off will appear less, and the nearer, larger.

Their true proportionable Heights may be thus determined: Any where in the *Fundamental Line* let AB be erected perpendicularly equal to the true Altitude (or if the Figure hath different Altitudes, let them all be transferred into the Perpendicular AB) and from the points A and B (and from all the points of intermediate Altitudes, (if there be any such) draw Right Lines to the Eye point in V , or to any point in the Horizontal Line: Those Lines AV and BV will constitute a Triangle with AB , within which all the Points of Altitude will be contained. Thro' the points o , n , and m , draw parallels to the *Fundamental Line*, as you see, and from the points a , a , a , erect Perpendiculars to those Parallels, and where they intersect the two Lines AV and BV ; as in the points a , a , a , and b , b , b , &c. they will determine the apparent Height of the Solid in that Scenographick Position to the Eye at V . And in practice these Parallels and Perpendiculars are to be easily described by the Help of a good *Drawing-Board* or *Table* fitted for this purpose, and others of this Nature.

Authors on this Subject of *Perspective*, are;

PESA, *Pensa*, *Pisa*; is a *Wey* or *Weigh*, or a certain *Weight* or *Measure* of *Cheese* and *Wooll*, containing formerly 256 *Pounds*.

PESAGE, is a *Duty* paid for weighing of *Merchandize* and other *Wares*, to a certain common *Weigher*, whom they called *Pesarius*.

PETER-Pence, called also *Hearth-pence*, *Rome Scot*, and in the *North Ream Pence*; was a *Levy* of a *Penny* on every *House* wherein there were 30 *Pence viva pecunie*, to be collected and sent to *Rome*: This at first tho' only a *Contribution*, at last pass'd into a standing *Tax*; one half of it went for *Alms* to the *English School* at *Rome*, and the other half to the *Pope's Use*.

It was at first given by *King Ina*, and confirm'd by *Offa* and *Ethelwolp*; established by the *Laws* of *Canute*, *Edward the Confessor*, *William the Conquerour*, and *Henry I.* 'Twas collected by the *Bishops*, who employed the *Rural Deans* and *Archdeacons* to receive it. The whole *Summ* was by *Pope Gregory* stated at 200 *l.* 26 *s.* In the Year 1365, *King Edward* the Third first forbade the *Payment* of this *Duty* to the *Pope*; but the *Custom* soon returned again, and continued till the *Reign* of *Henry* the Eighth, when *Polydore Virgil* was employed here as the *Pope's Receiver-General*. No *Place* nor *Religious House* was exempt from this *Imposition*, but only the *Abby* of *St. Albans*.

PETIT-Sergeanty: To hold *Lands* or *Tenements* in *Petit-Sergeanty*, is to hold them of the *Crown*, by yielding the *Sovereign* a *Knife*, *Buckler*, *Arrow*, or a *Bow* without a *String*, or other like *Service* at the *Will* of the first *Feoffer*; and there belongs neither *Ward*, *Marriage* nor *Relief*: No one can hold *Land* in *Grand* or *Petit-Sergeanty*, but of the *Crown*. See *Stat. of Car.* 2. c. 24.

PHALANX, among the *Macedonians*, was an oblong square close *Battle* of *Pikemen*, consisting of 16 *File*, and 500 in *Front*, as *Polybius* saith; and the *Soldiers* stood so close together, that the *Pikes* of the 5th *Rank* extended 3 *Foot* beyond the *Front* of the *Battle*.

PHASES of the Planets: Since all the *Planets* as well as the *Earth* are *spherical*, *opaque*, and *scabrous Bodies*, they must reflect every way the *Sun's Rays* which fall upon them; and it will follow also from hence, that one half of every *Planet*, or

that *Hemisphere* which is turned towards the *Sun*, will be illuminated by him, and the other *Hemisphere* at that *Time* must remain in *Darkness*. And further, since 'tis that *Hemisphere* of any *Planet*, which is obverted to the *Earth*, which is considered by any *Observer*:

The eight little Circles represent the different *Phases* of *Venus*, as they will appear to an *Eye* placed in *T* on the *Earth*, while she moves round in her *Orbit* *A C E G* about the *Sun*. It will be plain then, that when *Venus* is in *A*, and the *Earth* at *T*; she being then most *retrograde*, (see the Word *Direct* in this Vol.) will least of all appear to us, because her *obscure Hemisphere* is entirely obverted towards us. And if she happen to be then in either of the *Nodes*, *i. e.* in the *Plane* of the *Ecliptick*, she will appear like a *Spot* in the *Body* of the *Sun*.

But when she gets further to *B* (the *Eye* being still supposed to be in *T*) she will still be *retrograde*, but some small part of her illuminated *Disk* will be visible; and she will appear with illuminated *Horns* which will be turned from the *Sun*, or towards the *West*. When she comes to *C*, one half of her illuminated *Disk* will be visible to an *Eye* in *T*, and then she will appear like an *Half-Moon*; in *D* she will be *gibbous*, and in *E* at *full*. And the same *Phases* she will put on as she moves in the other *Semicircle* from *E* to *A* again, only the illuminated *Horns* will be turned a contrary *Way*; as appears by the second *Figure*, where all the several *Phases* are delineated.

And the same kind of Phases must happen to Mercury in the several parts of the Orbit, Regard being had to the Figure of it, and the Time of his Periodical Revolution round the Sun.

PHILTRATION. See Filtration.

PHOSPHORUS; by Order of, and before the Royal Society at London, Mr. Hawksbee made several Experiments on the Phosphorus, about its Production and Propagation of Light in vacuo; and it plainly appeared from them, that the removing the common Air did very sensibly encrease its Light. And by the Experiments made by the same Person on the Mercurial Phosphorus, and mentioned in *Phil. Transf.* N. 303. it is also manifest, that tho' Mercury when strongly agitated in the common Air would exhibit in a darkned Room some Sparks of Light, yet that a very sensible and eminent Degree of it might be produced by shaking it in proper Glasses in Vacuo.

Bernouli, Professor of Math. at Groningen, made an easy portable Mercurial Phosphorus after this Manner: In a clean neat Viol he included about five or six Ounces of well purified clean Quicksilver; and then evacuating the Viol of Air by applying to an Air-Pump, it would, when shook strongly in the Dark, appear all bright and luminous, so as that one might distinguish the Faces of the Spectators.

PHYSICKS, or Natural Philosophy. The most eminent Books on this Subject which will give the Reader a true and useful Knowledge of Nature, are these:

Sir Is. Newton's *Principia Philosoph. Naturalis Mathematica.*

Ejusdem *Optice: sive de Lumine & Coloribus.*

Borellus de *Motionibus a Gravitate pendentibus.* — De vi percussione.

Wallis *Mechanicks, sive Liber de Motu Tractatus Geometricus.*

Hon. Fabri *Dialogi Physici.* Lugd. Galliarum. 1669. 8vo.

Mr. Boyle's *Physical Pieces.*

Keil's *Introductio ad Veram Physicam.*

Ditton's *Laws of Nature and Motion.*

Cheyne's *Philosophical Principles of Natural Religion.*

All Dr. Hook's Tracts printed while he was living, and his *Opera Posthuma.*

Philosoph. Transactions.

And *Collections.*

Acta Eruditorum Lipsiæ.

Collegium Experimentale sive Curiosum, in quo primaria hujus seculi Inventa & Experimenta Physico-Mathematica inveniuntur 2 Vol. 4to.

Essays of Natural Experiments made in the Academy del Cimento, English'd by Mr. Waller, 1684. 4to.

Ray's Wisdom of God in the Works of the Creation, Last Edit. with 3 *Physf. Discourses.*

Woodward's Natural History of the Earth.

Bohun, of Winds.

De Resistencia Solidorum, by Alex. Marchettus, Florentiæ. 1665. 4to.

Hypothesis Physico-Nova G. G. Leibnitz. Lond. 1671. 12mo. See N. 74. of *Phil. Transf.*

Horologium Oscillatorium Christop. Hugenii, Paris, Fol. 1673.

Traite de la Percussion ou Choque de Corps per M. Mariotte a Paris 1673. 12mo.

Traite de Mouvements des Eaux & des autres Corps Fluides par Feu. par M. Mariotte. Paris 1686. 8vo.

Pardies Local Motion, Engl.

Exegesis Physico-Math. de momentis Gravium.

Whiston's Theory of the Earth.

Gallilei Dialogi de Mechanica & Motu Locali.

— de *Systemate Mundi.*

Sinclari Ars nova & magna Gravitatis & Levitatis.

Dee de Præstantioribus quibusdam Naturæ Virtutibus. 4to Lond. 1558.

Miscellanea Curiosa Germanica, in 8 Vol. 4to.

Physico-Mathesis de Lumine, Coloribus, & de Iridi. per Grimaldi.

PIAZZA's, or as our Vulgar frequently call them *Piaches*, are in the Italian the same as our Cloysters.

PICAGE, from the Latin *Pica*, was a Custom or Duty paid at Fairs and Markets for breaking the Ground and pitching up of Stalls and Standings; and this Profit of Picage was usually given or granted in Charters for holding a Fair or Market.

PIEDROIT, in Architecture, is a Square Pillar which is partly within the Wall. *Bulid. Dict.*

PILÆ, in Architecture, and their *Quadra's* and *Tables* (as we yet see them in ancient Altars and Monuments) were employ'd for Inscriptions; but if shorter and more massy, they serve for Arches of Bridges and for Buttresses to solid Work. *Evelyn's Parallel.*

PINK, is a Vessel used at Sea mast'd and rigg'd like other Ships, but only she is built with a round Stern, the Bends and Ribs compassing so as that her Sides buldge out very much; wherefore these Pinks are difficult to be boarded, and also are made to carry greater Burdens than others. They are often used for Store-Ships, and Hospital-Ships, in the Fleet.

PINNACE, is a small Vessel, with a Square Stern, going with Sails and Oars, and carrying three Masts; and is used as a Scout for Intelligence, and for Landing of Men, &c. also one of the Boats belonging to a great Man of War, which serves to carry the Officers to and from the Shoar, is called the *Pinnace*.

PISCI-

PISCIVOROUS *Animals*, are such as feed on Fish. See *Birds*.

PITCH, is a Word used by Architects and Builders in these Senses. Sometime *Paving* is called *Pitching*: But usually they understand by it the Angle which a Gable-end, and consequently the whole Roof of a Building is set to. If the Length of each *Rafter* be $\frac{1}{2}$ of the Breadth of the Building, then they say that Roof is of a *True Pitch*: But if the Rafters are longer, they say 'tis a *high* or *sharp pitch'd Roof*; if shorter, they call it a *low* or *flat pitch'd Roof*.

PLACE *Apparent of a Planet*, is a point in the Starry Heaven which is found by a Right-Line passing from the Spectator's Eye on the Earth's Surface, and terminated at the other End amongst the fixed Stars. In the Figure under the Word *Parallax* in Vol. I. If *A* be the Centre of the Earth, and *B* a point on its Surface; let *C* represent the Moon, then will *G* be her true and *H* her apparent Place in the Starry Heaven.

PLACE *True of a Planet*, in Astronomy, is that point amongst the fix'd Stars which is found by imagining a Right Line to be drawn from the Earth's Centre thro' the Planet, and terminated at the other End in the Starry Heaven.

PLACE *Geometrick*. The Ancients called their *Locus* or Place, ἀναλυμένον, i. e. *Resolutus*, and the Order of their Writings about it, according to *Pappus*, is this, (1.) *Euclidis Datorum*, Lib. 1. (2.) *Apollonii λόγος ἀναλύων*, or *de Rationis Sectione*, Libri 2. (3.) The same Author's *λογος ἀναλύων*, of the Section of a Space, 2 Books. (4.) His two Books of *Tactiones* (ἐπαφῶν.) (5.) *Euclide* his 3 Books of *Porismata*. (6.) *Apollonius* his *περὶ κωνικῶν*, or of *Inclinations*, Book 2. (7.) The same Writer's two Books of *Loca plana*, τόπων ἐμπέδων. (8.) His eight Books of *Conicks*. (9.) *Aristaeus* his five Books *τόπων στερεῶν*, or of *Solid Places*. (10.) *Euclide* his two Books of *Places ad Superficiem*. (11.) *Eratosthenes*'s two Books *de Medietatibus*. Of all which only *Euclid's Data*, and four Books of *Apollonius* his *Conicks*, are left now in Being.

See also *J. Craig's Tractatus Mathematicus de Fig. Curvilinearum Quadraturis*; & *de Locis Geometricis*. Lond. 1693. 4to.

PLANE, is an Instrument used in *Joinery*, to make Boards plane, try, and smooth, or in order to joint or frame them together, &c. These are of several Names and Sorts according to the several Uses; as, 1. The *Pore-plane*, which is a long Plane, and used first of all before either *Smoothing-plane* or *Jointer*. The Edge of the Iron of this Plane is not ground straight, but rising with a Convex Arch in the middle of it, that its Edge may bear to be set the *Ranker*, for its Use is to take off the Irregularities of the Stuff as soon as may be, in order to prepare it for the *Smoothing-plane*, or *Jointer*. If the Stuff be free and frowy, that is, even tempered all over, you may then set the Plane so rank as that you may take off a Shaving of the Thickness of an old Shilling; but if it be hard or curling, you can't take off one thicker than an old Groat. 2. The *Smoothing-plane*, is a short small Plane, whose Iron is set very fine, and its use is to take off the Irregularities of the *Fore-plane*, or those which it hath left. 3. The *Jointer* is a Plane longer than the *Fore-plane*, and hath its Sole perfectly strait from End to End; it comes after the *Fore-plane* and *Smoothing-plane*, and is design'd to shoot an Edge of a Board perfectly

straight in order to jointing, as also Boards of any Thickness; for 'tis used to *Try*, as they call it, that is, smooth Tables with, whether large or small; wherefore its Iron must be set very fine, little above an Hair's breadth above the Sole of the Plane, and the length of the Edge of it exactly strait, or parallel to the Plane of the Sole or Bottom of the Plane. 4. The *Strike-Block* is a Plane made as true as the *Jointer*, and like it, only shorter; being used to shoot a short Joint, which it doth more handily and readily than the long *Jointer*. 'Tis used also for framing and fitting the Joints of *Mitres* and *Bevels*, but then the piece of Wood is drawn by Hand over the Plane several Times till 'tis shot true. 5. The *Rabbit Plate* is used to cut part of the upper Edge of a Board strait or square down into the Stuff, so that the Edge of another Board cut down after the same manner may fit and join in with it on the Square; and when two Boards are thus cut away, this lapping over is called *Rabbing*. The *Rabbit-plane* is sometimes used also to strike a *Pascia*, in a piece of Moulding. The Iron of this Plane is full as broad as the Stock is thick (usually about an Inch) that the Angles of the Edge may cut down exactly strait; and it delivers its Shavings at the Side and not out of a Mouth at the Top, like other Planes. 6. The *Plow*, is a narrow *Rabbit-plane*, with the Addition of two Staves with Shoulders to them, and on the Bottom of the Shoulders a Fence: Its use is to plow a narrow square Groove on the Edge of any Board, of any proper Depth. 7. *Moulding-planes*, of which are several kinds, as the Round Plane, the Hollow, the O—G—, the Snipes Bill, &c. and these of several Sizes, as from half an Inch to an Inch and half. When these Planes are used on soft Wood, as Deal, Pear-Tree, Maple, &c. the Iron is set to an Angle of 45 Degr. with the Sole or Base of the Plane; but if it be very hard Wood, as Box, Ebony, Lignum Vitæ, &c. it is set to 80 Deg. and sometimes quite upright. There is also some difference in the grinding of the Basil or the Slope of the Edge of the Iron of the Plane; for in working on hard Wood this is ground to an Angle of about 18 or 20 Deg. but in soft Wood, not to one above 12 Degrees; for the more acute the Basil is, the better and smoother the Iron cuts, but the more obtuse and thicker it is, the stronger is the Edge to cut upon hard Work.

PLANE of the *Projection*, in the Astronomical Perspective, or Stereographick Projection, is a Plane which passes thro' the Centre of the Sphere, the being supposed the Pole of or in a Point in the Axis of that Plane, and 90 Degr. above it or the Surface of the Sphere; thus, if the Eye be in the Zenith or Nadir Points, the Horizon will be a Plane on which the Circles of the Sphere may be projected Stereographically: And from hence it will follow, that all great Circles of the Sphere passing thro' the Eye-point, must be at Right Angles to the Plane of the Projection, because they pass thro' its Poles. See *Spherick Geometry*, or *Projection* in Vol. I.

PLANETS. The Motions of the six Primary Planets round the Sun is so adjusted, that the Square of the Times of their peroidical Revolutions are as the Cubes of their Distances from the Sun: And the same thing is found by all Astronomers to be true, with Regard to the Motions of the Secondary Planets or Satellites round their primary ones. *Greg. Astron. p. 26, 27.*

The Forces with which the *Primary Planets* are continually drawn from a Rectilineal Motion, and by that Means are retained in their Orbits, are reciprocally as the Squares of their Distances from the Centre of the Sun. *Id.* p. 33.

The Forces with which the *Secondary Planets* are retained in their Orbits, are reciprocally as the Squares of their Distances from the Centres of their Primary Planets about whom they revolve. p. 34.

The *Nodes* and *Apsides* of all the Planetary Orbits are at rest and do not move progressively. p. 55.

The Planets and Comets are retained in their Orbits by the Force of Gravity; the same Law prevailing thro' all the Solar System. p. 57.

If a Primary Planet revolving round the Sun as its Centre carry round with him a Satellite which revolves also round the Planet; the Motion of this Satellite will be *accelerated* all the while it is moving from the Quadratures to the Syzygies, and *retarded* all the while it is moving from the Syzygies to the Quadratures: So that it will move *faster* near either its Conjunction or Opposition, and *slower* near the Quadratures. The Figure of its Orbit will also be more *Curvilinear* in the Quadratures than in the Syzygies, and consequently the Satellite will be or recede farther from the Primary Planet, in the Quadratures than in the Syzygies, so as that the Orbit will be an *Ellipsis*, whose Centre is the Primary Planet, and whose greater Axis lies at Right Angles to a Line drawn from the Sun; and the lesser Axis is coincident with that Line. This Dr. Gregory demonstrates in his *Astron.* p. 282, &c.

But if the Orbit of the Satellite Planet, instead of being a Circle be an *Ellipsis*, in whose *Focus* the Primary Planet is supposed to be placed, then will the greater Axis of this Elliptical Orbit, twice advance forward, *viz.* in the 2 Quadratures, and twice recede backward, *viz.* in the 2 Syzygies, of every Revolution of the Satellite round the Planet. p. 298.

In each Revolution of the Satellite round the Planet the *Apsides* will, for the most part, advance more forwards than they recede backwards, and by the Excess of this Progression, will move in *Consequentia*.

PLASTICE, or the *Plastick Art*, is the Art of making Figures of Men, Birds, Beasts, Fishes, Planets, &c. in Clay, &c. The Workmen are called *Plaste*. It differs from Carving, because here the Figures are made by *Addition* usually, but in Carving always by *Subtraction* of what is superfluous. It is now with us chiefly used in Fretwork Ceilings; but the *Italians* apply it to the Mantlings of Chimneys with great Figures.

PLAY. The Laws of Chance or the Proportion of Hazard in Play or Gaming is a Thing Mathematically computable, &c. For tho' it be usually very uncertain in any Game depending on Chance, who shall win; yet it may, in most Cases, be determined who hath the better of the lay, and what Advantage one hath above the other; (which if Gentlemen knew and considered, they would not, perhaps, venture their Money with Sharpers, and such Wretches as make it their whole Business to know and remember the Odds in Gaming, as well as to practice most infamous Ways of Cheating by false Dice, slight of Hand, &c. But, I proceed to an easy Instance; tho' whether a Man shall throw 6 with one Die the first time be uncertain, yet how much it is against him, or how im-

propable that he doth not, may easily be determined. So likewise if another and I play at Tables or Back-Gammon, 3 up, and I am the first one; tho' it be uncertain, and can't be determined Mathematically who shall win; yet by those Principles I can demonstrate what the Advantage is on my Side, and how much the Value of my Expectation or Chance exceeds his.

A vast Variety of Questions about these Things will arise in Play, amongst two or more Gamesters; in Order to the Determination of which, this must be premised as a Principle.

That the Value of any one's Chance or Expectation of Winning, is what would purchase the like Chance, Advantage or Expectation in a just or equal Game.

Thus if a Person should, unknown to me, hide in one Hand 7 s. and in the other 3 s. tho' it be impossible for me to be certain which Number is in which Hand; yet I'm sure 'tis an Advantage to me to have the Choice of which Hand I will take; and (as I shall shew below) this Advantage is worth five Shillings.

In order to which, I lay down this Proposition.

Proposition I.

Where there is an equal Chance for $a=3$ s. and $b=7$ s. the Value of my Expectation is $\frac{a+b}{2}$; or half the Summ of a and b .

To investigate the truth of which Proposition; suppose I would seek what the value of my Expectation is in this Case, let it in the Analytick way of Enquiry, be called x .

Then, by the general Axiom or Principle, If I had x , I were able in a fair and equal Game to purchase such an Expectation again.

Suppose therefore I play with another on these Terms, that each of us shall Stake down x , and that the Winner shall give a to the Loser: I say this is just and fair, and that I have an equal Chance, either to get a , if I lose the Game, or to have $2x-a$ (that is, both the Stakes, subducting a) if I win. Now to make it an equal Game, this $2x-a$ must be $=b$, wherefore transposing a and dividing by 2, you will have this Equation $x=\frac{a+b}{2}$, which gives x sought.

Thus in Numbers, If I have an equal Chance of getting 3 s. or 7 s. then by this Proposition my Expectation or Interest is worth 5 s. and 'tis certain, that having 5 s. I may have the same Chance; for if I play with another, and each of us Stake 5 s. with this Condition, that the Gainer shall pay the Loser 3 s. This is an equal Way of Gaming; and 'tis plain, That I have an equal Chance to get or receive 3 s. if I lose, or 7 s. if I win.

That is, if a Man will give me the Choice of 7 s. in one of his Hands, and 3 s. in the other, 'tis as good as giving me 5 s.

Proposition II.

Where there is an equal Chance of a, b , or c , the value of my Expectation is $\frac{a+b+c}{3}$, or one third of the Sum of a, b , and c .

Let x (as before) be the Value of my Expectation; then must x be such, that I can purchase with it the same Expectation in a just and equal Game. Suppose the Conditions of the Game were, that of three Gamesters each of us stake down x , and I agree with one of them, to give him b if I win, and he doth the same by me; with the other I agree to give c , if I win; and he doth the same with me: I say, this is fair and equal Play; for here I have an equal Chance to get b , if the first win, c if the second win; or $3x - b - c$ (that is, all the Stakes, deducting b and c) if I win my self. Now to make the Game equal, $3x - b - c$ must be equal to a , wherefore $x = \frac{a+b+c}{3}$. And so on; if

there had been an equal Chance for four Things as $a+b+c+d$, the Value of my Expectation will be $x = \frac{a+b+c+d}{4}$, &c.

Proposition III.

Let the Number of Chances by which $13 (=a)$ may happen to me, be $p=3$, and the Number of Chances by which $b=8$, falls to me be $q=2$, and supposing all the Chances to happen with an equal Facility; then, I say, the Value of my Expectation is $\frac{pa+qb}{p+q}$; that is, in Words, The Quotient arising from the Summ of the Products of both the Numbers a and b , when multiply'd into their Respective Chances p and q , and then divided by the Summ of those two Chances. To prove which,

Suppose as before my Expectation to be x : If I have x , I shall be able to purchase with it the same Expectation again in an equal Game. For this I may take in as many Persons to play with me as make up the Number of $p+q$; of which every one must stake x , Therefore the whole Stake will be $px+qx$, and every one plays with equal hopes of winning.

With as many of my Fellow-Gamesters as the Number q stands for, I bargain one by one, that which of them soever wins shall give me b ; and if I win, I will do so by them. Then with the rest of the Gamesters, whose Number is $p-1$ (that is, all the remaining Gamesters but those express'd by q , and my self) I bargain, that whoever of them gains the Stakes shall give me a , and I agree to do so by them, if I win. 'Tis plain, that this is fair Play, no Man being injured. And in this Case I have q , Expectation to gain b ; and $p-1$ Expectation to win a : And 1 Expectation (*viz.* If I win my self) to gain $px+qx-bq-ap+a$; for if I win I must give b to each of the q Gamesters, and a to each of the $p-1$ Players; which makes $ab+pa-a$; if therefore $qx+bx-ba-ap+a$ were equal to a , I should have p Expectations of a ; (since just now I had $p-1$ Expectations of it) and q Expectations of b ; and so I should come just to my first Expectation; wherefore putting

$px+qx-bq-ap+a=a$. By Reduction $x = \frac{ap+bg}{p+q}$.
Q. E. 3.

In Numbers, If I have 3 Chances for 13, and 2 Chances for 8, I say by this Rule my Expectation is worth 11.

For $13 \times 3 = 39$. and $8 \times 2 = 16$. and $39 + 16 = 55$, and $55 \div 5 = 11$.

And if I have 11, I can easily shew that I may come to this Expectation: For, suppose I play with 4 others, each of which, as well as I, stakes 11; with two of these I bargain, that whoever of us wins shall give the others 8 a-piece; and then with the other 2, I agree, that the Winner shall give to the 2 Losers of us 13 a-piece. Then 'tis plain, I have 2 Expectations to get 8, and 3 Expectations to get 13 (*viz.* if either I or any of the other two win) for in this Case I gain all the Stakes which make 55; out of which I must give the first two 8 a-piece, and the other two 13 a-piece, and so there remains 13 for my self.

To apply these things to the ordinary Cases of Play.

1. Suppose he that come first to Three be up, or wins the Stake between two Gamesters: And let me be two and he but one; Query, What is my Advantage? Or, if we leave off Play, what is my just Share of the Stakes?

The first Consideration here is, how much each of us wants to be up; as suppose we play 3 up, and he be 1 and I 2; or if we play, first come to 20, and he be 18 and I 19 Games; in both these Cases he wants 2 of being up and I want but one. The Question is, what Advantage I have of the Lay? or what Proportion or the Stakes is due to me if we should now leave off.

To find which, let us see what would happen if the Game went on: If I get the next Game, or End, I am up, and win the Stakes; which suppose you call $a=8$, but if he win 2, then he will be up as well as I, and so both our Lots are equal; and if we should then divide, each of our Shares will be $\frac{a}{2}$ or $\frac{1}{2}a$.

But before we play that Game, if I am two and he but one, the Hazard, which of us shall win that Game, being equal, I have an equal Chance to get the whole Stake or the half; that is, a or $\frac{a}{2}$; for if I win the Game I have a , and if he win, my just share of the Stake is $\frac{1}{2}a$.

Since therefore, before I begin this Game, I have an equal Chance to gain a or $\frac{1}{2}a$, the Value of my Expectation (by Prop. I.) is half the Sum of both those Chances (*i. e.*) $\frac{a+\frac{1}{2}a}{2} = \frac{3}{4}a = 6$. Now if I have $\frac{3}{4}a$ due to me as my Share, he can have but $\frac{1}{4}a$ due to him as his Proportion, so that if we play'd for 8 Pieces, and would draw Stakes when I am two and he but one, and if three be up, I must have 6 Pieces and he but 2 Pieces, and the Odds on my side is Three to One.

Another way thus; in

Case 1. The Deficiencies being 3, the Set must be up in two Ends; wherefore take the Members of the 2d Power of $a+b$, and distribute them thus: Because A wants but one of up, let all the Members, where there is one a or more, with their *Uncia* be collected for A , and all where there's two b 's (or bb and above) for B .

For

For A.	For B.
1 aa	1 bb
2 ab	
3	1

Wherefore A's odds to B is 3 to 1.

Or by simple Subtraction only, Let the Stake of each be 32 s. then if A wins the next Game he is up and hath the whole or 64 Shillings; but if B wins it, their Shares will be equal. A there might have said, If B will leave off let him give me the 32 Shillings. which I am sure of, tho' he should win the next Game; and since he will not venture for the other 32 s. let us divide it fairly between us; so A must have 16 s. more, which will make his Share in the whole 48 Shillings, and he must have only 16 Shillings.

'Tis the same odds, i. e. 3 to 1, that a Man throws not Pile twice together with one Piece, as that he throws two Piles the first throw with two Pieces.

For reckoning each Face of the Piece of Money for a Chance, like the Face of a Dye, 'tis plain, of the 4 Chances on the two Pieces, there is only two Piles for him, whereas there is 2 Crosses, one Pile and one Cross, and one Cross and one Pile against him; each Piece having two Faces) that is, there is one for him and 3 against him.

Case 2. Suppose I want but one Game of up, and my Fellow-Player 3.

I consider the State of our Case, if either my self or he gain the next Game. If I win it I am up, and so have the Stake a ; if he win it, he will then want two of being up, as I want but one. And then I shall be in the same State as was supposed in the Case before this; and my Share of the Stakes, if we should divide fairly, is $\frac{3}{4}a$; wherefore before I threw I had an equal Chance for a or $\frac{3}{4}a$, and therefore (by Proposition I.) my Expectation is worth $\frac{a + \frac{3}{4}a}{2} = \frac{7}{8}a$: But if my Proportion of Expectation be $\frac{7}{8}a$, his can be but $\frac{1}{8}a$; and therefore my Odds is as 7 to 1.

Otherwise thus,

The Deficiencies being 4, the Sett must be up at 3 Games End: Then take the Members of the third Power of $A+B$ and distribute them thus:

For A,	For B,
1a ³	1b ³
3aab	
3abb	
7	1

Wherefore the Odds is as 7 to 1.

Here also by common Subtraction 'tis plain; That if A wins the Game he hath 64 s. but if B wins it, they are in the Condition mentioned in Case 1. That is, there is then 48 s. due to A; wherefore he might say, Give me that 48 s. that is due to me (for I'm sure of it whether I win or lose the next Game) and if you will leave off and not hazard the other 16 s. let us divide them equally; give me 8 s. more, which makes my Share 64 s. leaving yours but 8 s. wherefore A's Advantage was 7 to 1.

Case 3. By this Method of Calculation you will find, that if I want but one of being up and he 4, the Odds on my Side is 15 to 1.

Case 4. Suppose I want 2 and he 3 Games of being up.

Then if I win the next, I shall want but one and he three. This State of the Sett is worth $\frac{7}{8}a$ by the last Case; but if he win, then each of us will want 2, and so our Chance is equal, and there is $\frac{1}{2}a$ due to each of us; wherefore I have an equal Chance to gain $\frac{7}{8}a$ or $\frac{1}{2}a$: But $\frac{\frac{7}{8}a + \frac{1}{2}a}{2} = \frac{9}{8}a$.

wherefore, if we were to divide the Stakes justly, there is eleven 16ths due to me, and consequently but 5 Sixteenths due to him; wherefore I must have eleven parts of the Stake, and he but five.

Otherwise thus;

Let A want 2 of up, and B want 3.

The Deficiencies 2+3 being 5, the Sett must be up in one Game less; viz. 4.

I take therefore the 4th Power of the Binomial $A+B$, viz. $a^4 + 4a^3b + 6a^2b^2 + 4ab^3 + b^4$, and distribute it thus;

Let all the Members where there are two a 's be collected for A, and all those where there are three b 's for B.

A.	B.	Then adding all the Unciae
1a ⁴	4b ³ a	in each Collection together
4a ³ b	1b ⁴	they will give the Chances and
6a ² b ²		shew the Odds of A's winning
4ab ³		or being up before B, to be
11	5	as 11 to 5.

And so on Universally.

As in Case the next, where A wants two and B wants four of up.

The Deficiencies being 6, the Sett will be up in one Game less, viz. 5. Taking therefore the Unciae of the 5th Power of $a+b$ you will have

for A.	for B only	Wherefore the Odds
1a ⁵	1b ⁵	is 26 to 6, or 13 to 3.
5a ⁴ b	5ab ⁴	
10a ³ b ²		
10a ² b ³		
in all 26.	in all 6.	

This Method by the Unciae of a Binomial was communicated to me by the Honourable Francis Roberts, Esq;

Case 5. Suppose I want 2 and he 4.

If I win next I shall want but one and he will still want four; but if I lose the next Game, I shall want 2 and he 3; wherefore by Case 3, 4. I have an equal hazard of gaining $\frac{1}{2}a$ or $\frac{7}{8}a$, and this by Prop. I. is worth $\frac{9}{8}a$; wherefore his Share is but $\frac{1}{8}a$, and therefore the Odds on my Side is 13 to 3.

N. B. Wherefore he that wants but 2 of up, when the other wants 4, is in a better State than he who wants but one when the other wants but two (as in Case 1. for his Expectation then is but $\frac{3}{4}a$ or $\frac{1}{2}a$, whereas now 'tis $\frac{9}{8}a$).

To carry this a little farther, Suppose 3 Men at play, and let the first and second want but one Game of up; and the third want two.

To find the value of the Share of the first (in Case of a Division of the Stakes) you must consider what will happen if either he or any of the two other gain the first Game. If the first win he gets the Stake a , if the second win the first hath Nothing; but if the third win, each would want a Game; so that $\frac{1}{3}a$ is each Man's Share: Where-

Wherefore the first Man hath one Expectation to gain a , one to get nothing, and one for $\frac{1}{3}a$; which by Prop. II. is $\frac{a+0+\frac{1}{3}a}{3}=\frac{4}{3}a$. But the second Man's Expectation was as good as that of the first, for he wanted also but one of up; wherefore his also is $\frac{4}{3}a$ of a : But $\frac{4}{3}a+\frac{4}{3}a=\frac{8}{3}a$, and consequently the Third's Share can be but $\frac{2}{3}a$; wherefore the Stakes being divided into 9 parts, the two first Men must have 4 a-piece, and the third must have one.

And after this manner you may proceed with any Number of Players; of which some want more and some less of the Setts of Games. If you go about to investigate any one's Share, you must consider what would be due to him, if either he or any one Gamester should win the next Game; and then, adding all their Shares, and dividing the Sum by the Number of the Gamesters, the Quotient will be the Share you seek.

Proposition IV. Problem.

To find at how many Throws one may undertake to throw 6 with one Dye?

Case 1. If I undertake to throw six the first time tis plain there is but one Chance for me and 5 against me. Let the Stake therefore be a , then shall I have one Expectation to gain a , and 5 to gain

Nothing; wherefore by Prop. II. $\frac{a+5 \text{ nothing}}{6}$

(for 5 times Nothing is Nothing) $=\frac{1}{6}a$, is the Value of that Expectation, and consequently my Antagonist must have $\frac{5}{6}a$; wherefore he ought to lay me 5 to 1.

Case 2. If I undertake to throw 6 at 2 Throws with one Dye, my Chance may thus be found;

If I throw 6 the first time, I have my Stake; if I do not, I have but one throw remaining; which (by Case 1.) is $=\frac{1}{6}a$; wherefore there are five Chances for my gaining $\frac{1}{6}a$, and but one for a ;

which (by Prop. II.) $=\frac{a+\frac{5}{6}a}{6}=\frac{11}{6}a$, the Chances

against me then give my Fellow Gamester $\frac{5}{6}a$, and consequently, that I don't throw 6 at two Throws, is 25 to 11.

Case 3. By the same Method of Calculation you will find that I don't throw 6 at three times is 125 to 91, a little more than 4 to 3.

Case 4. That I do throw it at 4 times is 671 to 625, a little more than an even Wager.

Case 5. That I do it at 5 times, is 4651 to 3125, viz. almost 3 to 2.

Case 6. That I do it at 6 times, is 31031 to 15625, almost 2 to 1.

The Solution of this Problem and of the following one I had also from the Honourable Fr. Roberts, Esq; Thus,

In how many times, with a single Dye, may one undertake to cast Six?

The Chances of one Dye being 6, I make 6 the Numerator of a Fraction, and the Chances against my throwing 6 being 5, I make that the Denominator; and by Consequence, the Denominator subducted from the Numerator leaves the Chances which are for me.

Vol. II.

Now I say, that the Number of Throws requir'd must be the Index of that Power of $\frac{6}{5}$, which makes the Numerator at least double to the Denominator; for by that Means the Chances against me being subducted, a Majority will remain for me.

Throws	6	5	6	5	6	5
1	6	5	6	5	6	5
2	36	25	36	25	36	25
3	216	125	216	125	216	125
4	1296	625	1296	625	1296	625

Wherefore at 4 Throws I have something the Advantage: And so you may proceed on as far as you please.

Problems of this Nature are very expeditiously solved by the Logarithms, as in this Example.

In how many times, with six Dice, may one undertake to throw all Sixes?

All the Chances on 6 Dice being the 6th Power of 6; that is, 46656, let x be the Number of Throws required.

$x2$	1	46556 ^x	2.	that is, this Fraction when raised up to the Power of x must have its Numerator above double of the Denominator; or by the Logarithms.
		46655		
	2	0.00000931x		0.30103000.
	3	Wherefore dividing one by the other, it will follow, that $x > 32334$.		
	4	And consequently $x = 32335$.		

Now without the Logarithms, (which solve this in a few Minutes) a Man's Life would scarce serve to go thro' the Operation; for $\frac{46656}{46655}$ must be raised up to the 32335th Power, which would make a Row of Figures almost a Quarter of a Mile in Length.

Proposition V. Problem.

To find at how many times one may throw 12 with only two Dice.

Case 1. 'Tis plain, the first Throw, the Castor hath but one Way to throw it, and 35 Throws to miss it; wherefore by Prop. II. his Expectation is but $\frac{1}{36}a$.

Case 2. He that undertakes it at twice, if he throw 12 the first time gains a ; if not, he hath but one Throw more for it; and that is worth but $\frac{1}{36}a$, by the former Case; wherefore there is but one Chance for him for 12 at the first Throw, and 35 Chances against him: So that he hath 1 Chance for a and 35 for $\frac{1}{36}a$, which by Prop. II.

is worth $\frac{71}{1296}a$, and there will be against him $\frac{1225}{1296}a$, which is above 16 to 1.

Omitting then the Chances of doing it at three Throws, let us find the Hazark or Odds of doing it at 4 Throws.

If he that undertakes to throw 12 at 4 Throws do it the first or second Throw, then he hath a ; if not, there remains two other Throws against him;

R r r

him; which by the former Case are worth $\frac{71}{1296}a$.

But for the same Reason in his two first Throws, he hath 71 Chances for a , against 1225 Chances which will lose it; wherefore at first he hath 71

Chances for a , and 1225 which give him $\frac{71}{1296}a$;

which by the 2d Proposition is worth $\frac{1500625}{1679610}a$.

And thus if you pursue all the Cases (saith the ingenious Author of the Laws of Chance, p. 38, 39.) you will find that he that undertakes to throw 12 with two Dice at 24 Throws, has some Disadvantage of the Lay, as he that engages to do it at 25, hath some Advantage.

Proposition VI.

After the same manner may be found, that you may undertake to throw two Sixes at ten Throws of one Dye, or with one Throw of ten Dice.

Proposition VII.

If I play with another but one Throw with two Dice, so that if 7 comes up I win the Stake, if 10 he gains it; what is the Odds, and how much of the Stakes would belong to me if we draw?

Of the 36 Chances on the two Dice, there are 6 which will give me 7, 3 which give me 10, and consequently 27 other Chances which give me neither, and which equals the Game; in which Case there is due to each of us $\frac{1}{2}a$; but if none of the 27 should happen, I have 6 Chances to gain a and 3 by which I may get Nothing; which, by Prop. II. is $\frac{3}{4}a$ in Value. So I have 27 Chances for half a and 9 Chances for $\frac{3}{4}a$, which (by Prop. II.) = $\frac{13}{24}a$ for me, and $\frac{11}{24}a$ for him.

Prop. VIII.

If I were playing with another, by turns, with two Dice, so that if I throw 7 I win, and if he throw 6 he wins, and he hath the first Throw; What is the Proportion of my Hazard to his?

Suppose I call the Value of my Hazard x , then if the Stakes be a , his Hazard will be $a-x$.

Then whenever 'tis his Turn to throw, my Hazard is x ; but when it is my Turn, the Value of my Hazard is greater.

Suppose I then call it y . Now because of 36 Throws on two Dice, there are 5 which will give him 6, and 31 which bring it again to my turn to throw; I have 5 Chances for nothing and 31 for y , which (by Prop. III.) is worth $\frac{31}{36}y$. But at first I supposed my Hazard to be x , wherefore $\frac{31}{36}y = x$, wherefore $\frac{31}{36}x = y$. I supposed likewise when it was my Turn to throw, that the Value of my Hazard was y : But then I have 6 Chances which give me 7, and consequently the Stake; and 30 which give my Antagonist the Dice; that is, make my Hazard worth x . So I have 6 Chances for a , and 30 for x ; which by Prop. 3. is worth $\frac{6a+30x}{36}$,

but by the Supposition, that is $=y = \frac{31}{36}x$, and therefore $\frac{6a+30x}{36} = \frac{31}{36}x$; and by Reduction

$x = \frac{11}{24}a$, which is the Value of my Hazard;

wherefore his must be $\frac{13}{24}a$, and consequently my Chance to his is as 31 to 30.

In the Book above-mentioned, called *The Laws of Chance*, you will find the Advantages and Disadvantages of the several Chances at Hazard, Raffle, Whist, &c. this Way computed.

Proposition IX. Probl.

To find in any Number of Games the Value of the First.

Suppose A and B play so that he that wins the first 9 Games shall have the Stakes, and A hath won one of the 9 already; if they leave off, how much of B 's Money is due to A .

To find this, take the first 8 even Numbers, 2, 4, 6, 8, 10, 12, 14, 16, and multiply them continually, that is, the first by the second, and then the Product arising thence multiply by the third, &c. Take also the first 8 odd Numbers, and do so by them. The Product of the even Numbers will be a Denominator, and that of the odd ones a Numerator of a Fraction; which Fraction will express the Quantity of B 's Money due to A on his winning the first of the 9 Games.

Suppose only 4 Games up, of which A is one: Take the three first even Numbers, as 2, 4, 6, and multiply them continually, they will make 48; the three first Numbers 1, 3, 5, so multiply'd make 15: Therefore there is due in this Case to A , $\frac{15}{48}$, or $\frac{5}{16}$ of B 's Money; wherefore, if each had staked 16 Shillings, there would be a Crown due to A besides his own Stake of 16 Shillings.

Proposition X. Probl.

To find the Value of his Hazard who undertakes at the First Throw to cast Doublets with any assigned Number of Dice.

In two Dice, 'tis plain, that to avoid Doublets, every one of the Six different Throws of the first Dye, can only be combined with Five of the Second; because one of the Six is of the same kind, and therefore will make Doublets.

For the same Reason, the 30 Throws of 2 Dice which are not Doublets, can only be combined with four Throws of a third Dye, and with but 3 Throws of a fourth Dye.

Wherefore in General this will be the Series.

$$\frac{6 \times 5 \times 4 \times 3 \times 2 \times 1 \times 0, \&c.}{6 \times 6 \times 6 \times 6 \times 6 \times 6 \times 6, \&c.}$$

The Under Series is the Summ of all the Chances; and the Upper, the Number of Changes against him who undertakes to throw Doublets.

Each Series must be continued to so many Terms, as are the Number of Dice. V. gr. If one should undertake to throw Doublets, the first Throw with four Dice, his Adversary's Hazard is $\frac{5 \times 4 \times 3 \times 2}{6 \times 6 \times 6 \times 6} = \frac{360}{1296} = \frac{5}{18}$, and he hath $\frac{13}{18}$: So that 'tis 13 to 5 that he throws Doublets the first time with 4 Dice.

In

In Seven Dice, 'tis easie to see the Chances against the Undertaker are nothing, because then there must necessarily be Doublers.

Proposition XI.

If I have p Chances for a ; q Chances for b ; and r Chances for c : I say, my Expectation is worth $\frac{ap+bg+cr}{p+q+r}$, that is, in Numbers, supposing $p=2$. $a=3$. $q=4$. $b=5$. $r=1$. $c=9$; the Value of my Hazard is $\frac{2 \times 3 + 4 \times 5 + 1 \times 9}{7} = 5$. For

call my Expectation x , then x must be such, as having it, I am able to purchase as good a Hazard again, in a just and equal Game. Suppose the Law of the Play were this, that I playing with so many others, as with my self, make up the Number $p+q+r$; with as many of them as the Number p represents, I make this Bargain, that whoever wins shall give me a , and I will do so to each if I win: With those represented by the Number q , I bargain to have b if any of them win, and to give b to each of them if I win my self; and with the rest of the Players, whose Number is $r-1$, I agree to give or to receive c after the same Manner. Now all being in an equal Probability to gain, I have p Chances to get a , q Chances for b , and $r-1$ Chances to get c , and one Chance, *i. e.* when I win my self, to get $px+qx+rx-ap-bq-rx+c$. which if it be supposed equal to c then I have p Chances for a , q Chances for b , and r Chances for c (for just now I had $r-1$ Chances for it) therefore if $px+qx+rx-ap-bq-rx+c=c$: Then is $x = \frac{ap+bg+cr}{p+q+r}$ as it ought to be.

By this Theorem all the Chances at Hazard may easily be calculated. Vid. *Laws of Chance*, p. 87.

PLEAS of the Sword. *Placita ad Gladium*. In 2 H. 3. Ranulph the 3d. Earl of Chester granted to his Barons of *Cheshire* an ample Charter of Liberties; *Exceptis Placitis ad Gladium suum pertinentibus*. The Reason of which was, that William the Conqueror gave the Earldom of Chester to his Kinsman Hugh (commonly called *Lupus*) Ancestor to this Earl Ranulph, *Tenere ita Libere per Gladium, sicut ipse Rex Willhelmus tenuit Angliam per Coronam*. And consonant hereunto, in all Indictments for Felony, Murder, &c. in that Country Palatine, the Form was anciently, *Contra Pacem Domini Comitis, Gladium & Dignitates suas*.

PLEBANIA, *Ecclesia plebanianis*, is a Mother-Church which hath one or more subordinate Churches.

PLEBANUS, was sometimes the Title of a Rural Dean, because the Deanaries were formerly affixed to the *Plebaniæ*, or chief Mother Churches within such a District, which at first was usually Ten Parishes. Sometimes it seems to have been used for a Parish-Priest of such a large Mother-Church as was exempt from the Jurisdiction of the Ordinary, and therefore he had the Authority of a Rural Dean committed to him by the Archbishop, to whom the Church was immediately subject.

PLEBISCITUM, in the Roman Law, was whatever was enacted by the Common People, at the Request of the Tribune, or some other plebeian Magistrate.

PLEURA, is a double Membrane, which covers all the inward Cavity of the *Thorax*; it arises from the *Vertebrae* of the Back, and ascends on each side upon the Ribs, to the middle of the *Sternum*. It is fixed to the *Periosteum* of the Ribs, and to the internal intercostal Muscles, and it covers the Midriff. Its Side towards the Cavity is smooth and equal, but that which is fixed to the Ribs is rough.

PLOW, an ancient Instrument, tho' now not much used at Sea, mentioned in the former Volume; and its Description is thus given by Sir *Jonas Moor* in his Navigation.

There is first, a Staff, as A L G, on which a small Arch, as H I, and a Cross, as E F, are fitted together with three Vanes, as A an Horizontal Vane, B a Shade Vane, and C a Sight Vane, which is moveable upon the Staff.

In order to make an Observation of the Sun's Altitude with this Instrument, you must fit on the Horizon-Vane, and then you may place the Shade Vane to any Degree of Altitude in the Divisions of the Arch, so it exceed not the Altitude to be observed, nor be above 10 Degrees (which a little Practice will soon enable you to guess readily at :) for in both these Cases the Divisions on the Staff are deficient. Then put on the Sight-Vane, hold up the Instrument, and turn the Back of the Arch to the Sun, and move the Sight-Vane on the Staff backwards and forwards, till the Shade of the upper Edge of the Shade-Vane fall on the upper part of the Slit of the Horizon-Vane; and that at the same time, looking thro' the Sight-Vane, you can see the Horizon thro' the Horizon-Vane; for then will the Summ of the Degrees on the Arch and on the Staff be the Altitude, allowing for the Height above the Horizon and for Refraction. For the Height above the Horizon they usually allow 6 or 8 Inches.

PLOW-Land, *Carucata*, was formerly as much arable Land as one Plow could plough up in one

R r r 2

Year :

Year. This in the Beginning of the Reign of *Rich. I.* was accounted at 60 Acres ; and in the 9th of *Rich. I.* 100 Acres is allowed for a Plow-Land. And this Measure was very different according to Time and Place.

PNEUMATICAL Experiments, are such as are made in the exhausted Receiver of the Air Pump, in order to discover the several Properties of the Air and its Influence on other Bodies. Of these you may find great Variety in *Mr. Boyle's Works*, and in the *Philosophical Transactions* ; and those made with great Accuracy and Care.

PNEUMONICA Vena. See *Vena Pneumonica*, in this Vol.

POCKET of Wooll, is the Quantity of half a Sack. 3 *Instit. Fol.* 96.

POINTS of the Compass. See *Compass* and *Rhumbs*.

POLEINE, was a kind of Shoe with a picked Point turned up at the Toe : These first came into Fashion in the Reign of *William Rufus*, and by degrees came to be of that excessive Length, that in *Richard the Second's* Time, they were ty'd up to the Knees with Silver or Gold Chains, according to the Dignity of the Wearer. They were forbidden by *Edward the Fourth*, in the fifth Year of his Reign, under a great Penalty, to be worn so very long ; but they were not quite disused till the Reign of *Henry the Eighth*.

POLITICAL Arithmetick, is the Application of Arithmetical Calculations to the Extent and Value of Lands, Number of People, Publick Revenues, Taxes, Trade, Commerce, Manufactures, or whatever relates to the Power, Strength, Riches, &c. of any Nation or Common-wealth. Of this Nature several Discourses have been published ; as *Sir William Petty's Political Arithmetick*, *Grant's Observations on the Bills of Mortality* ; *Capt. Haley's* on those of *Breslaw* in *Silesia* ; *Dr. Davenant's* Discourses of Trade, &c. From these kinds of Inquiries and Computations, *Sir William Petty* hath advanced, that the Land of *Holland* and *Zealand* is not above 1000000 of Acres, whereas that of *France* is above 80,000000, and yet those Places are near a third part as rich and as strong. That the Rents of Lands in *Holland* to those of *France*, are about 7 or 8 to 1. That the People of *Amsterdam* are $\frac{2}{3}$ of those of *Paris* or *London*, which don't differ, he saith, above a 20th part from one another. That the Value of the Shipping of *Europe* is about 2 Millions of Tuns ; of which the *English* have 500000, the *Dutch* 900000, the *French* 100000, the *Hamburgers*, *Danes*, *Swedes*, and *Dantzickers*, have 250000, and *Spain*, *Portugal*, and *Italy*, &c. about as much. The Value of the Goods exported from *France* into all the Parts is supposed Quadruple to what is sent into *England* alone, and consequently in all about 5000000. What is exported out of *Holland* into *England*, is worth 2000000 ; and what is exported thence into all the World, is 18000000. The Money yearly raised by the *French King* (in Peace) is about 6 $\frac{1}{2}$ Millions Sterling ; and all *Holland* and *Zealand* pay about 2100000 *l.* and all the Provinces together about 3000000. That the People of *England* are about 6000000 ; their Expence at 7 *l.* per Annum a Head, 42000000. The Rent of the Lands about 8 Millions, and the Profits of the Personal Estate as much. The Profits of all the

Labour of the People 26000000. In *Ireland* the People amount to about 12 Hundred Thousand. The Corn spent in *England*, at 5 *s.* per Bushel Wheat, and half a Crown Barley, is worth Ten Millions per Annum. The Navy of *England* (then) required 36000 Men to man it ; other Trade of Shipping about 48000 Men to manage it. In *France*, to manage the Shipping Trade, he reckons then but 15000 Men. The whole People of *France* he accounts about 13000000 and an half ; and those of *England*, *Scotland*, and *Ireland*, all together, to be 9 Millions and an half. In the King of *England's* Dominions are about 20000 Church-men ; and in *France* above 270000. In our whole Dominions above 40000 Seamen, in *France* not above 10000. In *England*, *Scotland*, and *Ireland*, and all other Dominions belonging to us, there was then about 60000 Tun of Shipping ; which is worth about 4 Millions and a half of Money. The Sea-Line round *England*, *Scotland* and *Ireland*, and the adjacent Islands, is about 3800 Miles.

In the whole World about 300,000000 of People, and not above 80 Millions with whom the *English* and *Dutch* have Commerce. The Value of the Commodities traded for in the whole, not above 45000000. The Manufactures of *England* in the whole, exported from *England*, amount to about 5000000 per Ann. Lead, Tin, and Coals, 500000 *l.* per Ann. The Value of the *French* Commodities (then) brought into *England*, did not exceed 1200000 *l.* per Ann. The whole Cash of *England* in current Money was then about 6000000 *l.* and at 6000000 of Souls, allowing each to spend 7 *l.* per Ann. the whole Expence will be 42000000, that is, about 800000 *l.* a Week. The Rent of Houses in *England* was then about 4000000 *l.* per Annum.

Dr. Davenant also in his Discourses on the publick Revenues and Balance of Trade of *England*, shews the great Use of Political Arithmetick in all the Considerations about the Revenues and the Management of our Trade ; he gives some good Reasons why *Sir William Petty's* Number above-mentioned are not entirely to be rely'd upon, and therefore advanced others of his own, which are founded upon and supported by the Observations of the ingenious and industrious *Mr. Gregory King*. Some of the Particulars of which, that are most useful, are these : That the Land of *England* is 39 Millions of Acres. The Number of People, according to this Account, is now about 5545000 Souls, they increasing about 9000 every Year, Allowances being made for Plagues, &c. Wars, Shipping, and the Plantations. The People of *London* he reckons at 530000. Those in the other Cities and Market Towns in *England*, at 870,000, and those in the Villages and Hamlets at 4100000. The yearly Rent of the Land he accounts to be 10,000000. That of the Houses and Buildings 2,000000 *l.* per Ann. The Produce of all kinds of Grain he reckons to be worth 9,075000 *l.* in a Year of moderate Plenty. The Rent of the Corn Land annually 2,000000 *l.* and the neat Produce above 9,000000. The Rent of the Pasture Meadows, Woods, Forests, Commons, Heaths, &c. 7,000000. The Annual Produce by Cattle, in Butter, Cheese, and Milk, he thinks, is about 2,500000. The Value of the Wooll yearly shorn, about 2,000000 : Of Horses yearly bred, about 250000. Of the Flesh yearly spent as Food, about

bout 3,350,000. Of the Tallow and Hides about 600,000. Of the Hay yearly consumed by Horses, about 1,300,000; of Hay consumed by other Cattle, 1,000,000.

Of the Timber yearly felled for Building 500,000 *l.* Of the Wood yearly spent in Firing, &c. about 500,000 *l.* The Land of England to its Inhabitants is now about 7½ Acres per Head. The Value of the Wheat, Rye and Barley necessary for the Sustenance of England amounts to at least 6,000,000 of Pounds Sterling per An. The Value of the Woollen Manufacture made here is about 8,000,000 *l.* per Ann. and our Exports of all Finds of the Woollen Manufacture do amount to above 2,000,000 *l.* per An. The annual Income of England on which the whole People live and subsist, and out of which Taxes of all kinds are paid, is now since the War about 43,000,000 *l.* That of France 81,000,000, and that of Holland 18,250,000 *l.* &c.

The Ingenious Capt. Halley, Geometry Professor in Oxon, hath made a very exact Estimate of the Degrees of the Mortality of Mankind, drawn from curious Tables of the Births and Burials at the City of Breslaw, the Capital of Silesia, with an Attempt to ascertain the Price of Annuities upon Lives from thence. This is Published in *Philos. Transf. N.* And in the *Miscellanea Curiosa*, Vol. I. From a Table which he hath there calculated he derives the following Uses. 1. To find the Proportion of Men able to bear Arms in any Multitude; which he reckons from 18 to 56 Years old; and accounts about ¼ of the whole. 2. To shew the differing Degrees of Mortality (or rather of Vitality) in all Ages; by which Means he finds the Odds there is, that any Person of any Age doth not die in a Year's Time, or before he attain such an Age. 3. To shew at what Number of Years, 'tis an even Lay that a Person of any Age shall die; and finds for Instance, that in an even Lay, that a Man of 30 Years of Age lives between 27 and 28 Years. 4. To regulate the Price of Insurance upon Lives: And, 5. The Valuation of Annuities on Lives. 6. How to value two or three Lives after the same Manner. And from the whole he makes two very good Observations. 1. How unjustly we complain of the Shortness of our Lives, for it appears, one Half of those that are born don't live above 17 Years. 2. That the Growth and Increase of Mankind is not so much stinted by any Thing in the Nature of the Species, as it is from the curious Difficulty most People make of venturing on the State of Marriage. And therefore Celibacy ought to be every Way discouraged by all wise Governments; and those who have numerous Families of Children, to be countenanced and encouraged by good Laws, (*i. e.*) such as the *Jus Trium Liberorum*, among the Romans, &c. See on this Subject also *Grant's Observations on the Bills of Mortality*; who reckons that there are 39,000 square Miles of Land in England.

That in England and Wales there are 45,000,000 Souls.

That the People of London are about 640,000; one fourteenth of the People of England.

That England and Wales are about 10,000 Parishes.

In Dublin (then) 30,000 People.

That there are 25 Millions of Acres in England and Wales, viz. about 4 Acres to every Head.

That but 64 out of 100 of the Children born are living at 6 Years old.

That but 40 of 100 are alive at 16 Years End.

But 25 out of 100 at 26 Years End.

But 16 out of 100 at 36 Years End.

But 10 out of 100 at 46 Years End.

But 6 out of 100 at 56 Years End.

But 3 out of 100 at 66 Years End.

But 1 out of 100 at 76 Years End.

That London doubles itself in about 64 Years.

Sir William Petty also in his Discourse about *Duplicate Proportion*, tells us, that 'tis found by Experience, That there are more Persons living between 16 and 26 than of any other Age: And laying down that as a Supposition: He infers, That the Square Roots of every Number of Mens Ages under 16, (whose Root is 4) shews the Proportion of the Probability of such Person's reaching the Age of 70 Years. v. gr. 'Tis 4 Times more likely that one of 16 Years of Age lives to be 70, than a Child of 1 Year old. 'Tis thrice as probable, That one of 9 Years lives to 70, as such a new-born Child, &c.

That the Odds is 5 to 4, that one of 25 dies before one of 16 Years.

That 'tis 6 to 5 (still as the Square Roots of the Ages) that one of 36 Years old dies before one of but 25 Years of Age. And so on according to any declining Age to 70; compared with 4.6: Which is nearly the Root of 21, the Law Age.

The above-mentioned Mr. Halley, in his Observations on the Breslaw Bills of Mortality, saith; That 'tis 80 to 1, a Person of 25 Years of Age doth not die in a Year.

That 'tis 5 ½ to one, a Man of 40 lives 7 Years; and that one of 30 may reasonably expect to live 27 or 28 Years.

And so great a Difference is there between the Life of Man at different Ages; that 'tis 100 to 1, one of 20 lives out a Year; and but 38 to 1, that one of 50 doth so. Whence, and from some other Observations, with great Pains he computed the following Table, shewing the Value of Annuities for every 5th Year of Life to the 70th.

A Table of the Value of Annuities

Age.	Years Purchase.
1	10 . 28
5	13 . 40
10	13 . 44
15	13 . 33
20	12 . 78
25	12 . 27
30	11 . 72
35	11 . 12
40	10 . 57
45	9 . 91
50	9 . 21
55	8 . 51
60	7 . 60
65	6 . 54
70	5 . 32

POLLARDS, were formerly a kind of Spurious Coin used in *England*, but these, as also Crocards, Staldings, Eagles, Leonomies, and Steepings have been long since disused. See *Matt. West. in Anno. 1299. p. 413. 2 Inst. fol. 577. and Plowden, fol. 469.*

PONTON : The late invented Ponton is a Boat of *Tin* or rather *Latten*, eight Yards long and two broad, having a large Ring at each Corner : When the Army marches it is laid on a Carriage, and drawn by five Horses. Each Boat hath an *Anchor*, and *Cable*, and *Baulks*, and *Chests* belonging to it. The *Baulks* are seven Yards long and about five or six Inches square : The *Chests* are Boards joined together by Wooden Bars about a Yard broad and four Yards long. When these Pontons are to be used, they are slipp'd into the Water, and placed about two Yards asunder, having a strong Rope running through the Rings, which is fastened on each Side the River you would pass over, to a Tree, Stake, &c. The Baulks or Beams are laid across the Boats at a due Distance, and the Chests upon them ; and these are joined close to make a Bridge, over which Foot, Horse, and even a Train of Artillery may pass.

PORES. Sir *Is. Newton* in his *Opticks* shews, that Bodies are much more rare and porous than is commonly believed. Water is 19 times lighter and consequently rarer than Gold ; and Gold is so rare as very readily and without the least Opposition to transmit the Magnetick *Effluvia*, and easily to admit Quick-silver into its Pores, and to let Water pass through it ; for a Concave Sphere of Gold hath, when filled with Water and solder'd up, upon pressing with great Force, let the Water squeeze through it, and stand all over its outside in multitudes of small Drops like Dew, without bursting or cracking the Gold, as he was informed by an Eye-witness. Whence we may conclude, that Gold hath more Pores than solid Parts, and by Consequence, that Water hath above 40 Times more Pores than Parts. And he that shall find out an Hypothesis to solve how Water can be thus rare, and yet not be capable of Compression by Force, may doubtless by the same Hypothesis make Gold and Water, and all other Bodies, as much rarer as he pleases.

So that Light may find a ready Passage thro' transparent Substances, there being open and free Space sufficient for such a Passage. We find that the Magnet transmits its Vertue without any sensible Diminution or Alteration, through all cold Bodies that are not Magnetick, as Gold, Silver, Brass, Glass, Water, &c. The gravitating Power of the Sun (if you will explain it Mechanically) is transmitted entire through all the vast Planetary Bodies, so that with an equable Force it acts thro' all their Parts, even to their very Centres ; i. e. according to the Quantity of Matter in each Part. The Rays of Light, let 'em be either Bodies actually coming to us from the Sun, or only Motions or Impressions upon the Medium, move in Right-Lines, and are hardly ever, unless by great Chance, reflected back again in the same Right-Line after their Impingence on Objects ; and yet we see that Light is transmitted to the greatest Distances thro' Pellucid Bodies, and that in Right-Lines. Now how Bodies should have Pores sufficient for these Effects is hard to conceive, but yet not impossible. For Sir *Is. Newton* hath shewn, That the Colours

of all Bodies arise from their Particles being of such a determinate Size or Magnitude : (See *Colours.*) Wherefore if we conceive those Particles to be so disposed, as that there is as much of Porosity or Space interspersed between them as the Quantity of these Particles amounts to. And in like Manner, if you suppose these Particles to be composed of others much less, and that these have as much interspersed Vacuity as their Quantity amounts to ; and so on till at last you come to solid Particles without any Pores : Then if in any Body there be 3 (for Instance) of these Sizes of Particles, and that the last be of the solid or least Sort ; that Body will have 7 Times as much Vacuity as Solid Matter. If you suppose 4 such Degrees or Sizes of Particles, and that the last and least be solid ; the Body will have 15 Times as much Pores as Solidity. If you imagine any Body to have 5 such Degrees or Sizes of Particles, it will have 31 Times as much Space as Solidity interspersed : And if it have 6 such Sizes of Particles as before, it will have 63 Times as much Vacuity as Solid Matter, and so on. And perhaps in the wonderful Confirmation and Fabrick of Natural Bodies there may be other Proportions of Space to Matter to us wholly unknown, whence 'tis possible there may be yet far greater Quantities of Vacuity interspersed in Bodies.

PORTA or Vena Porta : Dr. *Keil* in *Animal Secretion*, p. 36, 37, &c. thinks that he hath found out the true Use of this Vein, (of which you have a large Description in Vol. I. under *Vena Porta*) which is, that the Bile being to be mixed with the Chyle as it comes out of the Stomach into the *Duodenum*, could no where be so conveniently secreted from the Blood, as where the Liver is placed : But if all the Branches of the *Celiac Artery* carried all the Blood to the Liver, from which the Gall was to be separated ; it is evident, considering the nearness of the Liver to the Heart, and the intestine Motion of the Blood, that so viscid a Secretion as the Gall is, could never have been formed in the Blood, and consequently could never have been secreted by any Gland in that Place. In this Case Nature is forced to alter her constant Method of sending the Blood to all the Parts of the Body by the Arteries. Here she forms a Vein, (which is no Branch of the *Cava*, as all the others are) and by it she sends the Blood from the Branches of the *Mesenterick* and *Celiac Arteries*, (after it hath passed thro' all the Intestines, Stomach, Spleen, Gall, and Pancreas) to the Liver. By this extraordinary Contrivance the Blood is brought a great way about before it arrives at the Liver ; and its Celerity is extremely diminished ; so that all the Corpuscles which are to form the Bile, may have sufficient Time to attract one another, and unite before they come to the secreting Vessel. And thus, saith he, have we found out the true Use of the Porta ; which he confirms afterwards, by shewing what Nature doth further in Prosecution of the same Design ; in increasing the Cavities of all the Arteries as they divide, and that as the Trunk of the *Mesenterick Artery* bears a lesser Proportion to its Branches than the *Aorta* does to its Branches ; so the Branches of the *Mesenterick Artery* are likewise less in Proportion to their Conjugate Veins than the *Aorta* is to the *Vena Cava*. The descending Trunk of the *Aorta* below the *Emulgents* is to the *Vena Cava* at the same Place,

as 324 is to 441. But a Branch of the *Mesenterick* Artery is to its corresponding Branch of the *Porta* as 9 to 25: And therefore the Blood in the Branches of the *Porta* moves above 177 Times Slower than it does in the Trunk of the *Mesenterick* Artery, and then only upon the Account of the Increase of the Diameters of the Vessels. So necessary is it to abate the Rapid Intestine Motion of the Blood, which would otherwise hinder the Coalescence of the Particles for the Formation of the Ball.

PORTABLE Barometer. See *Barometer*.

PORTFIRE, is a Composition of Meal, Powder, Sulphur and Salt-Petre drove into a Case of Paper, but not very hard; 'tis about 9 or 10 Inches long, and is used to fire Guns and Mortars instead of Match.

PORTREVE, is the Title for the Chief Magistrate in some Sea-Coast Towns: And *Cambden* in his *Brit. saith*, the Chief Magistrate of *London* was so called in *William* the Conqueror's Time, as appears by a Charter of his to this City. In *Richard* the First's Time, the City was governed by two Bailiffs appointed by the King; but presently after King *John* granted them a Mayor for their yearly Magistrate.

PORTIFORIUM, was formerly an Ensign or Banner, which was provided in all Cathedral and most Parochial Churches, to be solemnly carried in the Front of any Procession.

PORTMANNIMOTE, sometimes hath been used for *Portmote*, which see.

PORTMOTE, is a Convention or Meeting of the Inhabitants of a Port or Burgh, in which some Customary Duties were anciently paid to the Lord of the Fee.

PORT-NAILS, are such Nails as are used to fasten the Hinges to the Ports of Ships.

PORTOISE, aboard a Ship, is the same with *Portlast*, or the *Gunwale*; and as they say *the Yard is down a Portlast*, when it lies down on the Deck, so for a Ship to ride a *Portoise*, is to ride with her Yards a *Portlast*, or struck down on the Deck.

PORTRAITS, is the Painters Word for Pictures of Men and Women (either Heads, or greater Lengths) drawn from the Life; and the Word is used to distinguish this kind of Face-Painting (as it is often called) from History-Painting.

PORTSOKNE, the *Soke* or Liberties of any Port; i. e. City or Town.

POST, in the Art Military, is used for any sort of Ground or Place, whether fortified or not, where a Body of Men can make a Stand, fortify themselves, or be in a Condition to fight an Enemy; and therefore they say the *Post* was relieved, the *Post* was quitted, the *Post* was taken Sword in Hand, &c. A Spot of Ground seized by a Party to secure the Front of an Army and to cover the Posts that are behind, they call an *Advanced Post*: And the *Advance Guard* or the *Right* of the 2 Lines of an Army, &c. they call the *Post of Honour*.

POSTNATI, are such as were born in *Scotland* after the Descent of that Crown to *K. James I.* And it was resolved in the 7th Year of that King's Reign by all the Judges, that such Persons are *no Aliens* in *England*. But the *Ante-Nati* or such as were born in *Scotland* before that Time, were Aliens as to the Time of their Birth.

POUND, *Libra*, contains 12 Ounces; and tho' now it signify 20 s. when applied to Money, which is but the 3d part of a Pound in Weight, yet it is

because 20 s. did heretofore (with us) weigh a full Pound Troy or 12 Ounces, each of these Ounces contained so many *Solidi* or Shillings, and so many *Denarii* or Pence, as they who govern'd the Money Matters thought fit, sometimes more, sometimes fewer. The old Saxon Pound did contain 48 Shillings, and each Shilling contained 5 d. so that the *Libra Anglo-Saxonica* contained 240 d. When the Pound was reduced 'tis hard to tell exactly, but in *W. the Conqueror's* time it contained 20 s. sometimes the Pound was composed of 12 Ounces or *Ora*, and then the *Ora* was 20 d. and sometimes of 15 Ounces or *Ora*, and then the *Ora* was 16 d. But tho' either of these may be taken for the *Shilling*, yet generally it was 20 d. and this was the Value of the Ounce in the *Libra Denariorum* and the *Libra Sterlingorum*, which are the same. See *Chro. Presciosum*.

POWER of the County, See *Posse Comitatus* in Vol. 1.

POWERS Mechanick, of these there are 5 usually accounted, the *Lever*, the *Balance*, the *Wedge*, or inclined *Plane*, *Screw* and the *Pulley*. About these Powers (the Nature of which you will see under those Words, or the *Latin* Names) there are some Universal Laws agreed on, which it would be well for Mechanicks, Engine-Makers, &c. to have in Readiness in their Minds, lest some such impossible Whims as the *Perpetual Motion*, &c. should get Possession of their Heads.

R U L E I.

The Moving Forces or Powers are to the Weight to be moved, reciprocally, as the Space passed by the Weight, is to that passed by the Power.

Thus in the *Windlace Axis in Peritrochio*, &c. the Circle or Part of such a Periphery, which the Power moves, is to the Periphery of the Axis of the Cylinder reciprocally as the Weight to the Power.

And in *Pulleys* 'tis plain that the Ropes are shortened in Proportion to the Elevation of the Weights.

R U L E II.

The Power or moving Force, and the Weight are reciprocally proportional to their Velocities.

R U L E III.

The same Force which can lift (ex. gr.) 100 lb. the height of 2 Feet; will raise 200 lb. the height but of one Foot.

PRAGMATICK Sanction, is a Term in the Civil Law for a Letter written to a Corporation, or any Publick Body, by the Emperour, in answer to their Request to enquire or know the Law of him. But if this Letter be sent only to particular Persons who have consulted him in the like Case, 'tis called a *Rescript*.

PRÆAMBLE, *Proœmium*, in the Law-sense, is the Beginning of an Act of Parliament, &c. and as it were a Key, to open the Intent of the Makers of the Acts, and the Mischiefs design'd to be prevented or remedied by the same.

PRÆBEND. See *Prebend*, in Vol. 1.

PRÆMUNIENTES, are Writs sent to every particular Bishop to come to Parliament, *Præmunientes*, or warning him to bring with him the Deans and Arch-Deacons within his Diocess, one *Prætor* for each Chapter, and two for the Clergy of his Diocess.

PRE-

PRECARIA, the same which *Bedrep*, *Binddag* or *bidendag*, a days Work; which the Tenants of some Manners are bound by their Tenure to do for their Lord in Harvest: See the great Book of the Customs of the Abbey of *Battel*, Tit. *Apeldarham*. fol. 60.

PRECEPTORIE, or *Commanderie*. As the larger Monasteries had formerly their remote Country Cells which were Subordinate to the Mother-house of Religion; so the Knights Templars and Hospitalars sent part of their Fraternity to some country Cell, which was govern'd by a Person whom they called a *Preceptor* or *Commander*: And thence the Place was called a *Preceptorie* or *Commandrie*: and all these were Subject to the Prime Body, who had their Principal Seats in *London*. *Kenet's Paroch. Antiqu.* Sixteen of these *Preceptories* we have the Names of; viz. *Cressing Temple*, *Balsall*, *Shengay*, *Newland*, *Yevely*, *Witham*, *Temple-Brue*, *Wallington*, *Rothely*, *Ovennington*, *Temple-Combe*, *Trebigh*, *Ribstan*, *Mount St. John*, *Temple-New Sum*, and *Temple-Church*.

PRECIPE *quod Reddat*, is a Writ of a great Diversity both in its form and use: For which See *Ingressus* and *Entry*. This form is extended as well to a *Writ of Right* as to other Writs of *Entry* or *Possession*. Tis called sometimes a *Writ of Right Close* as a

PRECIPE *in Capite*, where it issueth for the Tenants holding of the King in Chief as of his Crown, and not of him, as of any Honour, Castle or Mannor. Sometimes also 'tis called a *Writ of Right Patent*, as when it issues out of the Chancery Patent; i. e. open to any Lords Court for any of his Tenants deforc'd against the Deforcer, and must be determined there.

PRECONTRACT, is a Contract (usually understood of Marriage) which was made before another Contract, and consequently as far as 'tis contrary to and inconsistent with, annuls the latter.

PRE-EMPTION, was formerly allowed to the Crowns Purveyor, to have the first buying of all Corn, other Provisions, &c. before others. See 12 Car. c. 24.

PRE-FINE, (in Law) is that Fine which is paid on Suing out the *Writ of Covenant*.

PREMUNIRE. See **PRÆMUNIRE**.

PREPOSITUS *Vine*, some will have to be the Constable of a Town, or Petit Constable. Tis also sometimes used for a *Reeve*: For others say in our Old Records, it signifies the *Reeve* or *Bailiff* of the Lord of the Mannor who is sometimes called *Serviens Ville*. But by the Laws of K. Henry. I. the Lord answered for the Town where he was Resident: Where he was not present his Deputy or Seneschal was responsible if he were a Baron. But if neither of them could be present, then the *Prepositus* & *quatuor de unaquq; villa*, the *Reeve* and 4 of the most Substantial Inhabitants were Summoned in.

PRESBYTERIUM, the *Presbytery*; The Choir or Chancel of a Church; so called because that Place was appropriated to the Bishops and Priests; and other Clergy, while the Laity were confined to the *Nave* and Body of the Church, *Cowel's Interpreter*.

PRESIDENT, in a Legal Sense, is the Crowns Lieutenant in a Province or Function: As the president of *Wales*, *York*, *Berwick*; of the King's Council, &c.

PRESSURE; by this Word some Philosophers,

addicted to the Cartesian Hypothesis, mean a kind of Motion which is impressed upon and propagated through a Fluid Medium. And by this they would explain all the Phænomena of Light and Colours, as well as of many other Effects; by certain new Modifications which do there happen to the Rays of Light, as they are usually called. But as our Excellent Sir *Is. Newton* shews, (p. 307 of the Latin Edition of his *Opticks*) this is a Mistake.

For if Light (for Instance) consisted only in Pressure, propagated without Actual Motion, it could not therefore agitate and warm such Bodies as Reflect and Refract it: And if it consisted in an Instantaneous Motion, or one propagated to all Distances in an Instant; as some have advanced; there would be required an Infinite vis or Force, to produce that Motion, every Moment, in every Lucent Particle. And if Light consisted either in Pressure, or in Motion propagated in a Fluid Medium, whether instantaneously or in Time, it must from thence come to pass, that it should inflect itself in umbram. For Pressure or Motion in a Fluid Medium cannot be propagated in Right Lines, beyond any Obstacle which shall hinder any Part of the Motion; but will inflect and diffuse itself every Way into those Parts of the Quiescent Medium which lie beyond the said Obstacle.

Thus the Force of Gravity tends downward, but the Pressure, which arises from that Force of Gravity tends every Way with an Equable Force: And with equal Ease and Force, is propagated in Crooked Lines as in Straight. Waves on the Surface of Water while they slide by the Sides of any Large Obstacle, do inflect, dilate and diffuse themselves by Degrees, into the Quiescent Water lying beyond the Obstacle. The Waves, Pulses, or Vibrations of our Air in which Sounds consist, do manifestly inflect themselves, tho' not so much as the Waves of Water; for the Sound of a Bell or of a Cannon, can be heard over a Hill, which intercepts the Sonorous Object from our Sight: And Sounds will be propagated as easily thro' Crooked Tubes, as thro' Straight: But Light is never observed to go in Curve Lines nor to inflect itself in Umbram. For the fixed Stars do immediately disappear on the Interposition of any of the Planets, as well as some Parts of the Sun's Body, by the Interposition of the Moon, Venus or Mercury.

PREST Money, from the French *Prest*, ready; is Money given to Soldiers when they are *Prest*: And binds such as receive it to be ready at Command at all Times appointed by their Officers.

PREST Sail: A Ship at Sea is said to carry a *Prest Sail*, when she carries all that she can possibly Croud: Which is sometimes done in giving Chase to an Enemy: But 'tis a dangerous Experiment and ought not to be tryed often, lest a Ship should over-set, or bring her Masts by the Board, in which latter Case she will become a Prey to the Enemy.

PRESTATION Money, was according to some, a Sum of Money paid by the Arch-Deacons to the Bishops annually *pro Exteriori Jurisdictione*: But others say it was a *Subsidium Charitativum*, which in reasonable Causes a Bishop might require of his Clergy.

PRETENSED Right or Title: *Jus Pratenfum*; where one is in Possession of Lands or Tenements, and another who is out, claims it and sues for it. Here the *Pretensed* Right or Title, is said to be in him who doth thus Claim or Sue.

PREVA-

PREVARICATION, In the Civil Law, is where an Informer colludes with the Defendant, and so makes only a feigned Prosecution.

PREVENTER Rope, in a Ship, is a small Rope used to secure the Ties, so that if one Part should break, the other may not run thro' the Ram-head. See *Ropes* in Vol. I.

PRICK-Posts, in a Building, are such as are framed into the *Breast-Summers* between the principal Posts for strengthening the Carcase of the House.

PRIDIAL Services. See *Services*.

PRIMAGE, is a Duty due to the Mariners and Sailors for the loading of any Ship at the setting forth from any Haven. Anno 32. H. 8. c. 14. which in some Places is a Penny in the Pound: In others Sixpence for every Pack or Bayl, &c. according to the Custom of the Place.

PRIMES, are the first larger Divisions of the single Number on *Gunter's* Line of Proportion, whose next Subdivisions are called Tenths, &c. See *Line of Proportion*.

PRIMÆ VIÆ. See *Via Prima*.

PRIMITIÆ, *First-Fruits*: In our Law, the Profits, after Avoidance, of every spiritual Living as rated in the King's Books, for one Year.

PRINCIPAL Posts, in any wooden Building, are the Corner Posts, which are tennanted into the Ground Plates below, and the raising Plates above, i. e. into the Beams of the Roof.

PRINTING. There is a Dispute between the Towns of *Harlem* in *Holland*, and *Mentz* in *Germany*, about the Invention of this noble Art.

The *Harlemers* say, that *Laurenz Janz Koster* of *Harlem*, was the first Inventor of *Printing*, A. D. 1430. But that at first he used only wooden Blocks or Plates, (like those used in *China* and some other Eastern Countries, where that kind of *Printing* hath been much longer in Use, and perhaps gave the first Hint to our Manner of *Printing* now in Use;) tho' after some Time he left those off, and cut single Letters in Steel, which he sunk into Copper *Matrices*, and fitting them into Iron Molds, cast single Letters of Metal in these *Matrices*.

They say also, that his Companion *John Guttenburgh* stole his Tools away while he was at *Church*, and with them went to *Mentz* in *Germany*; where setting his stolen Instruments to work, he claim'd the first Invention of this Art before *Koster* did his.

To prove this, they say that one *Rabbi Joseph*, a Jew, in his Chronicle, mentions a printed Book that he saw at *Venice* in the Year 5288, according to the Jewish Account, and of ours, 1428, as may be seen in *Pet. Scriverius*.

But notwithstanding all this, and also what they say further of a Book entituled *De Spiegel*, which they shew printed at *Harlem* in *Dutch* and *Latin*, tho' without Date; but they pretend it to be the first that ever was printed: Notwithstanding this, says *Moxon*, *Guttenburgh* of *Mentz* is more generally taken for the Inventor of *Printing*, than *Koster* of *Harlem*.

Dr. Wallis saith, this Art was first invented about the Year 1460, and was practis'd in *Germany* immediately, but whether first at *Mentz* or *Harlem*, he determines not. He saith the Book which bears the Repute of being the first that ever was printed, is *Tully's Offices*; which was printed in the Year 1465 or 1466; for the Copy of it in the *Bodleian* Library in *Oxon*, disagrees a Year with that in the Library of C. C. College there. In that Book in

Vol. II.

the *Bodleian* Library, is a Note written which mentions one *Johannes Faustus*, as Coadjutor to *Guttenburgh*, as also *Peter Scheffer*, on the same Account; and this *Scheffer*, *Joh. Arnoldus* in *Libello de Chalcographia Inventionem*, makes the Inventor of the *Matrices*. These three work'd together a while, and then parted.

There is also another Note written in a later Hand, in the said Book, which refers the first Invention of *Printing* to the Year 1453; but most to the Year above-mentioned by *Dr. Wallis*, viz. 1460.

Next to these two Places of *Mentz* and *Harlem*, it seems to have been practis'd first at our University of *Oxon* in *England*: For *K. H. 6.* and *Thomas Bouchier*, then *A. B.* of *Canterbury*, sent *Wm. Turner*, Master of the Robe, and *Wm. Caxton*, Merchant of *London*, over to *Harlem* to learn this Art, who privately prevail'd with one *Frederic Corseles*, (an Under Workman) for a Sum of Money to come over hither; who did so, and at *Oxford* set up the Art of *Printing*, before it was used any where else, except in *Mentz* and *Harlem*. And there is a Treatise, said to be of *S. Jerom*, (because found in his Works) but in Reality of *Ruffinus* on the Creed, printed at *Oxon* in a broad Octavo, in the Year 1468, which is but 3 Years after the Edition of *Tully's Offices* at *Mentz*; and perhaps is one of the first Books printed on Paper, for that of *Tully* was on Vellum. Soon after this, *Caxton* (who first brought it, as is supposed, to *Oxford*) promoted it to *London*; which *Baker* in his Chronicle saith was about 1471: But *Moxon* in his Art of *Printing* saith, he had not seen any Books printed at *London* before 1480; about which Time it was received in *Italy*, *Germany*, &c.

In *Philos. Transactions*, N. 288, and 310, there is this further Account of the Rise and Progress of the Art of *Printing*.

Boxhornius Schrevelius, and other Authors say, That *Koster* could not, nor did he in Fact print so large a Book as the *Speculum Salutis*, without gradual Improvements; and his first Essays were on small and loose Leaves of Paper before he attempted whole Books.

In the *Bodleian* Library at *Oxford*, are two Books, and in that of *Bennet Coll.* in *Cambridge* is another very ancient printed Book, printed only on one Side of the Paper; the whole wrought, or cast on Wood, nor set or composed with *Printing* Letter, and printed with Writing-Ink; which do sufficiently shew that they were done when this Art was in its Infancy, and are very probably the Work of *Koster*; but they are without Date or Printer's Name.

Koster had an Assistant whose Name was *John Fust*, or as some write him *Faust* or *Faustus*; from whom he took an Oath of Secrecy, as *Schrevelius* tells us, but *Fust* ran away with *Koster's* Tools and Materials, and in some time set up a *Printing-Press* at *Mentz*, where he was assisted by his Servant *John Scheffer*, a young Man of a good Genius, and who afterwards married his Daughter, and became his Partner. They tell a Story also of *Fust's* going to *Paris*, but whether before or after he settled at *Mentz*, is uncertain, and offering there a great number of printed Bibles to Sale, as if they were Manuscripts: But the *French* considering the Number of these Books, and their exact Conformity one to another throughout the whole, to a Line, a Word, a Letter, nay even to a Point, and that the best of Book-writers could not be thus exact, forc'd the Secret out of him,

S f f

him, by either actually indicting him for a *Magician*, or threatening him at least so to do; and this 'tis said gave Rise to the Story of Dr. *Faustus*.

And 'tis probable about this Time many printed Books were sold up and down for *Manuscripts*.

'Tis not certain in what Year *Fust* and *Scheffer* began first to work at *Mentz*. But *Schrevelius* saith, *Faustus* (as he calls him) printed *Alexandri Doctrinale cum Petri Hispani Tractatibus*, A. D. 1442. And *Lambetius* in *Comment. de Biblioth. Cæs. Lib. 2. p. 988.* saith, that he brought from *Inspruck* to the Imperial Library at *Vienna*, a *Psalter* printed on Parchment by *Fust* and *Scheffer*, 1457. And soon after this Date many Books were printed, which are still in Being: as the *Durandus* in the Library of *Basil*, printed 1458. *Johannis Johannis Catholicon*, in his Majesty's Library, printed 1460. The Latin Bible of 1462 in the French King's Library, all before the *Tully's Offices* above-mentioned; which was not printed till 1465 or 1466. The first Book printed here in England, was the *Ruffinus*, printed at *Oxford* 1468, as was said before. But they practised the Art earlier in other Countries; and in particular, it was used at *Rome* in the Palace of *Maximi*, A. D. 1455, by *Conrad. Sweynheim*, and *Arnold Pannartz*, both Germans, and who continued Printers there many Years after, as *Martellinus* in his *Rome Sacra* affirms.

Some think that Paper, (made of Linnen Rags) was first made at *Basil*, by some Greeks, who fled out of their Country after *Constantinople* was sackt, A. D. 1452; and this in Imitation of the Cotton Paper used in the *Levant*. Certain it is the Cotton Paper hath been of very ancient use in the East; there being in the Bodleian Library an Arabick Manuscript (among those the University bought of Dr. *Huntingdon*) written in the 427th year of the *Hegira*, which is A. D. 1049, on this Paper; and some there are without Dates, which seem older.

And as for the Linnen-Rag-Paper, it must be much older than 1452; for in the Archives of the Library of the Dean and Chapter of *Canterbury*, there is an Inventory, on our Paper, of the Goods of *Henry Prior of Christ's Church* there, that is in the 20th Year of *Edw. 3.* which is A. D. 1346. and in the Cotton Library are several Writings, on our Paper, as high at least as the 15th of *Edw. 3.*

Some think the *Rolling-Press* was invented by *Lipsius*; but there is a printed Book in the Bodleian Library, (placed *Laud. p. 138.*) being a *Missale secundum usum Eccles. Herbipolensis*, (i. e. *Wurtzburgh*) in Germany. At the Beginning of this Book is an Instrument of *Rodulfus* the A. B. of this Church, containing the Reasons of the Publication of this *Missale*, and instead of a Seal, there is annexed a Print engraven of the Arms of the See, &c. very finely done (for that Time, for 'twas before *Durer*) and on which are evident Marks of the Pressure by the Plate, with some Touches of Ink at the Edges, &c. which all that have seen it judge to be plain Marks of its being done or wrought off in a *Rolling-Press*. And there are sufficient Reasons to prove that this Book is as ancient as 1481.

Mr. *Bagford* thinks we had not the first Hint of Printing from the Chinese, of whom we had no Knowledge hardly, when this Art was invented: But rather from Old Medals, Seals, &c. and the Letters on them. But if it be certain, as it seems

to be, that Cards are as old as H. 6. nothing seems to give a better Hint to the Invention of Printing than Card-making, as is evident by the first Specimen of *Printing at Harlem*; and by those Books above-mentioned in the Bodleian Library, and that of *Bennet-College* in *Cambridge*.

The cutting of the Molds or Blocks for making our Playing Cards, is after the same Manner as that of the old Books first printed at *Harlem*. They lay a Sheet of wet or moist Paper on the Form or Block, being first lightly brushed over with Ink made of *Lamp-Black* mixt with Starch and Water. Then they rub it off with a round Lift with their Hand, which is done with great Expedition. They colour the Court Cards by the help of several Patterns or *Stanefiles*, as they call them; being Card-Paper cut thro' with a Penknife for every Colour, as *Red*, &c. (for at the first Printing, the Card hath only a meer Out-line.) These Patterns are painted with Oil-Colours to keep them from wearing out by the Brushes; for they lay it upon the Picture, and by sliding a Brush that is full and loose over the Pattern, it fixes the Colour into the cut Holes, and leaves it on the Print that is to be a Card; and so they go thro' with all the Colours on the Cards: This very probably was the Way of their first printing at *Harlem*, as might have been discovered before this, if they had consider'd that the Great Letters in our old MSS. (of 900 Years old) are done by the Illuminators, after this of Card-making.

The next Form of Printing in *Harlem* was by cutting whole Forms in Wood from MSS. exactly written, and without Pictures. Such perhaps was the *Donatus*, which might bear Date about 1450; some say, 1440. This appears plain, saith Mr. *Bagford*, from Copy Books which we have seen printed at *Rome*, *Venice*, *Switzerland*, and *England*, as high as 1500.

The third way of Printing was with single Types made of Wood; but who invented this is not known; it was at first esteemed so great a Rarity, that the Printers carried about their Lettets in Bags at their Backs, and got Money at great Mens Houses by printing the Names of the Family, Epitaphs, Songs, and other small Pamphlets.

The fourth Improvement of this noble Art was the Invention of Single Types made of Metal: which is owing to *Peter Scheffer*, above-mentioned, first Servant, and then Son-in-law to *Faustus*, who work'd at *Mentz*. Sometimes you have the Names of these two Men printed at the End of their Books, and sometimes not; sometimes with Dates as high as the Year 1457, and as low as 1490.

As for *John Guttenburgh*, who by many Authors is said to be the first Inventor of Printing, we cannot find one Book with his Name and Printing.

As the first *Harlem* Printing was only a Book with Pictures, and the Impression taken off with a Lift coiled up, as our Card-makers do now use; so when they came to use single Types, they made use of stronger Paper, with Vellum and Parchment, and then the Press was first used; tho' afterwards much improved; as was their *Printing-Ink*.

Rolling-Press-Printing was not used in England till K. *James I.* and then brought hither from *Antwerp* by our industrious *John Speed*.

As to the Art or Practice of Printing it self, 'tis so useful to the Common-wealth of Learning, to have it better understood by Authors and Editors of Books than it usually is, that I shall here give a full

a full but succinct Account of the whole Matter from Mr. Moxon's Mechanick Exercises of Printing; and from what I could collect from my own Observation, or get by Information.

The principal Officer in this Affair is called the *Master Printer*: Who contrives or finds a Room or Rooms, for setting up what they call a *Printing House*; or who furnishes a *proper Place*, with all Tools and Instruments used in Printing.

And first he must consider what Number of *Presses* and *Cases* he shall want that his Room may be proportionate to his Number. They usually allow about 7 Foot square on the Floor, for each *Press*: And for every *Frame* of *Cases*, which holds 2 pair of *Cases*, viz. a pair of *Roman* and a pair of *Italick*, five Foot $\frac{1}{2}$ in Length and $4\frac{1}{2}$ in Breadth; tho' they contain but 2 Foot and 9 Inches: But then Room enough will be left to pass freely between the Frames.

The *Cases*, must be so placed that the Light may fall to the left Hand of the *Compositor*; or else his Hand will interpose between the Light and his Eyes, and so shadow or obscure the Letter he is to take up.

The *Presses* also must be so placed as that the Light may fall from a Window right before the *Form* and *Tympan*.

The *Correcting Stone*, or *Stones* must also stand against a good Light; and as near as can be in the Middle of the Room, if there be but one, that the several *Compositors*, may come the better to it.

In some Corner of the Room with a Sink under it, must the *Lee Trough* and *Rinsing Trough* be placed; or in some other Place if there be Room enough.

The *Distributing Frame*, stands also pretty near the Middle of the Room; and round about the Sides *Nest Frames* may be placed to hold the *Cases*, that lie out of present Use; and the *Letter Boards*, with *Forms* set on them; that both the *Cases* and the *Forms*, may be the better secured from running to *Pye*.

Having thus contrived his Room or Rooms to the best Advantage; it is to be next furnished with its proper Materials as *Letter*, *Cases*, *Presses*, *Chases*, &c. of which next in Order.

Of Letter.

The Printer must be provided with a good *Fount* as they call it, or *Found* of *Letter*, and of all *Bodies*: For most Printing Houses have all these that Fellow, except the two first: And the *Dutch* (and I believe the *French* of late) have several other *Bodies*, and we have one more, which is sometimes used in *England* which they call a *Small Pica*: But this differs but little from the *Pica*.

These *Bodies*, are commonly cast with a *Roman*, *Italick*, and sometimes an *English Face*: But the Printer hath also some *Bodies* with *Hebrew*, *Syrack*, *Greek*, and with the *Musick Face*: As also Characters Mathematical, Chymical, Algebraical, &c. The following Table shews the Names and Sizes of these several *Bodies*: Or what Number of each Body is contained in a Foot.

Pearl	148	} contain'd in a Foot.
Nompareil	150	
Brevier	112	
Long Primer	92	
Pica	75	
English	66	
Great Primer	50	
Double Pica	38	
Two Lined English	33	
Great Cannon	17 $\frac{1}{2}$	

In the Choice of his *Letter*, a Printer hath great Scope to shew his Judgment and Skill as to their Shape, &c. and I think in the whole, the Preference must be given to the *Dutch Types* or *Letters*: But be their Shape what it will, the Letters must be deep cut, that they may print clear, last longer, and be less subject to entertain *Picks*. They must also be deep sunk in the *Matrices*, lest the Bottom Line of a Page should *Beard*; and the *Beard* must also be well cut off by the *Letter Founder*.

There must be provided also *Brass Rules* of about 16 Inches long; for the *Compositor* to cut into such Lengths as his Work requires: These *Rules* must be exactly *Letter high*; for if they are much too high they cut thro' the Paper, Tympan, and Blankets: And if but a little so, their *Shoulder* or *Beard* will print black; and they will also bear the *Platten* off the *Letters* that stand near them, so that those *Letters* will not Print at all; and if they be too *Low*, then the *Rules* themselves will not Print. These *Rules* must also be straight all their whole Length: Their Edges of equal Breadth and neither too thick nor too thin: and the *Brass* should be very well *Planished*, that it may be Stiff and Strong.

Of Cases.

What they call a pair of *Cases* is an *Upper* and a *Lower one*: They are usually both of equal Length, Breadth and Depth: viz. 2 Foot 9 Inches long, one Foot 4 Inches $\frac{1}{2}$ broad, and about one Inch $\frac{1}{4}$ deep besides the bottom Board. These *Cases* are encompassed about with a *Frame* about $\frac{3}{4}$ of an Inch broad; that the Ends of the several Partitions may be let into the Substance of the *Frame*: but the hithermost Side of the *Frame* is about $\frac{1}{2}$ Inch higher than the other Sides, that when either the *Galley*, or another pair of *Cases* are set upon them, the Bottom edge of the *Galley*, or of these *Cases* may stop against that higher *Frame* and not slide off. Both *upper* and *Lower Case* have a thick Partition about $\frac{1}{4}$ of an Inch broad; but the Divisions for the several *Boxes* of the *Upper* and *Lower Cases* are not alike: For each half of the length of the *Upper Case* is divided into 7 equal Parts, and its Breadth into 7 also; so that the whole makes 49 *Boxes*. But the 2 half Lengths of the *Lower Case* are divided each into 8 equal Parts, and its Breadth into 7: And yet not throughout so neither, but the *Lower Case* hath 4 several Sizes of *Boxes*.

These *Cases* should be placed in good substantial *Frames*; which should be so placed with an *easy Declivity*, that the *Compositor* may the better see and come at his Letters.

Of the Galley.

These *Galleys* are of different Sizes according to the Page to be composed. They are commonly made of 2 Flat wainscot Boards each of $\frac{1}{4}$ or $\frac{1}{2}$ of an Inch in Thickness: The uppermost to slide in Grooves of the *Frame* close down to the undermost. The 3 Sides of the *Frame* are fixed fast and square down on the upper Plain of the undermost Board, to stand about $\frac{1}{2}$ of the height of the Letter above the Superficies of the *Slice*.

The Sides of the *Frame* must be broad enough to admit of a pretty many good strong *Oaken Pins* along the Sides, to be drove hard into the bottom Board, and almost quite through the Sides of the *Frame*, that the *Frame* may be firmly fixt to it; but

but they must not be *glewed*; because the Compositor may have sometimes Occasion to wet the Page in the Galley.

Of the Correcting Stone.

This Stone is made of *Marble, Purbeck*, or any other Stone that may be made flat and smooth: It should be capacious enough to hold two Chases or more; that the Compositor on Occasion, may set some Pages by on it ready to *Impose*, tho' two Chases lie on the Stone: So that it may be about 2 Foot broad and $4\frac{1}{2}$ Feet long. It must be placed on a strong Frame like a Table about 3 Foot one Inch from the Ground or Floor.

Of Letter Boards and Paper Boards.

Letter Boards, are to lay the Letters on, and are oblong Squares; about 2 Foot long, 18 Inch. broad and 1 an $\frac{1}{4}$ Inch thick: These should be made strong, and clapt on the under side within about 4 Inches of either End with Pieces of about 2 Inches square as well to keep them from warping, as that the Compositors may easily take them to remove them. *Paper Boards* are only to set Heaps of Paper on, and to press the Paper with.

Of Furniture, Such as

Head-sticks, &c. must be made of dry Wainscot that they may not shrink when the Form stand by; they are Quadrate High, Straight, and of an even Thickness all their Length: and both these and *Side-sticks* are called *Riglet*, if they are not above an Inch in Thickness.

Side-sticks, and *Foot-sticks*, are of the same height with the *Head-sticks*; the latter serving to determine the Breadth, at Bottom and Top; as the *Side-sticks* do the length of each Page.

Gutter-sticks, are used to set between Pages, on either Side the Crosses, as in 8^{vos.} 12^{mos.} 16^{mos.} and Forms upwards.

There are *Quoins* also used to lock up the Forms, or wedge them so close together (with a *Mallet* and *Shooting-stick*) both on the Sides and Head and Foot of the Page, that every Letter bearing hard against every other Letter, the whole Form may Rise, as you will see hereafter. The *Shooting-stick*, should be of Box, and is of a wedge-like Shape and of about 6 Inches long.

There is also a *Dressing-block*, usually made of Pear Tree, about 3 Inches square and an Inch high; its use is by being run over the Face of the Form, and gently knockt there with the Head of the *Shooting-stick*, to press down such Letters, as may happen to stand higher than the rest.

Of the Composing Stick.

This is made of a thin Iron Plate, about 10 Inches long and doubled up square so as that the bottom may be $\frac{1}{2}$ Inch and $\frac{1}{4}$ broad, and the Back about an entire Inch broad. At the further End of the Iron Plate so doubled up, is foldered on an Iron Head which must stand square to the Bottom, about the thickness of a *Long-Primmer*: But all its outer Edges are basild and filed away into a moulding. About 2 Inches from this Head and in the Bottom, is begun a Row of round Holes about an Inch asunder to receive the Shank of the *Male Screw*, that Screws the

sliding Measures fast down to the Bottom: So as these sliding Measures may be set nearer or further from the Head, as the measure of the Page requires.

In the Figure annexed *a* is the Head of the Composing Stick, *bb* the Bottom, *cc* the Back, *d* the Lower Sliding Measure or Check, *e* the Upper Sliding Measure or Check, *ff* the Male Screw, *g* the Female Screw.

The Lower sliding Measure is a pretty thick Iron Plate, as broad as the Inside of the Bottom; about 4 Inches in length: And in its Middle is a Groove, quite thro' it, within about half an Inch of each End, to receive the Shank of the Screw.

On the fore End of this Plate stands square another Iron Head about a *Brevier* thick, and reaching as high as the Top of the Back. The Upper sliding Measure is made just like the Lower, only $\frac{3}{4}$ of an Inch shorter. Between these 2 sliding Measures, they can compose *Marginal Notes* to any Breadth.

The Compositor uses a Bodkin of Steel of about 2 Inches in length from the Shank of the Handle: the Handle is of soft Wood; that when 'tis knockt on the Face of any single Letter, which happens to stand too high, it may not batter it.

Of Chases.

These are Iron Frames about 22 Inches long, 18 broad, and $\frac{1}{2}$ Inch and $\frac{1}{4}$ thick, and the breadth of the Iron on every Side is $\frac{3}{4}$ of an Inch usually, but it should be an entire Inch: All the Sides must be truly square to one another; that when 'tis laid on the Correcting Stone, it may lie truly flat, and the out and inside must be filed straight and smooth. Each Chase hath 2 Crosses belonging to it: One shorter than the other; they are square to one another and are called the *Short* and the *Long Cross*. They have at each End a male Dove-tail filed bevil-way from the under to the upper side of the Cross, so that the underside of the Dove-tail is narrower than the upper: These *Male-dove-tails*, are fitted into *Female ones*, filed in the Inside of the Chase; and which are also wider on the upper Side of the Chase, than on the under, that the upper Side of the Cross may not fall thro' the lower Side. The *Short-Cross* is thus dove-tailed into the Middle of the 2 long Sides of the Chase; and the *Long Cross* into the Middle of the 2 other Sides. The *Short Cross* is moveable also in the Chase about 3 Inches $\frac{1}{2}$ from the Middle. The Middle of these 2 Crosses, are filed or notched half Way thro', one on its upper, the other on its under Side, that they may be let into one another, and in the Middle between the 2 Edges of the upper Side of the *Short Cross* are made 2 Grooves parallel to the 2 Sides of the Cross, beginning at about 2 Inches from each End: They are $\frac{1}{4}$ an Inch deep all the Way, and about $\frac{1}{4}$ of an Inch broad, that the Points may fall into them. The *Short Cross* is about $\frac{3}{4}$ of an Inch thick; and the *Long* about half as much.

See their Figure as they lie on the Correcting-stone.

Of the Press.

The Printing Press, whose Figure is here annexed, was invented by the famous *Willem Jansz*

Blaeu, of *Amsterdam* ; who was eminent not only for his good and great Printing, but also for his Globes and Geographical Maps and Charts.

'Tis called the *New Press* by *Moxon*, who saith, it was (in 1683) but little known in *England*, but generally used in *Holland*, and is much better and more commodious than the common *Printing-Press*.

aa, Represent its *Feet*, which are 2 Feet 9 Inches $\frac{1}{2}$ long, 5 deep, and 6 broad, having their Outfides truly square.

bb, Are the *Cheeks*, which are 5 Foot 10 Inches long besides the Tenons of the Top and Bottom, 8 Inches broad, and 4 and a half thick.

d, Is a Plank called the *Winter*, which is in Length besides the Tenons, a Foot 9 Inches $\frac{1}{4}$, in Breadth 8 Inches, and its Depth 9 Inches.

e, Is the *Cap*, or Top of all the Press, being 3 Foot and 1 Inch long, 4 $\frac{1}{2}$ Inches deep, and 9 $\frac{1}{2}$ Inches broad.

e, Is the *Head* of the Press; whose length, besides the Tenons, is 1 Foot 9 $\frac{1}{4}$ Inches, Breadth 8 $\frac{1}{2}$ Inches, and Depth 8 Inches. Its Top, Bottom, and hind Sides are all square; but the Foreside projects half an Inch over the Range of the Foresides of the *Cheeks*: In which Projecture is cut a Table with an hollow *Moulding*, about it 2 Inches distant from all the Sides of the Foreside of the *Head*; its Tenons are 3 Inches broad, and are cut down at either End, from the Top to the Bottom of the *Head*, and made fit to *Mortices* in the *Cheeks*, that may slide right, and yet play in them.

In the Under-side of the *Head* is cut a Hole about 4 Inches square, and 3 $\frac{1}{2}$ deep, into which a *Brass Nut* is fitted, for the *Worm* to play in.

i, Is Part of the *Worm* below the *Head*; the upper Part being hid in the *Brass Nut*.

i, k, l, m, n, Is the whole *Spindle*.

f, Is the *Till*, a Board about an Inch thick, one Foot 9 $\frac{1}{4}$ long besides the Tenons, its Breadth 8 Inches; in its middle is a round Hole for the Shank of the *Spindle*, and at 7 $\frac{1}{4}$ Inches from each End is a square Hole for the *Hose* to pass thro'.

gg, Are the *Hose*, being upright Irons of $\frac{3}{4}$ of an Inch square, and at each End have male Screws on them. Their lower Ends are fastened into the *Hose-books*, and their upper Ends into the *Garters* or *Curts*, which is a round Hoop placed over the flat Neck of the Shank of the *Spindle*.

bbbh, are the *Hose-books*, or the *Hooks* on the *Hose* the *Platten* hangs on; they proceed from 2 Branches of an Iron Hoop encompassing the lower End of the *Spindle*, on either Corner of the Branch.

k, l, Is the *Eye* of the *Spindle*, as *m* is its *Shank*, and *n* its *Toe*; the *Spindle's* Length in all is 16 $\frac{1}{2}$ Inches, the Length of the Cylinder the *Worm* is cut on is 3 $\frac{1}{4}$ Inches, and its Diameter 2 $\frac{1}{4}$.

oooo, Is the *Platten*, tied on to the *Hooks* of the *Hose*; this is usually made of beaten Plank 2 Inches and a half thick, 14 long, and 9 broad; its Sides are tied square, and its under side exactly plain and smooth.

In the middle of its upper side is let in and fastned an Iron Plate called the *Platten-Plate*, $\frac{1}{4}$ of an Inch thick, 6 Inches long, and 4 broad; in the middle of this Plate is made a square Iron Frame of about half an Inch high, and as much broad; into which is fitted the *Stud* of the *Platten-pan*, so as it may stand steady. This *Stud* is about an Inch thick, and then spreads wider and wider to the Top, where 'tis two Inches and a half.

p Is the *Bar*, in length about 2 foot 8 Inches, 'tis fastned strongly with a Nut and Screw into the *Eye* of the *Spindle*. About 4 Inches from the Shoul-

der this *Bar* is bowed with an obtuse Angle, that the *Press-man* may the more easily and readily catch at it, to draw its wooden Handle *q* within its reach.

rr, Are the *Hind-posts*, which stand at a Foot Distance from the hind sides of the *Cheeks*; they are 3 Foot 4 Inches long besides the Tenons, and 4 Inches thick, and square every way. These hind Posts have six Rails fitted to them, and marked *ss*, and called the *Hind-Rails*.

t t, Are the *Wedges* of the *Till f*.

uu, The *Mortices* of the *Cheeks bb*.

xxxx, yy, Express the *Carriage*; whose Plank is of *Elm* an Inch and half thick, 4 Foot long, and 1 Foot 8 Inches $\frac{1}{2}$ broad. On this Plank at its fore end is firmly nailed down a square Frame 2 Foot 4 Inches long, 1 Foot 10 Inches broad, and the Thickness of its sides 2 $\frac{1}{4}$ Inches square. This is called the *Coffin*, and is marked with the Figure (1) in the Plate, and in it the *Stone* is bedded.

(1) On each of the 4 Corners of the *Coffin* is let in and fastned down a square *Iron Plate*, with return-sides about 6 Inches long, each side 1 8th of an Inch thick, and 2 1 qr. broad.

Behind this *Coffin* is nailed on to its Outside a *Quarter*, of about 3 Inches longer than the Breadth of the *Coffin*; it hath all its sides 2 Inches over, and 3 of them square: But its upper side is hollowed round to a Groove or Gutter (2) an inch and half over. This *Gutter* is so nail'd on, that its hither End standing about an inch higher than its further End, the Water that descends from the *Tympan* (5) falling into it, is carried on the further side of the *Coffin* by the Declivity of the further End of the *Gutter* (2,) and so keeps the Plank of the *Carriage* neat and clean, and preserves it from rotting. Parallel to the outward sides of the hinder part of the Plank of the *Carriage* at 3 inches distant on either side, is nailed two Female Dove-tail Grooves, into which is fitted so as to slide two Male Dove-tails made on the two Feet of the *Gallows* (4) on which the *Tympan* rests.

At 3 inches from the hinder Rail of the *Coffin* in the middle of the Plank is cut a Hole of 4 inches square, and on the hither and further side of this Hole is fastned down a *Stud* of Wood, one on each side, and in the middle of these two Studs is a round Hole of about an Inch over, to receive the two Iron Pins of a wooden *Rowler*, or *Barrel*, with a Shoulder on each side of it to contain so much of the Girt as shall be rolled upon it.

The *Tympan* (5) is a square Frame having 3 of its Sides Wood and one of Iron. 'Tis 2 foot 8 Inches wide, 2 foot 2 inches long, and the Breadth of the wooden sides an Inch and half, and the depth one inch on its hinder end; at the 2 Corners is rivited an iron *Match Joint*, to be pinned on to another half Joint, fastned on the hind Rail of the *Coffin*. The fore end of the *Tympan* is of Iron, with a square Socket at either End for the wooden Ends of the *Tympan* to fit and fasten into; on the outer Edge of this Iron about an inch and half from its Ends are made 2 iron half Joints, to contain a Pin, which entring this, and a *Match half Joint*, made on the *Frisket*, (6,) serves for a *Frisket* to move truly upon. In the middle of each long Rail of the *Tympan* is a Hole half an Inch square, for the square Shanks of the *Point Screws*, (7, 8) to fit into. Within this *Tympan*, which may be called the *Outer*, is another called the *Inner Tympan*, which is fitted exactly to it, and gaged by an iron Pin, and an iron *Turning-Clasp*.

I hope

I hope this Description may serve to make the Figure a little Intelligible, and to give a general Idea of the *Printing Press*; but no words can possibly explain it so well, as once seeing of it work will do.

I shall omit describing the manner of making the *Types* or several sorts of *Letters*, used in *Printing*; but whosoever hath a mind to satisfy himself further may consult Mr. *Moxon's* book of *Printing*, where he will find the whole affair very largely and plainly described.

I shall only add something further about the Rules and Methods of *Distributing* and *Composing*.

After the *Press-man* hath wrought off as many Sheets from a *Form*, as he is appointed; he first washes the *Form*, and brings it to a place which they call the *Rinsing Trough*, and rears it a little aslope on one end of the *Chase*; for when 'tis so placed the *Face* of the Letter is less liable to damage, and the *Form* stands in a proper position for the *Compositor* to rear a *Letter Board* against the Back-side of it; by which he raises it up, and then sets *Letter Board*, and *Form* both a little aslope in the *Rinsing Trough*. Next with his *Mallet* and *Shooting-stick* he opens or *Unlocks* (as they call it) the *Quoins* and *Form*: and then the Furniture; viz. the *Head-sticks*, the *Inner Side-sticks*, and *Gutter-sticks*, if the *Form* have any, that he may have the more Room to open the Letter in order to its receiving the water the more plentifully: which is thrown on it by dish fulls to *Rinse* and *Clean* it, and the *Face* of the letter is rubbed with the *Fingers*, and shook so that the water may get between the Letters to clean them; and this is done till the water thrown and rubbed on, runs away quite clear and colourless. Then he thrusts the Letter and Furniture close up together again that the letter may not *Squabble*, as they call it, that is, break and fall asunder: after it hath stood a while to dry; he carries *Letter Board*, *Form* and all to the *Distributing frame*: and there he strips it of its Furniture, *Quarter by Quarter*, taking out the *Quoins*, &c. and then with his *Distributing stick* or *Riglet*, he takes up out of the *Form* as many *Lines* of Letter as he can, and turning their *Face* towards him, he carries them to his *Case*, and taking out the Letters &c. one by one, but very quick and nimbly, he distributes each of them to its proper *Box* in the *Case*. Then he proceeds to take off and *Distribute* another parcel, and so goes on till he hath done, or till his *Case* is full.

They usually choose to distribute their Letter over Night, that they may have a *Dry Case* to work on in the morning, for wet Letters are less easy to take up, and besides the Lye makes their fingers sore.

The *Compositor* next sets himself to the *Composing work*: and here he must first Determine his *Measure*; to which he fits his *Composing stick* (above described) by loosening the screw, and Sliding the *Cheeks* nearer to or further from its head.

Having fitted his *Measure*, he Places the *Galley* on his upper *Case* on the Right hand, and placing his Copy before him, he reads 5 or six words or such a part of it as he can keep in his mind, and then spells it over Letter by Letter, taking up the proper Letters out of their respective *Boxes* in the *Case*: he sets a *Space* between every word till they come to the end of the Line; but there none. He holds his stick in his left hand, and with his Thumb gently presses the Letters close to the cheek, keeping

Vol. II.

it secure, right and close together, as with his right hand he puts them into the *Stick* successively. And 'tis a very surprizing thing to see how very quick this work is performed; and how in an instant he spells, resolves upon, and takes out the several letters which compose his work, and supply his stick.

Having composed one Line; if it ends with a word, or a *Syllable* and a *Division*, and just fill the *Measure*, then it needs no more *Justifying* as they call it, the *Stick* being duly filled; but if the Line conclude not so, then he puts a *Space* more between every word, or at least so many as will fill up the *measure* pretty Stiff, or *justify* the Line. And here he takes care that his Letter don't *Hang*, as they call it, i. e. Stand a Skew.

After he hath thus composed one Line, he begins another, and so goes on till his *Stick* be full: and when it is so, he empties it, laying it down on his *Lower Case*, and by means of a *Riglet* of just the length of the Line, he claps it down into the *Galley*, placing the first line close and upright against the lower Ledge of the *Galley*.

As he Sets or composes this first stick of Letter, so he goes on till his page is out, remembring after the last line of every Page to set a *Direction*; that is, he sets a Line of *Quadrats* and at the End of it the first word of the next Page, or if the word be very long and the Line very short, two *Syllables*, or sometimes but one, of that word. And when 'tis the first Page of a Sheet, he sets a *Signature* as they call it (i. e.) A for the first Sheet, B for the Second, &c. And so successively till he come to W which is always skipt, because the Latin Alphabet hath no such Letter.

When our *Compositor* hath got a full Page in his *Galley*, he next ties it up fast together with a *Pack-thread*, or *Cord*, according to the bigness of his Letter and Page, and then carries it to the *Correcting Stone*, and here all the Pages which belong to a sheet, with the *Chase* and *Furniture* about them, are duly placed, or *Imposed* as they call it: that is, so disposed or ordered, as that when the Sheet comes to be wrought off at the Press, all the Pages may be folded into an orderly Succession. And the 4 different volumes of *Folios*, *Quartos*, *Octavos*, and *Twelves*, are all diversly *Imposed*.

Correction.

In *Correcting* Faults, if there be but a few of them, and these *Easy* ones, the *Compositor* gathers the *Corrections* in his *Stick*, beginning at the bottom of every Page and so ascending: because when he is *Correcting*, the corrections of the Top of the Page stand the first in the *Stick*, and therefore are readiest to his hand.

But if there be many and considerable Faults, he brings the *Lower Case* to the *Correcting Stone*, and takes his *Corrections* as he uses them. Then he unlocks the *Form*, but keeps the *Quoins* pretty tight up, lest his Letter should hang or squabble: and there folding the *Proof*, so that the *Head-line* in it may lie in the same Range with the *Head-line* of the Metal, &c. so that all the lines in the *Proof* coincide or range right with the respective ones in the Metal; by running his eye along easily the several Places, or Lines in the *Proof*, where the *Corrector* had mark'd a Fault; he as easily mends it in the Corresponding Line in the Letter of Metal.

If there be a Long word or more than one left out

T t t

out

out, the Compositor is usually forced to *over-run*, as they call it: *i. e.* he must put so much of the forepart of the Line, into the Line above it; or so much of the hinder part of the line into the next Line under it, as will make Room for what is left out.

If much be left out, he must *over-run* many lines either backwards or forwards, or both, till he come to a *Break*; and when he comes thither if it be not *Gotten in*, as their word is, then he is forced to *Drive out* a Line: and sometimes to get in that Line, he is forced to over run the next Page backwards or forwards, till that Line can come in.

The Quite contrary Process must he take, if he happen instead of *Leaving out*, to set any thing *twice over*: for if it be but little he must take it out, then *Drive out* his *Matter*: But if it be as much as two or three Lines, &c. Then he must over-run the next Page, or more, and sometimes the whole Sheet, till it be *Driven out*.

After all this Correcting there is, or always should be a *Revise*, to see that the Faults are truly mended; and if not, to have them *Re-Corrected*, by unlocking either the whole *Form*, or only that Quarter of it where the faults are, &c.

And because 'tis a Thing very useful for all Authors, and Correctors of Printing presses to be acquainted with, I shall conclude this Account of Printing with proper directions for both.

And first the Author should well examine his Copy before it go to the Press; and *Point* and *Mark* it so, as that the Compositor may know what words to Set in *English*, *Italick*, *Capitals*, &c. For his *Italick* words, he should draw a line under them *Thus*: for English words two Lines *Thus*: and for Capitals a Line of Points *Thus*, or else a Line with Red Ink. If there are no Proper *Breaks* made in the Copy; the Author must supply them by a Crotchet [*Thus*, before the word he would have begin his new Paragraph.

And every Author, if he can possibly, out of a due regard to his own Reputation, which else may much suffer, or at least as much as he can, will correct the *Sheets* of his Book himself; that is, look them over, after the Printers Corrector hath mended the Common Typographick Faults: And whether it be the Author himself, or some other Corrector, that hath this Care upon him, the way of correcting Faults so as they may be mended by the Compositor is after this manner.

When one Letter is put instead of another, as in this word *Tho* for *The*; he dashes out the wrong

e| Letter thus *tho*, and Writes the Letter it should be on the Right Hand Margin of the Page, right against the same Line, and makes a Dash behind it, as you may see in the Margin.

a| c|
r| o| If two or three, or more Words in the same Line have Faults in them as in these Words, *Poerience* *peo force*; where first an o is Set instead of a, e instead of c, t instead of r, and c instead of o: These he marks in an orderly succession towards the Right Hand, against the same Line, as you may see in the Margin.

Smile, But if one word be set instead of another, as *Scoff* instead of *Smile*,

here he marks *Scoff* out thus *Scoff*, and writes *Smile*, as in the Margin.

If a Word or Words, or Letter or Point be Left out, he makes this mark A, where it is Left out, for a mark of Insertion, and Writes in the Margin what must come in.

If a Space be Left out, he makes the former mark of Insertion where it should come in, and makes this mark # in the Margin.

If a whole Sentence be Left out, too long to be Writ in the Margin, he makes the mark of Insertion where it is Left out, and only Writes (Out) in the Margin. If the Sentence Left out be not very long, he Writes it under the Page, or on the Left Hand Margin of the Page: But if it be too large to be Writ in the Margin, or under the Page, he Writes in the Margin, See the Co- (See the Copy)

If a Word or Sentence be Set twice, as *Him Him*, he marks out one *Him* thus *Him*, and makes this mark S in the Margin, for *Dele*, to take out.

If a Letter be turned thus *K*, he dashes it out as you see, and makes this mark in the Margin.

If Words are Transposed, that is, if one Word stand in another Words place, as, no I love Swearing, and it should be, I love no Swearing; he marks this Fault thus, no| I love Swearing, and makes this mark G in the Margin. The like mark he makes in Matter and Margin if two Letters are Transpos'd.

If a Space or an m or n Quadrate, &c. stick up and Print Black, as tween these words, he marks in the Margin thus.

If a Word be Set in Roman Letter instead of Italick or English Letter, he dashes the Word underneath thus, and Writes Ital. or Eng. in Ital| Eng| the Margin.

In like manner, if a single Letter or more Letters be Set in Roman Letter, and it should be Italick or English Letter; or if in English or Italick, and it should be Roman Letter, he dashes the Letter or Letters thus underneath, and writes Ital. Rom. Ital| Rom| Eng or Eng. in the Margin: Or if Lower Case Letters be Set instead of Capitals, he dashes them underneath, and Writes Capt. in the Margin.

Having Read the Matter of the Proof he examines again if the Form be right Impos'd, for though he before turn'd the Pages in the Proof as he read them according to their orderly places, yet he will scarce trust to that alone, but again examines them on purpose, and distinctly, which he does not only by the Direction Word, but by examining the whole Sentence the Direction comes in, both at the end of the Page, and the beginning of the next Page.

Smile

(Out)

S|

K|

G

Capt|

He

He examines that all the *Signatures* are right, and all the *Titles* and *Folio's*.

If the Work be large *Forms* and small *Letter*, he has a second, and sometimes a third *Proof*, which he Reads as the first,

After the Second or Third *Proof* he has a *Revise* which is also a *Proof-sheet*: He examines in this *Revise* Fault by Fault, if all the *Faults* he marks in the last *Proof* were carefully mended by the *Compositor*; if not, he marks them in the *Revise*,

PRINTS. The Original of *Prints* or *Cutts*, as we sometimes call them, was this; in the Year 1460, one *Maso Finiguerra*, a Goldsmith of *Florence*, graved his Plate; and then casting some of it in melted Brimstone, he perceived, that what came out of the Mold was markt with the same Prints as his Plate, by the Black which the Sulphur had taken from the Graving: after this he tried to do as much on Silver Plates with wet paper, by rolling it smoothly with a Roller, and this succeeded. This Novelty tempted *Baccio Baldini*, a Goldsmith of the same City, to attempt the same thing, which he did with Success; engraving several Plates of *Sandro Boticello's* Invention and Design; and upon this *Andrew Mantegna*, who was then at *Rome*, set about engraving some of his own Pieces. This knowledge getting into *Flanders*, *Martin* of *Antwerp*, a famous Painter, graved abundance of Plates of his own Invention, and sent several Prints into *Italy*, which were markt thus, M.C. After him the Famous *Albert Durer* appear'd and gave the world a vast number of Prints, both in wood, and copper. About this time one *Hugo de Carpi*, an *Italian* Painter of no great Capacity, but of a ready Invention, found out a way, by means of several Plates of wood, to make Prints resemble Designs of *Claro-Obscuro*: and some Years after the Invention of *Etching* was discovered, which was soon made use of by *Parmeggiano*.

PRISAGE, is the Custom or Share that belongs to the Queen, out of such Merchandise as is taken at Sea by way of lawful Prize,

PRISM: A Glass bounded with two equal and parallel Triangular Ends, and three plane and well-polished Sides, which meet in 3 Parallel Lines, running from the 3 Angles of one End, to those of the other, is called a *Prism*; and is used in Opticks to make many noble and curious Experiments about *Light* and *Colours*; for the Rays of the Sun falling upon it at a certain Angle, do transmit thro' it a *Spectrum* or Appearance, colour'd like the *Iris* or *Rain-bow* in the Heavens. Under the word *Colours* you have a great variety of Experiments made with such Glasses, by the Incomparable Sir *Is. Newton*; and from whence, in a good measure, he hath established his Demonstrative Theory of *Light* and *Colours*; a large account of which you may find in his *Opticks*.

How to find the Refraction of a Ray of *Light* passing thro' such a *Prism*, the same Author shews thus: Let *abc* represent the Section of this *Prism* made by a Plane passing transversely to three parallel Lines or Edges, then when the *Light* passeth thro' it; and let *de* be the Ray incident on the first side of the *Prism* *ac*, where the *Light* goes into the Glass: Then by putting the Line of Incidence to the Line of Refraction as 17 to 11: Find (by the Direction given under the word *Incidence* in this Volume) *ef* the first refracted Ray; then taking this Ray for the Incident Ray on the second side of the Glass *bc*, where the *Light* goes out, find the next refracted Ray *fg*; by putting the Ratio of the Line of Incidence to the Line of Refraction as 11 to 17; for if the Line of Incidence out of Air into Glass be to that of Refraction as 17 to 11, the Line of Incidence back again, out of Glass into Air, must be as 11 to 17,

The same admirable Author, *Opticks*, p. 121, shews, how by the Properties of *Light* discovered by his most accurate Experiments, to explain the *Phænomena* of *Colours* made by *Prisms*; thus,

T r r 2

Let

Let abc be a Prism refracting the Sun's Light, brought into a darkned Room, by the Hole $F\phi$, almost as broad as the Prism; and let mn be a White Paper on which the refracted Light is cast: And suppose the most refrangible or deepest Violet Rays to fall on the Space $P\pi$, the left refrangible or deepest Red Ray on the Space $T\eta$; the middle sort, between the Indico and Blue Rays, on the Space $Q\chi$; the middle sort of the Green Rays on the Space $R\epsilon$; the middle sort between the Yellow and Orange Rays on the Space $S\sigma$; and the other intermediate sorts on intermediate Spaces. For so the Spaces on which the several sorts adequately fall, will, by reason of the different Refrangibility of these sorts be one lower than the other. Now if the Paper mn be so near the Prism that the Spaces $P\pi$ and η do not interfere with one another, the distance between them $T\pi$ will be illuminated by all the sorts of Rays in that Proportion to one another which they have at their very first coming out of the Prism, and consequently, will be White. But the Spaces $P\pi$ and η on either hand, will not be illuminated by them at all, and therefore will appear coloured; and particularly at P , where the outmost Violet Rays fall alone, the Colour must be the deepest Violet. At Q , where the Violet and Indico Rays are mix'd, it must be a Violet inclining much to Indico. At R , where the Violet, Indico, Blue, and one half of the Green Rays are mix'd, their Colours must (by the Constitution of *Problem 2. in pag. 114*) compound a middle Colour between Indico and Blue. At S , where all the Rays are mix'd, the Red and Orange, thin Colours, ought, by the same Rule, to compound a faint Blue, verging more to Green than Indico. And in the progress from S to T this Blue will grow more and more faint and dilute; till at T , where all the Colours begin to be mix'd, it ends in Whiteness.

So again on the other side of the White at T , where the least refrangible or utmost Red Rays are alone, the Colour must be the deepest Red. At σ , the Mixture of Red and Orange will compound a Red inclining to Orange. At ϵ , the Mixture of Red, Orange, Yellow, and one half of the Green, must compound a middle Colour between Yellow and Orange. At χ , the mixture of all Colours but Violet and Indico, will compound a faint Yellow, verging more to Green than Orange: and this Yellow will grow more faint

and dilute continually, in its progress from χ to π , where it will become White by a mixture of all sorts of Rays.

These Colours ought to appear were the Sun's Light perfectly White; but because it inclines to Yellow, the excess of the Yellow Rays, where-with it is tinged, being mix'd with the faint Blue between S and T , will draw it to a faint Green. And so the Colours in order from P to T ought to be Violet, Indico, Blue, very faint Green, White, faint Yellow, Orange, Red: Thus it is by computation, and they that please to view the Colours made by a Prism will find it so in Nature.

These are the Colours on both sides the White, when the Paper is held between the Prism and the Point χ where the Colours meet, the Interjacent White vanishes: For if the Paper be held still farther off from the Prism, the most refrangible and least refrangible Rays will be least in the middle of the Light, and the rest of the Rays which are found there, will by mixture, produce a fuller Green than before; also the Yellow and the Blue will now become less compounded, and by consequence, more intense than before.

And if thro' a Prism you view a White Object encompassed with Black or Darknes, the reason of the Colours appearing on the Edges is much the same. If a Black Object be encompassed with a White one, the Colours arising from seeing it thro' a Prism, are to be derived from the Light of the White one, spreading into the Regions of the Black; and therefore they will appear in a contrary order. And 'tis the same when an Object is viewed, whose Parts are some of them less or more luminous than others: For in the Borders of the more or less luminous parts, Colours ought always, on the same Principles, to arise from the excess of the Light of the more luminous, and to be of the same kind as if the darker parts were Black, but yet to be more faint and dilute.

And what is thus said of the Colours which are exhibited by Prisms, may easily be applied to those Colours which the Glasses of Telescopes and Microscopes, or even the Humours of the Eye produce: For if the Object Glass of a Telescope be thicker in one part than another; or if one half of the Glass, or one half of the Pupil of the Eye, be covered by any Opaque Body, then that Object Glass, or its half; or the half of the Eye which is uncovered may be considered, as a kind of *Cuneus* with

with curved Sides. And every Glafs, or Pellucid *Cuneus* (or Wedge) will produce the same effect as a *Prism*, by refracting the Rays of Light as they are transmitted thro' it.

PROCURATIONS, are a Pecuniary Sum or Composition paid by the Parish Priest to an Ordinary or some other Ecclesiastical Judge, as an Archdeacon, &c. to commute for the Provision or Entertainment which was otherwise to have been procured for him; which Entertainment was called a *Procuracion*.

PROCURATOR, is used for one that gathereth the Fruits of a Benefice for another man; 3 R. 2 Stat. 1. cap. 3. as *Procuracy* was the word for the Instrument empowering him to do it. In the West of England, such Persons are called *Proctors* to this day. *Cowel*.

PRODES Homes: This is a Title often given in our old Books to the Barons or other Military Tenants, who were called to the King's Council; and was no more than *Homines discreti & fideles*.

PROFER, *Profrum vel Proferum*; is the Time appointed for the Accounts of Sheriffs, and other Officers in the Exchequer; which is twice a Year. An. 51 H. 3. 5. In another Sense *Profer* also signifies the Officer or Endeavourer to proceed in any Action by any Man concerned so to do.

PROFILE, in Fortification, is the Representation of the Height, Depth and Thickness of any Work; and suppose the Work cut perpendicularly down from Top to Bottom; as in the Figure annexed, where you have the Profile of a *Rampart*, *Faussebray*, *Foss*, *Covert-way* and *Esplanade*.

a b l m is the Solidity of the Rampart, *a m* its Bale; *b l* its Top; *b c* its perpendicular Height; *a b* its inward Talus or Slope; *l m* its outward Talus or Slope; *b e* is the *Terre-plain*; *e l* is the Bale of the Parapet, *e d* its Banquet; *f b* is the inward Talus of the Parapet, *i l* the outward one, *b i* its upper one; *b 2* is the inward Height of the Parapet, *i k* the outward Height; *l* the Cordon; *n o p q* represents a *Faussebray* with its Banquet, &c. *q r* is its *Liziere* or Berm; *r s t u x* is the Foss or Ditch; *r s* the Scarp; *u y* the Counter-scarp; *t* the Lunette; *w u* the Depth of the Ditch; *x y* the Covert-way; *x z ** the Parapet and Glacis of the Covert-way; *y z* the Height of the Banquet and Parapet of the Covert-way; *x ** the Basis of the Glacis; *z ** the Slope of the Glacis.

PROFRE Vicecomitis. Tho' the certain Debt of the Sheriff could not be known before the finishing his Accounts, yet it seems there was anciently an Estimate what this constant Charge of the Annual Revenue amounted to, and what the constant Allowances amounted to according to a *Medium*; and those Summs were paid into the Exchequer at the Return of the Writ of Summons of the Pipe; and they were and are to this day called by this Name *Profre Vicecomitis*. But altho' these *Profers* are paid, yet if on conclusion of the Sheriffs Accounts, and after the Allowances and Discharges had by him, it appears that he be in Surplusage, or that he be charged with more than indeed he could receive, he hath his *Profers* paid or allowed to him again.

PROJECTIVE Dialling, is the way of Drawing, by a method of Projection, the true Hour-

Lines, Furniture of Dials, &c. on any kind of Surface whatsoever, without any regard had to the Situation of those Surfaces, either as to Declination, Re- or Inclination. This curious and in many Cases most useful manner of Dialling, seems to have been the Invention of our Mr. Sam. Foster, formerly Astronomy Professor in Gresham College. Something of this was printed in his *Posthumous Miscellanies* 1659, and more added by Mr. Leybourn (in his *Dialling*) from a Manuscript which Mr. Foster left behind him.

In order to perform this manner of *Projective Dialling* after Mr. Foster's way, there is necessary a *Semicircle* divided into two Quadrants, whose Divisions must begin, and be numbred both ways from the middle Point in the Arch, to the Diameter; which Diameter must be made to receive a Ruler into a Groove made in it, so as that the *Semicircle* may slide easily along it, and be fastened by a Scrue any where upon it: It will be convenient to have two or more of these Rulers of different Lengths. You may see the Fig. of this *Semicircle* and Ruler in *Leybourn's Dialling*, p. 198. But there is no difficulty in understanding the use of it at all; and a Quadrant, divided on both sides, may very well supply the place of the *Semicircle*.

The General Use of this Instrument is; Upon a Line drawn any where, to project an Altitude or Depression, above or below the Horizon, from a fix'd Point placed at a distance from that Line.

The manner of doing which is very easie; For if you hold the Edge of the Ruler to the fix'd Point, and also apply the Point of the Edge of the Ruler to the Line given, removing it higher or lower (as occasion requires) till the Thread and Plummets of the *Semicircle* or Quadrant fall on the degr. of Altitude or Depression intended; for then the

the Ruler lies at the Altitude or Depth, and so projects it from the fix'd Point into a Line, as was designed.

Two General and Easie ways to project Hour Lines on all Surfaces, Concave, Convex, &c. Inclining, Reclining or Declining.

1. Let a Gnomon, being first sharpened into a Point, be shaped and fastned in such wise, that it no way hinder either the draught of the Horizontal Line, or the Point of the Shadow from having free access to the Dial at all times of the Year.

2. Draw an Horizontal Line, by help of your Semicircle in a true Level both in regard of it self, and also to the Point of the Gnomon, through the whole Superficies on which the Dial is to be described. Or having two Points in the same Level, with the Point of the Gnomon, project it upon your Superficies, if it be a rugged one. And if the Superficies be more than one, or if any of them be very much inclined toward the Horizon, or else be very rugged, or far remote from the Gnomon, so that it will not at all, or not so well, receive an Horizontal Line upon it, you may *Either* set up some Board, or such like Object, upon which for a time you are to inscribe the Horizontal Line, and by help of which the Hours were to be projected upon the Superficies; Or else (which perhaps will be better) you may extend a Thred in the Air (it matters not which way, nor whether from the Gnomon towards the Sun, or from the Sun: whether stretcht out in one length, or with returns, so long as it lieth justly parallel, in every Point of it, to the Horizon, and in the same Level with the Point of the Gnomon;) which being fixed in this manner, will very well supply the use of the Horizontal Line: or the Horizontal Line may be partly Thred, and partly drawn upon the Superficies, as occasion shall be. And upon it may any Point be transferred, and signed out by slipping knots of Thred tied upon it.

3. Upon the Superficies of the Dial, observe the Point of the Shadow of the Gnomon (making a mark at it) and the Sun's Altitude, both of them at the same instant of time.

4. By the Altitude observed, compute the Azimuth of the Sun from the Meridian.

5. The same Azimuth must be transferred unto, or projected upon, the Horizontal Line by help of a Perpendicular Thred, covering to your sight (as it hangeth down) the Points of the Gnomon and Shadow both together; and at the same view cutting through the Horizontal Line: observe then punctually where it cuts through the same Line, for that same Section being signed thereon, shall be the Azimuth projected into the Horizontal Line.

6. Let any kind of Board or Past-board be now applied to the Point of the Gnomon; so, as that it may be staid, either upon the Horizontal Line (where it may so be conveniently) or at least so placed toward the Horizontal Line, that it may have a just respect unto it, and in that posture may have some stay for the edge of it to rest upon, that after it is furnished with such necessary Lines as must be drawn upon it, it may be placed in its former just posture without any Impeachment. Upon this plain so placed, let the Point of the Gnomon be signed, which may be called the Center; and from this Center to the Sign of the Azimuth before projected into the Horizontal Line, draw a

right Line: this right Line so drawn, shall represent upon the Board or Past-board; the same Azimuth which was before computed.

7. Then taking away the same Plain, draw upon it the Meridian or Line of 12; extending it from the Center before noted, at the true Angle that it hath from the Azimuth before computed and described, and also toward the true Coast of the World. And let it be extended on both sides the Center if need be.

8. To the Meridian so pitched upon the Past-board, draw (from the Center) the Lines of an Horizontal Dial made to the Latitude wherein you are.

9. Then again, let the plain Board or Past-board be applied to its former situation, the Center of the Horizontal Dial resting upon the Point of the Gnomon, and every thing else answering to the same just posture that it had at the first. Which done, let a Thred be fixed in the Center of the Horizontal Dial, by help whereof you may transfer every Hour from the Past-board into the Horizontal Line. Let every Hour be therein noted (by fixing marks upon the Horizontal Line where it is drawn, or by slipping Knots upon the Thred, where a Thred Horizontal Line is used) especially mark out the Hour of 12: For which (if it chance to run besides the Superficies) some kind of Object (whereon the Horizontal Line is also to be drawn) or an Horizontal Thred must be fastned, that may receive it, till such time as your Dial be finished.

10. After all this, take your Plain away (for there will now be no more need of it) and conjecture whereabouts the Axis of the World would pass from the Point of the Gnomon to the Poles of the World, for into that place is the Meridian to be projected. Which that it may be done more commodiously, if no object stand in the way that will receive it, you must place one there, it matters not whether above or below the Gnomon, chuse that which is most convenient: Or, a Thred laid aslope in the Meridian justly as it ought, will serve as well as may be. If then you hold up a perpendicular Thred, so that by your Eye you may see the Point of the Gnomon, and also the Point of 12 in the Horizontal Line, both together, the same Thred so hanging, shall shew where the Meridian is to be drawn. Or, you may extend a Thred from the Point of the Gnomon to the Point of 12 in the Horizontal Line, which Thred shall represent the Line of 12: And staying your Thred there, close to it, hang up two perpendicular Threds at a good distance, so shall the same two Threds, give you the track of the Meridian Line.

11. The next Work will be to project one of the Poles of the World (that namely, which lies the same way that this projected Meridian doth from the Point of the Gnomon) into this Meridian. And this is done by elevating or depressing your Semicircle, from the Point of the Gnomon towards the Meridian Line, according to the Latitude of your Place; for so will the Ruler of the Semicircle, or a Thred extended along by it, Sign out the very Pole Point. If now you extend a Thred from this Pole Point, to the Point of the Gnomon, the same shall represent the Axis of the World.

12. Last of all; by these helps, all the Hours may easily be projected. For if the Eye do lay, or project, this Thred or Axis upon each Point of those Hours that were inserted before into the Horizontal

horizontal Line, the Axis upon an Hour Point, or a Point upon the Axis, each one of those Projections shall represent upon your Dial, each of the Hours required, and will shew upon every Object that stands in the way, where the Hours are to be drawn. Or, where convenient room is wanting to place the Eye, so as it may make this Projection; there may two Threds be used for the same purpose, one whereof must be fastned to the Point of the Gnomon, the other to the Pole designed in the Meridian Line. Then stretching one of the Threds to any of the Points noted in the Horizontal Line, and holding it there, you may take the other, and extend it to the Superficies, so as it may closely pass by the first Thred, by which Work you may make as many Points upon your Superficies as you please, thro' which each Hour is to be drawn. Having thus traced the way before hand, you may afterward draw the Hour without any difficulty, be the Superficies never so irregular. Among which Lines, the Shadow of the Point of the Gnomon, as it creepeth along, will shew the Time of the Day.

If a Point be assigned upon any Superficies Flat or Curved, one, or more, wherein the Hour-Lines and Axis shall concur, how to project the Hours to that Point, and to set up an Axis after the ordinary manner to give Shadow to them without any knowledge how the Dial standeth, in respect either of the Declination or Inclination.

1. To the Point assigned (upon any side of it) by direction of your Semicircle or other Level, stretch out an Horizontal Thred, serving for the Horizontal Line: this Horizontal Line need not be one direct Line, but may be turned at one or more Angles, provided that it lie totally in the Superficies of the Horizon.

2. With a perpendicular Thred held up, project the Sun into the assigned Point, and into the Horizontal Thred, and tie a little mark of Thred upon the same Horizontal, through which the Shadow cutteth. At the same instant also, take the Sun's Altitude.

3. By the Altitude taken, find out the Azimuth; This Azimuth, what-ever it be, is represented by the knot.

4. Apply a Past-board to the Assigned Point, and hold it flat that it may answer to the Horizontal Thred also, and upon this Past-board, protract your Azimuth by a Thred extended from the Point assigned for the Center, to the mark upon the Horizontal Thred. This done,

5. By help of that Azimuth upon your Past-board, protract the Meridian Line, observing the true Coast, and quantity of the Angle from the Azimuth: and to the Meridian describe an Horizontal Dial.

6. Applying the Past board to its place again, all things standing right as before, project all the Hours in the Horizontal Thred from off the Past-board, and set marks upon the same for the Points of each several Hour, which marks may be little moveable Knots to slip to and fro upon the same Thred.

7. Project the Meridian Point by a perpendicular Thred upon some object into that place whereabouts you imagine the Axis of the World would pass, above or below from the Point assigned for the Center.

8. With your Semicircle elevated or depressed (as it shall be required) from the Point assigned for

the Center, according to your Latitude project the Pole of the World.

9. Extend a Thred from the Point assigned for the Center to the Poles of the World, which shall represent the Axis.

10. By the Point upon the Horizontal Thred, and this Axis (either by your Eye, laying the Axis to the Hour-points, or laying the Hour knots to the Axis) you may project all the Hours and draw them; Or else you may let the Axis alone, and content your self with the Pole point projected into the Meridian, for if from the Point assigned to be the Center or meeting of the Hours and Axis, you extend a Thred to each Hours-point in the Horizontal Line, and do repose (with your Eye) the same Thred upon the Pole-point, then shall the Shadow of the Thred give you that Hour-line, and do so in all the rest.

11. Your Thred or Axis lying in its true situation, you may easily fit an Axis to the same posture. If your Dial be described upon a plain Superficies, you may then (by one side of a Nominal Square, applied to a Thred or Axis, and the other side lying upon the Plain) find out the substyle, and measure from it the elevation of the Axis above the Plain: But if the Dial be described upon a curved Superficies, you must be content to set up your Axis by the direction of the Thred only.

12. This Point assigned for the Center, being a Point of the Axis, is as it were the Apex of the Gnomon, unto which all the Work is projected. But if it be required to set up an Axis to such a Superficies, upon which the Axis and Hours will not meet in any tolerable manner, because perhaps the Axis may be but of very small elevation above the Superficies, and yet an Axis is required: in this case, set up any Point (of Wire, or such like) of such distance from the Superficies, as that the Axis and Hours may be distinct: And through that Point let it be required to make the Axis pass, you have no more to do but only to project to this Point, as before, by letting the Shadow of a perpendicular Thred pass through that Point, and noting the same upon your Horizontal Thred, and counting that end of the Wire as your Center, proceed as before, for the Thred that lies to project the Hours is a pattern for the Axis.

This way is as general as the former, serving to project the Hours upon many Superficies, be they plain or curved, and however situate whether contiguous, or separate, and that without any laborious inquisition of any of their Situations, in respect of Inclination or Declination. If you will put in that Furniture which is usual, you must make some Mark (Notch, or Button) upon your Axis, unto which (as representing the Center of the World) by help of your Semicircle you are to project the Altitudes of such great or lesser Circles as you intend to insert; as hereafter shall be taught.

The 12 Propositions in the first way were to project to an Apex.

These 12 Propositions answerable in the second way are to project to an Axis.

And after this method it will be easie, and often very useful and curious, to Project a Dial from a small Hole made in a Pane or Quarry of Glass; (the rest of the Glass being covered) or which is better, a Plate of Tin with a round Hole of $\frac{1}{8}$ of an Inch in Diameter, being put in the room of a Pane of Glass for the Sun shining thro' that Hole, will

will cast a bright Spot of Light into the Room. Suppose then such a Hole to be the *Nodus*, or Point of the Top of the Perpendicular Style of any Dial, you may draw one or more Dials, (each side or part of the Room being a different Plane) after this manner.

(1.) Apply an Horizontal Dial in a true Horizontal Position, so that its Centre lie in that of the Hole in the Pane; and then by a Thred fixed at one end of the Centre of the Dial, and laid over successively, every Hour, Half Hour, Quarter, &c. find corresponding Points in the Sides of the Room where those Hour-Lines intersect them: Then (2.) The Twelve a Clock Line being an Azimuth also as well as an Hour Line, you may by a String and Plummer brought just to touch that Thred when strained over the 12 a Clock Hour Line, transfer that *Meridian Line* up to the Ceiling or down on the Floor, as you shall find occasion. (3.) Next in this *Meridian Line* find another Point, (by help of a Thred elevation to a proper Height (in degrees) by means of a Quadrant) from which, a Line or Thred extended to the Hole in the Window may represent either the *Direct* (or *Reversed*) *Axis* of the Earth; and therefore if you fix a Thred in one or both of these Points (or rather *Poles*) and extend it or move it along by the side of the other Thred, as it is brought successively over every Hour Line on the Horizontal Dial (in whose Centre, as well as in that of the Hole it is fixed) and as it is extended to the corresponding Hour Points before found in the Room: I say, that moveable String shall any where on the Ceiling or on the Floor, trace out any Hour Line which the Horizontal Thred shall successively represent.

And this Method of Projective Dialling, will direct us into this excellent Mechanick way of *Dialling* or drawing *Hour Lines* on any Plane how irregular soever as to Surface or Situation. Under the Plane where you intend to make a Dial, draw a true Level or *Horizontal Line*, and then to it set horizontally, a Scaffold or Frame of Boards, greater or lesser, according to the designed Bigness of the Dial. Next, by some good Dial, Clock, Equinoctial Ring, &c. get exactly the true Hour of the Day, and set your Minute Watch to it. Then place a good Horizontal Dial for the Latitude of the Place and which hath a fine String fastened in its Centre, on your Level Plane or Scaffold, and the Sun shining, turn it about till it shew the true Hour of the Day there. Then fix it; and by the motion of your Thred over every Hour, Half, Quarter, &c. you may easily project them all into your Plane or Place designed for the Dial.

PROLATE Spheroid, is a Solid produced by the Revolution of a Semi-Ellipsis about its *longer* Diameter; but if a Solid be formed by the Revolution of a Semi-Ellipsis about its *shorter* Diameter; 'tis then called an *Oblate Spheroid*: And of this Figure is the Earth we inhabit, and perhaps all the Planets are so too, having their *Equatorial* Diameter longer than their *Polar*.

PROMONTORY, is an Hill or High Land running out into the Sea: The Extremity of which towards the Sea, is usually called a *Cape* or an *Headland*.

PROPORTIONAL Scales, sometimes also called *Logarithmetical*; are only the Artificial Numbers or Logarithms placed on Lines, for the ease

and advantage of Multiplying, Dividing, Extracting Roots, &c. by the means of *Compasses*, or by *Sliding Rules*; and they are only so many *Lines of Numbers*, as they are called by Mr. Gunter. (See *Gunter's Line*.) But make *Single*, *Double*, *Triple*, or *Quadruple*; beyond which they seldom go.

PROSTYLE, in the ancient Greek Architecture, was a Rank or Row of 4 Columns only, and whose Station was in the Front of a Temple, or other great Building.

PROVINCE, was used among the *Romans* for a Country without the Limits of *Italy*, and gained to their Subjection by the Sword. But with us the word is most commonly used for the Circuit of an Archbishop's Jurisdiction; and in some of our Statutes 'tis used for a County.

PROVISION, in the Canon Law, is used for the providing of a Bishop or any other Person, an Ecclesiastical Living, by the Pope, before the Incumbent be dead. 'Tis called also *Gratia Expectativa*, and *Mandatum de Providendo*.

PROVISIONS: The Acts to restrain the exorbitant abuse of Arbitrary Power, made in the Parliament at Oxford, 1258, were called *Provisions*; because they provided against the King's Absolute Will and Pleasure.

PROVISO, in the Sea Phrase, for a Ship to *Moor a Provise*, is for her to have one Anchor out, and also a Hawser ashore, and so she is moored with her Head to the Shore with two Cables.

PROVISOR, is he that sues to *Rome* for a *Provision*; which see.

PROVOST Marshal, of an Army, is one appointed to secure Deserters, and all other Criminals: He is to go often abroad round the Army, to hinder the Soldiers from Pillaging: 'Tis part of his Office to indite Offenders, and to execute the Sentence pass'd upon them. He likewise regulates the Weights and Measures, and the Price of all Provisions, &c. in the Army. There is also a

PROVOST Marshal in the Royal Navy, who hath charge of the Prisoners taken at Sea. 13 Car. 2. c. 9.

PRUDENCE, is by the Writers of Ethicks defined to be a Habit of the Mind, by which a Man judges and determines truly how he should act and proceed, what he should do or avoid, in all things relating to his Temporal or Eternal Advantage, so as to render himself happy here and hereafter.

PRYAN Tin, is a sort of Tin that is found mix'd with a Gravelly Earth, sometimes White, but usually Red; 'tis not half so good as the other which is made out of Stone.

PTOLEMAICK System of the Heavens, was that invented by *Ptolemy*; in which he supposes the Earth immoveable any way in the Centre of the Universe, round about which the Moon first moves in a Circle; next her *Mercury*, then *Venus*: above whom moves the Sun, then *Mars*; above him *Jupiter*, and last of all *Saturn*, all in the Zodiac from West to East. Above *Saturn* he places the Sphere of the fix'd Stars, which he supposes to move slowly also from East to West, on the Poles of the *Ecliptick*. While the fix'd Stars themselves, and all the Planets, move from East to West on the Poles of the Equator, in the space of a Natural Day or 24 Hours. This Vulgar System of Astronomy, (in which I omit to mention the *Epicyles* and *Deferents*, &c. with which they endeavoured to solve the *Phænomena* which did almost

most all of them contradict this Scheme) was plainly overturned and refuted as soon as ever the use of the Telescope acquainted us with the *Phases of Venus and Mercury*; for from thence it was apparent, that their Orbits included the Sun, and therefore by degrees it came to be quite disused, and consequently I shall say no more of it.

PULLET, in a Ship, is a little Room within her Hold, in which the Piggs of Lead, or such like weighty things are put, that the Ship may be well ballasted in a little Room.

PULLEY, is a compounded Mechanick Power, consisting of one or more *Shivers* or *Rundles* with proper Blocks, &c. to raise up any Weight, &c. and this Instrument so fitted is called *Trochlea* or the *Pulley*; and at Sea with Ropes, &c. fitted so to it, it is called a *Tackle*.

Fig. 1.

Fig. 2.

In every Pulley, from the Position and Number of the Shivers, you may know how much the Weight *W* is diminished, by making the *Vis Motrix*, or Power, to be to the Weight: as 1 to the Number of the parts of the Rope going up and down.

Only this you must observe, that it is the *lower* Pulleys, or Blocks with Shivers, that give any Force to the Motion; for if a Weight hang on any upper Pulley or Shiver, it will require a Power to sustain it that shall be fully equal to the Weight.

Thus if a Weight hang as in the Position *a W*, it would certainly fall, if a Force or Power equal to it did not hold the Rope *b d*.

And all upper *Shivers* being every where of the same Nature, none of them can conduce any thing towards easing the Power or lightening the Weight; but they only serve for the Convenience of the Motion.

But if you suppose the Weight *W* (as in Fig. 1.) to be sustained by the Hook *b*, above the Block *a b*, then 'tis plain that the Hook *b* will sustain just half the Weight, and therefore the Power at *P* need be but equal to half the Weight *W*; for 'tis all one as if the Weight were hung to the middle of a Balance or *Libra a b*, whose equal Arms were upheld by two several Strings, as *b a* and *P b*.

'Tis also apparent in Fig. 1. That in order to raise the Weight *W*, the Height of one Foot, each part of the Rope, *viz.* *b a* and *P p*; (accounting downwards from the Hook *b*) must be made a Foot shorter, *i. e.* the Power must move two Feet, in order to raise the Weight but one: Wherefore in this Engine, the way of the Power is double to that of the Weight; and therefore their Celerities will also be in the same Ratio; wherefore if the Power be to the Weight as 1: to 2, its *Moment* will be equal to that of the Weight, and so will sustain the Weight.

Vol. II.

If the Weight be sustained by 3 turns of the Rope, and be made to ascend one Foot (as in Fig. 3.) then each Part, or Turn, or Fall of the Rope must be shortened 1 Foot (reckoning as before from the Hook at *b*) and this cannot be done unless the Power in *P* move three Feet: Here therefore the way of the Power is triple to that of the Weight, as is also its Celerity; wherefore if the Power be to the Weight as 1 to 3, or one third of it, it will sustain the Weight.

And so on in the 4th Fig. the Power *P* must be one fourth of the Weight, &c.

U u u

The

The *Pully* is a Wheel not only turning round its *Axis*, but made so, that at the same time 'tis drawn up by a Rope or Cord that goes round it: This may be considered as a perpetual *Homodromous* Lever or *Vestis*; for the Cord which is put over the Wheel *AFC* being fastned at one End at *D*, and the other End at *E* being drawn or held by some Power, so that the Weight suspended

from the middle of the Wheel *AFC*, be kept in *Æquilibrio*; 'tis then plain, that the moving Force is apply'd to the lower Pulley or *Shiver* in *A*, one of the Extremes of the Lever *AC*, the other Extreme *C* rising on the fix'd Rope or Chord *DC* as on an *Hypomochlion*. 'Tis plain also, that the Weight *F* is suspended from the middle Point *B*, and consequently as *AC*, the distance of the moving Force from the *Hypomochlion*, to *BC*, the distance of the Point of Suspension of the Weight from the same (that is, as 2 to 1): : so is reciprocally (from the Nature of the Lever) the Weight *F* to the Force sustaining it in *E*; and consequently one under-Pulley takes off always half the Weight, or raises double the Weight with the same Power or Force.

But if the Pulley be fix'd above only, it affords no help towards lifting up the Weight more easily;

for here the moving Force in *E* must be equal to the Weight in *W*, because the *Hypomochlion* in this case is in the middle at *B*; and consequently the Weight and Power equidistant from it, as in the Balance.

The upper Pulleys or *Shivers* then are of no other use but to facilitate the Motion of this Rope by their Volubility and apt Position.

So that to estimate the Power of the Combination of never so many *Shivers* or Pulleys put together, you need only double the Number of the lower *Shivers*, or of the Cords which pass over them without considering the upper ones, and they will give you the Multiple of the Weight to be raised this way; in comparison of what could be raised without any such help by the same Power.

So the Force of 50 lb. in a Pulley with two lower *Shivers* will raise four times as much, viz. 200 lb.

If the Force of 50 lb. and the Weight 200 lb. be both given, and the Number of *Shivers* be required, 'tis plain you must divide 200 by 50; that is, the Weight by the Power, and the Quotient will be 4, the Number of Ropes, and the half of that is the Number of lower *Shivers*.

If the Weight, suppose 1000 lb. be given, and the Number of Pulleys or Ropes, suppose 4; then divide the Weight by the Pulleys, and the Quotient is the Power of Force required; viz. 250 lb. And this Method of proceeding will give you the *Desiderata* in any Combination of Pulleys, and in any Conjugation of many Combinations.

PULMONES. See *Lungs* in Vol. II.

PULVINATA, in Architecture, is the Term for a *Freeze*, which swells out like a Pillow.

PUMPS, in a Ship are of several sorts, as the *Chain-Pumps* which are used in great Ships; and these go with more ease than others, yield more Water, and are easily mended. *Bare Pumps*, are small ones made of a Cane or a piece of Wood bored thro', and are used to pump Beer or Water out of the Casks. *Bur-Pumps*, are used by the Dutch, who have them by their Ships sides. In these there is a long Staff with a Bur at the end like a Gunner's Sponge, to pump up the *Bilgewater*: These are also called *Bilge Pumps*.

PUNCHINS, in Architecture, are short pieces of Timber, placed to support some considerable Weight: They commonly stand upright between the Posts, and are shorter and slighter than either the *Principal Posts* or *Prick Posts*. Those that stand on each side of a Door are called *Door Punchins*.

PUNCTATED *Hyperbola*, is an *Hyperbola* whose *Oval Conjugate* is infinitely small, that is, a Point. See *Curves*.

PUNCTUM. See *Point*.

PUNCTUM *Formatum* seu *Generatum*, in Conicks, is a Point determined by the Intersection of a Right-Line drawn thro' the Vertex of a Cone to a point in the Plane of the Base, with the Plane that constitutes the Conick Section. See *De la Hire's Latin Conicks*, p. 15. 16.

PUNCTUM *ex Comparatione*, is either *Focus* in an *Ellipsis* and *Hyperbola*; and it was so called by *Apollonius*, because the Rectangles under the Segment of the Transverse Diameter in the *Ellipsis*, and under that and the Distance between the Vertex and *Focus* in the *Hyperbola*, are equal to $\frac{1}{4}$ part of what he calls the *Figure*.

PUNCTUM *Lineans*; is that point of the generating Circle, which in the Formation of either Simple *Cycloids* or *Epicycloids*, produces any part of a *Cycloidal Line*. See *Epicycloid*.

PUNITORY *Interest*, is a Term in the Civil Law, for such Interest of Money as is given for Delay, or Breach of Trust.

PURE *Hyperbola*, is one which by the Impossibility of its 2 Roots is without any *Oval*, *Node*, *Spike*, or *Conjugate Point*. See *Curves*.

PURGATIVE Medicines; the manner of their Operation is very well accounted for by Dr. Cheyne in his Book of *Fevers*, thus: Purgative Medicines being receiv'd into the Stomach by the Mouth, their Particles do there vellicate or stimulate the Fibres of the Stomach, and thereby encrease the Digestive Faculty; i. e. bring the Muscular Fibres of the Stomach, and the Muscles of the *Abdomen* and *Diaphragm* into more frequent Contractions than ordinary, till they are admitted into the *Intestines*; the Fibres and Glands of which being more sensible than those of the Stomach (whose Parts, by the frequent rough Contacts of one against another, and of the gross Bodies which are often thrown into it, are as it were deadned) they easily move and bring them into frequent forcible Contractions; whereby these Glands are squeezed, and so emit a Fluid which lubricates the Passages: And this mixing with the *Fæculent Matter* of the *Intestines* (which is rendred fluid by the same active and stimulating Quality of the Purgative Medicine) renders it more fluid; by which, and by

by the uncommon Contractions of the Intestines, it passes more easily and plentifully into the *Rectum Intestinum*, and is thence ejected by Stool. Thus gentle and easie Purges act, and do only cleanse the Intestines, few of their Particles entering in by the Lacteal Veins and so affecting the Blood: But in violent Purgatives, the stimulating Particles are mixed with the Blood, and produce there many times very great effects by occasioning unnatural Fermentations, by separating the natural Cohesions of the Liquors of the Body; and also by vellicating the Spiral Fibres of the Veins and Arteries, bring those into more forcible Contractions, and thereby accelerate the Motion of the Blood; all which may sometimes have a good and sometimes a bad effect.

PURLINS, in Architecture, are those Pieces of Timber which lie across the Rafter on the Inside, to keep them from sinking in the middle of their Length.

PURPARS, a *Purparty*, is that part or share of

an Estate, which being held in Common by Co-partners, is by Partition allotted to any one of them.

PUTLOGS, are short pieces of Timber (about 7 Foot long) used in Building Scaffolds; they lie at Right-Angles to the Wall with one of their Ends resting upon the *Ledgers* or Poles which lie parallel to the side of the Wall of the Building.

PYRAMIDALES *Papillæ*. See *Papillæ Pyramidales*.

PYRAMIDOID, is what is sometimes called a *Parabolick Spindle*; and is a solid Figure formed by the Revolution of a *Parabola* round its *Base* or *greatest Ordinate*; and if you consider it according to the method of Indivisibles, you may conceive its Solidity to consist of an infinite series of Circles whose Diameters are all parallel to the *Axis* of the *Revolving Parabola*.

PYTHAGORICK *Tetraëds*, was a Point, a Line, a Surface, and a Solid.

QUADRAGATA *Terræ*; a Team of Land: or which may be tilled with 4 Horses.

QUADRAGESIMA, is the first Sunday in Lent, and so called, because 'tis about the fortieth Day before Easter; and on the same account the three preceding Sundays are called *Quinquagesima*, *Sexagesima*, and *Septuagesima*.

QUADRAGESIMALS: In Popish Times 'twas the Custom for People to visit their Mother Church on Midlent Sunday, and to make their Offerings at the High Altar. And the like kind of Superstitious Devotion was also used in *Whitson week*: But as the Processions and Oblations at *Whitson-side* were sometimes commuted for a rated Payment of *Pentecostals* or *Whitson Farthings*; so these were changed into a Customary Payment, and were called *Quadragesimals*; *Denarii Quadragesimales*; and sometimes *Letare Jerusalem*, because that Hymn was sung on Midlent Sunday. The Custom of *Mothering*, as 'tis called in many places in England, is still retained, being that of visiting Parents on Midlent Sunday; and it seems to be called *Mothering* from the Respect thus in old Time paid to the Mother Church. And the Epistle of *Gal. 4. 21.* is still retained on Midlent Sunday, which began *Jerusalem mater omnium*, &c. tho' the occasion of it is forgotten.

QUADRANS, the fourth part of a Penny, or a Farthing; for before the Reign of *Edw. 1.* our smallest Coin was a Penny, called then *Sterling*; and it was stamp'd with a Cross or Traverse Stroke, so that it might on occasion be cut easily or broken into Halves or Quarters: But to avoid the Fraud of unequal division of the Penny, this King *Edw. 1.* coined Half-pence and Farthings in round distinct Pieces. *Matt. West. in Anno 1279.*

QUADRANT of Davis. See *Back staff*.

QUADRANTATA *Terræ*, the fourth part of an Acre.

QUADRAT: To Quadrat a Piece of Ordinance, is to see whether it is duly placed in its Carriage, and that the Wheels be of an equal Height.

Vol. II.

QUADRATRIX of the Hyperbola: There is a new Curve lately invented by Mr. J. Perks of Great Swinford in Worcester shire, for the Quadrature of the Hyperbola; of which see an Account in *Phil. Trans. N. 306.*

QUADRATURE Lines, or Lines of Quadrature; are two Lines placed usually, or at least sometimes, on Mr. Gunter's Sector, and easily known there, by being mark'd with the Letter Q, and the Figures 5, 6, 7, 8, 9, 10; of which Q signifies the side of a Square, and the other Figures the sides of Polygons of 5, 6, 7, &c. Sides. S. there stands for the Semi-diameter of a Circle, and 90 for a Line equal to 90 Degr. in the Circumference.

Their Uses are readily (tho' not exactly) These:

1. To make a Square equal to a given Circle.

Open the Sector to the Radius of the given Circle by applying it over in the Point S, S, and then the Parallel Distance between the Points Q, Q, is the side of the Square required.

2. To make a Circle equal to a given Square.

Apply the side of the Square over in Q, Q. so will the Parallel Distance between S, S. be the Radius of the Circle sought.

3. To reduce a Square, or a Circle, into a Pentagon or other regular Polygon equal to it.

Take the Side of the Square, or Radius of the Circle given, and apply it over in its proper Points, and then the Parallel Distances between the Points of any of the other Polygons, shall be the Sides of those Regular Figures.

QUADRATURE of Curves, by Sir Is. Newton.

I don't here consider Mathematical Quantities as composed of Parts extremely small, but as generated

by a continual motion. Lines are described, and by describing are generated, not by any apposition of Parts, but by a continual motion of Points. Surfaces are generated by the motion of Lines, Solids by the motion of Surfaces, Angles by the Rotation of their Legs, Time by a continual flux, and so in the rest. These *Geneses* are founded upon Nature, and are every Day seen in the motion of Bodies.

And after this manner the Ancients by carrying moveable right Lines along immoveable ones in a Normal Position or Situation, have taught us the *Geneses* of Rectangles.

Therefore considering that Quantities, encreasing, in equal times, and generated by this encreasing, are greater or less, according as their Velocity by which they encrease, and are generated, is greater or less; I endeavoured after a Method of determining the Quantities from the Velocities of their Motions, or Increments, by which they are generated; and by calling the Velocities of the Motions, or of the Augments, by the Name of *Fluxions*, and the generated Quantities *Fluents*, I (in the Year 1665 and 1666) did, by degrees, light upon the Method of *Fluxions*, which I here make use of in the *Quadrature of Curves*.

Fluxions are very nearly as the Augments of the Fluents, generated in equal, but infinitely small parts of Time; and to speak exactly, are in the *Prime Ratio* of the nascent Augments: but they may be expounded by any Lines that are proportional to 'em. As if the *Areas* ABC , $ABDG$ be described by the Ordinates BC , BD , moving with an uniform motion along the Base AB , the Fluxions of these *Areas* will be to one another as the describent Ordinates BC and BD , and may be expounded by those Ordinates; for those Ordinates are in the same Proportion as the Nascent Augments of the *Areas*.

Let the Ordinate BC move out of its place BC into any new one bc : Compleat the Parallelogram $BCEb$, and let the right Line VTH be drawn which may touch the Curve C and meet bc and BA produced in T and V ; and then the just now generated Augments of the Abscissa AB , the Ordinate BC , and the Curve Line ACc , will be Bb , Ee , and Cc ; and the Sides of the Triangle CET , are in the *Prime Ratio* of these Nascent Augments, and therefore the Fluxions of AB , BC and AC are as the Sides CE , ET , and CT of the Triangle CET , and may be expounded by those Sides, or, which is much at one, by the Sides of the Triangle VBC similar to it.

'Tis the same thing if the Fluxions be taken in the ultimate Ratio of the Evanescant Parts. Draw

the Right Line Cc , and produce the same to K . Let the Ordinate bc return into its former place BC , and the Points C and c coming together, the Right Line CK co-incides with the Tangent CH , and the Evanescant Triangle Cec in its ultimate form becomes similar to the Triangle CET , and its Evanescant Sides CE , Ee and Cc will be ultimately to one another as are CE , ET and CT the Sides of the other Triangle CET , and therefore the Fluxions of the Lines AB , BC and AC are in the same Ratio. If the Points C and c be at any small distance from one another, then will CK be at a small distance from the Tangent CH . As soon as the Right Line CK co-incides with the Tangent CH , and the ultimate Ratio's of the Lines CE , Ee and Cc be found, the Points C and c ought to come together and exactly to co-incide. For Errors, tho' never so small, are not to be neglected in Mathematicks.

By the same way of arguing, if a Circle described on the Centre B with the Radius BC , be drawn with an uniform motion along the Abscissa AB , and at Right Angles to it, the Fluxion of the generated Solid ABC will be as the generating Circle, and the Fluxion of its Surface will be as the Perimeter of that Circle and the Fluxion of the Curve Line AC conjointly. For in what time the Solid ABC is generated by drawing the Circle along the Abscissa AB , in the same time its Surface is generated by drawing the Perimeter of that Circle along the Curve AC .

Of this Method take the following Examples:

Let the Right Line PB revolving about the given Pole P cut the Right Line AB given in Position; the Proportions of the Fluxions of the Right Line AB and PB is required.

Let the Right Line PB go out of its place PB into a new one Pb : In the Line Pb take Pc equal to PB , and draw PD to AB so that the Angle bPD may be equal to the Angle bPC ; and then from the Similarity of the Triangles bBC , bPD , the Augment Bb , will be to the Augment Cb as Pb is to Db .

Now let Pb return into its former place PB , that those Augments may vanish, and the ultimate Ratio of the Evanescant Augments, that is, the ultimate Ratio of Pb to Db will be the same as that of PB to DB , the Angle being right; and therefore the Fluxion of AB is to the Fluxion of PB in this Ratio.

Let the Right Line PB revolving about the given P Pole cut AB and AE two other Right Lines given in Position in B and E ; 'tis required to find the Proportion of the Fluxions of those Right Lines AB and AE .

Let

Let the revolving Line PB move out of its place PB into a new one $P'b$, cutting AB , AE into the Points b and E , and draw BC parallel to AE , meeting $P'b$ in C ; then Bb will be to BC as Ab is to Ae ; and BC to Ee as $Ab \times PB$, to $Ae \times PE$. Now let the Right Line $P'b$ return into its former place PB , and the Evanescent Augment Bb will be to the Evanescent Augment Ee as $AB \times PB$ is to $AE \times PE$, and therefore in this Ratio is the Fluxion of the Right Line AB to the Fluxion of the Right Line AE .

Hence if the revolving Right Line PB cut any Curve Lines given in position in the Points B and E , and the moveable Right Lines AB , AE touch those Curves in B and E , the Points of Section; the Fluxion of the Curve which the Right Line AB touches, will be to the Fluxion of the Curve which the Right Line AE touches, as $AB \times PB$ is to $AE \times PE$. The same thing will happen if the Right Line PB always touch any Curve given in Position in the moveable Point P .

Let the Quantity x flow uniformly, and let the Fluxion of x^n be to be found. In the same time that the Quantity x by flowing becomes $x + o$, the Quantity x^n will become $x^n + o|n$, that is, by the Method of Infinite Series's $x^n + no x^{n-1} + \frac{nn-n}{2} o o x^{n-2} + \text{Ec.}$ and the Augments o and $no x^{n-1} + \frac{nn-n}{2} o o x^{n-2} + \text{Ec.}$ are to one another as 1 and $nx^{n-1} + \frac{nn-n}{2} o o x^{n-2} + \text{Ec.}$ Now let those Augments vanish, and their ultimate Ratio will be the Ratio of 1 to nx^{n-1} ; and therefore the Fluxion of the Quantity x is to the Fluxion of the Quantity x^n as 1 to nx^{n-1} .

By like ways of arguing, and by the method of Prime and Ultimate Ratio's, may be gathered the Fluxions of Lines, whether Right or Crooked in all cases whatsoever, as also the Fluxions of Surfaces, Angles and other Quantities. In Finite Quantities so to frame a Calculus, and thus to investigate the Prime and Ultimate Ratio's of Nascent or Evanescent Finite Quantities, is agreeable to the Geometry of the Ancients; and I was willing to shew, that in the Method of Fluxions there's no need of introducing Figures infinitely small into Geometry. For this Analysis may be performed in any Figures whatsoever, whether finite or infinitely small, so they are but imagined to be similar to the Evanescent Figures; as also in Figures which may be reckoned as infinitely small, if you do but proceed cautiously.

From the Fluxions to find the Fluents is the more difficult Problem, and the 1st step of the Solution of it is equivalent to the Quadrature of Curves; concerning which I have formerly written the following Tract.

A Treatise of the Quadrature of Curves.

I consider indetermin'd Quantities as encreasing or decreasing by a perpetual motion, that is, as flowing encreasingly or decreasingly; and I represent 'em by the Letters z, y, x, v , and I mark their Fluxions or their Celerities by which they encrease by the same Letters with Points over 'em thus, $\dot{z}, \dot{y}, \dot{x}, \dot{v}$. There are likewise Fluxions of Fluxions, or Mutations more or less swift, which may be called the *Second Fluxions* of $\dot{z}, \dot{y}, \dot{x}, \dot{v}$, and may be marked thus, $\ddot{z}, \ddot{y}, \ddot{x}, \ddot{v}$; and the *First Fluxions* of these, or the *Third Fluxions* of $\dot{z}, \dot{y}, \dot{x}, \dot{v}$, thus, $\dddot{z}, \dddot{y}, \dddot{x}, \dddot{v}$; the *Fourth* thus, $\ddddot{z}, \ddddot{y}, \ddddot{x}, \ddddot{v}$, &c. And as $\dot{z}, \dot{y}, \dot{x}, \dot{v}$, are Fluxions of the Quantities z, y, x, v , and these are Fluxions of the Quantities $\dot{z}, \dot{y}, \dot{x}, \dot{v}$, and these Fluxions of the Quantities $\ddot{z}, \ddot{y}, \ddot{x}, \ddot{v}$: So these Quantities may be considered as Fluxions of others, which I shall mark thus, $\dot{\dot{z}}, \dot{\dot{y}}, \dot{\dot{x}}, \dot{\dot{v}}$; and these as Fluxions of others $\ddot{\dot{z}}, \ddot{\dot{y}}, \ddot{\dot{x}}, \ddot{\dot{v}}$, and these as Fluxions of others $\dddot{\dot{z}}, \dddot{\dot{y}}, \dddot{\dot{x}}, \dddot{\dot{v}}$. Wherefore $\dot{z}, \dot{y}, \dot{x}, \dot{v}$, &c. represent a Series of Quantities, in which every subsequent one is the Fluxion of the precedent, and any preceding one is a flowing Quantity or a Fluent, which has for its Fluxion that which follows it.

Of the like nature is this Series $\sqrt{az - zz}, \sqrt{az - zz}, \sqrt{az - zz}, \sqrt{az - zz}, \sqrt{az - zz}$; as also this Series, $\frac{az + z^2}{a - z}, \frac{az + z^2}{a - z}, \frac{az + z^2}{a - z}, \frac{az + z^2}{a - z}, \frac{az + z^2}{a - z}$.

And it is to be observed, that any preceding Quantity in these Series's is as the Area of a Curvilinear Figure, whose Ordinate Applicat apply'd at Right Angles is the flowing Quantity; and its Abscissa z : as $\sqrt{az - zz}$ is the Area of a Curve whose Ordinate Applicat is $\sqrt{az - zz}$ and the Abscissa z .

The design of all this will be apparent from the following Propositions.

Prop. 1. Prob. 1.

Having given an Equation involving any number of fluent or flowing Quantities, to find their Fluxions.

Solution.

Multiply every Term of the Equation by the Index of the Power of each flowing Quantity contained in that Term, and in each Multiplication change the Root of the Power into its Fluxion; and then the Aggregate of all the Products under their proper Signs will be the new Equation.

Expli-

Explication.

Let $a, b, c, d, &c.$ be determined and immutable Quantities, and let any Equation be proposed containing the fluid or flowing Quantities $z, y, x, &c.$ as $x^3 - xyy + aaz - b^3 = 0$. First let the Terms be multiply'd by the Indexes of the Powers of x , and in each Multiplication, instead of the Root or Side of the Power, or instead of x of one dimension only, write $\dot{x}$, and the Summ of the Products will be $3xx\dot{x} - xyy$. Let the same be done by y , and you will have $-2xy\dot{y}$: Do the same by z , and there will be produced $aaz\dot{z}$. Let the Summ of the Products be put equal to 0 and you will have the Equation $3xx\dot{x} - xyy - 2xy\dot{y} + aaz\dot{z} = 0$; I say that in this Equation the Relation of the Fluxions is determined.

Demonstration.

For let o be a Quantity extremely small, and let $o\dot{z}, o\dot{y}, o\dot{x}$, be the Moments of the Quantities z, y, x ; that is, the momentaneous synchronal Increments. And if the flowing Quantities are now z, y , and x , these after a moment of time being augmented by their Increments $o\dot{z}, o\dot{y}, o\dot{x}$, will become $z + o\dot{z}, y + o\dot{y}, x + o\dot{x}$, which being substituted in the first Equation instead of z, y , and x , give this Equation, $(z + o\dot{z})^3 - (z + o\dot{z})(y + o\dot{y}) + aaz + aao\dot{z} - b^3 = 0$. Subduct the former Equation from it and the Residual divided by o will be $3xx\dot{x} + 3xxo\dot{x} + x^3o - xyy - 2xyo\dot{y} - 2xoo\dot{y} - xoo\dot{y} - xoo\dot{y} + aaz + aao\dot{z} - b^3 = 0$. Subduct the former Equation from it and the Residual divided by o will be $3xx\dot{x} + 3xxo\dot{x} + x^3o - xyy - 2xyo\dot{y} - 2xoo\dot{y} - xoo\dot{y} - xoo\dot{y} + aaz = 0$. Let the Quantity o be lessened infinitely, and neglecting the Evanescent Terms, there will remain $3xx\dot{x} - xyy - 2xy\dot{y} + aaz = 0$. Q. E. D.

A more full Explication of the same thing.

After the same manner, if the Equation were $x^3 - xyy + aa\sqrt{ax - yy} - b^3 = 0$, there would be produced $3x^2\dot{x} - xyy - 2xy\dot{y} + aa\sqrt{ax - yy} = 0$; where, if you would take away the Fluxion

$\sqrt{ax - yy}$, put $\sqrt{ax - yy} = z$, and then will $ax - yy = z^2$, and (by this Proposition) $ax - 2yy = 2z\dot{z}$ or $\frac{ax - 2yy}{2z} = \dot{z}$, that is, $\frac{ax - 2yy}{2\sqrt{ax - yy}} = \sqrt{ax - yy}$.

And thence $3x^2\dot{x} - xyy - 2xy\dot{y} + \frac{a^3x - 2aayy}{2\sqrt{ax - yy}} = 0$.

And by the same Operation, you may proceed to Second Fluxions, Third Fluxions, and so on: Let the Equation $zy^3 - z^4 + a^4 = 0$, then it will be made by the first Operation, $zy\dot{y} + 3zy^2\dot{y} - 4z^3\dot{z} = 0$, by the Second Operation $zy\ddot{y} + 6z\dot{y}\dot{y} + 3zy^2\ddot{y} - 4\dot{z}^2 - 12z\dot{z}\dot{z} = 0$; and by the Third, $zy\dddot{y} + 9z\ddot{y}\dot{y} + 9z\dot{y}\ddot{y} + 18z\dot{y}\dot{y} + 3z\ddot{y}\dot{y} + 18z\dot{y}\ddot{y} + 6\ddot{z}^2 - 4\dot{z}\ddot{z} - 36z\dot{z}\dot{z} - 24\dot{z}^3 = 0$.

But when we thus proceed to Second and Third Fluxions, &c. it is convenient to consider some Quantity as flowing uniformly; and for its first Fluxion to write 1; but for the second and following ones 0. Let the Equation be $zy^3 - z^4 + a^4 = 0$, as above; and let z flow uniformly, and let its Fluxion be Unity; and then by the first Operation it will become $y^3 + 3zy^2 - 4z^3 = 0$, by the Second $6y\dot{y} + 3\dot{z}y^2 + 6zy\dot{y} - 12\dot{z}^2 = 0$, by the Third $9\ddot{y} + 18\ddot{z}y + 3\ddot{z}y^2 + 18\dot{z}\ddot{y} + 6\ddot{z}^2 - 24\dot{z}^3 = 0$.

But in Equations of this kind we must conceive, that the Fluxions in each of the Terms are of the same Order, that is, that they are all either of the first Order $\dot{y}, \dot{z}$, or all of the Second $\ddot{y}, \ddot{z}$, or all of the Third, $\dddot{y}, \dddot{z}$, &c. And when the thing happens otherwise, the Order is to be compleated by the supposed Fluxions of a Quantity flowing uniformly; and then the last Equation, by compleating the third Order, becomes $9\ddot{z}\ddot{y} + 18\ddot{z}\dot{y} + 3\ddot{z}\dot{y}^2 + 18\ddot{z}\dot{y}\dot{y} + 6\ddot{z}^2 - 24\dot{z}^3 = 0$.

Prop. 2. Prob. 2.

To find the Curves that are Quadrable.

Let ABC be the Figure, whose Area is to be found; BC an Ordinate apply'd at Right Angles, and AB the Abscissa: Produce CB to E that BE may be $= 1$, and compleat the Parallelogram $ABED$; and the Fluxions of the Areas ABC , $ABED$ will be as BC and BE : Therefore take any Equation by which the Relation of the Areas may be determined, and thence will be given the relation of the Ordinates BC and BE , (by Proposition 1.) Q. E. D.

We shall give Examples of this thing in the two following Propositions.

Prop. 3. Theor. 1.

If z be used promiscuously for the Abscissa AB and the Area AEB or $AB \times 1$; and R be put for $E + fz^n + gz^{2n} + bz^{3n} + \dots$. Let the Area of the Curve be $z^\theta R^\lambda$, and the Ordinate Applicate BC will be $\theta z^{\theta-1} R^\lambda + \lambda z^\theta R^{\lambda-1} \dot{R}$ into $z^{\theta-1} R^{\lambda-1}$.

Demonstration.

For if $z^\theta R^\lambda = v$, then by the first Prop. will $\theta z^{\theta-1} R^\lambda + \lambda z^\theta R^{\lambda-1} \dot{R} = \dot{v}$. Instead of R^λ in the first term of the Equation, and z^θ in the second, write $R^{\lambda-1}$ and $z^{\theta-1}$, and then the Equation will become $\theta \dot{z} R + \lambda z \dot{R}$ into $z^{\theta-1} R^{\lambda-1} \dot{v}$. But R was taken equal to $E + fz^n + gz^{2n} + bz^{3n}$, &c. and consequently (by Prop. 1.) $\dot{R} = nfz^{n-1} + 2ngz^{2n-1} + 3nbz^{3n-1} + \dots$ which being substituted in their stead, and BE or 1 placed in the room of z ; Then

then will $\theta \frac{+0+}{+1\lambda n} f z^n + \frac{+0+}{+2\lambda n} g z^{2n} + \frac{+0+}{+3\lambda n} h z^{3n} +$
 &c. into $z^{\theta-1} R^{\lambda-1}$ be $= v = B C$. Q. E. D.

Prop. 4. Theor. 2.

If for the Abscissa $A B$ be put z , for $e + f z^n + g z^{2n} +$ &c. be put R , and S for $k + l z^n + m z^{2n} +$ &c. Let the Area of the Curve be $z^{\theta} R^{\lambda} S^{\mu}$; then the Ordinate Applicate $B C$ will be $=$

$$\left. \begin{array}{l} \theta e k \frac{+0+}{+1\lambda n} f k z^n + \frac{+0+}{+2\lambda n} g k z^{2n} + \dots \\ \frac{+0+}{+1\mu n} e l z^n + \frac{+0+}{+2\lambda n} f l z^{2n} + \frac{+0+}{+2\lambda n} g l z^{3n} + \dots \\ \frac{+0+}{+2\mu n} e m z^{2n} + \frac{+0+}{+2\lambda n} f m z^{3n} + \frac{+0+}{+2\mu n} g m z^{4n} + \dots \end{array} \right\} \begin{array}{l} \text{into} \\ z^{\theta-1} \\ R^{\lambda-1} \\ S^{\mu-1} \end{array}$$

This is demonstrated after the same manner as the former Proposition.

Prop. 5. Theor. 3.

If z be put for the Abscissa of the Curve $A B$, and R be put for $e + f z^n + g z^{2n} + h z^{3n} +$ &c. And let the Ordinate Applicate be $z^{\theta-1} R^{\lambda-1}$ multiply'd into $a + b z^n + c z^{2n} + d z^{3n} +$ &c. and let $\frac{\theta}{n}$ be put $= r$, and $r + \lambda = S$. $S + \lambda = t$, $t + \lambda = v$, &c. Then the Area will be $z^{\theta} R^{\lambda}$ multiply'd into $\frac{1}{r+1} \frac{a}{e} +$

$$\frac{1}{r+1, e} \frac{b}{e} S f A + \frac{1}{r+2, e} \frac{c}{e} S f B - \frac{1}{r+2, e} g A + \frac{1}{r-3, e} \frac{d}{e} S f C - \frac{1}{r-3, e} h B - v h A$$

$$z^{3n} + \frac{1}{r+4, e} \frac{f D - g C - h B}{e} z^{4n} + \dots \text{ \&c. where } A, B,$$

$C, D, \&c.$ denote the whole given Co-efficients of each Term in the Series with their Signs $+$ and $-$, viz. A denotes the Co-efficient of the first Term $\frac{1}{r+1} \frac{a}{e}$, B the Co-efficient of the second Term $\frac{1}{r+1} \frac{b}{e} S f A$, C the Co-efficient of the third Term $\frac{1}{r+1, e} \frac{c}{e} S f B - \frac{1}{r+2, e} g A$, and so on.

Demonstration.

According to Prop. Third.

Let the Ordinates of the Curves be,	and their Areas
1. $\theta \frac{+0+}{+1\lambda n} f A z^n + \frac{+0+}{+2\lambda n} g A z^{2n} + \frac{+0+}{+3\lambda n} h A z^{3n}, \&c.$	$A z^{\theta} R^{\lambda}$
2. $\dots \frac{+0+n}{+1\lambda n} e B z^n + \frac{+0+n}{+2\lambda n} f B z^{2n} + \frac{+0+n}{+3\lambda n} g B z^{3n}, \&c.$	$B z^{\theta+n} R^{\lambda}$
3. $\dots \frac{+0+2n}{+1\lambda n} e C z^{2n} + \frac{+0+2n}{+2\lambda n} f C z^{3n}, \&c.$	$C z^{\theta+2n} R^{\lambda}$
4. $\dots \frac{+0+3n}{+1\lambda n} e D z^{3n}, \&c.$	$D z^{\theta+3n} R^{\lambda}$

And if the Sum of the Ordinates be put equal to the Ordinate $a + b z^n + c z^{2n} + d z^{3n} +$ &c. multi-

ply'd into $z^{\theta-1} R^{\lambda-1}$, the Sum of the Areas $z^{\theta} R^{\lambda}$ into $A + B z^n + C z^{2n} + D z^{3n} +$ &c. will be equal to the Area of a Curve which has that for an Ordinate. Therefore let the Corresponding Terms of the Ordinate be equal; and then a will become $= \theta A$, $b = \frac{\theta}{+1\lambda n} f A + \theta e B$; $C = \frac{\theta}{+2\lambda n} g A + \frac{\theta+n}{+1\lambda n} f B + \theta + 2n$, $e C$, &c. and thence $\frac{a}{\theta e} = A$, $\frac{b - \frac{\theta}{+2\lambda n} f A}{\theta + n, e} = B$. $C = \frac{\theta + 2\lambda n g A - \frac{\theta+n}{+1\lambda n} f B}{\theta + 2n, e} = C$. And so on *ad Infinitum*.

Now put $\frac{\theta}{n} = r$. $r + \lambda = S$. $S + \lambda = t$, &c. and in the Area $z^{\theta} R^{\lambda} A + B z^n + C z^{2n} + D z^{3n}, \&c.$ write the values of $A B C$ found above, and there will come out the propos'd Series. Q. E. D.

And it is to be observed, that every Ordinate is resolved into a Series two ways: For the Index n , may either be Affirmative or Negative. Let an Ordinate be proposed $3k - l z z$ this may

be either written $z - \frac{1}{2} \times 3k - l z z \times k - l z z + m z z$ or thus, $z \times -1 + 3k z^2 \times m - l z \times -1 + k z^2 \times -\frac{1}{2}$. In the former Case $a = 3k$. $b = 0$. $c = -l$. $E = k$. $f = 0$. $g = -l$. $h = m$. $\lambda = -\frac{1}{2}$. $n = 1$. $\theta = -1$. $\theta - 1 = -\frac{3}{2}$. $\theta = -\frac{3}{2}$. $r = -1$. $S = -\frac{1}{2}$. $t = -\frac{1}{2}$. $v = 0$. In the latter Case $a = -l$. $b = 0$. $C = 3k$. $e = m$. $f = -l$. $g = 0$. $h = 1$. $\lambda = -\frac{1}{2}$. $n = -1$. $\theta = -1$. $\theta - 1 = -2$. $r = -2$. $S = -\frac{1}{2}$. $t = -1$. $v = -\frac{1}{2}$. Each of these Cases must be try'd; and if either of the Series be broken off and terminated, the Terms at length growing different, the Area of the Curve will be had in Finite Terms. So in the former Case of this Example, by writing in the Series the Values of $a, b, c, e, f, g, h, \lambda, \theta, r, s, t, v$, all the Terms except the first vanish *ad infinitum*, and the Area of the Curve becomes $-2 \sqrt{\frac{k - l z z + m z^3}{z^3}}$. And this Area, by reason

of the negative Sign, adjoins to the Abscissa produced beyond the Ordinate. For every Affirmative Area adjoins to both the Abscissa and Ordinate, but a Negative one falls on the contrary parts of the Ordinate, and adjoins to the Abscissa produced, the Sign of the Ordinate remaining. By this means one of the Series, and sometimes both, is always terminated and finite; if the Curve can be squared Geometrically.

But if the Curve don't admit of such a Quadrature, both Series will be continued *in infinitum*, and one of 'em will converge and give the Area by approximation, except where r (by reason of the infinite Area) is either nothing or an Integer Number and Negative, or where $\frac{r}{e}$ is equal to Unity. If $\frac{r}{e}$ be less than Unity, that Series will converge in which the Index n is affirmative; but if $\frac{r}{e}$ be greater than Unity, the other Series will converge. In one Case the Area adjoins to the Abscissa drawn as far as the Ordinate, in the other Case it adjoins to it produced beyond the Ordinate.

Note farther, that if the Ordinate be a Rectangle under the Rational Factor Q and the Surd irreducible Factor R^{π} , and the Side R of the Surd Factor does not divide the Rational Factor Q ; then $\lambda - 1$ will be $= \pi$; and $R^{\lambda-1} = R^{\pi}$; but if the Side R of the Surd Factor divide the Rational Factor once, $\lambda - 1$ will be $= \pi + 1$ and $R^{\lambda-1} = R^{\pi+1}$; if it divide it twice, $\lambda - 1$ will be $= \pi + 2$ and

and $R^{\lambda-1} = R^{\pi+2}$; If thrice, $\lambda-1$ will be $\pi+3$ and $R^{\lambda-1} = R^{\pi+3}$, and so on, &c.

If the Ordinate be a rational irreducible Fraction whose Denominator is composed of two or more Terms; the Denominator is to be resolved into all its first Divisors. And if there be any Divisor which has never another equal to it, the Curve is not Quadrable. But if there be two or more Divisors equal, one of them must be thrown away, and still there will be two others or more, which are equal amongst themselves and unequal to the former; one of these also must be rejected, and so of all others that are equal, if there still be more; then the Divisor that is left, or the Product under all the Divisors which are left, if there be more, must be put instead of R and R^{-2} the reciprocal of the Square of R for $R^{\lambda-1}$, except where that Product is a Square, or a Cube, or a Biquadrate, &c. in which case the Side of it is to be put instead of R , and the Index of the Power 2, 3, or 4, taken negatively instead of λ ; and the Ordinate must be reduced to the Denominator R^2 , R^3 , R^4 , or R^5 , &c.

Let the Ordinate be $\frac{z^5+z^4-8z^3}{z^5+z^4-5z^3-z^2-8z-4}$; because this Fraction is irreducible, and the Divisors of the Denominator are equal, viz. $z-1$, $z-1$, $z-1$, $z+2$, & $z+2$, I reject one Divisor of either magnitude, and the product of the remaining $z-1$, $z-1$, $z-2$, which is z^3-3z^2+2z I put instead of R ; and the Reciprocal of the Square of R which is $\frac{1}{R^2}$ or R^{-2} instead of $R^{\lambda-1}$. Afterwards I reduce the Ordinate to the Denominator R^2 or $R^{1-\lambda}$, and it becomes $\frac{z^6-9z^4+8z^3}{z^3-3z^2+2z}$, that is, $\frac{z^3 \times 8 - 9z^2 \times 2 + 3z \times 2 - 3z + 2}{z^3-3z^2+2z}$. And thence is $a=8$, $b=-9$, $c=0$, $d=-1$, &c. $E=2$, $f=-3$, $g=0$, $h=1$, $\lambda-1=-2$, $\lambda=-1$, $n=1$, $\theta-1=3$, $\theta=4=r$, $S=3$, $t=2$, $v=1$, and these being put in the Series, the Area comes out $\frac{z^4}{z^3-3z^2+2z}$; all the Terms in the Series, except the first, vanishing.

If lastly, the Ordinate be an irreducible Fraction, whose Denominator is a Product under the Rational Factor Q , and the Surd irreducible Factor R^r , you must find all the first Divisors of the Side R , and reject one Divisor of each magnitude; and by those Divisors that remain, if there be any, multiply the Rational Factor Q ; and if that Product be equal to the Side R , or any

Power of that Side whose Index is an Integer Number; let that Index be m , and $\lambda-1$ will be $-\pi-m$ and $R^{\lambda-1} = R^{\pi-m}$, so that if the Ordinate be $\frac{3q^5-q^4x+9q^2xx-qqx^3-6qx^4}{qq-xx^3 \sqrt{q^3+qqx-qqx-x^3}}$, because the Side R of the Surd Factor or $q^3+qqx-qqx-x^3$ has the Divisors $q+x$, $q+x$, $q-x$, which are of two Magnitudes, I reject one Divisor of each Magnitude, and multiply the rational Factor $qq-xx$ by the Divisor that is left $q+x$. And because the Product $q^3+qqx-qqx-x^3$ is equal to the Side R , I put $m=1$, and thence, since π is $\frac{1}{2}$, $\lambda-1$ becomes $-\frac{3}{2}$. Therefore I reduce the Ordinate to the Denominator $R^{-\frac{3}{2}}$, and 'tis made $\frac{30 \times 2q^6+2q^5x+8q^4xx+8q^3x^3+7qqx^4+6qx^5 \times q^3+qqx-x^3}{x-x^3} = \frac{30q^6+2q^5x+8q^4xx+8q^3x^3+7qqx^4+6qx^5 \times q^3+qqx-x^3}{x-x^3}$, from whence $a=3q^6$, $b=2q^5$, &c. $e=q^3$, $f=qq$, &c. $\theta-1=0$, $\theta=1=n$, $\lambda=-\frac{3}{2}$, $r=1$, $S=\frac{3}{2}$, $t=\frac{1}{2}$, $v=0$, and these Values being put in the Series, the Area comes out $\frac{3qqx+3x^3}{3\sqrt{q^3+qqx-qqx-x^3}}$, all the Terms in the whole Series after the third, vanishing.

Prop. 6. Theor. 4.

If the Abscissa AB of a Curve be x , and R be put in the room of $e+fz^n+gz^{2n}+hz^{3n}+$, &c. and S in the room of $k+lz^n+mz^{2n}+nz^{3n}+$, &c. then let the Ordinate Applicate be $z^{\theta-1} R^{\lambda-1} S^{\mu-1}$ multiply'd into $a+bz^n+Cz^{2n}+dz^{3n}+$, &c. if there be the Rectangles of the Terms $e, f, g, h,$ &c. and $k, l, m, n,$ &c.

ek	fk	gk	hk
el	fl	gl	hl
em	fm	gm	hm
en	fn	gn	hn

And if the numeral Co-efficients of those Rectangles be respectively,

$$\begin{aligned} \frac{r}{n\theta} &= r, & r+\lambda &= S, & S+\lambda &= t, & t+\lambda &= v, & \&c. \\ r+\mu &= \dot{S}, & S+\mu &= \dot{t}, & t+\mu &= \dot{v}, & v+\mu &= \dot{w}, & \&c. \\ \dot{S}+\mu &= \ddot{t}, & \dot{t}+\mu &= \ddot{v}, & \dot{v}+\mu &= \ddot{w}, & \dot{w}+\mu &= \ddot{x}, & \&c. \\ \ddot{t}+\mu &= \ddot{v}, & \ddot{v}+\mu &= \ddot{w}, & \ddot{w}+\mu &= \ddot{x}, & \ddot{x}+\mu &= \ddot{y}, & \&c. \end{aligned}$$

The Area of the Curve will be

$$\begin{aligned} & \frac{a}{r\theta k} + \frac{b}{r+1, ek} + \frac{c}{r+2, ek} + \frac{d}{r+3, ek} + \dots \\ & \frac{f}{r+1, f k} + \frac{g}{r+1, g} + \frac{h}{r+2, f k} + \frac{i}{r+1, f l} + \frac{j}{r+2, e l} + \frac{k}{r+1, e m} + \frac{l}{r+2, e k} + \dots \\ & \frac{m}{r+1, g} + \frac{n}{r+2, f k} + \frac{o}{r+1, f l} + \frac{p}{r+2, e l} + \frac{q}{r+1, e m} + \frac{r}{r+2, e k} + \dots \end{aligned}$$

Where A denotes the given Co-efficient of the first Term, $\frac{a}{r\theta k}$ with its Sign $+$ or $-$, B the given

Co-efficient of the second Term, C the given Co-efficient of the Third, and so on. But of the Terms $a, b, c,$ &c. $e, f, g,$ &c. $k, l, m,$ &c. one or more

more may be wanting. This Proposition is demonstrated after the manner of the former, and what was observed there takes place here also. But the Series of such Propositions as these run on *ad infinitum*, and the Progression of the Series is evident.

Prop. 7. Theor. 5.

If R be put instead of $e + fz^n + gz^{2n}$, &c. as above, and in the Ordinate of any Curve $z^{\theta+n}R^{\lambda+1}$ there remain the given Quantities $\theta, n, \lambda, e, f, g$, &c. and instead of σ and τ be put any Integer Numbers successively, and if the Area of one of these Curves be given, which are denoted by innumerable Ordinates coming out in these forms, if the Ordinates be Binomials in the *Vinculum* of the Root, or if the Areas of two of those Curves be given; if the Ordinates be Trinomials in the *Vinculum* of the Root, or the Areas of three of those Curves; if the Ordinates are Quadrinomials in the *Vinculum* of the Root, and so on infinitely: I say, that the Areas of all these Curves will be given. For *Nomes* I here take all the Terms in the *Vinculum* of the Root, as well deficient as entire, the Indexes of whose Powers are in an Arithmetical Progression. So the Ordinate $\sqrt{a^4 - ax^3 + x^4}$ by reason of the two different Terms between a^4 and ax^3 ought to be reckoned a Quinquenomial. But $\sqrt{a^4 + x^4}$ is a Binomial, and $\sqrt{a^4 + x^4 - x^8}$ a Trinomial, seeing the Progression now proceeds by greater differences. This Proposition is thus demonstrated.

Case 1.

Let the Ordinates of two Curves be $pz^{\theta-1}R^{\lambda-1}$ and $qz^{\theta+n-1}R^{\lambda-1}$, and their Areas pA and qB , R being the Trinomial Quantity $e + fz^n + gz^{2n}$. And by *Prop. 3.* since $z^{\theta}R^{\lambda}$ is the Area of a Curve whose Ordinate is $\theta z^{\theta-1} + \frac{\theta}{\lambda n} f z^n + \frac{\theta}{2\lambda n} g z^{2n}$ multiply'd into $z^{\theta-1}R^{\lambda-1}$, subduct the former Ordinates and Areas from this latter Ordinate and Area, and there will remain $\frac{\theta}{\lambda n} e + \frac{\theta}{2\lambda n} f z^n + \frac{\theta}{2\lambda n} g z^{2n}$ multiply'd into $z^{\theta-1}R^{\lambda-1}$ the new Ordinate of the Curve; and $z^{\theta}R^{\lambda} - pA - qB$ its Area. Put $\theta e = p$, and $\theta f + \lambda n f = q$ and the Ordinate will be found $\frac{\theta}{2\lambda n} g z^{2n}$ multiply'd into $z^{\theta-1}R^{\lambda-1}$, and the Area $z^{\theta}R^{\lambda} - \theta e A - fB - \lambda n f B$. Divide both by $\theta g + 2\lambda n g$, and call the Area that will come out C , and taking r at pleasure, rC will be the Area of a Curve whose Ordinate is $rz^{\theta} + 2^{n-1}R^{\lambda-1}$. And after the same manner that from the Areas pA and qB we find the Area rC agreeing to the Ordinate $rz^{\theta} + 2^{n-1}R^{\lambda-1}$, we may from the Areas qB and rC find a fourth Area, as SD , agreeing to the Ordinate $Sz^{\theta+3n-1}R^{\lambda-1}$, and so on infinitely. And from the Areas B and A there is a like Ratio of Progression towards a contrary part. If any of the Terms $\theta, \theta + \lambda n$, and $\theta + 2\lambda n$ be wanting, and break off the Series, assume the Area pA in the beginning of one Progression, and the Area qB in the beginning of the other, and from these two Areas will be given all the Areas in both Progressions.

Vol. II.

And on the contrary, from any two other Areas assumed, one may go back by an Analysis to the Areas A and B , so that from these two Areas given, all the rest may be given likewise. *Q. E. D.* This is the case of those Curves where θ the Index of z is encreased or diminished by a perpetual addition or subduction of the Quantity n . The other is the case of those Curves where the Index λ is encreased or diminished by Unites.

Case 2.

If the Ordinates $pz^{\theta-1}R^{\lambda}$ and $qz^{\theta+n-1}R^{\lambda}$, whose corresponding Areas are pA and qB , be multiply'd by R , or $e + fz^n + gz^{2n}$, and afterwards be again divided by R , they become $pe + pfz^n + pgz^{2n} \times z^{\theta-1}R^{\lambda-1}$, and $qe + qfz^n + qgz^{2n} \times z^{\theta+n-1}R^{\lambda-1}$. And by the 3d *Prop.* $az^{\theta}R^{\lambda}$ is the Area of a Curve whose Ordinate is $\theta z^{\theta-1} + \frac{\theta}{\lambda n} afz^n + \frac{\theta}{2\lambda n} agz^{2n}$ multiply'd into $z^{\theta-1}R^{\lambda-1}$, and $bz^{\theta+n-1}R^{\lambda}$ is the Area of a Curve whose Ordinate is $\frac{\theta}{n} be + \frac{\theta}{n} bfz^n + \frac{\theta}{2\lambda n} bgz^{2n}$ multiply'd into $z^{\theta-1}R^{\lambda-1}$. The Summ of these 4 Areas is $pA + qB + az^{\theta}R^{\lambda} + bz^{\theta+n}R^{\lambda}$, and the Summ of their corresponding Ordinates.

$$\begin{array}{r} \theta ae + \frac{\theta}{\lambda n} afz^n + \frac{\theta}{2\lambda n} agz^{2n} + \frac{\theta}{n} bgz^{2n} \text{ into } z^{\theta-1}R^{\lambda-1} \\ + pe + \frac{\theta}{n} be + \frac{\theta}{n} bf + qg \\ + pf + pg \\ + qe + qf \end{array}$$

If the First, Third and Fourth Term be separately put equal to nothing; by the first Term, $\theta ae + pe$ will be made $= 0$ or $-\theta a = p$, by the Fourth $-\theta b - n^2 - 2\lambda n b = q$, and by the Third (striking out p and q) $\frac{2ag}{f} = b$. From whence the second Term becomes $\frac{\lambda n af - 4\lambda n age}{f}$, and therefore the Summ of the four Ordinates is $\frac{\lambda n af - 4\lambda n age}{f} z^{\theta+n-1}R^{\lambda-1}$, and the Summ of so many corresponding Areas is $az^{\theta}R^{\lambda} + \frac{2ag}{f} z^{\theta+n}R^{\lambda} + aA - \frac{2\theta + 2n + 4\lambda n}{f} agB$. Divide these Summs by $\frac{\lambda n af - 4\lambda n age}{f}$, and if the latter Quote be called D ;

D will be the Area of a Curve whose Ordinate is the first Quote $z^{\theta+n-1}R^{\lambda-1}$. And after the same way by putting all the Terms of the Ordinate except the first equal to nothing, the Area of a Curve may be found whose Ordinate is $z^{\theta-1}R^{\lambda-1}$. Let that Area be called C , the same way that the Areas C and D are found from the Areas A and B , two other E and F may be found from C and D , agreeing to the Ordinates $z^{\theta-1}R^{\lambda-2}$ and $z^{\theta+n-1}R^{\lambda-2}$, and so on *in infinitum*: And by a contrary Analysis one may proceed back again from the Areas E and F to the Areas C and D , and thence to the

the Areas A and B , and others which follow in the Progression. Therefore if the Index λ be increased or diminished by a continual addition or subduction of Unities; and of the Areas, corresponding to the Ordinates coming out in these Forms, two of the most simple be known, all others are given *in infinitum*. Q. E. D.

Case 3.

And by these two Cases conjoined, if both the Index θ be any how increased or diminished by the continual addition or subduction of n ; and the Index λ , by the perpetual addition or subduction of Unity, the Areas corresponding to the several arising Ordinates, will be given.

Case 4.

And by a like entcrease, if the Ordinate be expressed by 4 *Nomes* in the Radical Vinculum, and 3 of the Areas are given; or if it be express'd by 5 *Nomes*, and 4 of the Areas given, and so on: All the Areas will be given which can be generated by adding or subducting the Number n to or from the Index θ ; or Unity, to or from the Index λ . And 'tis the same case with Curves whose Ordinates are expressed by Binomials and one Area of those which are not Quadrable Geometrically, is given.

Prop. 8. Theor. 6.

If for $e + fz^n + gz^{2n} + \&c.$ and $k + lx^n + mx^{2n} + \&c.$ you put R and S as before, and in the Ordinate of any Curve $x^{\theta+n} R^{\lambda} + \tau S^{\mu} + \nu$ the given Quantities $\theta, n, \lambda, \mu, e, f, g, k, l, m, \&c.$ remain; and that for σ, τ , and ν , any Integer Numbers be successively written, and if the Areas of two of the Curves are given which are denoted by the Ordinates so arising, if the Quantities R and S are Binomials; or if the Areas of three of the Curves be given, if R and S consist conjointly of 5 *Nomes*; or if the Areas of 5 Curves be given, when S and R consist jointly of six *Nomes*, &c. and so on *in infinitum*: I say, the Areas of all the Curves will be given.

The Demonstration is like that of the former Proposition.

Prop. 9. Theor. 7.

The Areas of these Curves are equal to one another whose Ordinates are as the Fluxions of the Abscissa.

For the Rectangles under the Ordinates and the Fluxions of the Abscissa are equal, and the Fluxions of the Areas are as those Rectangles.

Corol. 1.

If any Relation between the Abscissa of two Curves be assumed, and thence (by Prop. 1.) the Relation between the Fluxions of the Abscissa be sought, and the Ordinates be supposed reciprocally proportionable to the Fluxions; then innumerable Curves may be found, whose Areas shall be mutually equal to one another.

Corol. 2.

For so will every Curve whose Ordinate is

$x^{\theta-1}$ into $e + fz^n + gz^{2n} + \&c.$, by assuming any Quantity for v , and putting $\frac{n}{v} = S$ and $x^v = x$, change into another equal to it self, whose Ordinate will be $\frac{v}{n} x^{\frac{v\theta-n}{n}}$ into $e + fx^v + gx^{2v} + \&c.$

Corol. 3.

And every Curve whose Ordinate is $x^{\theta-1}$ into $a + bz^n + cz^{2n} + \&c.$ $\times$ $e + fz^n + gz^{2n} + \&c.$, by taking any Quantity for v , and putting $\frac{n}{v} = S$, and $x^v = x$, will change into another equal to it self whose Ordinate shall be $\frac{v}{n} x^{\frac{v\theta-n}{n}}$ into $a + bx^v + cx^{2v} + \&c.$ $\times$ $e + fx^v + gx^{2v} + \&c.$

Corol. 4.

And every Curve whose Ordinate is $x^{\theta-1}$ into $a + bz^n + cz^{2n} + \&c.$ $\times$ $e + fz^n + gz^{2n} + \&c.$ $\times$ $k + lx^n + mx^{2n} + \&c.$, by taking any Quantity for v and putting $\frac{n}{v} = S$ and $x^v = x$, changes into another Curve equal to it self, whose Ordinate is $\frac{v}{n} x^{\frac{v\theta-n}{n}}$ into $a + bx^v + cx^{2v} + \&c.$ $\times$ $e + fx^v + gx^{2v} + \&c.$ $\times$ $k + lx^v + mx^{2v} + \&c.$

Corol. 5.

And every Curve whose Ordinate is $x^{\theta-1}$ into $e + fz^n + gz^{2n} + \&c.$ by putting $\frac{1}{x} = x$, changes into another equal to it self, whose Ordinate is $\frac{1}{x\theta+1} \times e + fx^n + gz^{2n} + \&c.$ that is $\frac{1}{x\theta+1+n\lambda}$ $\times$ $f + ex^n$, if there are two *Nomes* in the Vinculum of the Root, or $\frac{1}{x\theta+1+2n\lambda} \times g + fx^n + ex^{2n}$ if there are three *Nomes*, &c.

Corol. 6.

And every Curve whose Ordinate is $x^{\theta-1}$ into $e + fz^n + gz^{2n} + \&c.$ $\times$ $k + lx^n + mx^{2n} + \&c.$, by putting $\frac{1}{x} = x$, changes into another equal to it self, whose Ordinate is $\frac{1}{x\theta+1} \times e + fx^n + gz^{2n} + \&c.$ $\times$ $k + lx^n + mx^{2n} + \&c.$, that is $\frac{1}{x\theta+1+n\lambda+n\mu} \times f + ex^n$ $\times$ $l + kx^n$ if there are two *Nomes* in the Vinculum of the Root, or $\frac{1}{x\theta+1+2n\lambda+n\mu} \times g + fx^n + ex^{2n}$ $\times$ $l + kx^n$ if there be three *Nomes* in the Vinculum of the former Root, and two in that of the latter; and so in others.

N. B. The two equal Areas in these two last Corollaries lie on opposite sides of the Ordinates: If the Areas in either Curve join to the Abscissa, the corresponding equal Area in the other Curve adjoins to the Abscissa produced.

Corol.

Corol. 7.

If the Relation between the Ordinate y of any Curve and its Abscissa x be expressed by any affected Equation of this form, y^a into $e + f y^n z^d + g y^{2n} z^{2d} + h y^{3n} z^{3d} + \&c. = z^b$ into $k + l y^n z^d + m y^{2n} z^{2d} + \&c.$ this Figure, assuming $S = \frac{n-d}{n}$, $x = \frac{1}{s} z^e$, and $\lambda = \frac{n-d}{a d + \beta n}$ changes into another equal to it self, whose Abscissa x , from the Ordinate v being given, is determined by an Equation not affected; as $\frac{1}{s} v^{a \lambda} \times e + f v^n + g v^{2n} + h v^{3n} + \&c. | \lambda \times k + l v^n + m v^{2n} + \&c. |^{\lambda} = x$.

Corol. 8.

If the Relation between the Ordinate y of any Curve, and its Abscissa z be determined by any affected Equation in this Form, y^a into $e + f y^n z^d + g y^{2n} z^{2d} = z^b$ into $k + l y^n z^d + m y^{2n} z^{2d} + \&c. + z^c$ into $p + q y^n z^d + r y^{2n} z^{2d} + \&c.$ then this Figure, assuming $S = \frac{n-d}{n}$, $x = \frac{1}{s} z^e$, $\mu = \frac{a d + \beta n}{n-d}$ and $v = \frac{a d + \gamma n}{n-d}$, changes into another equal to it self, whose Abscissa x , from the given Ordinate v being given, is determined by an Equation less affected, as v^a into $e + f v^n + g v^{2n} + \&c. = S^{\mu} x^{\mu}$ into $k + l v^n + m v^{2n} + \&c. + S^{\nu} + x^{\nu}$ into $p + q v^n + r v^{2n} + \&c.$

Corol. 9.

Every Curve whose Ordinate is $\pi z^{\theta-1}$ into $e + f z^n + g z^{2n} + \&c. \times e + f z^n + g z^{2n} + \&c. |^{\lambda-1}$ $\times | a + b | e z^n + f z^n + g z^{2n} + \&c. |^{\tau}$, if $\theta = \lambda \nu$ and there be assumed $x = e z^n + f z^{2n} + g z^{3n} + \&c.$ $\pi, \sigma = \frac{\tau}{\pi}$, and $\beta = \frac{\lambda - \pi}{\pi}$, changes into another

equal to it self, whose Ordinate is $x^{\theta} \times a + b x^{\sigma}$. And observe that the former Ordinate in the Corollary becomes more simple by putting $\lambda = 1$, or by putting $\tau = 1$, and by effecting, that the Radix of the Dignity may be extracted, whose Index is ω , or also by putting $\omega = -1$ and $\lambda = 1 = \tau = \sigma = \pi$, that I may pass by other Cases, &c.

Corol. 10.

For $e z + f z^n + g z^{2n} + \&c. v e z^{\nu-1} + \frac{1}{\nu} z^{\nu} + \&c. + \frac{1}{2n} g z^{2n} + \&c. k + l z^n + m z^{2n} + \&c. \text{ and } \frac{n}{\lambda} z^{n+2n} + \&c. \text{ let } R, r, S \text{ and } s \text{ be substituted respectively, and then every Curve whose Ordinate is } \pi S r + \phi R^r \text{ into } R^{\lambda-1} S^{\mu-1} \times a s^{\nu} + b R^{\tau} |^{\omega}$ if it be $\frac{\mu - \nu \omega}{\lambda} = \frac{\nu}{\tau} = \frac{\phi}{\pi}$, $\frac{\tau}{\pi} = \sigma$, $\frac{\lambda - \pi}{\pi} = \beta$, and $R^{\pi} S^{\phi} = x$, changes into another equal to it self, whose Ordinate is $x^{\beta} \times a + b x^{\sigma}$. And observe, that the former Ordinate grows more simple, by

Vol. II.

putting Unities for τ, ν, λ or μ , and by effecting that the Radix of the Dignity may be extracted, whose Index is ω , or by putting $\omega = -1$ or $\mu = 0$.

Prop. 10. Prob. 3.

To find the most simple Figures with which any Curve may be Geometrically compared, whose Ordinate *Applicate* y , by an Equation not affected, is determined from having the Abscissa z given.

Case 1.

Let the Ordinate be $a z^{\theta-1}$, and then the Area will be $\frac{1}{\theta} a z^{\theta}$, as will easily be collected from Prop. 5. by putting $b = c = d = f = g = h$ and $e = 1$.

Case 2.

Let the Ordinate be $a z^{\theta-1} \times f z^n + g z^{2n} + \&c. |^{\lambda-1}$ then if the Curve can be compared Geometrically with Rectilinear Figures, it may be squared by Prop. 5. by putting $b = c = d$. If not, let it be changed into another Curve equal to it, whose Ordinate shall be $\frac{a}{\theta} \times \frac{\theta - n}{n} \times e + f x + g x^2 + \&c. |^{\lambda-1}$ by Cor. 2. Prop. 9.

Then if out of the Index of the Dignities $\frac{\theta - n}{n}$ and $\lambda - 1$ (by Prop. 7.) you reject the Unities till those Dignities become the least possible, you will then come to the most simple Figures that can be by this means collected. Then every one of these, (by Cor. 5. Prop. 9.) gives another which is sometimes yet more simple. And from these, by Prop. 3. and Cor. 9. and 10. of Prop. 9. compared one with another, some yet more simple Figures come out. And lastly, by assuming these to be the most simple Figures; and by proceeding in a Reverse or Inverse Method, may the required Area be computed.

Case 3.

Let the Ordinate be $z^{\theta-1} \times a + b z^n + c z^{2n} + \&c. \times e + f z^n + g z^{2n} + \&c. |^{\lambda-1}$, then will this Figure, if squarable, be squared by Prop. 5. But if not, then the Ordinate must be distinguished into the Parts, $v^{\theta-1} \times a \times e + f z^n + g z^{2n} + \&c. |^{\lambda-1}$, $z^{\theta-1} \times b z^n \times e + f z^n + g z^{2n} + \&c. |^{\lambda-1}$, &c. and by Case 2. the most simple Figures are to be found with which the Figures corresponding in those Parts may be compared; for then the Areas of the Figures corresponding to those Parts, and connected with their proper Signs $+$ and $-$, will compose the whole Area sought.

Case 4.

Let the Ordinate be $z^{\theta-1} \times a + b z^n + c z^{2n} + \&c. \times e + f z^n + g z^{2n} + \&c. |^{\lambda-1} \times k + l z^n + m z^{2n} + \&c. |^{\mu-1}$ and then if the Curve be Quadrable, it will be squared by Prop. 6. But if not, let it by Cor. 4. Prop. 9. changed into a more simple one, and then compared with the most simple Figures according

to Prop. 8. and Cor. 6, 9, and 10, of Prop. 9 as was done in Case 2 and 3.

Case 5.

If the Ordinate consist of different Parts, then the several Parts are to be esteemed as the Ordinates of so many different Curves, and those Curves, as many as are Quadrable, are to be squared, and their Ordinates subducted from that of the whole Curve.

Corol. 1.

Hence every Curve whose Ordinate is the Square Root of its affected Equation, may be compared with the most simple Figures, whether Rectilineal or Curvilineal. For that Root always consists of two Parts, which considered severally, are not affected Roots of Equations. Let the Equation be proposed

$$aay + xzy = 2a^2y + 2x^2y - z^4 \text{ its Root when extract-}$$

ed will be $y = \frac{a^3 + z^3 + a\sqrt{a^4 + 2xz^3 - z^4}}{aa + zz}$ whose ra-

tional part $\frac{a^3 + z^3}{aa + zz}$ and its Surd or Irrational Part

$$\frac{a\sqrt{a^4 + 2xz^3 - z^4}}{aa + zz}$$

are the Ordinates of Curves that may either be squared by this Proposition, or compared with the most simple Figures, with whom they admit a Geometrical Comparison.

Corol. 2.

And every Curve whose Ordinate is determined by any affected Equation, which by Cor. 7.

Prop. 9. doth not go into an Equation not affected, is either, if squarable at all, squared by this Proposition, or else is compared with the most simple Figures possible. And by this means is every Curve squared, whose Equation consists of three Terms; for if that Equation be affected, 'tis changed into one not so by Cor. 7. Prop. 9. and then by Cor. 2. and 5. of Prop. 9. passing into a most simple one, either gives the Quadrature of the Figure, if it be squarable, or a most simple Curve, with whom it may be compared.

Corol. 3.

And every Curve whose Ordinate is determined by any affected Equation, which by Cor. 8. of Prop. 9. passes into a Quadratick affected Equation; is either squared by this Prop. and its first Corollary, if quadrable at all, or else is compared with the most simple Figures, and with which it admits a Geometrical Collation.

Scholium.

When Figures are to be squared, it will be too troublesome always to have recourse to these General Rules: wherefore it is better once to square the most simple and useful Figures, and then to keep Tables of such Quadratures, to which to have recourse whenever such a kind of Curve is to be squared. Of this kind are the two following Tables; in which z denotes the *Abscissa*, y the *Rectangular Ordinate*, e the *Area* of the Curve to be squared, and d, e, f, g, h and n represent given Quantities with their Signs $+$ and $-$.

A TABLE of the more Simple Quadrable Curves.

The Forms of the Curves.	The Areas of the Curves.
Form 1.

$$\frac{16ee-8efz^n+6ffz^{2n}}{15nf^3} dR = t.$$

$$\frac{-96e^3+48eefz^n-36effz^{2n}+3ofz^{3n}}{105nf^4} dR = t.$$

A TABLE of those more Simple Curves which may be compared with the Ellipsis and the Hyperbola.

Let a G D or P G D or G D S be a Conick Section whose Area is required to the Quadrature of a Curve proposed, and let its Centre be A, its Axis K a, its Vertex a, its Semi-Conjugate Axis A P, the given beginning of the Abcissa A, or a, the Abcissa A B, or a B, or a B = x, the Rectangular Ordinate B D = v, and the Area A B D P or a B D G or a B D G = s, the Ordinate a G being applied at the Point a. Join K D, A D, a D, and let the Tangent D T be drawn, meeting the

Abcissa A B in T, and then let the Parallelogram A B D O be completed. If then to the Quadrature of the Curve proposed the Areas of two Conick Sections are required; let the Abcissa of the latter be ξ, the Ordinate T, and the Area σ. And let this Character ÷ stand for the difference of two Quantities, when 'tis uncertain which is the greater, and consequently which can be taken from the other.

Form 11:

1. $d\sqrt{\frac{e+fx}{g+bzn}} = y. \sqrt{\frac{e+fx}{g+bzn}} = x. \sqrt{\frac{e+fx}{g+bzn}} = v. \left\{ \begin{array}{l} \sqrt{g+bzn} = x. \sqrt{\frac{eb-fg}{b} + \frac{f}{b}xx} = v. \\ \sqrt{b+gz^{2n}} = x. \sqrt{\frac{eb-fg}{g} + \frac{f}{g}xx} = v. \end{array} \right. \frac{dxv^3-4dfs-4de\sigma}{nfg-nfb} = t.$

2. $d\sqrt{\frac{e+fx}{g+bzn}} = y. \sqrt{\frac{e+fx}{g+bzn}} = x. \sqrt{\frac{e+fx}{g+bzn}} = v. \frac{2d}{nb} = t.$

3. $d\sqrt{\frac{e+fx}{g+bzn}} = y. \sqrt{\frac{e+fx}{g+bzn}} = x. \sqrt{\frac{e+fx}{g+bzn}} = v. \frac{dbxv^3-3dfg}{2nfb} = t.$

In these Tables the Series of the Curves, of any Form, may be continued both ways in infinitum; viz. In the First Table, in the Numerators of the Areas of the 3d. and 4th. Form the Numeral Coefficients of the Initial Terms (2, -4, 16, -96, 868, &c.) are generated by multiplying the Numbers -2, -4, -6, -8, -10, &c. into one another continually; and the Coefficients of the subsequent Terms are divided from the Initial ones, by multiplying them gradually. In the Third Form, by $-\frac{3}{2}, -\frac{5}{4}, -\frac{7}{6}, -\frac{9}{8}, -\frac{11}{10},$ &c. and in the Fourth Form, by $-\frac{1}{2}, -\frac{3}{4}, -\frac{5}{6}, -\frac{7}{8}, -\frac{9}{10},$ &c. and the Coefficients of the Denominators, 3, 15, 105, &c. are produced by multiplying the Numbers, 1, 3, 5, 7, 9, &c. into one another continually.

But in the Second Table, the Series of the Curves of the First, Second, Fifth, Sixth, Ninth and Tenth Form, are found by Division alone; and of the

other Forms remaining, by help of Prop. the Third and Fourth, produced both ways in infinitum.

And as these Series may be varied by changing the Sign of the Number n : So, for instance, the Curve

$$\frac{d}{x} \sqrt{e+fx} = y \text{ becomes } \frac{d}{x^{\frac{1}{n}} + 1} \sqrt{fx}.$$

Prop. 9. Theor. 8.

Let $ADIC$ be any Curve having its Abscissa $AB=x$ and its Ordinate $BD=y$; and let $A E K C$ be another Curve whose Ordinate BE is equal to the Area of the former $A D B$ divided by Unity; and let $A F L C$ be a Third Curve, whose Ordinate BF , is equal to the Area of the Second $A E B$ divided by 1; and let $A G M C$ be a Fourth Curve whose Ordinate BG is equal to the Area $A F B$ of the Third divided by Unity; and let $A H N C$

$AHNC$ be a Fifth Curve whose Ordinate BH is equal to the Area of the Fourth AGB divided by Unity, and so on *in infinitum*. And let $A, B, C, D, E, \&c.$ be the Areas of the Curves whose Ordinates are $y, zy, z^2y, z^3y, z^4y, \&c.$ and whose common Abscissa is z .

Let any Abscissa $AC=t$ be given, and let $BC=t-z=x$, and let $P, Q, R, S, T, \&c.$ be the Areas of Curves having for their Ordinates $y, xy, x^2y, x^3y, x^4y, \&c.$ and their common Abscissa z .

Let all these Areas terminate at the whole given Abscissa AC , and at the Ordinate given in Position and infinitely produced CI : And then shall the first of the Areas thus posited, $ADIC$ be $=A$. The Second $AELC$ be $=A-B=Q$. The Third $AFLC$ be $=\frac{tA-2tB+C}{2}=\frac{1}{2}R$. The Fourth $AGMC$ be $=\frac{t^3A-3t^2B+3tC-D}{6}=\frac{1}{6}S$. The Fifth $AHNC$ be $=\frac{t^4A+4t^3B+6t^2C-4tD+E}{24}=\frac{1}{24}T$.

Corol.

Whence if the Curves, whose Ordinates are $y, zy, z^2y, z^3y, \&c.$ or $y, xy, x^2y, x^3y, \&c.$ are squarable, the Curves $ADIC, AELC, AFLC, AGMC, \&c.$ will also be squared; and the Ordinates BE, BF, BG, BH , will be proportionable to the Areas of the Curves.

Scholium.

That the Fluxions of Flowing Quantities may be considered as First, Second, Third, Fourth Fluxions, &c. hath been said above: And these Fluxions are as the Terms of infinitely converging Series. Thus, suppose z a Flowing Quantity, and that by flowing it become $z+o$, then may it be resolv'd into this Converging Series $z^n + n z^{n-1} o + \frac{n(n-1)}{2} o^2 z^{n-2} + \frac{n^3-3nn+2n}{6} o^3 z^{n-3} + \&c.$ In which Series the first Term z^n is the Flowing Quantity it self; the Second $o z^{n-1}$ shall be the first Increment or the first

Difference, to which considered as just Nascent, the first Fluxion is proportional. The Third Term $\frac{n(n-1)}{2} o^2 z^{n-2}$ will be the Second Increment or Difference to which considered as now Nascent, the Second Fluxion is proportional. The Fourth Term $\frac{n^3-3nn+2n}{6} o^3 z^{n-3}$ shall be the Fluents third Increment or Difference, and to which as Nascent, the Third Fluxion is proportional, &c. and so on infinitely.

These Fluxions may be expounded by $BD, BE, BF, BG, BH, \&c.$ considered as the Ordinates of Curves. As if the Ordinate BE ($=\frac{ADB}{1}$) be a Fluent or flowing Quantity, the first Fluxion will be as the Ordinate BD : If BF be the Fluent ($=\frac{AEB}{1}$) the first Fluxion of it shall be as the Ordinate BE , and the second as the Ordinate BD . If BH ($=\frac{AGB}{1}$) be the Flowing Quantity, its Fluxions, considered as First, Second, Third and Fourth, shall be respectively as the Ordinates BG, BF, BE , and BD . (See the last Figure.)

Hence, in Equations which involve only two unknown Quantities, of which one is a Quantity uniformly flowing, and the other is any Fluxion of another Flowing Quantity. That other Fluent may be found by the Quadrature of Curves: Let its Fluxion be expounded or expressed by BD ; and if this be the first Fluxion, seek the Area ADB $=BE \times 1$: If it be the Second Fluxion, let the Area AEB $=BF \times 1$ be sought; if it be the Third Fluxion, let the Area AFB $=D \times 1$ be sought; and the Area, when found, shall be the Exponent of the Flowing Quantity sought.

And also in Equations which involve a Fluent and its first Fluxion without any other Fluent; or two Fluxions of the same Fluent; suppose the First and Second, the Second and Third, the Third and Fourth, &c. still without any other Fluent, then the Fluents may be found by the Method of the Quadrature of Curves.

Let the Equation be $avv=av+vv$; supposing $v=BE$ and $\dot{v}=BD$, $z=AB$ and $\dot{z}=1$. This Equation, by completing the Dimensions of the Fluxions will become $avv=avz+\dot{v}vz$, $\frac{av\dot{v}}{av+vv}=\dot{z}$.

Suppose then v to flow uniformly, and let its Fluxion be $\dot{v}=1$, then shall $\frac{av}{av+vv}=\dot{z}$; and by squaring the Curve whose Ordinate is $\frac{av}{av+vv}$ and Abscissa v , you will have the Fluent or Flowing Quantity z .

Again, let the Equation be $aa\dot{v}=a\dot{v}+\dot{v}\dot{v}$, and let v be BF , $\dot{v}=BE$, $\ddot{v}=BD$, and $z=AB$:

Then by the Relation between $\ddot{v}$ and $\dot{v}$ or BD and BE , the Relation between AB and BE will be found as in the Example above: after which, by this Relation may the Relation between AB and BF be found, if the Curve AEB be squared.

Such Equations as involve three unknown Quantities may sometimes be reduced to such as involve only two Unknown Quantities; in which Cases the Fluents will be found from the Fluxions,

Corol. 2.

If n be supposed equal to any Term in the following Series, 1, 2, 3, 4, 5, 6, 7, &c. Every Curve whose Ordinate is $\frac{x-n}{\sqrt{dx+xx}}$ will be squared by this Series, and come out in finite Terms.

Corol. 3.

If m be equal to any Term in this Series, 0, 1, 2, 3, 4, 5, 6, 7, &c. Every Curve whose Ordinate is $\frac{x^m}{\sqrt{dx-xx}}$ depends upon the Quadrature of the Circle: But if the Ordinate be $\frac{x^m}{\sqrt{dx+xx}}$, on that of the Hyperbola: And if on the Centre C , with the Diameter $AB=d$, the Circle AEB be described; and AD be made $=x$, and DE erected at Right-angles, and CE drawn: Then will the Se-

ctor AEC divided by $\frac{d}{8}$, be equal to the Area of the Curve whose Ordinate is $\frac{x^m}{\sqrt{dx-xx}}$; after the same Manner if on the Centre C , and the Transverse Axis $AB=d$, an Equilateral Hyperbola be described; as AE : Let $AD=x$ and DE erected Normally, and CE drawn: Then shall the Se-

ctor ACE divided by $\frac{d}{8}$ be equal to the Area of the Curve whose Ordinate is $\frac{x^m}{\sqrt{dx+xx}}$.

Corol. 4.

If m be supposed equal to any Term not included within the former Limits; The Curve whose Ordinate shall be, $\frac{x^m}{\sqrt{dx+xx}}$ can neither be squa-

Vol. II.

red exactly, nor doth it depend on either the Circle or the Hyperbola; but yet is reducible to some more Simple Curve.

Theorem 3.

If A be the Area of a Curve, whose Abscissa is x , and Ordinate $x^m \sqrt{xx-xx}$; Let B be the Area of a Curve, whose Abscissa is the same x , and its Ordinate $x^{m-2n} \sqrt{rr-xx}$; and suppose $\sqrt{rr-xx}=y$. Then shall A be equal to $r^{2n}B$ into $\frac{m-1}{m+2}$ into $\frac{m-3}{m}$ into $\frac{m-5}{m-2}$ into $\frac{m-7}{m-4}$, &c. $=P$.

$$I - \frac{1}{m+2} x^{m-1} y^3 = -Q$$

$$- \frac{rr}{m} \text{ into } \frac{m-1}{m+2} x^{m-3} y^3 = -R$$

$$- \frac{r^4}{m-2} \text{ into } \frac{m-2}{m+2} \text{ into } \frac{m-3}{m} x^{m-5} y^3 = -S, \text{ \&c.}$$

Corol. 1.

If m be equal to any Term of the following Series 1, 3, 5, 7, 9, &c. The Quadrature of the Curve, whose Ordinate is $x^m \sqrt{rr+xx}$ will come out finite, and be expressed by the Theorem,

Corol. 2.

If n be equal to any Term in this Series 2, 3, 4, 5, 6, &c. The Curve whose Ordinate is $x^{2n} \sqrt{rr+xx}$ will be exactly squared by this Theorem.

Corol. 3.

If m be expounded by any Term different from those above mentioned; the Curve whose Ordinate is $x^m \sqrt{rr+xx}$ is neither exactly quadrable, nor dependant on the Circle or Hyperbola; but yet is reducible to a more Simple Form.

Theorem 4.

If A be the Area of a Curve whose Abscissa is x , and its Ordinate $\frac{x^m}{\sqrt{rr-xx}}$; Let B be the Area of another; whose Abscissa x is the same with the former; but its Ordinate $\frac{x^{m-2n}}{\sqrt{rr-xx}}$; Then I say,

$$A = r^{2n} B \text{ into } \frac{m-1}{m} \text{ into } \frac{m-3}{m-2} \text{ into } \frac{m-5}{m-4} \text{ into } \frac{m-7}{m-6}, \text{ \&c.} = P.$$

$$- \frac{1}{m} x^{m-1} y = -Q$$

$$- \frac{rr}{m-2} \text{ into } \frac{m-1}{m} x^{m-3} y = -R$$

$$- \frac{r^4}{m-4} \text{ into } \frac{m-1}{m} \text{ into } \frac{m-3}{m-2} x^{m-5} y = -S$$

$$- \frac{r^6}{m-6} \text{ into } \frac{m-1}{m} \text{ into } \frac{m-3}{m-2} \text{ into } \frac{m-5}{m-4} x^{m-7} y = -T, \text{ \&c.}$$

Y y y

Cor. 1.

Corol. 1.

If m be equal to any Term of this Series 1, 3, 5, 7, 9, &c. the Curve whose Ordinate is $\frac{x^m}{\sqrt{rr+xx}}$ will be found by this Theorem in finite Terms.

Corol. 2.

If n be equal to any Term in the following Series 1, 2, 3, 4, 5, 6, &c. The Curve whose Ordinate is $\frac{x^{2n}}{\sqrt{rr+xx}}$ is exactly quadrable by this Theorem.

Corol. 3.

If m be equal to any Term of this Series 0, 2, 4, 6, 8, 10, &c. The Quadrature of the Curve whose Ordinate is $\frac{x}{\sqrt{rr-xx}}$ depends upon the Quadrature of the Circle: For if from the Cen-

tre C a Circle AEG be described with the Radius $CA=r$; let CD be taken equal to x , and DE erected Normally in D ; join CE . Then will the Sector CAE divided by $\frac{1}{2}rr$, be equal to the

Area of the Curve, whose Ordinate is $\frac{x}{\sqrt{rr-xx}}$

And after the same manner, if to the Centre C , and Semi-Transverse Axis $CA=r$, an Equilateral

Hyperbola be described as EAM ; let FC be drawn at Right-angles to AC , and equal x ; then draw FE parallel to the Axis CA , till it meet the Hyperbola in E , and join EC : I say, the Hyper-

bolick Sector ACE divided by $\frac{rr}{2}$ is equal to the

Area of the Curve whose Ordinate is $\frac{x}{\sqrt{rr+xx}}$

Corol. 4.

If m be expounded by any other Term different from any of the Preceding ones; Then will the Curve whose Ordinate is $\frac{x^m}{\sqrt{rr+xx}}$ be neither exactly squarable, nor dependant on the Circle, or Hyperbola; but yet is reducible to a more Simple Form.

Theorem 5.

Let A be the Area of the Curve whose Abscissa is x , and its Ordinate $\frac{x^m}{d-x}$, and let B be the Area of another Curve, having the same Abscissa x , and whose Ordinate is $\frac{x^{m-n}}{d-x}$; Then shall the Area,

$$A = d_n B - \frac{x^m}{m} - \frac{dx^{m-1}}{m-1} - \frac{ddx^{m-2}}{m-2}, \text{ \&c. And}$$

if the Ordinate be $\frac{x^m}{d+x}$; Then the Area,

$$A = \frac{x^m}{m} - \frac{dx^{m-1}}{m-1} + \frac{ddx^{m-2}}{m-2}, \text{ \&c. } \mp d^n B.$$

Corollary.

If m be equal to any Term in the following Series 0, 1, 2, 3, 4, 5, 6, &c. The Quadrature of the Curve, whose Ordinate is $\frac{x^m}{d+x}$, depends upon the Quadrature of the Hyperbola.

For drawing DE , EF at Right-angles, let EG be taken equal to d ; and let GH be drawn Normal and Equal to EF . Then between the Asymptotes DE , EF , let an Hyperbola be described passing thro' H ; and taking $GK=x$, towards E in the first Case, and towards F in the latter, let the Ordinate KL be drawn: Then shall the Area $HGKL$ divided by dd be equal to the Area of the Curve, whose Ordinate is $\frac{x^0}{d+x}$. And from hence, supposing the Quadrature of the Hyperbola, will the Solid, generated by the Revolution of the Portion of a Cissoïd round the Diameter of the Generating Circle, be given in Finite Terms.

Theor. 6.

as above. Let there be this Equation $a - bx^m = cxy^n + dy_{2n} + y$. Suppose $y = v$, and it will stand $a - bx^m = cv + dv$. This Equation, by squaring the Curve whose Abscissa is x and Ordinate v , gives the Area v ; and the other Equation $y = v$, by working backward to the Fluents, will give $\frac{1}{n+1} y^{n+1} = v$: whence the Fluent y is found, and from hence, and even in such Equations as involve Three unknown Quantities and which cannot be reduced to others which involve but two, the Fluents may sometimes be found by the Quadrature of Curves.

Let there be this Equation $ax^m + bx^n = rex^{r-1}y + sexxy^{s-1} - fyy^t$: and let $x = 1$. Then will the latter part $rex^{r-1}y + sexxy^{s-1} - fyy^t$ by finding the Fluents in the Inverse Method, will become $ex^ry = \frac{f}{r+1} y^{r+1}$; which therefore is as the Area of a Curve whose Abscissa is x and its Ordinate $ax^m + bx^n$; and from thence the Fluent y will be given.

Let there be an Equation, $x \times ax^m + bx^n = \frac{dy^{n+1}}{\sqrt{e+fn}}$, then the Fluent, whose Fluxion is $x \times \frac{dy^{n+1}}{\sqrt{e+fn}}$ shall be as the Area of a Curve whose Abscissa is x and its Ordinate $ax^m + bx^n$; Also the Fluent, whose Fluxion is $\frac{dy^{n+1}}{\sqrt{e+fn}}$ shall be as the Area of a Curve whose Abscissa is y , and its Ordinate $\frac{dy^{n+1}}{\sqrt{e+fn}}$; that is (in Case 1. by Form 4. in Table 1.) as the Area $\frac{2d}{nf} \sqrt{e+fn}$. Let therefore $\frac{2d}{nf} \sqrt{e+fn}$ be equal to the Area of a Curve whose Abscissa is x and Ordinate $ax^m + bx^n$, and you will have the Fluent y .

And observe, that every Fluent which is collected from the First Fluxion may be increased or diminished by any Quantity that is not a Fluent: That which arises from a Second Fluxion may be augmented or lessened by any Quantity that hath no Second Fluxion: That which arises from a Third Fluxion may be increased or diminished by any Quantity having no Third Fluxion; and so on infinitely.

After the Fluents are obtained from the Fluxions, if there be any doubt about the Truth of the Conclusion, the Fluxions of the Fluents found, may be again gained, and compared with the Fluxions at first proposed; for if they then come out equal to those, you may suppose the Conclusion right; but if they are not thus equal, the Fluents must be corrected till they come out so. For both the Fluent may be assumed at pleasure, and that assumption may be corrected by putting the Fluxion of the Fluent so assumed equal to the Fluxion proposed, and then comparing the Homologous Terms among themselves.

In *Phil. Trans.* 252. p. 708. You have a Method for the Quadrature of Figures, Geometrically irrational; by Mr. J. Craig.

See also, the same Author's *Methodus Figurarum Lineis rectis & Curvis comprehensarum Quadraturas* Vol. II.

determinandi. Lond. 1685, 4°. And his Additions to it, in *Philos. Trans.* N. 235.

See also his *Tractatus Mathematicus de Figurarum Curvilinearum Quadraturis & Locis Geometricis*. Lond. 1693, 4°.

Vera Circuli & Hyperbolæ Quadratura in propria sua Proportionis specie inventa & demonstrata, per Jac. Gregory, Patavii, 4°.

Le Grand & Fameux Probleme de la Quadrature du Cercle resolu Geometriquement par le Cercle & la Ligne Droite. per M. Mallement de Messange. Paris, 1686. 12mo. See *Phil. Trans.* N. 185. where this Book is refuted by Cluverius, M. D. R. S. S.

De Quadratura Circuli, &c. per T. Hobbs. This Book Dr. Wallis hath twice refuted.

In *Philos. Collect.* N. 7. you have Mr. Leibnitz's Method for the Quadrature of the Circle.

In *Philos. Trans.* N. 196. you will find Dr. Wallis's Quadrature of the Testudo veliformis. And in N. 207. the same thing is solved by Dr. Gregory. Mr. Caswell *Astr. Profess.* of Oxford also in *Philos. Trans.* N. 217. gives a Quadrature of a Portion of the Epicycloid; and after this, in the next *Transactio*. Mr. Halley, Savilian Professor of Geometry in Oxon, advances a general Proposition for measuring all Cycloids and Epicycloids; which is this, That the Area of any Cycloid or Epicycloid, whether Primary, Contracted or Prolate, is to the Area of the generating Circle, and the Areas of the Parts generated in the formation of those Curves, are to the Areas of the Segment of that generating Circle; as the Summ of the double Velocity of the Centre, and of the Velocity of the Motus Circularis, is to the Velocity of that Motus Circularis.

In *Philos. Trans.* N. 245. Mr. Craig gives us the Quadrature of the Logarithmick Curve.

In the *Memoires de L'Academie des Sciences*, there is (in the Year 1699) a Quadrature of the Infinity of Segments, Sectors and other Spaces in the Vulgar Cycloid by Mr. Bernoulli, Professor of Math. at Groningen.

In the *Act. Erud. Lipsie* for Octob. 1683, you have a Method by Mr. Tschirnhause, of determining either the Quadrature of any Geometrical Figures, or the Impossibility of the same. And in May, 1684, he published in the same *Acta* another Paper concerning the Quadrature of Curvilinear Figures.

In *Phil. Trans.* N. 284, there is a Specimen of a general Method for determining the Quadratures of Figures, by Mr. J. Craig.

And in N. 278. one of Mr. de Moivre for the squaring of some kinds of Curves, or reducing them to more simple ones. Thus, Let A be the Area of a Curve whose Abscissa is x , and its Ordinate Ap-
plicate $x^m \sqrt{dx - xx}$. Let B be the Area of a Curve whose Abscissa is the same as that of the former, but its Ordinate $x^{m-n} \sqrt{dx - xx}$; Let $\sqrt{dx - xx} = y$, then shall A be $= d^n B$ into $\frac{2m+1}{2m+4}$

into $\frac{2m-1}{2m+2}$ into $\frac{2m-3}{2m}$ into $\frac{2m-5}{2m-2}$ into, &c. $= P$.
 $-\frac{1}{m+2} x^{m-1} y^3 = -Q \left[\frac{d}{m+1} \text{ into } \frac{2m+1}{2m+4} x^{m-2} y^3 = \right.$
 $\left. -R \right] - \frac{dd}{m} \text{ into } \frac{2m+1}{2m+4} \text{ into } \frac{2m-1}{2m+2} x^{m-3} y^3 = -S$.
 $\left[-\frac{d^3}{m-1} \text{ into } \frac{2m+1}{2m+4} \times \frac{2m-1}{2m+2} \times \frac{2m-3}{2m} x^{m-4} y^3 = -T, \&c. \right]$

3 Y 2

Where

Where observe,

1. That n is supposed to be an Integer and Affirmative Number.

2. That the Quantity $d^n B$ in the Series design'd by P is to be multiplied into as many of the Terms as there are Unites in n .

3. That so many following Series design'd by $-Q, -R, -S, -T, \&c.$ may be taken as there are Unites in n .

Which to illustrate by an Example or two.

If $n=1$, then I say $A=d^n B$ into $\frac{2m+1}{2m+4} \frac{1}{m+2}$

$x^{m-1}y^3$. And if $n=2$, then $A=d^n B$ into $\frac{2m+1}{2m+4}$

into $\frac{2m-2}{2m+2} - \frac{1}{m+2} x^{m-1}y^3 - \frac{d}{m+1}$ into $\frac{2m-1}{2m+4}$ into $x^{m-2}y^3$.

4. If y be equal to $\sqrt{dx-xx}$; Then A will be $=Q-R+S-T, \&c. + P$.

Corol. 1.

If m be put equal to any Term in the following Series $-\frac{1}{2}, \frac{1}{2}, \frac{3}{2}, \frac{5}{2}, \frac{7}{2}, \frac{9}{2}, \&c.$ The Quadrature of the Curve, whose Ordinate is $x^m \sqrt{dx-xx}$, or $x^m \sqrt{dx+xx}$, comes out finite and is exhibited by our Series; which that we may shew by an Example: Let the Area of the Curve, whose Ordinate is $x-\frac{1}{2}\sqrt{dx-xx}$ be to be investigated: Imagine this Curve to be compared with another, whose Ordinate is $x-\frac{1}{2}\sqrt{dx-xx}$. Because in this Case $n=1$. Therefore

$$A=d^n B \text{ into } \frac{2m+1}{2m+4} + \frac{1}{m+2} x^{m-1}y^3: \text{ But } m=-\frac{1}{2}: \text{ wherefore } 2m+1=0; \text{ and therefore } A=-\frac{1}{m+2} x^{m-1}y^3=-\frac{2y^3}{3\sqrt{xxx}}.$$

Here it is observable that the Area, thus found, sometimes falls short of, and sometimes exceeds the true Area, by a given Quantity: And to know such Defect or Excess, the Area thus found is to be supposed increased or diminished by a given Quantity as q ; and then supposing $x=0$, let the Area so increased or diminished, be supposed equal to Nothing; and so in the present Case q will be found equal to $\frac{2}{3}d\sqrt{d}$: And therefore,

$$A=\frac{2}{3}d\sqrt{d} \frac{2y^3}{3\sqrt{x^3}}.$$

Corol. 2.

If n be supposed equal to any Term in the following Series, 3, 4, 6, 7, $\&c.$ The Quadrature of the Curve, whose Ordinate is $x^n \sqrt{dx-xx}$; or $x^n \sqrt{dx+xx}$, becomes finite; and will be exhibited by our Series. Thus for instance; let the Area of a Curve, whose Ordin. is $x^3 \sqrt{dx-xx}$, be sought.

Imagine it to be compared with the Area of a Circle, which call A . Then shall $m=0, n=3$; and consequently $A=P-Q-R-S$: But since the Quantity $2m$, in the Denominator of the third Term, by which $d^n B$ is multiplied, is infinitely small, or rather nothing; the Quantity designed by P , will be infinite; and for the same reason, the Quantity expressed by $-S$, is infinite

also; and therefore the Quantities $A, -Q, -R$, will vanish: Wherefore $P=S$; and the Equation

divided by $\frac{2m+1}{2m+4}$ into $\frac{2m-1}{2m+2}$ becomes $d^n B$ in-

to $\frac{2m-2}{2m} = \frac{dd}{m} x^{m-3}y^3$: or $d B$ into $\frac{2m-3}{2}$

$= d d x^{m-3}y^3$; and putting 0 and 3, instead of m and n ; it will come out thus, $d B$ into $-\frac{3}{2} =$

$\frac{y^3}{x^3}$, or $B=\frac{2y^3}{3x^3}$.

Corol. 3.

If m be supposed equal to any Term of the following Series $-2, -1, 0, 1, 2, 3, 4, 5, \&c.$ The Quadrature of the Curve whose Ordinate is $x^m \sqrt{dx-xx}$ depends upon the Quadrature of the Circle: But the Area of the Curve whose Ordinate is $x^m \sqrt{dx+xx}$ depends upon the Quadrature of the Hyperbola; and the Relation of that Curve to either the Circle, or Hyperbola will be exhibited in the Series, and in Finite Terms.

Corol. 4.

If m be explained by any other Term different from those above mentioned: Then the Curve whose Ordinate is $x^m \sqrt{dx+xx}$, can neither be exactly squared, nor doth it depend on either the Circle or the Hyperbola: But yet it may be reduced to a more Simple Curve by our Series.

Theorem 2.

Let A be the Area of a Curve whose Abscissa is x , and ordinate $\frac{x^m}{\sqrt{dx-xx}}$. And let B be the

Area of a Curve whose Abscissa is also x ; but its Ordinate is $\frac{x^{m-n}}{\sqrt{dx-xx}}$. Let $\sqrt{dx-xx}=y$:

Then shall $A=d^n B$ into $\frac{2m-1}{2m}$ into $\frac{2m-3}{2m-2}$

into $\frac{2m-5}{2m-4}$ into $\frac{2m-7}{2m-6}, \&c. = P. \left[-\frac{1}{m} x^{m-1}y = -Q \right.$

$\frac{d}{m-1}$ into $\frac{2m-1}{2m} x^{m-2}y = -R$

$-\frac{dd}{m-1}$ into $\frac{2m-1}{2m}$ into $\frac{2m-3}{2m-2} x^{m-3}y = -S$.

$-\frac{ddd}{m-3}$ into $\frac{2m-1}{2m}$ into $\frac{2m-3}{2m-2}$ into $\frac{2m-5}{2m-4}$

$x^{m-4}y = T$.

N. B. The Observations made above on Theorem 1. will be of Use here also.

Corol. 1.

If m be supposed equal to any Term in this Series $\frac{1}{2}, \frac{3}{2}, \frac{5}{2}, \frac{7}{2}, \frac{9}{2}, \&c.$ Then the Quadrature of

the Curve whose Ordinate is $\frac{x^m}{\sqrt{dx+xx}}$ will be

finite, and will be exhibited by this Series.

Corol. 2.

rel, &c. (7) *Mus Domesticus*, Major & Minor: The common Rat and Mouse; *Mus major Aquaticus*, the Water-Rat; the Musk Rat. *Mus Avellanarum* Major & Minor. The Dormouse or Sleeper, *Mus Noricus*, *Cricetus*, *Alpinus* seu *Marmotta*. (7) The *Cavia Cobaya*, or *Cuniculus Americanus*; the Guinea Pig: The *Agati* and *Paca* of Brasile: The *Mus Norwegicus* or Leming: The *Glis Gesneri* or the Rill: The *Mus Indicus*, &c.

To these several Kinds of Quadrupeds the following Anomalous ones must also be added;

1. Such Four-footed Viviparous Animals as have a longish Snout, with their Feet divided into many Claws or Toes, and having Teeth; as (1) the *Echinus Terrestris*, or common Urchin or Hedge-hog. (2) The *Erinaceus Indicus albus*. Car. Mus. Leyden. (3) The Tatu or Armadillo prima of Marcgrave. (4) The Tatuete of Brasile; or the second Species of the Armadillo, according to Marcgrave. (5) Tatu Apra; his third Species of the Armadillo. (6) Tatu Mustelinus, Soc. Reg. Mus. The Weasel headed Armadillo. (7) *Talpa*, the Mole, Want, or Mold-warp. (8) The *Mus Araneus*, Shrew, hardy Shrew, Shrew mouse.

2. Quadrupedous and Viviparous Animals with a longish Snout, having their Feet divided into many Claws or Toes, but without Teeth, are these:

(1.) The *Tamandua guacu* of Brasile, Marcgr. *Ursus Formicarius Cardani*; the great Ant Bear. (2) The *Tamanduais* of Brasile, or Marcgrave's lesser Ant-Bear.

3. Anomalous Flying Quadrupeds with a shorter Snout, with their Feet divided as above, and are the Bat-kind or Flitter-mice: Of which there are several Sizes, and different Forms.

4. There is one very odd anomalous Animal, which hath but 3 Claws on each Foot; and that is the *Aff*, or *Ignavus* of Marcgrave; the Sloth or Sluggard.

5. Viviparous and Sanguineous Quadrupeds breathing with Lungs, but having only one Ventricle in their Heart, are These. (1) *Rana aquatica*, the Frog, or Frosh. *Rana Arborea* seu *Ranunculus Viridis*, the small Tree or green Frog. (2) *Bufo*, five *Rubeta*, the Toad. (3) *Testudo*, the Tortoise, Gr. *χελών*; of these there are Land and Water ones; and many different Species in Foreign Parts.

6. Oviparous Quadrupeds with a long Tail, stretcht out horizontally; are the Lizard Kind: As (1) *Lacertus omnium Maximus*; The Crocodile. (2) *Cordylus*, five *Caudiverbera*, *Uromastix Græcis*, larger than the green Lizard. (3) *Tapaxin* *Novæ Hispaniæ*. The *Lacertus Orbicularis* of Hernandez, Ch. 9. c. 16. *Lacertus Vulgaris*, the common Eft, Swift, or Newt. (4) *Lacertus Viridis*, the green Lizard. (5) *Lacertus Fucetanus* Aldrovand; at Rome and Naples called Tarantola. (6) *Lacertus Indicus*; called Senembi, and Inguana. (7) *Lacertus Brasiliensis*, called Tejuguacu and Temapara, by Marcgrave. (8) The Taraguira, Ameira, Taraguico Aycuraba, Americima, Curapopepa, Teiunham, &c. of Marcgrave; the *Lacertus Indicus*, &c. (9) *Scincus*, seu *Crocodilus Terrestris*. (10) *Seps*, five *Lacerta Chocidica*, a Kind of footed Serpent. (11) *Stellio*, the Swift or Spotted Lizard. (12) *Salamandra Terrestris*, *Salamandra Aquatica*, the Water-Eft. (13) *Lacerta volans Indica*. (14) *Chamaeleo*, the Chameleon.

QUÆRENS non invenit Plegium, in the Law, is a Return made by the Sheriff on a Writ dire-

cted to him, with this condition intert. *Si A fecerit B Secutum de Clamore*, &c.

QUÆSTA, was the Term for an Indulgence or Remission of Penance, exposed to Sale by the Popes; who by this notorious Cheat got great Summs: The Retailers of these Indulgences, were called *Quæstuarii*, and I believe *Quæstionarii*, vid. Matt. West. in Anno, 1279.

QUANTITAS Acceleratrix of any Vis or Force, is the Measure of the Velocity generated in a given Time, by that Force.

QUANTITY of Motion: Sir Is. Newton in his Principia, shews that this, which is found by taking the Summ of Motions tending the same Way, on their Difference, if they tend towards contrary Parts; is not at all changed by the Action of Bodies on one another.

For Action and Reaction are always equal and contrary, by his Third Law of Nature: And therefore by the Second Law, must make Equal Mutations in Motions towards contrary Parts.

If therefore the Motions tend the same Way, whatever is added to the proceeding Body, or that struck forward, is subducted from the following Body; so that the Summ of the Motions will be the same as before. If the Bodies meet, there will be an Equal Subduction of the Motion of either: And therefore the Difference of the Motions made towards the contrary Parts, will remain the same.

As suppose a Spherical Body A, to be thrice as great as the Spherical one B; and let A have Two Degrees of Velocity any way, and let B follow it in the same right Line with Ten Degrees of Velocity: So that the Motion of A, to that of B, will be as Six (3×2) to Ten. Wherefore the Summ of the Motions of both of them will be $6 + 10$, or sixteen Parts. Now after B hath overtaken A, and struck against it, if A gain by the Stroke any Degree of Motion, as suppose 3, 4 or 5 Parts; B must lose as much: And therefore after the Concourse, A will move on accordingly with 9, 10, or 11; and B will follow with 7, 6, or 5 Parts: So that the Summ of the Motions of both, will be still 16 as at first before the Concourse, or Shock.

But if the Body A be supposed to gain by the Stroke 9, 10, 11, or 12 Parts of Motion; and therefore to move forward with 15, 16, 17, or 18 Parts, after the Concourse: Then will the Body B, by losing just so many Degrees as A gains, either move forward, with one Part, having lost 9; or will be perfectly at rest, losing all its 10 Degrees of Velocity; or lastly will move backwards with one or two Parts of Motion: So much being deducted out of the 11, or 12 Parts of the Progressive Motion, or forwards. And thus the Summs of the Motions the same Way forward; as $15 + 1$, or $16 + 0$. And the Differences of the Motions contrary Ways; as $17 - 1$, or $18 - 2$; will always be the same, viz. = 16 Parts, as before Concourse and Reflexion. And the Motions with which Bodies go on after Reflection being known, the Velocity of Each may be found; by supposing That to be to the Velocity before the Reflection :: as the Motion afterwards to the Motion before. Thus in the last Case, where the Body A had six Parts of Motion before the Reflection, and 18 afterwards; and the Velocity of two Parts before the Reflection: Its Velocity after the Reflexion will be found to be Six; by saying, as the Motion of six Parts before the Reflection, to That of

of 18 afterwards : So is the Velocity of two Parts before, to that of Six afterwards.

QUARREL, in the Law is *Quarela*, à *querendo*: And it extends not only to Actions personal, but also to *mixt*; and the Plaintiff is then called *Querens*: And in most of the Writs it is said, *Queritur*: So that if a Man release all Quarrels, (ones Deed being taken most strongly against ones self) it is as beneficial as all *Actions*; for by it all Actions Personal and Real are released. *Cowell's Interp.*

QUARENTINE, is a Benefit allowed by the Law of England, to the Widow of one dying seized of Land; and whereby She may challenge to stay in his Capital Messuage, or Chief Mansion-House (so it be not a Castle) for 40 Days after his Decease; and if She be molested by the Heir at Law, or any other; She may claim a Writ *De Quarentina habenda*.

QUARENTINE also signifies a Furlong, from the French *Quarente*, Forty: Because 'tis a Quantity of Land containing 40 Perches. 'Tis used also for that Space of forty Days, wherein any Person coming from Foreign Parts, and infected with the Plague, is not permitted to Land, or come on Shore, till that Term is expired.

QUARTER-Sessions, is a Court held by the Justices of Peace in every County, once in every Quarter of the Year. How far the Jurisdiction thereof extends: See *Lamb. Eirin. Lib. 4.* and *Smith de Republ. Anglic. Lib. 2. c. 19.* The Holding these Sessions was first Ordained by the Statute of 25 Ed. III. Statut. 1. c. 18.

QUARTER-Wheeling, in the Military Art, is turning the Front of a Body of Men round where the Flank was. If it be done to the *Right*, the Man in the Right-angle keeps his Ground, and faces about while the Rest wheel.

QUARTER-Wind, at Sea, is such a Wind as comes in abaft the Main-mast Shrouds, even with the Quarter of the Ship.

QUARTERS, (in Architecture) are those slight upright Pieces of Timber which are placed between the Punchions and Posts, they are used to *Lath* upon.

QUASI-Mode Sunday, is that called *Low Sunday*, or the Next after *Easter*; so called from the first Words of the *Introit*, or Hymn, for Mass on that Day; it occurs often in the Date of Old Records — *Charta Gilberti Prioris de Eynsham Priori de Sherburn dat. Postridie Festi Quasi-Mode Geniti*: And this Solemn Time is in some Old Deeds expressed only thus, *Q. M. G.* by the Initial Letters of the Words, *Quasi Mode Geniti*.

QUEEN-Gold, *Aurum Reginae*, is a Royal Revenue belonging to every Queen of England, during her Marriage to the King, both by Law, Custom and Prescription; and payable by divers Persons in England and Ireland (on divers Grants from the Crown) by way of Fine or Oblation, amounting to Ten Marks or upwards, *viz.* one full Tenth-part above the Entire Fine; as Ten Pounds on every Hundred Pound Fine, on Pardons, Contracts and Agreements: This becomes a Real Debt to the Queen Consort, by the Name of *Aurum Reginae*.

QUICK-Silver: The Way and Manner how this strangely Fluid Mineral is gained; you have a good

Account of by Dr. Pope in *Phil. Transf. N. 2.* Thus: It is found in the Mines of *Friuli*, a Territory belonging to the *Venetians*, about a Days Journey and a half from *Gorizia* Northwards; and at a Place called *Idria*, situated on a Valley of the *Julian Alps*. They have been for 160 Years subject to the Emperour, and all the People speak *Slavonian*. In going thither we travell'd several Hours thro' some of the finest Woods I ever saw; full of Firs, Oaks, and Beeches of an Extraordinary Thickness, Straitness and Height. The Town, like others in the *Alps*, is built all of Wood but the Church; and one House, in which the Over-seer of these Mines lived. The Valley and the Mountains too, out of which the Mercury was dug, were of a pleasant Verdure, which they attributed to the Moisture of the Mercury. The best and greatest of their Mines, we went into, is dedicated to *St. Barbara*; as the other Mines are to other Saints.

At the Beginning of the Entrance, the Way was not difficult, nor the Descent great; but in many Places you cannot stand upright; this way of going down holds not long, before you descend by Perpendicular Ladders, all the way down; and the Bottom, where there are several Lanes cut out in the Mountains, is lined and propt with several great Pieces of Fir-Trees as thick as they can be set: They dig the Mineral with Pick Axes, following the Veins: 'Tis for the most part hard as a Stone, but more weighty; of a Liver-Colour, or that of *Crocus Metallorum*. There is also some soft Earth in which you plainly see the Mercury in little Particles. Besides this, there are often found in the Mines round Stones like Flints, of several Bignesses; very like those Balls of Hair, which I have seen in *England* taken out of the Stomachs of Oxen. There are also several Marchasites, and Stones, which seem to have Specks of Gold in them; but on trial they say, they can find none. Some of these Stones are very ponderous, and well impregnated with Mercury: But others are light having little or none in them.

The manner of getting the Mercury is this: They take of the *Earth*, brought up in Buckets, and put it into a *Sieve*, whose bottom is made of *Wires* at so great a Distance, that you may put your Finger between them; 'tis carried to a stream of Running Water, and washed as long as any thing will pass through the *Sieve*. That *Earth* which passeth not, is laid aside upon an Heap; that which passeth, is reserved in a *Hole*, and is taken up again, and put into a *second Sieve*; and so on to about 10 or 12 *Sieves* proportionably less. It often happens in the *First Hole*, that there is Mercury at the bottom; but towards the farther End, where the Intervals of the *Wire* are less, it's found in very great Proportion. The Waste Water is so much impregnated with Mercury, that it cureth *Itches* and other *sordid Ulcers*. The *Earth* laid aside, is Pounded, and the same Operation repeated. The fine small *Earth*, that remains after this, and out of which they can wash no more Mercury, is put into *Iron Retorts*, and the Fire forces the Mercury into the *Receivers*: The Officer unluted several of them; and I observed in all that he first poured out Perfect Mercury, and after that came a Black Dust, which being Wetted with Water, discovered it self to be Mercury, as the other was. They take the *Caput Mortuum* and Pound it, and Renew the Operation. There are 16 Furnaces for this

Theorem 6.

Let A be the Area of the Curve whose Abscissa is x , and Ordinate $\frac{x^m}{rr+xx}$; Let B be the Area of another Curve whose Abscissa is the same x : Let its Ordin. be $\frac{x^{m+2n}}{rr+xx}$. I say its Area $A = \frac{x^{m+1}}{m-1} - \frac{rrx^{m-3}}{m-3} + \frac{r^2x^{m-5}}{m-5}$, &c. $\mp r^2 B$.

Corollary.

If m be equal to any Term in this Series 0, 2, 4, 6, 8, &c. The Quadrature of the Curve, whose Ordinate is $\frac{x^m}{rr+xx}$ depends upon the Rectification of the Circular Arch. For if with the Radius

$CA = r$, and on the Centre C , the Circle AEG be described: Let the Tangent CK be erected equal to x , and join CK meeting the Periphery in E . Then I say that AE divided by rr , shall be equal to the Area of the Curve whose Ordinate is $\frac{x^m}{rr+xx}$.

A General Corollary to all the 6 Theorems.

Every Mechanick Curve whose Quadrature depends on any of the infinitely many Curves, whose Ordinates put on any of the following Forms, viz.

$$\frac{x^m}{rr+xx}, \frac{x^m}{\sqrt{dx+xx}}, \frac{x^m}{\sqrt{dx-xx}}, \frac{x^m}{\sqrt{rr+xx}},$$

may be squared by $\sqrt{rr+xx}$; $\sqrt{dx+xx}$; $\sqrt{dx-xx}$; this Series; as will sufficiently appear from this one Example.

Suppose the Cube of the Circular Arch corresponding to any Versed-line be made the Ordinate of the Curve, whose Abscissa shall be that very Versed-line: The Area of the Curve is required to be investigated.

Let the Abscissa be x , the circular Arch v ; the Fluxion of the Area is $v^3 \dot{x}$; Let the Area be $v^3 x - q$. Then $v^3 \dot{x} + 3v^2 \dot{v} x - \dot{q} = v^3 \dot{x}$; where

fore $\dot{q} = 3v^2 \dot{v} x$: But $\dot{v} = \frac{dx}{2\sqrt{dx-xx}}$; there

fore $\dot{q} = \frac{3dv^2xx}{2\sqrt{dx-xx}}$: but by Theorem 2. $\frac{x}{\sqrt{dx-xx}}$

$$= \frac{dx}{2\sqrt{dx-xx}} - \dot{y} = \dot{v} - \dot{y}: \text{ and therefore } \dot{q} =$$

$$\frac{3}{2} dv^2 \dot{v} - \frac{3}{2} dv^2 \dot{y}; \text{ and therefore } q = \frac{1}{2} dv^3 -$$

$$\frac{3}{2} dv^2 \dot{y}: \text{ Where we can find the Fluent, whose}$$

$$\text{Fluxion is } \frac{3}{2} dv^2 \dot{y}. \text{ Let this Quantity be } \frac{3}{2} dv^2 \dot{y}$$

$$- r. \text{ Then } \frac{3}{2} dv^2 \dot{y} + 3dv\dot{v}y - \dot{r} = \frac{3}{2} dv^2 \dot{y}.$$

$$\text{And therefore } \dot{r} = 3dv\dot{v}y = \frac{3}{2} d dvx. \text{ Let } r$$

$$= \frac{3}{2} d dvx - s. \text{ Then } \frac{3}{2} d dvx = \frac{3}{2} d dvx$$

$$+ \frac{3}{2} d dx \dot{v} - \dot{s}; \text{ and consequ. } \dot{s} = \frac{3}{2} d dx \dot{v}$$

$$= \frac{3d^2xx}{4\sqrt{dx-xx}} = \frac{3}{4} d^2 \dot{v} - \frac{3}{4} d^2 \dot{y}; \text{ by Theor. 2.}$$

$$\text{wherefore } s = \frac{3}{4} d^2 v - \frac{3}{4} d^2 y; \text{ and therefore the}$$

$$\text{Area sought is } v^3 x - \frac{1}{2} dv^3 + \frac{3}{2} dv^2 y - \frac{3}{2} d dvx$$

$$+ \frac{3}{4} d^2 v - \frac{3}{4} d^2 y.$$

And because of Solids generated by the Rotation of Curves, the Surface is generated the same way; the Longitude of Curves, and all their Centres of Gravity, do depend on the Quadratures of Curves: These will easily be computed if they depend on the aforeaid Curves.

QUADRUPEDS, are perfect hairy Viviparous Animals, having but four Feet. And these Animals according to Mr. Ray in his *Synopsis Animalium* are thus divided.

Into such as are Hoofed (*Ungulata*;) or Clawed, or Digitate (*Unguiculata*.)

(1.) The Hoofed Animals with four Feet, are either Whole Hoofed; *Solidipeda*, *Μονόχλαα*, *Μόρυχα*, *Solidungula*: As, The Horse, Ass, the Onager, or Wild Ass: The Mule and the Zebra of Africa, or the fine striped Indian or African Ass, almost like a Mule in Form and Stature.

Of this Whole Hoofed Kind, Aristotle has observed; that no one hath two Horns, (he might have said any) no one hath the Talus or Astragalus; nor have the Males any appearance of Breasts.

(2.) Cloven-footed; and that either into Two Divisions only: As the *Δίχλαα* or Bifurcate Kind, which are again subdivided into such as are

1. Ruminant, *Μρυγάζοντα*, i. e. Such as Chew the Cud; and these either have hollow and perpetual Horns as the Ox, Sheep, and Goat Kind: Or Deciduous, as the Hart and Deer Kind; which usually shed their Horns annually. (See Ruminant in this Vol.)

Of the Bull Kind, they reckoned these: The common Bos; of which the Male is *Taurus*, the Female *Vacca*: (2) The German *Urus*, *Urechs* or *Aurochs*, (3) The Bison, (4) The Bonafus, (5) The Bubalus, or Buffalo, (6) The Bos Africanus of Bellonius; Obs. l. 2. c. 50. which he takes to be the Bubalus of the Ancients.

Of the Sheep Kind; besides the common Sort; they reckon, (2) The Arabian *Ovis Laticauda*, whose Tails sometimes are of 30l. Weight: (3) The *Ovis Strepsiceros Cretica Bellonii*: (4) The *Ovis Africana*, with short Hairs instead of Wool. (5) The *Ovis Guineensis*, or *Angolensis* of Margrave, (Hist. Brasil. l. 6. c. 10.)

Of the Goat Kind, are besides the common *Capra domestica*; (2) The Ibex, or German Steinbock; found in the Tops of the Alps: (3) The *Rupicapra*, French Chamois, German Goms. (4) The *Gazella Africana*, or Antelope. (5) The *Gazella Indica*. (6) The *Gazella*

Gazella Africana. (7) The *Capra Sylvestris Africana* *Grimmii*. (8) The *Capra Mambrina* or *Syriaca* of *Gesner*. (9) The *Buselaphus* or *Moschelaphus Cail*, in *Gesner*. (10) The *Tragelaphus Cail*, in *Gesner*. (11) The *Tragelaphus Bellonii*.

Of the *Hart* or *Deer Kind*: As, (1) The *Cervus*, *Ελαφς*, the *Red Deer*. (2) The *Cervus Platyceros* or *Palmatus*; the *Fallow Deer*. (3) *Alce* or the *Elk*. (4) *Rangifer*, the *Rain Deer*. (5) The *Axis Plinii*, according to *Bellonius*. (6) The *Caprea Plinii*. (7) The *Cuguacu-etc* and *Cuguacu-xapara* of *Marcgrave*. (8) The *Caprea Groenlandica*.

2. Of the *Cloven-footed Animals* into Two Parts only, and which do not chew the *Cud*: There is only the *Hog* and *Swine Kind*; and under this *Head*, besides the common *Swine*; they reckon, (2) The *Wild Boar* or *Swine*. (3) The *Porcus Guineensis* *Marcgravi*. (4) The *Porcus Indicus*, called *Babyroussa*. (5) The *Tajaca* or *Aper Mexicanus* *Moschiferus* of *Dr. Tyson*, called by *Marcgrave* *Tajaca Cunigoara*; by others *Quaubela Coymalt* and *Quapi-zotl*; and by *Acosta* and some others, *Zaino*. See a most accurate Description of this Animal, in *Philos. Trans. N. 153*.

3. There are some *Four-footed Animals* whose *Hoof* is cloven into *Four Divisions*; and these seem to be not *Ruminant*s As the *Rhinoceros*, the *Hippopotamus*, the *Tapijerete* of *Brasile*, the *Capy-Bara* of *Brasile*, the *Animal Moschiferum*.

II. *Clawed* or *Digitate* (*Unguiculata*) *Four-footed Animals*. Of this kind there is one Sort whose *Claws* are not divided or separated, but adhering one to another, covered with one common *Skin*, but with obtuse *Nails* sticking out round the *Margin* of the *Foot*; as the *Elephant*, which is *anomalous*, and not clearly referrable to this Kind, or that of *Cloven footed Quadrupeds*.

(2) There is another Species of this *Digitate Kind* of *Quadrupeds*, which hath only two *Claws*, as that of *Camels*; and tho' these have no *Horns*, they do both *Ruminate*; and have also the four *Stomachs* of *Horned Ruminant Animals*.

Of the *Camel*, or *Dromedary*, there are two Sorts; one having but one *Bunch* on the *Back*, the other two. To this Kind belongs the *Peruvian Glama*, which some have reckoned among the *Sheep-kind*. As also the *Pacos*, the *Ovis Indica* or *Peruviana* *vulgo*, much less than the *Glama*.

3. A third Species of this *Unguiculate Kind* of *Quadrupeds* includes such Animals as the *Greeks* called, *Πλασινύχια*, and *Ἀνθρωπομορφα*; which have the *Foot* divided into many *Claws* with broad *Nails* on them: As the *Ape* and *Monkey Kind*. Of these some have no *Tails*, and are called *Simiae* or *Apes*. Others have *Tails*, and are called *Monkeys*, *Cercopithecii*; and such as have either long or short *Tails*, if they are of a large *Size*, are called *Papiones* or *Baboons*. There are great Numbers and Varieties of this Species of *Quadrupeds*; of which Naturalists have described these. (1) The *Ourang-Outang*, or *Homo Sylvestris* of *Dr. Tyson*, described by him in a particular Discourse. (2) The *Guari-ta* of *Brasile*, *Marcgravi*. (3) The *Cagui* of *Brasile*, greater and lesser. (4) The *Cay* of the same Region, described by *Lerius*. (5) The *Caitaia* of the same Country. (6) The *Cercopithecus Angolensis major*. (7) The *Cercopithecus Barbatu Guineensis*, 2 or 3 Sorts of it. (8) The *Cercopithecus non Barbatu Clusii*. (9) *Cercopithecus Clusii*, called *Sagouin*; and, if *Apes* and *Monkeys* have their *Snouts* very prominent like *Dogs*, they are called *Cynocephali*.

4. A fourth Species of this *Unguiculate Kind* of *Quadrupeds* is, when though the *Claws* are many, yet they are not covered at the *Ends* with broad flat *Nails*, like *Monkeys* or *Apes*; but are rather like the *Talons* of *Hawks*, &c. Crooked and Sharp-pointed. And these in respect of their *Teeth* may be divided into such as have many *Dentes Primores*, aut *Incisores*, (i. e. cutting *Teeth*) in each *Jaw*; of which there are two Sorts, a Greater, which either have a short round *Head*, as the *Cat kind*; or a longish *Snout* as the *Dog-kind*; or a Lesser Sort; having a long slender *Body* with very short *Legs*, as the *Weasel* or *Vermine Kind*. There are some of this Species of *Quadrupeds*, which have only Two large remarkable *Teeth* in each *Jaw*: and these are of the *Hare Kind*, and live only upon *Herbs*, *Grass*, &c.

Of the *Cat-kind* of *Quadrupeds* they reckon to be (1) The *Lion*, (2) The *Tiger*, (3) The *Pardalis*, whose *Male* is *Pardus*, *Female* *Panthera*, the *Leopard*. (4) The *Lupus Cervarius* or *Lynx*. (5) The *Catus Pardus* or *Cat-a-mountain*. (6) The common *Cat*. (7) The *Bear*.

Of the *Dog-kind* they account, (1) The *Wolf*, (2) *Lupus Aureus* the *Jackall*, (3) The common *Dog*. Of which kind they enumerate; (1) The *Mastive*, (2) The *Canis Venaticus Graius* or *Graculus*; or according to some *Scoticus*, the *Greyhound*. (3) The *Graculus Hybernicus* or *Irish Greyhound*. (4) The *Canis Venaticus Sagax*, *Indagator*, *Seftator ferarum*, &c. the *Hound*. (5) The *Canis Venaticus Hispanicus* or *aviarius*: The *Spaniel* for *Land* or *Water*. (6) The *Vertagus* or *Tumbler*. (7) The *Canis Oikos*, *Domesticus*, the *House-dog*. (8) The *Canis Melitæus* or *Lap dog*. (9) The *Canis Getulus* or *Islandicus*; the *Shock*: And of all these Sorts there are many Varieties of *Mongrels* and *Hebrious Breeds*.

Another Sort of the *Dog-kind* is (4) The *Fox*. (5) The *Animal Zibethicum*, the *Civet-Cat*, as 'tis corruptly called; but by its *Teeth* and *Snout* is plainly of the *Dog-Tribe*. (6) The *American Coati*, or *Raccoon* or *Rattoon*. (7) The *Tzquiepaté*. (8) The *Carigüeya*, *Maritucaca*, *Carigoy*, *Ropozá*, or *Possum*. (9) The *Taxus*, or *Meles*. The *Badger*, *Grey*, or *Pate* (in the North) (10) The *Lutra* or *Otter*. (11) The *Phoca* or *Sea-Calf*, or *Seale*. (12) The *Equus Marinus*, or *Morse*, or *Sea-Horse*, mistaken by some for the *Hippopotamus*. The *Dutch* call him *Walras*; the *Danes* and *Islanders*, *Rosmarus*. (13) *Manati seu Vacca Marina*; the *Sea-Cow*.

Of the *Vermine* or *Weasel-kind* of *Quadrupeds*, is first, The *Mustela vulgaris* the *Weasel*; in *Yorkshire*, *Foumart* or *Fitcher*, (*γάρδν*) (2) *Viverra Indica*, called *Quel* and *Quirpele*; and another Sort called *Mungo* and *Mungathia* of a reddish *Grey*. (3) The *Mustela*, the *Ermine* or *Stoat*, if white; and the *Mustela Sylvestris*, the *Ferret*. (4) *Putorius*, the *Pole-cat*, (5) *Martes*, *Foyna* (whence our word, a *Gown* of *Foins*) the *Marten* or *Martlet*. (6) *Mustela Zibellina*, the *Sable*. (7) The *Genetta*. (8) The *Ichneumon Bellonii*.

Of the *Hare Kind* of *Quadrupeds*, are first *Lepus*, the common *Hare*: (2) *Cuniculus*, the *Rabbit* or *Coney*. (3) The *Tapeti* or *Brasile Coney*, and the *Aperea* of *Brasile*. (4) The *Hystrix*, or *Porcupine*; and the *Hystrix Americanus*, or *Cuanda* of *Brasile*. (5) The *Castor*, *Fiber*, or the *Beaver*. (6) The *Sciurus vulg.* or *Squirrel*. The *Virginian*, *Zealandick*, the *Barbary*, the *American Flying Squirrel*, &c.

this Ute, each of them carrying 24 Retorts; in all 384 Retorts.

All the Mercury got without the use of Fire, whether by *Washing*, or found in the Mines (for in the Digging some, the Particles get together, so that in some places you might take up two or three Spoonfuls of pure Mercury) is called by them *Virgin Mercury*, and esteemed above the rest. The Officer told me, that making an *Amalgama* of Gold and *Virgin Mercury*, and putting it to the Fire, that Mercury would carry away all the Gold with it, which *Common Mercury* would not do.

The Engines for drawing the Water, are all moved by Water, brought thither in no Chargeable *Aqueduct* from a Mountain 3 Miles distant. The Water Pump from the bottom of the Mine by 52 Pumps, 26 on a side, is contrived to move other Wheels, for several other Purposes.

The Labourers (being 280 always employed) work for a *Julio* a Day, which is not above 6 or 7 pence, and Endure not long: For although None stay underground above 6 Hours; all of them in time (some later, some sooner) become

Paralytick, and die *Hedick*. We saw a Man who had not been in the Mines for above half a Year before, so full of Mercury, that putting a piece of Brass in his Mouth, or rubbing it in his Fingers, it immediately became as White, as if he had rubbed Mercury upon it. Those also that Work upon the Back-side of Looking Glasses, are very Subject to the *Palsy*.

They convey their Wood thus. About 4 Miles from the Mines on the sides of Two Mountains, they cut down the Trees, and draw them into the Interjacent Valley. Higher up in the same Valley they make a Lock or Dam; when the Water is ready to run over it, they open the Flood-Gates, and the Water carries all the Trees impetuously to *Idria*, where the Bridge is built very strong, and at very Oblique Angles to the Stream, on purpose to stop them, and throw them on shore near the Mines.

Those Mines heretofore. Cost the Emperor 70000 or 80000 Florins yearly; but now they Cost him not above 28000. They produced

2. The Town of *Idria* in the County of *Goritia* and Province of *Friuli*, is seated low, and encompassed with Hills on all sides. A River of the same Name runs by it, and proves sufficient upon plentiful Rains to convey down the *Fir-Trees* and other Wood required in the Service of the Mines: And to this End there is an handsome Work of Piles made sloping athwart the River (after the same manner as I observed in *Newsol* in *Upper Hungary*, cross the River *Gran*) to stop the Trees.

The Entrance into these Mines is not high, or upon an Hill, but in that Town it self. The deepest part of the Mine from the Entrance, is between 120 and 130 Fathoms.

The *Virgin Quick-silver*, which they call *Jung-fraw*, is that which discovers it self without the help of Fire. Sometimes it is plainly seen in the Ore, or falls down in Drops, and sometimes Streams out in good quantity; as about Seven Years ago it ran out of the Earth at first in a Stream as small as a Thread, and afterwards as big as a Pack-thread, but ceased in 3 or 4 Days. That also is accounted *Virgin Quick-silver*, which is separated only by Water.

Plain *Quick-silver* they obtain by Fire out of the Ore, and out of the *Cinnabar* of Mercury, which they dig out of this Mine. The Ore of this Mine is of a Dark Colour, mixed with Red.

The *Quick silver Ore* of this Mine ordinarily contains half, and sometimes $\frac{2}{3}$ of *Quick silver*.

I went into the Mine by the Pit of *St. Agatha*, and came up again by that of *St. Barbara*, descending and ascending by Ladders. I ascended at one of 639 Staves, or 89 Fathoms. It has been wrought 200 Years, about the same space of time

with *Newsol Mine*, but comes much short in time of the *Silver Mine* at *Schemnitz*; and much shorter yet of the notable *Lead Mines* in *Upper Carinthia*.

In a Laboratory, where the *Quick-silver* is separated by Fire, I saw an Heap of 16000 Retorts of Iron; every one of which costs a Crown at the best Hand from the Iron Furnaces in *Carinthia*. There are 800 Retorts, and as many Recipients, employed together, in drawing over the *Quick-silver* in 16 Furnaces; 50 in each Furnace, 25 of a side; 12 above, and 13 below of each side.

June 12. 1669, when I was there, they carried out 40 Saumes of *Quick silver* into Foreign Parts, each Saume containing 315 pound Weight, to the value of 4000 Ducats of Gold. Some of it is sent as far as *Cremnitz* in *Hungary*, for the Use of the Gold Mines: And very much carried away Southward; for they are not far from the *Sontius*, or *Lysenzo*, a considerable River, which runs into the Gulf of *Trieſte* in the *Adriatick Sea*.

In the Castle, I saw 3000 Saumes of *Quick-silver* together in Barrels, the *Quick-silver* being first made up in double Leather: And in another House as much Ore as can be distilled in 2 Years, except they have great Plenty of Rain to bring down the Wood.

The Country is well stored with stately Firs, Larches, Pines, Pinasters, Picea's, and that nobly crisped and well grain'd kind of *Acer*, whereof Viols and Violins are made: Whereof there is also Plenty in the Country of *Salzburg* and *Carinthia*.

Travelling sometimes in the Night, we had continually about us a great number of large Glow-worms, which put into Papers, gave a dimm Light like Candles in Lanthorns; and the Air also

was full of *Flaming Flies*, affording some delight unto us.

The way to this Place from *Croatia* I found difficult; and coming from it to *Aidoschini* and *Croatia*, I passed over *Swartzenburg*, or the *Black Mountain*, from whence I descended 10 Miles in a Rocky Country, and far more Stony than the *Craw*, or *Campus lapidosus*, in *Provence*.

In the Valley of *Lancy*, which runs between the Mountains of *Turin*, grows a Plant like the *Doronicum*, (so also called by the Inhabitants and Botanists,) near the *Roots* whereof you may find *Pure Quick-silver*, running in small Grains like *Pearls*; the *Juice* of which Plant being expressed, and exposed to the Air of a Clear Night, there will be found as much *Mercury*, as there is lost of *Juice*.

QUIETUS, was formerly a Writ of Discharge granted to those Barons and Knights, who personally attended the King in his Wars, or any Foreign Expedition; by which they were exempted from the Claim of *Scutage*, or a Tax on every Knights Fee.

QUINQUAGESIMA; See *Quadragesima*.

QUINTAL, or *Quintan*, was an old Sportive Exercise, practised usually at Weddings, and was either so dangerous or ludicrous as to be forbid often by Ecclesiastical Authority; The manner of it was thus: A Post was erected perpendicularly in the Ground, on the Top of which was a slender Beam turning round on a Spindle: At one of whose Ends was a Sloap or flat Board; and at the other a Bag of Sand or Dirt. And the Sport was with a long Staff or wooden Launce to ride a Tilt at the Board, and to be either so skilful or lucky to escape the Blow which the Sand Bag would be likely to give the Runner at this *Quintan*, by the turning round of the Beam. This seems to have been the same with that Sport called *Arietum Levatio*, which is frequently prohibited

in our Old Synods and Episcopal Constitutions. *Kennet Par. Antiquities*.

QUINTAL, also was formerly used for a Weight of Lead, Iron and common Metals, of usually an Hundred Pounds; at Six-score to the Hundred.

QUINQUE-Portus, the *Cinque* or *Five Ports* of the Kingdom of *England*, were so called formerly by way of Eminence: They are *Hastings*, *Dover*, *Romney*, *Hithe*, and *Sandwich*. There belongs to them also, two Ancient Towns, which are *Winchester*, and *Rye*; and several other Places which are called their *Members*; as *Seaford*, *Feverham*, *Folkstone*, &c.

These had formerly, and have still, great Privileges allowed them on the account of finding the King a certain Number of Ships of War, on occasion: The Numbers of which are these. *Hastings* is bound to find twenty one Ships, each carrying twenty one Men and a Boy. *Romney* is to find Five Ships, with 24 Men and a Boy in each. *Hithe* also must find Five Ships, and in each 21 Men and a Boy. *Dover* is to find 21 Ships, in each 21 Men and a Boy. *Sandwich* should find Five Ships, each carrying 21 Men and a Boy. The Ships and Boys are 57. The Men 1188. The Service, which the Barons of these *Cinque-Ports* owe the Crown, is to attend with these Ships at their own Charges for fifteen Days, and to set out to those Places whither they are to go, and to stay as long as the King pleases, at his Charge. See *Somner's Treatise of Rom. Forts and Ports in Kent*.

QUIRK, is a Term in Architecture for a Piece of Ground whether Square or Oblong, taken out of a Corner, or any Place else of a Ground-plot, to make a Court or Yard, &c.

QUOINS are the Stones and Bricks placed in the Corner of any Building; and if any stick without the Brick-work (their Edges being Cypher'd off) they are called *Raftick Quoins*.

R A F

RACHAT, *Rachetum*, from the French *Racheter*, to redeem, was formerly used for the same as *Theft-boote*, viz. the Compensation or Redemption of a Thief, *Skene de verb. signif.*

RADECHENISTORS in Dooms-day book, is used for *Liberi-Homines*; and *Spelman* thinks it to be what *Bracha* calls *Rade-knights*.

RADIAL-Curves are Curves of the Spiral kind, whose Ordinates, if they may be so called, do all terminate in the Centre of the including Circle, and appear like so many *Radii* or Semi-diameters of that including Circle. See *Spiral*.

RADMAN is a word often used in Dooms-day, and seems to be the same with *Rade-knight* or *Rad-knight*. Others think it comes from *Read*, Counsel, and then *Read-man*, is a Counsellor.

RAFTERS, in any Building, are those Pieces of Timber, which stand by pairs upon the *Reason*, meet in an Angle at the Top, and help to compose the Roof of a Building: They should not stand farther than 12 Inches from one another.

R A I

RAGEMAN, is a Statute so called, of Justices assigned by K. *Edw. 1.* and his Counsel, to go a Circuit through all *England*, and to hear and determine all Complaints of Injuries done within 5 Years next before *Michaelmas*, in the fourth Year of his Reign. *Cowel*.

RAIN-BOW. In order yet further to explain the *Phænomena* of the *Rain-bow*; Sir *Isaac Newton* in his Excellent Treatise of Opticks, p. 126. advances this Proposition.

By the Properties of Light (discovered by his New Experiments) to explain the Colours of the Rain-bow.

This Bow never appears but where it rains in the Sun-shine; and it may be artificially made by spouting out Water, which by breaking aloft shall scatter into Drops, and fall like Rain; for the Sun on these Drops certainly causes the Bow to appear to an Eye duly posited to the artificial Rain, and the

Supposing now then o be the Spectator's Eye, and op a line drawn parallel to the Sun's Rays, and let $po e$, $po f$, $po g$, and $po h$, be Angles of $40^\circ 17'$, $42^\circ 2'$, $50^\circ 57'$, and $54^\circ 7'$ respectively; and these Angles turned about their common side op , shall with their other sides oe , of , og , and oh , describe the Verges of 2 Rain-bows $afbe$, and $chdg$: For if e, f, g, h , be Drops placed any where in the Conical Surfaces described by oe , of , og , oh , and be illuminated by the Sun's Rays se , sf , sg , sh : The Angle seo being equal to the Angle $po e = 40^\circ 17'$, shall be the greatest Angle in which the most refrangible Rays can after one Reflexion be refracted to the Eye: And therefore all the Drops in the Line oe , shall send the most refrangible Rays most copiously to the Eye, and thereby strike the Senses with the *deepest violet Colour* in that Region. And in like manner the Angle sfo being $=$ to the Angle $po f = 42^\circ 2'$, shall be the greatest in which the least refrangible Rays after one Reflexion can emerge out of the Drops; and that these Rays shall come most copiously to the Eye from the Drops in the Line of , and strike the Senses with the *deepest red Colour* in that Region. And by the same Argument, the Rays which have intermediate Degrees of Refrangibility, shall come most copiously from Drops between e and f , and so strike the Senses with the intermediate Colours, in the Order which their Degrees of Refrangibility require: *i. e.* in the Progress from e to f , or from the Inside of the Bow to the Outside in this Order; Violet, Indico, Blue, Green, Yellow, Orange, Red. But the Violet, by the mixture of the white Light of the Clouds, will appear faint, and incline to a Purple.

Again, the Angle sgo being equal to the Angle $po g$, or $50^\circ 57'$, shall be the least Angle in which the then *least* refrangible Rays can, after 2 Reflexions, emerge out of the Drops; and that the least refrangible Rays shall come most copiously to the Eye from the Drops in the Line og , and strike the

Sense with the *deepest Red* in that Region. And the Angle sbo being equal to $po h = 54^\circ 7'$, shall be the least Angle in which the *most* refrangible Rays, after 2 Reflexions can emerge out of the Drops; and that those Rays shall come most copiously to the Eye from the Drops in the Line oh , and so strike the Senses with the *deepest Violet* in that Region. And by the same Argument, the Drops in the Regions between g and h , shall strike the Senses with the intermediate Colours, in the Order which their Degrees of Refrangibility require, (*i. e.*) in the Progress from g to h , or from the inside of the Bow to the outer, in this Order: Red, Orange, Yellow, Green, Blue, Indico, Violet. And since these 4 Lines oe , of , og , oh , may be situated any where in the above-mentioned Conical Surface, what is said of the Drops and Colours in these Lines, is to be understood of the Drops and Colours every where in these Surfaces.

Thus shall there be made two Bows of Colours, an interior and stronger, by one Reflexion in the Drops, and an exterior and fainter by two; for the Light becomes fainter by every Reflexion: And their Colours shall lie in a contrary Order to one another, the Red of both Bows bordering upon the Space gf , which is between the Bows. The Breadth of the interior Bow foc , measured across the Colours shall be $1^\circ 45'$, and the breadth of the exterior gob , shall be $3^\circ 10'$; and the Distance between gof , shall be $8^\circ 55'$. The greatest Semidiameter of the innermost, (*i. e.*) the Angle $po f$ being $42^\circ 2'$; and the least Semidiameter of the outermost $po g$ being $50^\circ 57'$. These are the Measures of the Bows, supposing the Sun to be a Point; but by the breadth of his Body, the breadth of the Bows will be increased, and their Distance decreased by half a Degree.

This Explication of the Rain-bow is yet farther confirmed, by the known Experiment of hanging up in the Sun-shine a Glass-globe filled with Water; and then viewing it in such a Posture, that the

the Rays which come from the Globe to the Eye may contain with the Sun's Rays an Angle of either 42 or 50 Degrees: For if the Angle be about 42 or 43 Degrees, the Spectator suppose at *o* (in the preced. Fig.) shall see a full red Colour in that side of the Globe which is opposed to the Sun, as is represented at *f*. And if that Angle become less (suppose by depressing the Globe to *e*) there will appear other Colours, Yellow, Green and Blue successively, in the same side of the Globe. But if the Angle be made about 50 Degrees, (as suppose by lifting up the Globe to *g*.) there will appear a red Colour in that side of the Globe which is towards the Sun: And if the Angle be made greater, (suppose by lifting up the Globe to *h*) the Red will turn successively to the other Colours, Yellow, Green, Blue, &c. The same thing may be done (as the Author tried) letting the Globe rest, and only raising and depressing the Eye, or moving it so, as to make the Angle of a just Magnitude.

RAINS: Our Seamen call that Tract of the Sea to the Northwards of the Equator betw. 4 and 10 Degrees of Latitude, and lying between the Meridian of *Cape Verde*, and that of the Eastermost Islands of the same Name, or of the *Cape Verde* Islands, they call this Tract the *Rains*: Because there are almost continual Calms, constant Rains, and Thunder and Lightning to a strange Degree there; and the Winds, when they do ever blow, are only small uncertain Gusts, and shift about all round the Compass; so that Ships are sometimes here detained a long while, and can make but very little way.

RANDEZVOUS, in a Military Sense, is a Place appointed by the General of an Army, for all the Forces to meet on a Day appointed; let what Weather, &c. happen that will.

RANK, in a Military Sense is the Order or Strait Line made by the Soldiers of a Battalion, or Squadron drawn up side by side, *Doubling of Ranks* is putting two into one.

RAPACIOUS Animals, are in general such as live upon Prey: And 'tis a general Division of Birds, into such as are *Rapacious and Carnivorous*, and such as are *Frugivorous*. The Characteristick notes of Birds of Prey are; that they have a great Head and a short Neck, hooked, strong and sharp pointed Beak and Talons, fitted for ravine and tearing of Flesh; strong and brawny Thighs for striking down their Prey: A broad thick fleshy Tongue like that of a humane Creature; 12 Feathers in their Train; and 14 flag Feathers in each Wing. The two *Appendices*, or blind Guts, are always very short; They have a *Membranous* Stomach, and not a *Musculous* one or a *Gizzard*, such as Birds have that live on Grain: They are very sharp-sighted, and are not *Gregarious*, but Solitary generally speaking, though Vultures will fly 50 or 60 in a Company.

RAPHA, in Anatomy, is a Ridge or Line which runs along the Under side of the *Penis*, and reaching from the *Franum* to the *Anus*, divides the *Scrotum* and *Perinaeum* in two. This line is not usually cut in the Grand Operation of cutting for the Stone, because 'tis both harder than the rest of the Skin thereabouts, and also because you must then cut upon the Interstices of the Muscles, which will make the Re-union the more difficult.

RATE of a Ship of War is its distinction as to Bigness and Capacity; and this is usually accounted by the Length and Breadth of the Gun-deck, the Number of Tuns they contain, and the Number of Men and Guns they carry. For such Men of War as have their Gun-decks from 159 to 174 Feet in length, and from 44 to 50 Foot broad: That contain from 1313 to 1882 Tuns, that have from 706 to 800 Men, and carry from 96 to 110 Guns: We reckon of the *First Rate*.

Second Rate Ships, have their Gun-decks from 153 to 165 Feet long; and from 41 to 46 broad: Contain from 1086 to 1482 Tuns; and carry from 524 to 640 Men, and from 84 to 90 Guns.

Third Rates have their Gun-decks from 142 to 158 Feet in length; from 37 to 42 Foot broad: They contain from 871 to 1262 Tuns; carry from 389 to 476 Men, and from 64 to 80 Guns.

Fourth Rates are in length on the Gun-deck from 118 to 146 Foot, and from 29 to 38 broad: They contain from 448 to 915 Tuns; carry from 226 to 346 Men; and from 48 to 60 Guns.

Fifth Rates have their Gun-decks from 100 to 120 Foot long, and from 29 to 31 Feet broad: Contain from 259 to 542 Tuns; carry from 145 to 190 Men; and from 26 to 44 Guns.

Sixth Rates have their Gun-decks from 87 to 95 Foot long, and from 22 to 25 Foot broad: They contain from 152 to 256 Tuns; carry from 50 to 110 Men, and from 16 to 24 Guns.

Our New-built Ships are much larger, as well as better, than the Old ones of the same *Rate*; and that is the Reason of the double Numbers all along; the larger of which express the Proportions of the New-built Ships.

RATION, is now in the Army, a word in use for a certain Proportion of Ammunition-Bread or Forrage distributed to every Man in the Army, as his Portion for such a Time.

RAVISHMENT *de Garde* was a Writ that formerly lay for the Guardian by *Knights Service*, or in *Socage*, against him that took away from him the Body of his Ward.

RAYS of Light with Regard to Opticks, are by Sir *Is. Newton* considered, as the last Parts of that wonderful Fluid; and that as well such as are successive in the same Lines as contemporary in several Lines: For 'tis manifest that Light consists of Parts both successive and contemporary; because in the same place you may stop that which comes one moment, and let pass that which comes presently after, and in the same Time you may stop it in any one place, and let it pass in another. Wherefore the least Light, or part of Light, which may be stopt alone without the rest of the Light; or propagated alone, or do or suffer any thing alone, which the rest of the Light does not, or suffers not, he calls a Ray of Light.

The Mathematicians indeed usually consider the Rays of Light to be *Lines* reaching from the luminous Body to that illuminated; which were just if Light were propagated in an instant, as some have supposed: But the Observations of the Eclipses of *Jupiter's* Satellites made first by Mr. *Romer*, do shew that 'tis propagated in Time, and in particular that it takes up about 7 Minutes in moving from the Sun to the Earth.

The incomparable Sir *I. Newton* in his *Opt.* Book 2. Part 3. p. 65. After having premised p. 50. that those Surfaces of transparent Bodies *reflect* the greatest Quantity of Light, which have the greatest *Refracting* Power; and also that in the Confines of equally refracting Mediums there is no *Reflexion*; and at pag. 45. That the Transparent parts of Bodies according to their several Sizes must reflect Rays of one Colour, and transmit those of another on the same Grounds, that thin Plates or Bubbles do transmit or reflect those Rays; which he takes to be the ground of all their Colours: proceeds, in the Eighth Proposition, to enquire into the Cause of the Rays of Lights being reflected, and he shews that the Cause of Reflexion is not the impinging of Light on the solid or impervious Parts of Bodies as hath commonly been believed, as appears from the following Considerations.

(1.) That in the Passage of Light out of Glass into Air, there is a Reflexion as strong as in its Passage out of Air into Glass, and rather something stronger, and much stronger than in its Passage out of Glass into Water: And it seems not probable that Air should have more reflecting Parts than Water or Glass. But if that could be supposed it would not do, because the Reflexion is as strong or stronger when the Air is drawn away from the Glass (as suppose in the exhausted Receiver of Mr. Boyle's Air-pump) as when it is adjacent to it.

(2.) If Light in its Passage from Glass to Air be incident *more obliquely* than at an Angle of 40 or 41 gr. it is wholly reflected; but if *less obliquely*, it is in a great Measure transmitted. Now it is not to be imagined that Light at one Degree of Obliquity should meet with Pores enough in the Air to transmit the greatest Part of it, and at another Degree of Obliquity should meet with nothing but Parts to *reflect* it wholly; especially considering that in its Passage out of Air into Glass, how obliquely soever it falls, it finds Pores enough in the Glass to transmit the greatest Part of it. If it be said that it is not reflected by the Air but by the utmost Superficial Parts of the Glass; there is still the same Difficulty: Besides, that such a Supposition is un-intelligible, and will also appear to be false by applying Water behind some part of the Glass instead of Air. For so in a convenient Obliquity of the Rays, as suppose of 45 or 46 gr. at which they are all reflected where the Air is adjacent to the Glass, they shall be in a great Measure transmitted where the Water is adjacent to it: Which argues, that their Reflexion or Transmission depends on the Constitution of the Air and Water behind the Glass, and not on the striking of the Rays upon the Parts of the Glass.

(3.) If the Colours made by a Prism placed at the Entrance of a Beam of Light into a darkened Room, be successively cast on a second Prism placed at a greater Distance from the former, in such manner that they are all alike incident upon it; the second Prism may be so inclined to the Incident Rays, that those which are of a blue Colour shall all be reflected by it, and yet those of a red Colour pretty copiously transmitted. Now if the Reflexion be caused by the Parts of Air and Glass, how comes the *Blue*, at the same Obliquity of Incidence, wholly to impinge on those Parts so as to be all reflected, and yet the *Red* find Pores enough to be in a great Measure transmitted?

(4.) Where 2 Glasses touch one another, as he shews in the first Observation, there is no sensible Reflexion, yet why should not the Rays of Light impinge on the Parts of Glass, as much when contiguous to other Glass, as when so to Air?

(5.) When the Top of a Bubble of Water in *Obs.* 17. at last began to grow very thin, there was so very little Light reflected from it, that it appeared intensely *black*; and yet round about where the Water was thicker, the Reflexion was so strong as to make the Water to appear very *white*.

Nor is it only at the least Thickness of Bubbles and thin Plates that there is no manifest Reflexion, but at many others continually greater and greater: For he found (in *Obs.* 15.) that Rays of the same Colour were by turns transmitted at one Thickness, and reflected at another, for an indeterminate Number of Successions; and yet in the Surface of the thinned Body, where it is of any one Thickness, there are as many Parts for the Rays to impinge on, as where it is of any other Thickness.

(6.) If Reflexion were caused by the Parts of reflecting Bodies, it would be impossible for thin Plates or Bubbles at the *same place* to reflect the Rays of one Colour and transmit those of another, as by the 13 and 15 Observations 'tis plain they do: For it is not to be imagined that at one Place the Rays which (for instance) exhibit a *Blue*, should have the Fortune to dash upon the *Parts*; and those which exhibit a *Red* should fall upon the *Pores* of the Body: And then at another Place, where the Body is either a little thicker or thinner; that on the contrary, the *Blue* should fall on its *Pores*, and the *Red* upon its *Parts* polished.

(7.) Were the Rays of Light reflected by impinging on the solid Parts of Bodies, their Reflexions from these Bodies could not be so regular as they are. For in polishing with Sand, Glass, Putty, or Tripoly; it is not to be imagined that those Substances can by grating and fretting the Glass, bring all its least Particles to an accurate Polish, so that all their Surfaces shall be truly plane or truly spherical, and look all the same way, so as together to compose one even Surface. The smaller indeed the Particles of these Substances are, the smaller will the scratches be, by which they continually fret and wear away the Glass until it be polished: But be they never so small they can wear away the Glass no otherwise than by grating and scratching it, and breaking off the Protuberances; and they polish it no otherwise than by bringing its roughness to a very fine Grain, so that the Scratchings upon it become too small to be visible. And then if Light were reflected by impinging upon the solid Parts of the Glass, it would be scattered as much by the most polished Glass as by the roughest: Wherefore it remains a Problem, how Glass polished by fretting Substances can reflect Light so regularly as it doth; and this can't well be solved, unless the Reflexion of the Ray be effected, not by a single Point of the reflecting Body, but by some Power of the Body which is evenly diffused all over its Surface, and by which it acts upon the Ray without immediate contact, for that the Parts of Bodies do act on Light at a distance, he shews in another Place. (*See Light.*) And if Light be reflected not by impinging on the solid Parts of Bodies but by some other Principle, 'tis probable that these Rays which do impinge on the solid Parts of Bodies, are not reflected

reflected but stifted and lost in the Bodies; for otherwise two Sorts of Reflexions must be allowed. Should all the Rays be reflected which impinge on the Internal Parts of Water or Chrystal, these Substances would rather have a cloudy, than a transparent Colour. To make Bodies look black many of the Rays must be stoppt, retained and lost in them, and it seems not probable that any Rays can be stoppt and stifted in them, which do not impinge on their Parts. After this he shews in Prop. 9. That Bodies reflect and refract Light by one and the same Power variously exercised in various Circumstances; as appears from several Considerations. 1. Because when Light goes out of Glass into Air, as obliquely as it can possibly do, if its Incidence be made still more oblique, it becomes totally reflected; for the Power of the Glass after it hath refracted the Light as obliquely as is possible, if the Incidence become still more oblique, becomes too strong to let any of its Rays go thro', and consequently cause a Total Reflexion. 2. Because Light is alternately reflected and transmitted by thin Plates of Glass for many Successions, according as the Thickness of the Glass increases in Arithmetical Progression; for here the Thickness of the Glass determines whether the Power by which Glass acts upon Light, shall cause it to be reflected, or permit it to be transmitted. And, 3. Because those Surfaces of Transparent Bodies, which have the greatest refracting Power, reflect the greatest Quantity of Light, as was shewn in the first Proposition.

And in the Latin Edition of his Opticks towards the End, under the 21st Query, he shews that the Cause of Reflexion and Refraction both, is only the Attraction of the Part of the Body acting upon the Rays of Light at a little distance, as they pass out of, or thro' the Surface of the Glass. (See Light) For as the Rays pass out of Glass into a Vacuum they are always inflected towards the Glass; and if they fall on the Vacuum too obliquely, they will return again to the Glass, and be totally reflected. Now this Phænomenon can't be attributed to the Resistance of the Vacuum, (which is nothing) but must be attributed to some force in the Glass, which reduces or draws back the Rays after they are gotten out of the Glass into the Vacuum. For if the hinder Surface of the Glass be covered with clear Water, Oil, pellucid and liquid Honey, a Solution of sublimate, &c. Then the Rays which otherwise would have reflected, will pass into that Liquor. And this shews plainly that the Rays are not reflected, till after they have pass'd the hinder Surface of the Glass, or are beginning to go out of it. For if as they are going out, they fall into any of the Liquors above-mentioned, they then go on in the Course they were in before: because the Attraction of the Glass is balanced by the Attraction of the Parts of the Liquor.

And this appears yet plainer, by the Compression of two Prisms, or Object Glasses of a long Telescope, together, when one is plain, and the other a little Convex; for then they will neither exactly touch, nor yet be at any considerable distance one from another, as it may be not above the $\frac{1}{1000}$ part of an Inch.

For then the Rays which, at passing out of the hinder Surface of the first Glass, would have been reflected and turn again to it, if the Distance of the 2^d Glass had been considerable, will now all readily in that part, pass through the Second

Prism or Object Glass, just as if there were a hole thro' it. See Sir *Is. Newt.* Observ. 1. 4. and 8th. of Part 1. Book 2. of his Opticks.

It hath been discovered by that Excellent Danish Astronomer, Mr *Romer*: that tho' the Motion of the Rays of Light coming from us to the Sun be amazingly swift, yet it is by no means instantaneous. And the Velocity of that Motion may be thus determined in the Figure annexed; let the Circle *HLKEFG* represent the Earth's annual Orbit, described by its Revolution round the Sun, which suppose placed in *A*. Let the Point *B* represent the Planet *Jupiter*, casting a Shadow backwards towards those Parts which lie behind him in respect to the Sun. Let the little Circle *DRC* denote the Orbit of any one of the Satellites of *Jupiter*, revolving round that Planet placed in *B*. And let the Chord *GF* be in length equal to the Semi-diameter of the Earth's annual Orbit *AE*, or *AH*: As let also *LK* be, on the other hand.

All this supposed, 'tis plain that those Immersions of *Jupiter's* Satellites into his Shadow, and those only which happen from their Conjunction to their Opposition with that Planet, can be visible to the Inhabitants of the Earth, which live within the Semi-circle *HGF*: And those Emerisions out of his Shadow, and those only which happen from the Satellites Opposition to their Conjunction with *Jupiter* again, can be visible to such as live under the Semi-circle *HLKE*: Because the Interposition of the Body of *Jupiter*, hinders both from being visible. 'Tis apparent also, that an Observer placed in *F*, if the Motion of Light were instantaneous, would see the Immersion of a Satellite into the Shadow at the same Moment of absolute Time, as another would do if placed in *G*; and it would be the same thing on the other side with regard to the Points *K* and *L*.

But

But if the Propagation of Light take up any sensible Time, 'tis plain that the Observers posited in *G* and *L*, being nearer to *Jupiter* by an entire Semi-diameter of the *Magnus Orbis*, than those in *F*, and *K*; must needs see the Immersions and Emergences a little sooner than those can do; and from the Space of Time which is proportionable to that Semi-diameter of the Earth's Annual Orbit, may Estimation be made of the Velocity of the Rays of Light; and so the thing is in Fact: For whenever the Earth is in that part of its Orbit which is nearest to *Jupiter*, the Immersions of the *Satellites* into his Shadow do anticipate the mean Time which they should happen in, according to Calculation; as when the Earth is in the opposite Parts of the Orbit, they do really appear later than by Calculation they should do. And so they will appear later to an Observer placed in *F*, than to one placed in *G*; and the Emergences later to one in *K*, than to one in *L*: As Mr. *Romer* first found, and is now agreed on by all Astronomers. There was indeed some doubt about this matter started by *Cassini*; but our Accurate Mr. *Halley* Savilian Professor of Geometry at *Oxford*, hath cleared up all the Difficulty; and demonstrated that this Progressive Motion of the Rays of Light, to such a Distance, and in such a given Time, is absolutely necessary to account for the Phenomena of the Eclipses of the *Satellites* of *Jupiter*. And as to the Time, or with what determinate Velocity the Rays move, Mr. *Romer* judged that it required about Eleven Minutes of an Hour, for the Light reflected from *Jupiter*, to move the length of the Chord *FG* in the Figure above; or the Distance of the Semi-diameter of the Earth's annual Orbit: But this, by *Cassini*'s more accurate Observations, seems to be much lessened, for according to him it can't be above 7 Minutes and 5 Seconds. Suppose then it be reckoned at 9 Minutes, which is the Medium between *Romer*'s Eleven, and *Cassini*'s Seven. Then will the Motion of Light be so prodigious swift, as to move about Eighty Millions of Miles in 9 Minutes: That is 8888888 Miles in a Minute; and 148148 Miles in a Second; and 74074 Miles in half a Second, or while you can pronounce *One, Two*, distinctly.

A Motion, tho' not instantaneous, as no one can be; yet so wonderfully swift, that the Motion of a Bullet from the Mouth of a Cannon, (or any such like Velocity of a Body projected,) is like the creeping of a Snail, the Motion of the Legs of the *Ignavus*, or the imperceptible Pace of the Hand of a Clock, when compared with it: Nay, the Motion of the Earth it self in the Annual Orbit, which yet is pretty swift, (*viz.* at the Rate of $3\frac{1}{2}$ English Miles in a Second) is not the Ten Thousandth part of the Velocity of the Rays of Light.

From which very surprising Proposition, the Ingenious Mr. *Whiston* deduces these Corollaries.

1. That the Eclipses of the Sun, Moon, or *Satellites* of *Jupiter*, do not happen at the same moment of Time, that they appear to us to do.

2. That the more remote any Planets are from us, the longer will be the Distance between the true and apparent Time of their Eclipses: Thus, tho' the Moon's Eclipses will appear to us to be nearly at the same Time, at which they really happen; yet those of the Sun must appear later,

those of the *Satellites* of *Jupiter*, later yet; and those of *Saturn*'s *Satellites*, latest of all.

3. The apparent Places of the Sun, and the Planets in the Heavens, are not their true and real ones at any Time of Observation.

4. Supposing the Distance of the fixed Stars from us to be so immensely great, as we have all the reason in the World to conclude it to be; and to which the Distance of the Sun from us hardly bears any sensible Proportion; 'tis plain that the Light of the fixed Stars cannot come to us in many Hours, nor in many Days nor Weeks; perhaps, not in some Months Time. So that, as that Excellent Mathematician the Honourable Mr. *Francis Roberts*, was once in Discourse suggesting to me; if the Author of Nature should please to annihilate *Syrus*, or any other fixed Star; it might be 3 Months Time before we should miss him, and find his Place vacant in the Heavens.

REACTION: See *Repulse*.

REACTION; The Naturalists say, that Reaction is directly contrary and equal to Action, in Bodies. Or the mutual Actions of two Bodies striking one against another are exactly equal, but made with contrary Directions. Or yet in other words by the Action and Reaction of Bodies one on another, there are produced equal Changes in each; and those Changes are impressed towards (directly) contrary Parts, or ways. This will be best understood by Instances: For, whatever Body presses or draws another, is equally pressed or drawn by it again. If any one press a Stone with his Finger, his Finger is as much pressed by the Stone: If a Horse by a Rope, &c. draw a Stone, the Horse shall equally be drawn by the Stone; for the Rope being stretched both ways, endeavours to relax it self again, and by that means will draw the Horse towards the Stone; and will as much hinder the Progression of the Horse, as it forwards the Profection of the Stone. If any Body lighting against another doth by its force any way change its Motion; it self will undergo the same Change in its own proper Motion, but towards contrary Parts, from the Reaction of that Body, and the Equality of its mutual Pression. By these Actions are produced equal Changes, not indeed of the Velocities, but of the Motions of Bodies; (*i. e.* in such Bodies as have no Impediment any other way) for the Changes of their Velocities, being made towards contrary Parts, (because the Motions are equally changed) are reciprocally proportional to the Bodies themselves.

REAFFORESTED is used, where a Forest hath been *Disafforested*, and then made a Forest again: As the Forest of *Dean*, by 20 *Car. 2*.

REAP-Towel, or *Rip-Towel*, was formerly a Gratuity or Reward given to Customary Tenents, when they had reaped their Lord's Corn.

REAR-Half-Files, are the 3 hindermost Ranks of a Battalion when it is drawn up 6 deep.

REAR-Line of an Army encamped; is the second Line: this lies about 400 or 500 Yards distant from the first Line, which is called the *Front-Line*. Sometimes there is a Third, which is called the *Reserve-Line*.

REAR-Rank, is the last Rank of a Battallion when drawn up.

REA-

REASON or *Reson*, and, as some seem to write it more truly, *Raising Pieces*, are those Pieces of Timber which lie under the Beams on the Brick or Timber in the Side of a House.

REASONABLE-*Aid*, was a Duty claimed by the Lord of Fee of his Tenants, holding in Socage or Knights Service to marry his Daughter, or to make his Son Knight.

REBATE, is a Difference between a certain Quantity of Money, due at a certain Day, and the present Value or Worth of it; or in other words, how much *less* a Man ought to pay, who pays at the present, a Summ of Money not due till a certain Number of Years, &c. are expired. On this see an Act both from Equity and a Mathematical Calculus in the *Acta Eruditorum Lipsie*, from October, 1683, by G. G. Leibnitz.

REBELLIOUS *Assembly*, is a gathering together of Twelve or more Persons, intending or going about, practising or putting in Ure unlawfully, and of their own Authority, to change any Laws, Statutes, &c. to destroy Enclosures, break down Banks of Fish ponds, &c. unlawfully to get common; to destroy Deer in Parks, Coneys in Warrens, Doves in Dove Houses, Fish in Ponds, to burn Stacks of Corn, or to abate Rents or Prizes of Victuals, &c. See *Ch. 1. Mar. 12. and 1 Eliz. 17.*

REBELLUM in some of our old Charters signifies the same as a Rejoinder, Replication, or Answer in a Court of Equity.

RECEIVER is commonly used in the Civil Law in an ill Sense, for one that receives stolen Goods, and conceals them; but when annexed to other Words, 'tis used in a very good one; as the

RECEIVER of the *Fines*, which is an Officer that receives the Money of all such as compound with the Crown upon an Original Writ in the Court of Chancery. There is also the

RECEIVER General of the *Dutchy of Lancaster*, which gathers in all Fines, Forfeitures, Assessments, &c. within that Dutchy.

RECEPTACLE of the *Chyle*, was known and described by *Bartholomeus Eustachius* many Years before the Discovery of the Lacteal Veins, *vid. Keil's Anatom. p. 47, 48.* In living Bodies this Receptacle is easily found, but with greater difficulty in such as are dead. It lies about the descending Trunk of the great Artery, between the *Celiac* and *Emulgent* Arteries, surrounded by several Lymphatick Glands, which are called *Glandule Lumbares*, which discharge their *Lympha* into it. It appears to be only a large Bag formed by the Union of the second Order of Lacteals, and many Lymphæducts which open into it; it will contain about an Ounce of Water. Sometimes in Brutes as well as in Men, it is divided into two or three Parts, which at last unite into one Duct about the Bigness of a Goose-quill.

RECLINATION of a *Plane*, is the Number of Degrees which any Dial Plane lies or falls backward from the Zenith. This is found easily by the means of long Rules, and a Quadrant; for having drawn an Horizontal Line on the Plane, by a Level or Quadrant, and to it another Line at Right-angles, to which apply a Ruler so, that one End of it may hang over or reach beyond the Plane: Then will a Quadrant applied to the under Edge of that Ruler, shew you the Degrees and Minutes of the Plane's Reclination; accounting

Vol. II,

from that Side of the Quadrant that is contiguous to the Edge of the Ruler.

RECLUSE, is one that by reason of his or her Order in Religion is shut up, and cannot stir out of a Cloyster, &c. See *Littleton, Sect. 434.*

RECOGNITIO is the Impannel of a Jury or the Inquest of 12 or more legal Men, who were therefore called *Recognitores*. So, *habere Recognitionem*, was to have a Trial or Verdict of Jurors; for Liberty of which a Fine was formerly paid to the King. *Recognitio Nova Assise*, is a new Trial.

RECTA *Directrix*, is a Line in Conicks made by the mutual Intersection of the Vertical Plane, with the Plane of the Base. *De la Hire.*

RECTA *Prisa Regis*, was formerly a Right the King claimed of taking out of every Ship laden with Wines, One Butt or Pipe, before the Mast, and Another behind it, as a Custom or Duty due to the Crown. *K. Edw. 1.* in his Charter of Privileges to the Barons of the Cinque Ports, among other things, discharges them particularly from this Duty.

RECTATIO, was a word formerly used for a Claim of Right; or an Appeal to the Law, for the recovery of such a Claimed Right. So also the Word,

RECTITUDO was then used for a Right or Legal Due; and Oblations and Tithes were called *Rectitudines Dei*.

RECTIFICATION of Curves. To what hath been said on this Point under *Rectifying* in Vol. 1. and under *Cycloid* in Vol. 2. 'twill be proper to add, what the ingenious Mr. *Moirre* advances in his *Illustrious Specimens of the Use and Advantages of the Doctrine of Fluxions*: Where he saith, that the Rectification of Curve Lines will be obtain'd, if we consider the Fluxion of the Curve as a Hypothenuse of a Rectangular Triangle, whose sides are the Fluxions of the Ordinate and Abscisse. But in the Expression of this Hypothenuse, care must be taken that only one of the Fluxions be remaining, as also only one of the indeterminate Quantities, *viz.* that whose Fluxion is retain'd. Some Examples will render this clear,

The right Sine CB being given, to find the Arch AC. Let AB = x . CB = y . OA = r . CE the Fluxion of the Abscisse, ED the Fluxion of the Ordinate, CD the Fluxion of the Arch CA. From the Property of the Circle $2rx$

$-xx = yy$, whence $2rx - 2xx = 2yy$, and there-

fore $\dot{x} = \dot{y}$. But $CD = \dot{y} + \dot{x} = \dot{y} +$

$$\frac{y^2 \dot{y}}{rr - 2rx + xx} = \frac{\dot{y}}{\dot{y}}$$

$$\frac{y^2 \dot{y}}{rr - yy} = \frac{rr \dot{y}}{rr - yy}$$

$$\text{therefore } CD = \frac{r \dot{y}}{\sqrt{rr - yy}} = \frac{1}{\sqrt{rr - yy}} \times r \dot{y}$$

$$= r \dot{y} \times \frac{r}{\sqrt{rr - yy}} = \frac{r^2 \dot{y}}{\sqrt{rr - yy}}$$

And consequently

A a a a

if

if $rr - yy$ be thrown into an infinite Series, and

the several Members of it be multiplied into ry , and then the flowing Quantity of each be taken, we shall have the length of the Arch A C. After the same manner, giving the versed Sine, the same Arch may be found. For resumming the Equation

found above $2rx - 2xx = 2yy$, we have $y =$

$\frac{rx - xx}{yy}$, but $CD = xx + yy = xx +$

$$\frac{rrxx - 2rxxx + x^2xx}{yy} = \frac{rrxx - 2rxxx + x^2xx}{yy} \cdot \frac{xx}{xx} +$$

$$\frac{rrxx - 2rxxx + x^2xx}{yy} \cdot \frac{xx}{xx} + \frac{rrxx - 2rxxx + x^2xx}{yy} \cdot \frac{xx}{xx}$$

, that is, (reducing all to the same Denominator, and expunging

contradictory Terms) $\frac{rrxx}{2rx - xx}$, whence CD

$= rx$, and consequently the length of the

Arch AC may be easily found from what is said already.

The Fluxion of the Curve Line is sometimes more easily found by comparing the two similar Triangles CED, CBO, for this Proportion arises. $CB : CO :: CD$, that is for the Circle $\sqrt{2rx - xx}$

The Curve of the Cycloid may be determin'd by the same Method too. Let ALK be a Semi-Cycloid, whose generating Circle is ADL. Having any point as B in the Diameter AL, draw

BI parallel to the Base LK meeting the Peripheus of the Circle in the point D; compleat the Rectangle AEIB, and draw FH parallel to EI and infinitely near to it, as also BI cutting FH in G, and the Curve AK in H. Put $AL = d$. $AB (= EI) = x$. $GH = x$. It is known that the right Line BG is every where equal to the Summ of the Arch AD and the right Sine BD: whence 'tis manifest, that the Fluxion IG is also the Aggregate of the Fluxions of the Arch AD and the right Sine BD. But the Fluxion of the Arch AD was found =

$\frac{1}{2} dx$ and the Fluxion of the right Sine

$$\sqrt{dx - xx}$$

BD will be found to be $dx - 2xx$ therefore IG

$$2\sqrt{dx - xx};$$

$= dx - xx$ and therefore IH (= IG) +

$$\sqrt{dx - xx},$$

GH) = $\frac{ddxx - dxxx}{dx - xx}$; from whence IH =

$$\frac{x\sqrt{dd - dx}}{\sqrt{dx - xx}} = x\sqrt{d} = dx \cdot \frac{1}{2} - \frac{1}{2},$$

quently $AI = 2dx = 2\sqrt{dx} = 2AD$. This Conclusion may also be very easily deduc'd from the known Property of the Tangent. For since the little part of it, as IH, is always parallel to the Chord AD, the Triangles IGH, ABD are similar, whence $AB : AD :: GH : IH$, that is, $x : \sqrt{dx} ::$

$x : x\sqrt{dx}$, therefore $IH = x\sqrt{dx} \cdot \frac{1}{2} - \frac{1}{2}$. By

the help of the Fluxion IH also, we may investigate the Area of the Cycloid. The Fluxion of the

Area AEI, is the Rectangle $EIG = dxx - x^2x$

$$\sqrt{dx - xx}$$

$x\sqrt{dx - xx}$. But the Fluxion of the Portion ABD is the same; therefore the Area AEI and the correspondent Portion (of the Circle) ABD, are always equal.

Let AB be the Curve of the Parabola, whose Axis is AF, Parameter a ; let $AE = x$, $EB = y$, $AB = z$, $BD = x$, $DC = y$, $BC = z$. The Equation expressing the Nature of the

Parabola, being $ax = yy$, we have $ax = 2yy$,

whence $x = 2yy$; but $BC = BD + CD$,

$$z = x + y = \frac{4y^2}{a} + y =$$

$$\frac{4y^2}{a} + y, \text{ and therefore } z = y\sqrt{4y^2 + aa}$$

$$\text{that is } zz = xx + yy = \frac{4y^2}{a} + y =$$

$$\frac{4y^2}{a} + y, \text{ and therefore } z = y\sqrt{4y^2 + aa}$$

$$\frac{4y^2}{a} + y, \text{ and therefore } z = y\sqrt{4y^2 + aa}$$

$$\frac{4y^2}{a} + y, \text{ and therefore } z = y\sqrt{4y^2 + aa}$$

$$\frac{4y^2}{a} + y, \text{ and therefore } z = y\sqrt{4y^2 + aa}$$

$$\frac{4y^2}{a} + y, \text{ and therefore } z = y\sqrt{4y^2 + aa}$$

$$\frac{4y^2}{a} + y, \text{ and therefore } z = y\sqrt{4y^2 + aa}$$

$$\frac{4y^2}{a} + y, \text{ and therefore } z = y\sqrt{4y^2 + aa}$$

$$\frac{4y^2}{a} + y, \text{ and therefore } z = y\sqrt{4y^2 + aa}$$

$$\frac{4y^2}{a} + y, \text{ and therefore } z = y\sqrt{4y^2 + aa}$$

$$\frac{4y^2}{a} + y, \text{ and therefore } z = y\sqrt{4y^2 + aa}$$

$$\frac{4y^2}{a} + y, \text{ and therefore } z = y\sqrt{4y^2 + aa}$$

$$\frac{4y^2}{a} + y, \text{ and therefore } z = y\sqrt{4y^2 + aa}$$

$$\frac{4y^2}{a} + y, \text{ and therefore } z = y\sqrt{4y^2 + aa}$$

is also given, and *vice versa*. For $\frac{1}{2} a z = y$

$\sqrt{y^2 + \frac{1}{4} aa}$, and consequently $\frac{1}{2} a z$ is the Space

whose Fluxion is $y \sqrt{y^2 + \frac{1}{4} aa}$. But such a Space is no other than the Exterior (Equilateral) Hyperbola A B E G, whose Semi-axis A B = $\frac{1}{2} a$, its Abscisse A E = y , and its Ordinate E G = x .

For the Mensuration of a Surface described by the Conversion of a Curve round its Axis; we are to assume for the Fluxion of it, a Cylindrick Superficies, whose Altitude is the Fluxion of the Curve, and whose distance from the Axis is the Ordinate Applicate corresponding to that Fluxion. *Ex. gr.* Let A C be the Arch of a Circle, which turning round the Axis A D, generates a spherical Superficies, which we would measure. Now D C the Fluxion of the Arch is already found to be =

$r x$

—, which if we multiply by the Peri-

$\sqrt{2rx - xx}$

phery belonging to the Radius B C, that is, by

$\frac{c}{r} \sqrt{2rx - xx}$ (putting — the Ratio of the

Circumference to the Radius) we shall have cx for the Fluxion of the spherical Superficies, and consequently that Superficies it self, is cx .

RECTUM, was used formerly for a Trial: *Commune Rectum* was a Trial at Law; or in common Courte of Law: And *Stare ad Rectum*, was to stand Trial.

REDUNDANT Hyperbola is one so called, because it exceeds the Conical Sections, in the Number of its Hyperbolical Legs; being a Triple Hyperbola with six Hyperbolical Legs: See Curves.

RED Book of the Exchequer is a MS. Vol. of several Miscellany Treatises, in the keeping of the Queen's Remembrancer in that Office; in it are the Number of the Hides of Land, in many Counties, before the Conquest, &c. See Bp. Nicholson's Hist. Library.

RED seer, when a Piece of Iron in a Smith's Fire of his Forge is heated too much, it will Red-seer, as they call it, that is, break or crack under the Hammer, while it is working between hot and cold. Some call this Red-shire.

RE-Extent in the Law, is a Second Extent made on Lands or Tenements, on a Complaint made that the former Extent was partially performed.

REEVE of a Church is the Guardian of it; or the Church-Warden; as *Shire Reeve* is the Sheriff or Guardian of a County; and *Port Reeve* the Warden of a Port, or Haven.

REFECTORY was that Place in a Monastery where the Monks, Friars, Nuns, &c. usually Dined and Supped.

REFERENDARY, *Referendarius*, was a Term used by the Old Saxons, as appears by Grants and Charters, for such a Person as a Master of Requests was to the King or Queen, amongst us before the Vol. II.

Court of Requests was taken away by 16. 17. Car. I. See Court of Requests, in Vol. I.

REFINING is the Art of separating all other Bodies from Gold and Silver, and this is performed four Ways.

The End of Refining is the Separation of all other Bodies from Gold and Silver, which is performed 4 ways, viz. by Parting; by the Test; by the Almond Furnace or the Sweep; and by Mercury. 1. Parting is done with the *Aqua fortis*. Some Refiners, to make the *Aqua fortis*, take Salt Peter 3 pound, and Dantzick (not English) Vitriol 2 pound (for the English Vitriol makes a weaker Water, and Dirty Colour'd Verditer, and wholly spoils it.) After they are well Bruised and Mixed in a Mortar, they Distill 100 pound of the Materials, put into a Cast-Iron Pot, after this manner.

Build a Furnace 2 Yards high or more; and at the top place in your Iron Pot: To which fit a Head of Earth, like the Head of a large Distillation for Chymical Oyls, which must have a large Belly, branching it self out 8 Inches from the Iron Pot, into 3 Branches; one whereof in the midst comes directly straight forward, two other Lateral ones come Obliquely: All which Branches are 4 or 5 Inches hollow in Diameter, and 5 or 6 long. To these Branches are fitted Glass Bodies, Narrow and Hollow at both Ends, Large and Globous in the Midst. These must be exceedingly well Luted on with Colcothar, Rags, Flour and Whites of Eggs. To the first Glass Body is Luted on another Glass, of the same Figure and Size, and in order 8. alike in all, till they come to the Receiver, which is an Ordinary Gallon Glass. All These Rows of Glasses lie on Boards shelving from the Head to the Receiver. The two Upper Receivers or Glass Bodies need Exceeding good Luting, for the rest Ordinary Lute will serve.

The Lute is made of good Lome, some Horse-dung, and a little Colcothar; although the two former do well.

A little Fire and that of Newcastle Coals does the Work. And you need never Break or Unlute any of the Receivers; but the Lowermost.

The *Aqua fortis* being Distilled off, is put into a large Earthen Pot, and there is added of Fine Silver, one or two Penny weight (which is called *Fixes*) to every Pound of *Aqua fortis*, which within 4 hours, will purge it from all Dirt and Impurity, and make it fit for Parting, which is thus done.

If their Silver Gilt be Fine enough for Wire, they only Melt it in a Wind Furnace, and Cast it, Melted, into a large Tub of Water, that they may have it in small Pieces; but if it be but Standard, they first Fine it on the Test. These small Pieces taken from the Water, being well Dried, are put into a Glass Taper-fashion'd, 2 Foot High, and 7 Inches at the Bottom; and then the Glasses are Charged with *Aqua fortis* about 2 thirds of it, and set in a Range of Iron covered 2 Inches deep with Sand, and a Gentle Charcoal-Fire is made under it.

Small Bubbles will soon arise, and the Water also run over. If so, they take off the Glasses, and hold them till it doth Deserve, or else pour out some of it into a Vessel which is at Hand.

If Lead be Mixed with it, they cannot keep it from Running over.

When the *Water* hath been once *Quieted* from this *Ebullition*, it will Rise no more.

The *Greenness* of the *Water*, manifesteth the Quantity of *Copper* contained in it.

If the *Water* Boil over, 'twill Penetrate the *Bricks* and *Wood*.

They commonly let it stand a Night on the *Iron-Range*, with a gentle Heat under it, and in the Morning softly pour off the *Water* impregnated with all the *Silver*; all the *Gold* lying like black Dirt at the bottom; which being washed out is put into small *Parting-glasses*, and set over the *Sand* with their *Conduit Water* for an hour, and then the *Water* poured off. This is repeated 5 or 6 times, to Separate the *Salt* from the *Gold*, which is now fit to be melted, and cast into *Ingots*.

To regain the *Silver*, they have large Round *Washing Bowls*, lined within with melted *Rosin* and *Pitch* (for otherwise the *Water* would eat the *Wood*, and penetrate the sides of the *Bowl*) covered with *Copper Plates* 10 Inches long, 6 wide, and Half or more thick. Into which *Bowls* they pour good store of *Water* (the more, the better the *Verditer*) and then the *Silver Water*, which working on the softer Metal of *Copper*, leaves all the *Silver* in moist fine *Sand* at the Bottom, and Sides of the *Bowl*, and *Plates* of *Copper*; which being taken out, is Washed, Dried and Melted for any Use.

If any *Brass* or *Shroffe Metal* be in the *Plates*, they gather very little of the *Silver*; the Latter mixing with the *Silver*.

With the *Copper-water*, poured off from the *Silver*, and *Whiting*, *Verditer* is made thus. They put into a Tub a Hundred Pound weight of *Whiting*, and thereon pour the *Copper-water*, and stir them together every Day, for some Hours together. And when the *Water* grows pale, they take it out, and set by for farther Use, and pour on more of the *Green Water*; and so continue till the *Verditer* be made; which being taken out, is laid on large Pieces of *Chalk* in the Sun, 'till it be dry for the Market.

The *Water* mention'd to be taken from the *Verditer*, is put into a *Copper*, and boiled till it comes to the Thickness of *Water-Gruel*, now principally consisting of *Salt-Peter* deduced, (most of the *Spirit* of *Vitriol* being gone with the *Copper* into the *Verditer*;) a Dish full whereof being put into the other Materials for *Aqua-fortis*, is Re-distilled, and makes a *Double-water*, almost Twice as good as that without it.

2. By the *Test*, all Metals are separated from *Silver*, except *Gold*, because they swim over it, when they are all melted together.

The *Test* is thus made. They have an *Iron Mould*, Oval, and two Inches Deep. At the Bottom hereof are 3 *Arches* of *Iron*, set at Equal Distances, 2 Fingers wide, if the great Diameter of it be 14 Inches long; and so proportionable in Greater or Lesser *Tests*. This Cavity they fill with fine Powder of *Bone-Ashes*, moistened with *Lixivium*, made with *Soap-Ashes*. Some use *Cakes* of *Pot-Ashes*, or other *Ashes* well cleansed, and so pressed well together with a *Muller*, that it becomes very close and smooth at the Top. There is left above, a Cavity in the Midst of it, to contain the melted *Silver*. This Cavity is made greatest in the Middle; for the *Bone-Ashes* come up parallel to the Circumference of the *Mould*; only a small Channel in that End, which is most re-

more from the *Blast*, for the Running off of the *Baser Metals*, and so is made *Declive* to the Center of the *Test*, where 'tis not above half an Inch deep.

The *Test* thus made, is set *Annealing* 24 Hours, and then 'tis set in a *Chimney* a Yard High, parallel almost to the Nose of a great Pair of *Bel-lows*; and then therein is put the *Silver*. Which being covered all over with *Billets* of *Barked Oak*, the *Blast* begins, and continues all the while strongly. The *Lead*, purify'd from all *Silver*, (which they call the *Soap* of *Metals*) first put in, melts down with the *Silver*, and then the *Lead* and *Copper* swim at the Top, and run over the *Test*. Whole Motion the *Refiner* helps with a long Rod of *Iron* drawn along the Surface of the *Silver* towards the fore mention'd *Slit*; and often stirring all the Metal, that the *Impurer* may the better rise; and by continuing this Course, Separation is made in 2 or 3 Hours.

The greatest part of the *Lead* flies away in *Smoke*.

If the *Lead* be gone before all the *Copper*, 'twill rise in small Red fiery Bubbles; and then they say the Metal *Drives*, and must add more *Lead*. The force of the *Blast* drives the Higher Metals to the lower side of the *Test*, and helps its running over.

When the *Silver* is fully *Fined*, it looks like most pure *Quick-silver*; and then they take off their *Sogs* and let it Cool. In the Cooling, the *Silver* will frequently from the Middle, spring up in small Rays, and fall down again. If moist *Silver* be put into that which is melted, 'twill spring into the Fire.

A good *Test* will serve two or three Firings.

So soon as the *Silver* will hold together, they take it out of the *Test*, and beat it on an *Anvil* into a round Figure, for the *Melting-Pot*; which being set in a *Wind-Furnace*, surrounded with *Coal*, and covered with an *Iron-Cap* that no *Char-coal* fall into it, is then melted.

If any *Dross* or *Filth* be in the *Melting-Pot*, they throw in some *Tincal*, which gathers the *Dross* together, that it may be separated from it.

These *Melting-Pots* are never Burned, but only Dried, and last a whole Day, if they be not suffered to Cool; but if they once Cool, they infallibly Crack.

3. In the *Almond Furnace* or *Sweep*, all sorts of Metals are separated from *Cinders*, parts of *melting Pots*, *Tests*, *Brick*, and all other harder Bodies; which must be first beaten into small Pieces with a Hammer on an *Iron Plate*.

Those which stick but superficially to the *Silver*, they Wash off thus; they have a Wooden round Instrument 2 Foot wide, somewhat hollow in the Middle, with a Handle on each side. On this they put the Materials, and hold them in a Tub of *Water* below the Surface, and so waving it to and fro, all the lighter and looser matter is separated from the Metal.

The *Furnace* is 6 feet High, 4 feet Wide, and 2 feet Thick, made of *Brick*; having a Hole in the Midst, at the Top 8 Inches over, growing Narrower towards the Bottom of it, where on the Fore-part, it ends in a small Hole, environed with a Semi-circle of *Iron*, to keep the Molten Metal. About the Middle of the Back, there is another Hole to receive the Nose of a great Pair of *Bel-lows*.

When

When the *Furnace* is *Annealed* with Charcoal and Hot, they throw two or three Shovels of Coal, to one of the fore-mention'd Stuff, and so proceed during the whole Work, which continues three *Days* and *Nights*, without Intermission. After Eight or Ten *Hours* the *Metal* begins to run; and when the Receiver below is pretty full, they lade it out with an Iron Ladle, and cast it into *Sows* in Cavities, or Forms, made with *Ashes*.

They frequently stop the *Passage Hole* with *Cinders* to keep in the Heat; and when they think a Quantity of *Metal* is melted, they Unstop the *Hole* to pass it off.

If the Stuff be hard to *Flux*, they throw in some *Slag* (which is the *Recrement* of *Iron*) to give it *Fusion*.

A stinking blue *Smoke* proceeds from the *Furnace*, and all By-standers put on the *Colour* of *Dead Men*.

To get the *Silver* from those *Metals*, and to *Refine* their *Copper* from the *Lixarge*, they now use no other Art than that of the *Test*.

4. By *Quick silver* the *Filings* of *Gold* and *Silver* are separated from *Dust*, &c. This *Dust* is put into a Hand Mill with *Quick silver*, and being continually Turned upon that and the *Metals*, an *Amalgama* is made of them, and Fair Water poured in, carries off the *Dust* as it runs out again by a small Quill.

This *Amalgama* is put into an *Iron*, with a *Bolt-head* set into the *Fire*, having a long *Iron Neck* 3 Feet long, to which is fitted a *Receiver*. The *Fire* *Distills* off the *Mercury* into the *Receiver*, and the *Gold* and *Silver* remains in the *Bolt head*.

REFLECTED *Dialling* is the Art of describing Hour lines, Azimuths, Parallels of Declination, or of Altitude, &c. and all the Furniture of Dials; on such Places as the *Sun's* direct Rays can never come to directly, but only by the help of some reflecting Surface; as suppose on the Ceiling of a Room, &c. where the Beams may be reflected by a piece of Looking Glass placed on the Board, Stool or Transome of a Window; or other convenient place: And this may be done either by a Glass placed Horizontally, or at oblique Angles to the Horizon.

1. If the Glass be placed Horizontally, you may, by the following Method, upon any Wall or Ceiling of a Room, where that Glass can reflect a Spot of Light, draw true Hour Lines, Furniture, &c. tho' the Surface be never so irregular, as convex, concave, or of any form whatsoever.

First, draw on Past board or other Material, or get made in Brass an Horizontal Dial for the Latitude proposed.

Then by the help of the Azimuth, or at the time when the Sun is in the Meridian; or by knowing the true Hour of Day, whereby may be drawn several Lines on the Ceiling, Floor, and Wall of the Room; so as in respect of the Centre of the Glass they may be in the true Meridian-circle of the World: For if right Lines were extended from the Centre of the said Glass by any Point, though elevated in any of those Lines so drawn, it would be directly in the Meridian circle of the World.

Now all reflective Dialling is performed from that Principle in Opticks, which is, That the Angle of Incidence is equal to the Angle of Reflection. And as any direct Dial may be made by help of a Point

found in the direct Axis, so may any reflected Dial be also made by help of any Point found in the reflected Axis.

And in regard the reflected Axis for the most part will fall above the Horizon of the Glass without the Window, so that no Point there can be fixed, therefore a Point must be found in the said reflected Axis continued below the Horizontal of the said Glass, until it touch the Ground or Floor of the Room in some part of the Meridian formerly drawn, which Point will be the Point in the reversed Axis desired, and may be found, as followeth.

One End of the Thred being fixed at or in the Centre of the said Glass, move the other End thereof in the Meridian formerly drawn below the said Glass, until the said reversed Axis be depressed below the Horizon, as the direct Axis was elevated above the Horizon, which may be done by applying the Side or Edge of a Quadrant to the Thred, and moving the End thereof to and fro in the said Meridian, until the Thred with a Plummert cut the same Degree as the Pole is above the Horizontal Glass, and then that Point where the End of the Thred toucheth the Meridian either on the Floor or Wall of the Room, is the Point in the reflected reversed Axis sought for.

Now if the reversed Axis cannot be drawn from the Glass by reason of the jetting of the Window or other impediment, that Point in the reverse Axis may be found by a Line parallel thereto, by fixing one End of it on the Glass, and the other End in the Meridian, so as that it may be parallel to the Floor or Wall in which the reversed Axis point will fall, and find the Axis point from that other End of the Lath: so if the same Distance be set from that Point backward in the Meridian on the Floor, as is the Lath, the Point will be found in the reversed Axis desired.

Thus having found a Point in the reflected reversed Axis; it is not hard, by help whereof and the Horizontal Dial, to draw the reflected Hour-lines on any Ceiling or Wall, be it never so concave or convex.

To do which; First note, that all straight Lines in any projection or any Plane, do always represent great Circles in the Sphere, such are all the Hour lines.

Place the Centre of this Horizontal Dial in the Centre of the Glass, the Hour lines of the said Dial being horizontal; and the Meridian of the World, which may be done by Plumb lines, let fall from the Meridian on the Ceiling: Then fix the End of a Thread or Silk in the said Centre of the Dial or Glass, and draw it directly over any Hour line on the Dial which you intend to draw at the further side of the Room, and there let one hold or fasten that Thread with a small Nail.

Then in the Point formerly found on the reversed Axis on the Floor, fix another Thread there (as formerly was done in the Centre of the Dial) then take that Thread, and make it just touch the Thread (on the Hour line of the Horizontal Dial extended) in any Point thereof, it matters not whereabouts, and mark where the End of that Thread toucheth the Wall or Ceiling, and there make some Mark or Point.

Then again move the same Thread higher or lower at pleasure, till it, as formerly, touch the said same Hour Thread, and mark again whereabouts on the Wall or Ceiling, the End of the said Thread also

also toucheth. In like manner may be found more Points at pleasure, but any two will be sufficient for the projecting or drawing any Hour-line on any Plane, how irregular soever. For if you move a Thread, and also your Eye to and fro, until you bring the said Thread directly between your Eye and the Points formerly found, you may project thereby as many Points as you please at every Angle of the Wall or Ceiling, whereby the reflected Hour-line may be exactly drawn.

Again, in like manner remove the said Thread fastned in the Centre of the Horizontal Dial, (which also is the Centre of the Glass) on any other Hour-line desired to be drawn, and as before fasten the other End of the Thread, by a small Nail, or otherwise at the further Side of the Room, but so that the said Thread may lie just on the Hour-line proposed to be drawn on the Horizontal Dial. Then (as before) take the Thread fastned in the Point on the reflected Axis, and bring it to touch the Thread of the Hour-line in any part thereof, and mark where the End of that Thread toucheth the said Wall or Ceiling: Then again (as before) move the said Thread so, as that it only touch the said Thread of the Hour-line in any other part thereof, and also mark where the End of that Thread toucheth the said Wall or Ceiling: So is there found two Points on the Wall or Ceiling, being in the reflected Hour-line desired, by help of which two Points the whole Hour-line may be drawn; for if (as before) a Thread be so situated, that it may interpose between the Eye and the said two Points found, you may make many Points at pleasure, whereunto the said Thread may also interpose, which for more Conveniency may be made at every Angle or bending of the Wall or Ceiling, be they never so many: So that if Lines be drawn from Point to point, that said reflected Hour-line will be also exactly drawn.

In like manner may the Hour-lines be drawn so, that the Reflex or Spot of the Sun from the said Horizontal Glass situated in the said Window (as before) shining amongst the said reflected Hour-lines drawn on the Wall or Ceiling, will exactly shew the Hour of the Day desired.

Now if Lines be drawn round about the said Room, equal to the Horizon of the said Glass, it will shew when the Sun is in or near the Horizon.

To draw the Equator and Tropicks on any Wall or Ceiling to any Horizontal reflecting Glass.

1. *To draw the reflected Equator or Equinoctial line on the Wall or Ceiling, which represents a great Circle.*

Take the Thread fixed in the Centre of the Glass, and move the End thereof to and fro in the Meridian-line drawn on the Ceiling, until by help of a Quadrant the said Thread be elevated equal to the Complement of the Latitude, (which will be always perpendicular to the reversed Axis) marking in the Meridian where the end of that Thread falls; then on that Point and the said Meridian line on the Ceiling erect a perpendicular Line, which Line may be continued on any Plane whatsoever, and is the reflected Equinoctial-line desired.

Note that all great Circles are right Lines, and are always drawn or projected from a right Line.

2. *To draw the Tropicks. Note, that all Parallels of Declination are lesser Circles, and are Conick Sections.*

First, make or take out of some Book a Table of the Sun's Altitude for each Hour of the Day calculated for the Place of the Latitude proposed, when the Sun is in either of the Tropicks. Then take the Thread fixed in the Centre of the Glass, and by applying one Side of a Quadrant to the said Thread, and moving one End of it to and fro in the Hour-line proposed, elevate the said Thread answerable to the Sun's height in that Hour, when he is in that Tropick you desire to draw, and mark where the End of that Thread so elevated toucheth in that Hour-line proposed. So may you in like manner find a several Point in each Hour-line for the Sun's height in that Tropick, whereby a Line may be drawn on the Wall or Ceiling from Point to point formerly made in the said Hour-lines, which is the Tropick desired.

In like manner may any Parallel of Declination be drawn: If there be first calculated a Table of the Sun's Altitude at all Hours of the Day, when the Sun hath any Declination proposed, whereby may be drawn either the Parallels of the Sun's place, or the Parallels of the Length of the Day.

To draw the Parallels of Declination to any reflected Glass most easily, by help of a Trigon first made on Past-board or other Material.

Fix the Trigon to the reflected reversed Axis, so that the Centre of the Trigon may be in the Centre of the Glass, then will the Equinoctial on the Trigon be perpendicular to the said Axis: Then take the Thread fixed in the Centre of the Glass, and lay it along either of the Tropicks, or other Parallels of Declination required, which is drawn on the said Trigon, which Thread must be continued so, that the End thereof may touch any Hour-line, and on that Hour-line mark the Point of Touch, the Thread being still laid on the same Parallel of Declination on the Trigon: In the same manner find a Point in each Hour-line. Lastly, draw a Line by those Points so found, which will be the Tropick-line or other Parallel of Declination, as the Thread was laid on, on the Trigon.

To draw the Azimuth-lines on any Wall or Ceiling to any Horizontal reflecting Glass. Note, that all Azimuths are great Circles.

First, find a Vertible-point, either above to the Zenith, or below to the Nadir of the Glass (by some called a Perpendicular or Plumb-line) and mark in what Point it cuts the Floor of the Room, which Point I call the reflected Vertical-point, wherein the End of a Thread is to be fixed: For by a Point found in the reflected Axis of the Horizon the Azimuths may be drawn, as by a Point found in the reflected Axis of the Equinoctial the Hour-lines may be drawn.

Then on Past-board or other Material draw the Points of the Compass or other Degrees, and fix the Centre thereof in the Centre of the Glass, and the Meridian thereof in the Meridian of the World,

as was shewn in drawing the Hour-lines, being careful to place it Horizontal.

Then take the Thread fixed in the place of the Glass, and draw it over any Azimuth, which is desired to be drawn, and at the further side of the Room fasten that Thread with a small Nail as it was in drawing the reflected Hour-lines: Then take the Thread whose End is fastened in the said reflected Vertical-point, and bring that Thread so as just to touch the said Horizontal Thread, and augment it, until the End thereof touch the Wall or Ceiling, and there make a Mark or Point. In like manner, move the said Thread, whose End is fasten'd in the said Vertical-point, higher or lower at pleasure, till as formerly it touch the said Horizontal Thread, and mark again whereabouts the End thereof toucheth the said Wall or Ceiling: Now by help of these two Points found in the reflected Azimuth-line, the whole Azimuth-line may be drawn; for if (as before in drawing the Hour-lines) a Thread be so situated, that it may interpose between the Eye and the said two Points, you may make many Points at pleasure to which the said Thread so situated may also interpose, which may be made at every Angle or bending of the Wall or Ceiling (as before) whereby the reflected Azimuth line desired may be drawn. In like manner may the other reflected Azimuth lines be drawn.

Also there may be Lines drawn parallel to the Horizon round about the Room, by help of the Thread fixed in the Centre of the Glass, and a Quadrant for the Elevation thereof, which will shew the Sun's Altitude at any appearance thereof.

Thus have I shewed the drawing of a reflected Dial from an Horizontal Glass, with all the usual Furniture thereon, though the Wall or Place on which it is to be drawn, be never so gibbous or irregular, or in what shape soever.

Now the Glass may be exactly situated Horizontal, if you draw a reflected Parallel for the present Day, and know also the true Hour, and so place the Glass, that the Spot or Reflex of the Sun may fall thereon on the Ceiling, for there is no way by an Instrument to do it, the Glass is so small.

2. If the Glass be placed *obliquely*, and not parallel to the Horizon, it will *recline* with some Angle from the Zenith, and then to draw the reflected Dial true, these two Things are principally to be considered.

1. The Reflected Horizon.
2. The Reflected Meridian.

Note the Horizon and Meridian are two great Circles.

1. To draw the reflected Horizon according to the Situation of any reclining Glass whatsoever.

First, let two Pieces of nealed Wire be fastened on the Window on each side of the said Glass, the Ends thereof being without the Room in the Air, at whose Ends let there be fastened a Thread which may be pulled straight at pleasure, by bending of the Wire, then bend those Wires upward or downward, until the Thread fastened at the End

of each Wire be exactly Horizontal with the Centre of the Glass, which may be tried by a Quadrant: Then I tie a String or Thread cross the Room, in such a Sort that I may from most part of the Thread see the reflecting Glass, and therein the said Horizontal Thread without the Room: Then on the said Thread cross the Room, I tie a slipping Knot to move to and fro at pleasure, which Knot I move to and fro on the said Thread, until by looking in the said Glass I find from my Eye the said Knot and part of the Horizontal Thread without, all as it were in a right Line, the one interposing the sight of the other. Then being careful to keep the Knot in that position, fasten one End of a Thread in the place of the Centre of the reclining reflecting Glass, and bring that Thread so, as just to touch the aforesaid Knot, augmenting that Thread, until the End thereof touch the Wall or Ceiling, and there make a Mark or Point; so is there one Point found on the Wall or Ceiling in the reflected Horizon of the World. Then I begin again, and remove the position of that Thread (which went overthwart the Room) either higher or lower at pleasure, still having regard that I may from the most part of the said Thread see the reflecting Glass, and therein the same Horizontal Thread without the Room. Then, as before, I move the said Knot on the said Thread to and fro, until (as before) by looking in the said Glass I find from my Eye the said Knot, and part of the Horizontal Thread both in one right Line, the one interposing the sight of the other; and by the said Knot I bring the Thread, whose End is fastened in the Centre of the said Glass, and keeping it just to touch the said Knot, I continue it, until the End thereof touch the Wall or Ceiling, as before, and there I make another Mark or Point; so is there two Points found in the said reflected Horizon on the Wall or Ceiling. By which said two Points, if a Thread (as before) be so situated, that it may interpose between the Eye and the said two Points, there may be many Points to be in the same Interposition of the Thread, which (as before) may be made at every bending or Angle of the Wall or Ceiling, whereby the reflected Horizon desired may be drawn, by drawing a Line from point to point round about the Room; which will be the true reflected Horizon according to the Situation of the Glass.

2. To draw the Reflected Meridian, according to the Situation of any Reclining Glass whatsoever.

First, take a Lath or thin Piece of Wood of any convenient Length at pleasure, as some one and an half, or two Foot long, and at each End thereof make a Hole, the one to hang a Thread or Plumbet, and the other is to put a small Nail therein to fasten it in some part of the Window over the Centre of the Glass, so that the Thread and Plumbet may hang without the Room: Then by help of the Sun's Azimuth you may draw the Meridian-line, (as before) as if the Glass were horizontal, and move the Lath with the Thread and Plumbet at the End of it to and fro, until the Thread and Plumbet be in the direct Meridian of the World with the Centre of the Glass. Then (as before) tie a Thread cross the Room, in such sort that from or by some part of the said Thread both the reclining Glass and the Thread to which the Plumbet is fastened may be seen at one Time. Then

(as

(as before) on the said Thread, which crosses the Room, I tie a slipping Knot, which I move to and fro on the said String, until by looking in the said Glass I find from my Eye the said Knot and some part of the perpendicular Thread without, all as it were in one right Line, the one shadowing or interposing the sight of the other; being then very careful to keep that Knot in the same Position, then take the Thread (the End whereof being fastened in the said Centre of the Glass) and bringing it just to touch the said Knot, I augment that Thread, until the End thereof touch the said Wall or Ceiling, and the said Thread also touch the Knot, as before: Then in that place where the End of the said Thread toucheth the Wall or Ceiling, I make a Mark, which Mark or Point will be directed in the reflected Meridian of the World, according to the Situation of that Glass. Then again I remove that Thread, (overthwart the Room) on which the said Knot is, either higher or lower than it formerly was, at pleasure, still having regard that from some part of the said Thread within, you may see both the reclining Glass and the perpendicular Thread without at one Time; and (as before) move the said slipping Knot on the said Thread, until by looking in the said reclining Glass, you see the said Knot and some part of the perpendicular Thread without in one right Line, so as the one shadows or hinders the sight of the other, (as before) which Knot then must not be removed from its Situation; then take that Thread (whose End is fastened in the Glass) and bring it to touch that Knot, the End of the said Thread being continued to touch the Wall or Ceiling: so is that Point of Touch on the Ceiling another Point found in the reflected Meridian of the World. So is there two Points found in the said reflected Meridian on the Wall or Ceiling; by which, if a Thread (as before) be so situated, that it may interpose between the Eye and the said two Points, many Points thereby in the said reflected Meridian may be made at every Bending or Angle of the Wall or Ceiling, whereby the reflected Meridian desired may be drawn, by drawing a Line from Point to point obliquely in the Room, which will be the true reflected Meridian of the World, according to the Situation of that Glass.

Now this reflected Horizon and Meridian being first drawn, they will be of great use in drawing the Hour-Lines, together with all the Furniture that possibly can be drawn on any Dial.

To draw the Reflected Hour-Lines to any Reclining Glass on any Plane whatsoever, that the Sun will be reflected on: By help of an ordinary Horizontal Dial for that Latitude.

First, extend several Threads from the Centre of the Glass to the extremity of the reflected Horizon in the Room (which for more Conveniency and Use may be the several Hour-lines, and may also serve as a Bed to situate the Horizontal Dial on the reflected Horizon) having regard to situate the Centre of the Dial on the Centre of the Glass, and the Meridian of that Dial on the reflected Meridian of the World: Then to find the Point in the reflected reversed Axis on the Floor of the Room: Take a Thread, one End thereof being

fastened in the Centre of the Glass, and move the other End thereof to and fro in the reflected Meridian under the reflected Horizon, until by help of a Quadrant the said Thread is found to be depressed under the reflected Horizon, equal to the Latitude of the place, and where the End of the said Thread intersects or meets the reflected Meridian either on the Floor or Wall, that Point is the reflected reversed Axis, as was required. In which Point fasten one End of a Thread, which Thread will be of great use in drawing the reflected Hour-lines on any Wall or Ceiling whatsoever. Now if this Thread, whose End is fastened in a Point on the reflected reversed Axis, be taken and brought to touch any part of any one of the Threads of the Hour-lines (produced to and fastened in the reflected Horizon) the said Thread being continued so, as the End thereof may touch the Wall or Ceiling, and also any part of the said Thread touch the Hour-line or Thread proposed; that Point on the Wall or Ceiling is in the reflected Hour-line desired to be drawn: Also the other Point in the same reflected Hour-line may be found; if the said Thread, whose End is fastened in the reflected Axis, be brought to touch some other part of the same Hour-thread proposed; so that when (as before) the End of the said Thread toucheth the Wall or Ceiling, some part of that Thread may also touch the Hour-line desired, which Point or Touch on the Wall or Ceiling, is also another Point in the said reflected Hour-line desired. By which two Points so found (as before) the reflected Hour-line may be drawn by a Thread, projecting from those Points from the Eye, as it was formerly directed in drawing the reflected Hour-lines to an Horizontal Glass.

To draw the Reflected Equinoctial-line, and also the Tropicks on any Wall or Ceiling, to any Reclining Reflecting Glass.

1. *To draw the Reflected Equinoctial-line on the Wall or Ceiling.*

Take that Thread, whose End is fastened in the Centre of the reclining Glass, and move the other End thereof to and fro in the said reflected Meridian formerly drawn, until (by help of a Quadrant) the said Thread is elevated above the reflected Horizon formerly drawn, equal to the Complement of the Latitude, (which as before will be always perpendicular to the reversed Axis) and make a Point in the said reflected Meridian, where the End of the said Thread toucheth; then on that Point and the said reflected Meridian on the Ceiling, raise a perpendicular Line, which is the reflected Equinoctial-line desired.

2. *To draw the Reflected Tropicks, or other Parallels of Declination.*

First, (as before) make or take out of some Book or Table of the Sun's Altitude for each Hour of the Day, calculated for the Place of Latitude proposed, when the Sun is in either of the Tropicks, or other parallel of Declination: Then take that Thread, whose End is fastened in the Centre of the Glass, move the other End thereof to and fro in the Hour-line proposed, until by applying one side of a Quadrant to the said Thread you find

find the said Thread elevated above the reflected Horizon answerable to the Sun's height in that Hour proposed, when he is in that Tropick or Degree of Declination proposed. Which Altitude required will be found in the foresaid Table for that End calculated, which said Thread being of the Elevation above the reflected Horizon, as the said Table directeth: Then mark where the End of the Thread (so elevated) toucheth the Wall or Ceiling in that Hour line: So is one Point found in the reflected Parallel of Declination desired to be drawn. In like manner, find in the said Table in the same Parallel or Degree of Declination what Altitude the Sun hath at the next Hour, and elevate the said Thread, whose End is fastened in the Centre of the Glass, equal to the Sun's Altitude in that Hour above the said reflected Horizon, by help of the said Quadrant, and where the other End of the said Thread falleth in the Hour-line proposed, make another Mark or Point. And so in like manner make the Points (belonging to that Parallel of Declination) in the remaining Hour-lines, according to the several Altitudes found in the said Table of Altitudes: Then drawing by hand a Line to pass through those several Points so found as before, which Line is the reflected Parallel of the Sun's Declination desired. In like manner may be drawn all or any other Parallel of Declination, which may have respect to the Sun's place, or the Length of the Day, as shall be desired.

Or,

To draw the said reflected Tropicks, or other Parallels of Declination, without any Tables calculated, only by help of a Trigon first made on Past board, or other Material. Note, that all Parallels are lesser Circles.

First (as formerly is shewed in drawing the Parallels of Declination to a reflecting Horizontal Glass) fasten the Trigon on the reflected reversed Axis, so that the Centre of the Trigon may be in the Centre of the Glass, then also will the Equinoctial on the Trigon be perpendicular to the said reflected reversed Axis: Then take the Thread fixed in the Centre of the said Glass (which is also in the Centre of the Trigon) and lay it upon that Parallel of Declination, drawn on the said Trigon, whose reflected Parallel is required to be drawn on the Plane or Ceiling: Then move the Trigon, the Thread lying on the said Parallel, until the End of the said Thread touch any Hour-line on the said Wall or Ceiling, in which Point of Touch on that Hour-line make a Mark, so will that Point be in the reflected Parallel of Declination desired. In like manner, move the said Trigon, still keeping the Thread on the same Parallel, until the End of that Thread touch another Hour-line on the said Plane or Ceiling, and there also make another Mark. And so in like manner find a Point in each Hour-line, through which that reflected Parallel must pass; then drawing a Line to pass through those several Points on the said Plane or Ceiling, which Line is the reflected Parallel of the Sun's Declination desired.

In like manner may be drawn any other reflected Parallel of Declination required.

To draw the Reflected Azimuth-lines to any Reclining Glass, or any Plane whatsoever that the

Sun-beams will be reflected on. Here note that Azimuths are great Circles.

First, know that the reflected Vertical-point in the Axis of the reflected Horizon, will always be found in the reflected Meridian. And look how many Degrees the reflected Horizon differs from the direct Horizon, so many must the reflected Axis of the Horizon differ from the direct Axis of the Horizon: Hence the reflected Vertical-point, whereby the reflected Azimuth-lines are drawn, may be thus found.

Take that Thread whose End is fixed in the Centre of the Glass, and move the other End thereof to and fro in the reflected Meridian, until by applying one Side of a Quadrant thereto, you find the said Thread depressed just 90 Degrees, or perpendicular under the reflected Horizon; then make a Mark or Point where the other End of the said Thread toucheth the said reflected Meridian on the Wall, Ground or Floor of the Room, which Point so found, is the reflected Vertical-point desired, in which Point fasten one End of a Thread:

Then on Past-board or other Material draw the Points of the Compass or other Degrees, placing the Centre thereof in the Centre of the Glass, and the Meridian thereof in the reflected Meridian of the World, which said Past-board must be also situated in the reflected Horizon just as the Horizontal Dial was formerly directed to be situated for drawing the reflected Hour-lines: And as the Threads from the Centre fastened in the reflected Horizon were also the Hour-lines on the Horizontal Dial, whereby the reflected Hour-lines were drawn: So now the Threads from the Centre fastened in the reflected Horizon may be the Horizontal Azimuth-lines, whereby the reflected Azimuth-lines may be drawn: Or if that Thread, which is fastened in the Centre of the Glass be drawn exactly over any Azimuth-line, the End whereof being fastened by a Nail or other Means in the reflected Horizon on the other Side of the Room, there may several Points be found in the Wall or Ceiling, through which the reflected Azimuth-line must pass, as followeth:

Take that Thread, one End of which is fastened in the said Vertical-point, and bring it just to touch the Azimuth-thread formerly fastened, and continue it until the End thereof touch the Wall or Ceiling, (and also the Thread it self touch the said Azimuth it self, as before) in which Point of Touch on the Wall or Ceiling make a Mark, thro' which Point that reflected Azimuth-line must pass. Then move the said String fastened in the said Vertical-point, so that it may just touch the said Thread again, but in another place: Then as before continue that Thread, until the End thereof touch the Wall or Ceiling again, as before, and there make another Mark, through which the said reflected Azimuth-line must also pass: In like manner may more Points be found for your further Guide, in drawing that Azimuth-line. But two Points being found will be sufficient.

To draw any Reflected Line by any two Points given over any Plane whatsoever, without projecting by the Eye.

Fasten two Threads in the place of the Centre of the said reclining Glass, drawing the said

B b b b

Threads

Threads straight, fastening each of the other Ends in the two reflected Azimuth-points formerly found on the Wall or Ceiling. Then situate a Thread cross or thwart the Room, so as it may cross those other Threads from the Centre, near at right Angles, and also just touch both of them in that Situation. By which said Thread cros the Room may any Number of Points in the said reflected Azimuth-line to be drawn, be found at pleasure: For if the End of another Thread be also fastened in the Centre of the said Glas, making the other End thereof to touch the Wall or Ceiling, but so that it may also just touch the said Thread, which is fastened cros the Room, which Point of Touch on the said Wall or Ceiling is another Point in the said reflected Azimuth-line required to be drawn. In like manner may more Points be found at every Angle or Bending of the Wall or Ceiling for the exacter drawing the reflected Azimuth-line required, which doth find Points, whereby is drawn the same reflected Azimuth-line (or other Lines) as was formerly done by a Thread so situated, that it may interpose between the Eye and any two Points assigned on the Wall or Ceiling.

In like manner, if the Thread fastened on the further Side of the Room were removed to another Azimuth-line on the said Past-board, and then fasten it again on the further Side of the Room (as before) you may by help of the said Thread, fastened in the said Vertical-point, find several Points on the Wall or Ceiling, thro' which that Azimuth-line will pass: So may you either by this or the former way draw what Azimuth-lines you please, either in Points of the Mariner's Compass or Degrees, as you please, by drawing it first on Past-board, as before is directed.

And note generally, that such Relation the point found on the Floor or Ground in the reflected reversed Axis, hath to the Hour-line drawn on the Horizontal Dial, in drawing the reflected Hour-lines: The same hath the reflected Vertical-point found on the Floor or Ground, to the Azimuths drawn on the Past-board in the drawing the reflected Azimuth-lines.

To draw the Reflected Parallels of the Sun's Altitude, or Proportions of Shadows to any Reclining Glas on any Plane whatsoever, that the Sun-beams be reflected on. Here note, that Parallels of Altitude are lesser Circles, therefore are not represented by a Right-line.

First, know generally that what respect the Parallels of Declination have to Hour-lines, such have the Parallels of Altitude to the Azimuths.

For if one End of a Thread be fastened in the Place of the Centre of the reclining Glas, and the other End moved to and fro in any reflected Azimuth-line, until the said Thread be elevated any

Number of Degrees proposed above the reflected Horizon (the Elevation of which Thread being found, by applying a Quadrant thereto) and making a Mark or Point where the End of the said Thread toucheth the said reflected Azimuth drawn on the Wall or Ceiling, that Point so found is the Point through which that Almicanter or reflected Parallel of the Sun's Altitude must pass.

In like manner, remove the other End of the said Thread fastened in the Centre of the Glas to another reflected Azimuth-line, and (as before) move it higher or lower, until by applying the Edge of a Quadrant to that Thread, you find the said Thread above the reflected Horizon on the same Number of Degrees first proposed, and at the End of the said Thread in that reflected Azimuth-line drawn on the Wall or Ceiling, I make another Mark or Point, through which the same reflected Almicanter or Parallel of Altitude must also pass: And so in like manner I find a Point on each reflected Azimuth-line, through which the same Parallel of Altitude must pass. Then drawing by hand a Line to pass through these several Points so found, as before, that Line is the reflected Parallel of the Sun's Altitude proposed. In like manner may be drawn all the other Parallels of Altitude desired, which will shew the Sun's Altitude or the Proportion of any Shadow to its Altitude, at any Appearance of the Sun's Reflexion thereon.

To draw the Jewish or old Unequal Hour-lines to any Reclining Glas on any Plane whatsoever that the Sun-beams will be reflected on. Here note, that the Jewish Hour-lines are great Circles.

First, (by the Rules formerly given) draw two reflected Parallels of Declination of 16 deg. 55', the one being near the Summer, and the other near the Winter-Tropicks: For when the Sun hath that Declination, the Day is 15 Hours long in the Summer, and 9 in the Winter: Then (as is formerly directed) situate a Thread just between the Eye, and those three Points in the said reflected Dial, as is expressed in the ensuing Table, so may you thereby draw all or any of those Jewish Hour-lines desired, which will at any Appearance of the Spot by the Reflex of the Glas amongst those Hour-lines, shew how many of the Equal Hours is past since Sun-rising, as was desired. Now in this Latitude of 51 deg. 30'. If the Parallels of the Sun's Declination be drawn, both when the Day is 9 and 15 Hours long, that is, when it is 16 deg. 55', any of those Jewish Hour-lines will intersect the common Hour-lines, either upon the Hours, Half-hours, or Quarters. And such a Declination may be found, that it shall so do in any Latitude desired.

Unequ. Hours.	15		Equal H.	9		Unequ. Hours.	15		Equal H.	9	
	H.	M.		H.	M.		H.	M.		H.	M.

6	12	00	12	12	00	12	7	30	6	4	30

REFLECTING *Telescope*. See *Telescope*.

REFLECTION, is a Power the Human Mind hath of perceiving its own Operations, within it self, when it is employed about the *Ideas* it hath before gotten by Sensation; which *Operations*, when we come to reflect and consider on them, do furnish our Understanding with a great Number of Ideas, which could not be had by bare Sensation, of things without us: Such as Perception, Thinking, Believing, Doubting, Reasoning, Knowing, Willing, &c. and all the differing Actions of the Mind.

REFLECTION in the Pythagorean or Copernican System is the Distance of the Pole from the Horizon of the Disk; which is the same thing as the Sun's Declination in the Ptolemaick Hypothesis.

REFLEXIBILITY of the Rays of Light is their Disposition to be turned back into the same Medium, from any other Medium on whose Surface they fall; and therefore those Rays are more or less reflexible, which are returned back more or less easily.

As if Light pass out of Glass into Air, and by being enclined more and more to the common Surface of the Glass and Air, begins at length to be totally reflected by that Surface; those Sorts of Rays which at like Incidences are reflected most copiously; or by inclining the Rays begin soonest to be totally reflected, are most reflexible. *Newton's Opticks*, p. 2.

There is the same constant Relation between Colour and Reflexibility: Light of a violet Colour being in like Circumstances reflected at least Thickness of any Plate or Bubble; (see *Obs.* 13, 14, and 15, compared with 4 or 18th) The red Rays at the greatest Thicknesses; and the intermediate Colours at intermediate Thicknesses: So that the colorick Properties of the Rays must be connate with them, and immutable.

REFORM, to reform in a Military Sense is to reduce a Body of Men either by disbanding the Whole, or only breaking a Part, and retaining the Rest, or sometimes by incorporating them in other Regiments. So that a

REFORMED Officer is one whose Troop or Company is broke, and he continued in either whole or half Pay, doing Duty in the Regiment.

REFRACTED Dials are such as shew the true Hour only, by the means of some Refracting Transparent Fluid: As thus,

If you stick up a Pin or Stick, or assign any Point in any Concave, Bowl, or Dish, to shew the Hour, and make that the Centre of your Horizontal Dial; (see *Reflected Dialling*) assigning the Meridian Line on the Edges of the Bowl, point out the rest of the Hour-line also on the Edges of the Bowl, and taking away the Horizontal Dial, elevate a String, or Thread from the End of the said Pin fastened thereto over the Meridian Line, equal to the Latitude or Elevation of the Pole of the Place: Then with a Candle, or by bringing the Thread to cast a Shadow on any Hour-point formerly mark'd out on the Edges of the Bowl, that Shade in the Bowl is the true Hour-line; and if the Bowl be full of Water, &c. When this is done, it will never shew the true Hour by the Shadow

of the Top of the Pin, but when filled again with the same Liquor.

REFRACTION, Sir *Is. Newton* in his *Opticks* p. 56, 57, 58. On this Natural Supposition that Bodies refract Light by acting upon its Rays in Lines perpendicular to their Surfaces, demonstrates: That the Sine of Incidence of every Ray of Light considered apart, is to its Sine of Refraction in a given Ratio. See Incidence.

And as he shews that the Sun's Light consists of Rays of different Degrees of Refrangibility; so p. 61. he proves that the Difference of the Refraction of the least Refrangible and most Refrangible Rays is about the $27\frac{1}{2}$ Part of the whole Refraction of the mean refrangible Rays; and that in some Refractions, the Refraction of the least to that of the most refrangible Rays, is very nearly as 27 to 28.

Then in Book 2. Part 3. He demonstrates that Bodies reflect and refract Light by one and the same Power variously exercised in various Circumstances, (see Reflexion) and then he comes to this Proposition; That if Light be swifter in Bodies than in *vacuo*, in the Proportion of the Sines which measure the Refraction of those Bodies, then the Forces of the Bodies to reflect and refract Light, are very nearly proportional to the Densities of the same Bodies; excepting that unctuous and sulphureous Bodies refract more than others of the same Density. Of this at p. 73. he gives a Table, and compares the refracting Power of many Bodies with that of the Air.

And the Refraction of the Air is determined by that of the Atmosphere observed by Astronomers, and he shews that the whole Refraction of Light in passing thro' the Atmosphere, from the highest and rarest Part of it down to the lowest and densest, is equal to the Refraction it would suffer, in passing at like Obliquity out of a Vacuum immediately into Air of equal Density, with that in the lowest Part of the Atmosphere.

In particular he shews there, That the Refractions of a *Pseudo Topaz*, a *Selenitis*, Rock Chrystal, Island Chrystal, vulgar Glass, (i. e. Sand melted together) and Glass of Antimony; which are terrestrial stony Alcalizate Concretes; and of Air, (which probably is the Result of such Substances by fermentation) tho' these Substances be very differing from one another in Density, yet have they their refracting Powers almost in the same Ratio to one another as their Densities are: Excepting that the Refraction of that strange Substance, *Island Chrystal*, is a little greater than the Rest. And particularly Air, which is 3400 Times rarer than the *Pseudo Topaz*, and 4200 Times rarer than Glass of Antimony, hath, notwithstanding its Rarity, the same refracting Power in respect of its Density, which those two very dense Substances have in respect of theirs; excepting so far as those two differ one from another.

Again, the Refraction of Camphire, Oil Olive, Line seed, Oil, Spirits of Turpentine, Amber, which are fat sulphureous Bodies; and a Diamond, (which probably is an Unctuous Substance coagulated) have their refractive Powers in proportion to one another as their Densities; without any considerable Variation.

But the refractive Power of these Unctuous Bodies is 2 or 3 Times greater in respect of their

Densities, than the refractive Powers of the former Substances in respect of theirs.

Water hath a refractive Power in a middle Degree between those two Sorts of Substances, and probably is of a middle Nature; for out of it grow all vegetable and animal Substances, which consist as well of sulphureous, fat and inflammable Parts, as of earthy, lean, and alcalizate Ones.

Salts and *Vitriols* have refractive Powers in a middle Degree between those of earthy Substances and Water; and accordingly are composed of those two Sorts of Substances; for by Distillation and Rectification of their Spirits,

Spirits of Wine have a refractive Power in a middle Degree between those of Water and oily Substances; and accordingly seems to be composed of both, united by Fermentation: The Water, by means of some Saline Spirits with which it is impregnated, dissolving the Oil, and volatilizing it by the Action; for Spirit of Wine is inflammable by means of its oily Parts; and being distilled often from Salt of Tartar, grows by every Distillation more and more aqueous and flegmatick.

So that it seems rational to attribute the *Refractive Power of all Bodies chiefly, if not wholly, to the sulphureous Parts with which they abound.* For it's probable that all Bodies abound more or less with Sulphurs. And as Light congregated by a Burning Glass, acts most upon sulphurous Bodies, to turn them into the Fire and Flame; so, since all Action is mutual, Sulphurs ought to act most upon Light: And that the Action between Light and Bodies is mutual, appears from hence, that the densest Bodies which refract and reflect Light most strongly, grow hottest in the Summer Sun, by the Action of the refracted or reflected Light.

At the End of his Latin Edition of the Opticks under Query 21. He shews that the Cause of *Refraction* (and Reflexion both) is the Attraction of the Parts of the refracting Body, acting at a little distance, upon the Rays of Light as they pass thro' it.

And because the Particles which compose the *Island Chrystal* (see *Light*) do all act by a *conformable Ratio*, on the Rays of Light in order to produce that *Unusual Refraction*, which is observed in that odd Body: Therefore 'tis probable that those Particles in the forming the Parts of that Chrystal, were not only disposed themselves in *certain Order*, so that their Extremities all looking the same way, they did concrete into regular Figures; but also that their *Sides*, that is such as were homogeneous as to their attracting Forces, by a kind of *Polar Virtue* or *Polarity*, were all turned the same way.

The same Excellent Author shews Optic. Lat. p. 316. That having demonstrated in his *Principia*; that if Refraction were caused by the Attraction of the Rays of Light; the *Sine of the Angle of Incidence* must be to That of the refracted Angle always in a given Ratio; and this being by repeated Experience found to be true in Fact: 'tis then plain that Attraction is the Cause of the Rays of Light.

REFRANGIBILITY of the Rays of Light, Sir *Is. Newton* defines to be their Disposition to be refracted, or turned out of their way, in passing out of one Transparent Body or Medium into another; and a greater or less Refrangibility of Rays is their Disposition to be turned more or less out

of their way (in Observat. 24 of his Opticks) in like Incidences on the same Medium.

He shews also that there is constant Relation between Colours and Refrangibility: The most refrangible Rays being of a *violet Colour*; the least refrangible *Red*; and those of intermediate Colours, having proportionably intermediate Degrees of Refrangibility.

REGAL Fishes are Whales and Sturgeons, *An. 1. Eliz. c. 5.* to which some add Porpusses. The King by his Prerogative, hath every Whale cast ashore in his Dominions, unless granted to Subjects by special Words: The King himself hath the Head and Body; and the Queen the Tail to make Whale bones for her Royal Vestments.

REGALIA, are the Personal Prerogatives of a Prince; and these are either *Prerogatives of Justice*; such as his Power over *Weights and Measures*; of *Coining Money*; of *making Magistrates*, &c. or *Prerogatives of Favour*: Such as the Power of *making Communities and Colleges*, &c.

REGARDERS of the Forest } were formerly
REGARDATORES Forestæ }
a Sort of Officers, who were every Year, upon Oath, to make a *Regard*, or to make a View of the Forest Limits, and to enquire into all the Damages and Trespasses committed, and to present them at the next *Swain Mote* or *Forest Court*. *Manwood* refers their Institution to *K. Henry II.* But *Spelman* thinks the Name at least was given since; and that then they were the same with those Officers, called *Custodes Venationis*. *Dr. Kenner's Par. Antiq.*

REGIUS Professor *Anno 12. Car. 2. cap. 17.* *K. Henry* the Eighth founded five Lectures in each of our Universities, *viz.* of Divinity, Hebrew, Greek, Law, and Physick; the Readers of which Lectures are in the University Statutes, called *Regii Professores*.

REHABERE facias seisinam, quando Vicecomes liberavit seisinam de maiore parte quam deberet, is a Writ judicial mentioned, *Reg. Judic. fol. 13. 51.* and in *fol. 54.* there is another Writ mentioned of this Name and Nature.

REHABILITATION *Anno 25. H. 8. cap. 21.* was one of those Exactions mentioned in that Statute to be claimed heretofore by the Pope in England; and seems to signify a *Bull* or *Breve*, for re-inabling a spiritual Person to exercise his Function, that was formerly disabled.

RE INFORCED Ring of a Cannon, is that which is next after the *Trunnions*, between them and the *Vent*, and the *Re-inforced* part of a Gun, is from the *Bale Ring* to the *Re inforced Ring*. This part is made thicker in Metal than any other part of the Piece.

RELATION in the Law sense is the same as *Fictio Juris*, to make a Nullity of a thing from the beginning (for a certain Intent) which had Essence, *Vide Co. Lib. 3. fol. 28.* *Butler and Baker's Case*; but more plainly thus: *Relation* is where, in consideration of Law two Times, or other things are considered so, as if they were all one; and by this the thing subsequent is said to take its Effect by *Relation*, at the Time preceeding. As if *A* deliver a Writing to *B*, to be delivered to *C*, as the Deed of *A*, when *C* has paid a Summ of Money. Here when the Money is paid, and the Writing delivered; this shall be taken as the Deed of *A*, at the Time when it was first delivered. And so Bills of Parliament, to which the Queen assents on

on the *last* Day of Parliament shall *Relate*, and be of Force from the *first* Day of the Session.

RELIEF, *Relevamen*, (in Doomsday *Relevatio*, *Relevium*) was a certain Summ of Money, which the Tenant holding by Knights Service, Grand Sergeanty, or other Tenure, for which Homage or Regal Service is due; or by Soccage, for which no Homage is duely paid to his Lord at his Entrance, *Mag. Cart. c. 2. and 38. E. 1. Stat. 1. Skene de Verbor.* saith *Relief* was given by the Tenant or Vassal that was of perfect Age, after the expiring of his Wardship, to the Superior Lord, of whom he held his Lands in Knight Service: That is by *Ward* and *Relief*; for by payment thereof he *Relieves*, and as it were *relevat*, raiseth up again his Lands after they were sunk into his Superiors Hand, by Reason of Wardship, &c. See also 12 *Car. 2. c. 24.*

RELIEF, *Relevium*, was a Fine formerly paid to the King by every one that came to the Inheritance of Land held in *Capite*, or *Military Service*, to *Relieve*, or as it were to redeem their Estate, and to hold Possession of it. At first it consisted in Horses and Arms, till by the *Assise* of Arms in 27 *Henry 2.* every Man's Armour was preserved for his Heir, and the *Relief* payable in Money, of which the first Rates were determined by *Magna Charta.*

RELIEFS were payable also not only to the King as Supreme Lord, but to all Barons and Knights by those Tenants who held under them by Military Service. *Relevare* was the word for paying such *Relief*, and for obtaining by that means Possession of such Estate.

Some Customary and Servile Tenants paid a *Relief* for renewing of a *Tenure*, on the Death of the last Possessor. *Kennet's Paroch. Antiquit.*

RENEWING of *Leases and Lives*, &c. (See also *Reversions*) Tho' there be Variety of Tables extant for computing Interest and Annuities; (in this Vol.) yet till the little Book of Tables for *Renewing and Purchasing College and Church Leases*, was published at Cambridge, (and recommended by the Famous Sir *Is. Newton*) there was a Defect in this Affair. But there the Tables are not only easie and commodious, and their Construction clear; but the *Ground and Reasons* of *Renewing*, are given, from the Construction and Use of a little Table of *Reversions*; which you will find inserted here with its Use and Application under the word *Reversion*.

I have therefore given you the following, plain and easie Tables of *Renewing*, from the said Book; by the Use of which the *Renewing* of *Leases* or *Lives*, will become a clear, facile and intelligible Thing.

And altho' these Tables are only for *Leases* of 21, 20, 40, and 10 Years; yet by the Table of *Reversions* above mentioned, other Tables of *Renewing* of *Leases* for any Number of Years under 41, may be made; as by this Example will appear.

Suppose in a Lease of 31 Years, I would renew 7 Years lapsed; allowing 6 *l. per Cent.* profit. To do this, I take the Summ of the *Reversions* for 7 Years from 31 upwards (from the Table of *Reversions*) accounting 31 as 1; which Summ is 1 *l. 7 s. 7 d. 0 q.* or according to the way of accounting in the following Tables; 1 Year, 2 Quarters, 1 Month, and 5 Decimal parts

purchase; and that is the *Fine* to be paid for renewing the 7 Years lapsed, and which was sought.

And this being understood it will not be difficult to do the like for any other Number of Years, either in this or any other Lease; and according to any other Rate of Interest.

As to the Nature of the following Tables, they differ a little from Mr. *Æcroids*, in the Rate of Interest for which they are calculated.

Mr. *Æcroids* are made at 11 *l. 3 s. 6 d. $\frac{6}{7}$ per Cent.* But this Table for renewing a Lease of 21 Years, is calculated at 11 *l. 11 s. 8 d. $\frac{1}{4} - \frac{3}{10}$* , and at 5, 6, 8 and 10 *per Cent.* So the *Fine* for renewing 7 Years lapsed in a Lease of 21 Years, by *Æcroid's* Tables is 1 *l. 1 s. 3 d. (i. e.)* 1 Year, and 3 Weeks purchase: But by our Tables it is but one Years Value, at 11 *l. 11 s. 8 d. $\frac{1}{4}$, $\frac{3}{10}$ per Cent.* The Reason of which is, because the Rate of Interest is greater: But when the Rate of Interest is lesser, then the *Fine* is greater.

Thus at 10 *l. per Cent.* The *Fine* for renewing 7 Years lapsed, is 1 Year, 1 Quarters, and 1 Weeks Value: But at 8 *l. per Cent.* the *Fine* for renewing 17 Years lapsed, is above 1 Year and 3 Quarters Value; and at 6 *per Cent.* the *Fine* is 2 Years and almost an half Value.

So in the Table for renewing a Lease of 20 Years, at 12 *l. 6 s. per Cent.* The *Fine* for renewing 7 Years lapsed, is but one Years Value in these Tables; whereas in his, it is 1 *l. 3 s. 8 d.* That is one Year and above two Months Value: But at 5, 6, 8 and 10 *l. per Cent.* the *Fine* is greater, because the Rate of Interest is less, as was said above.

And that this is Right, will appear, if you consider that the Tables for *Renewing* of *Leases*, consist of the *Summs* of the Tables of *Reversion*, or *Decrease* of Money.

For 'tis apparent that the greater the Rate of Interest is, the greater is the *Decrease* of Money in the *Reversion*: And consequently the lesser are the *Summs* of those *Reversions*; which are the *Fines* for *Renewing*: An Example will make this very plain.

If you look into the Table of *Reversions*, you will find: That 1 *l.* or 20 *s.* in 40 Years, decreases to 2 Pence Half penny at 12 *l. per Cent.* compound Interest; and at 10 *l. per Cent.* it decreases to 5 Pence Farthing in 40 Years: Now the Summ of these *Reversions* for 7 Years, accounting 40 as 1; 39 as 2, &c. is but 2 *s. 1 d. 2 q.* But at 10 *per Cent.* the Summ for 7 Years is 4 *s. 2 d. 3 q.* which Summs are the *Fines* for renewing 7 Years lapsed in a Lease of 40 Years, at the Rates of 12, and 10 *per Cent.*

From whence 'tis clear and plain, that the lesser the Rate of Interest is, the greater must be the *Fine* for renewing: And the greater that Rate is, the lesser must be the *Fine*: And consequently the Difference between these Tables and *Æcroids* arises only from the different Rate of Interest, for which they were calculated.

The following Tables for renewing and purchasing of *Leases*, do shew the Value in Years, Quarters, Months, and Decimal Parts of a Month, accounting 3 Months to a Quarter, and that a Month is divided into Ten parts. And tho' this way of Division be not quite so exact, as if it were expressed in Decimals of Pounds, Shillings, Pence, &c. Yet 'tis more familiar and commodious, and the Difference is very inconsiderable, for it will never be

be above a Decimal of a Month over or under the true Value, which in these Considerations is not to be regarded. And therefore when a Fine is required of any Person, either for renewing or purchasing of a Lease, the Tables will shew exactly enough what Rate of Interest is allowed: And so if any one would give or take a Fine according to any Rate of Interest proposed, they may do it near enough by the Tables.

At 1 *l.* per An. Rent, the Divisions by these Tables will be 5 *s.* per Quarter, 1 *s.* 8 *d.* per Month, and a Decimal of a Month 2 *d.* And because there are 4 Weeks in a Month it will be 5 *d.* per Week; five Decimals of a Month therefore make 10 *d.* which are equal to 2 Weeks, and 3 Decimals of a Month are but 1 Penny above a Week; so that 'tis easie to turn the Decimal parts of a Month into Weeks.

And these Kind of Numbers will be easily added or subtracted as in these 2 Examples.

	<i>T.</i>	<i>Q.</i>	<i>M.</i>	<i>d.</i>	<i>p.</i>
Suppose I were to add	3	2	1	6	
these 2 Fines,	2	3	1	7	
Summ	6	2	0	3	

ADDITION.

I say 7 and 6 makes 13 Decimals, 10 of which making a Month, I write 3 and carry 1; 11 carried and 2 Months makes 3 Months; wherefore I write a Cypher, and carry 1 Quarter, &c.

And this being understood, Subtraction will also be easie, as in this Instance.

	<i>T.</i>	<i>Q.</i>	<i>M.</i>	<i>d.</i>	<i>p.</i>
If from	3	2	1	6	
You take	2	3	1	7	
Remains	0	2	2	9	

The first Table which offers it self for Renewing of Leases, is for the Term of 21 Years, it shews the Values in Years, Quarters, Months, and

Decimal parts of a Month, as all the Rest do: the First part of this Table is calculated at 11 *l.* 11 *s.* 8 *d.* $\frac{1}{2}$, $\frac{1}{4}$, per Cent. per An. Compound Interest, so that the Fine for Renewing 7 Years Lapsed, or the present Worth of 7 Years in Reversion, not to begin till 14 are expired, is exactly one Years Value; which Fine, and consequently Rate of Interest, Bishops, Deans and Chapters, Heads and Fellows of most Colleges in both Universities, do observe in Letting and Renewing of their Leases; but at other Rates of Interest, the Fine for Renewing 7 Years lapsed, the Table shews as followeth, viz.

The Fine for Renewing 7 Years Lapsed

	10	p.	c.	is	1	1	0	3	
						Which by the	29	3	4
						Table of Red.	24	13	4
						at 10 <i>l.</i> yearly	17	15	0
						Rent is	12	15	0

The Years *in esse* may be valued as a Lease of so many Years, as in this Lease of 21 Years, if 7 Years are run out, then there are 14 *in esse*, whose Value are as a Lease of 14 Years, and may be found by the Table for Purchasing; or if you subtract the Value of the Years in Reversion from the Value of the whole Lease, the Remainder is the Value of the Years *in esse*.

To find the Value of some of the Years in Reversion, as suppose 3 of the 7, I do thus, because 3 wants 4 of 7, I take the Value of 4 Years in Reversion, from the Value of 7 in Reversion, the Remainder is the Value of 3 Years required.

Example.

	<i>X.</i>	<i>Q.</i>	<i>M.</i>	<i>D.</i>	<i>p.</i>
The Value of 7 Years in					
Reversion, at 11 <i>l.</i> 11 <i>s.</i> 8 <i>d.</i>	1	0	0	0

The next Table is for the Term of 20 Years, the First part thereof is calculated according to the Rate of about 12 l. 6 s. per Cent. per Ann. so that 1 Years value is the Worth of 7 Years lapsed, or in Reversion; which Fine, and consequently Rate of Interest, by some is observed in a Lease for 20 Years; but at other Rates of Interest: The Fine for Renewing 7 Years lapsed in this Lease of 20 Years, you will find by the Table as followeth, viz.

The Fine for Renewing 7 Years lapsed.

r. Q. M. D. p. c.					l. s. d.				
at {	5 p. c. is	3	0	0	8	Which by the Table of Red. at 10 l. yearly Rent is	30	13	4
	6 p. c. is	2	2	1	4		26	3	4
	8 p. c. is	1	3	1	9		19	1	8
	10 p. c. is	1	1	1	8		14	0	0

The Years *in esse* may be valued as a Lease of so many Years, or their Value may be found, by subtracting the Value of the Years lapsed, from the Value of the whole Lease, as was directed before in the Lease of 21 Years.

The Value of some of the Years in Reversion may also be found in this Lease, as is directed before in the former Lease; however to make all plain, I shall give one Example: As suppose, I am to find the Value of 4 of the 7 Years in Reversion in this Lease; then according to the Rule given in the Lease of 21 Years, I do thus; because 4 wants 3 of 7, I take the Value of 3 Years in Reversion, from the Value of 7 in Reversion, the Remainder is the Value of the 4 Years required.

Example.

The Value of 7 Years in Reversion at 6 l. per Cent.				T. Q. M. D. p. c.			
				2	2	1	4
The Value of 3 Years at the same Rate is				0	3	2	9
Which subtract							
Remains				1	2	1	5

This Remainder being given for a Fine will make up this Lease to 17 Years, that is 4 added to 13.

A Table

The third Table for renewing of Leases, is for the Term of 40 Years; it is calculated according to five several Rates of Interest, and in its manner of using differs not from the other, nevertheless an Example will be convenient, which therefore I shall give; as suppose there be 14 Years lapsed or run out in a Lease for 40 Years, What must I give to make up this Lease again, according to those several Rates of Interest signified by the Table? That is, What must I give for 14 Years in Reversion, after 26 *in esse*? Or, What's the present Worth of 14 Years, beginning 26 Years hence? For answer I find by the Table that the Fine for Renewing 14 Years lapsed.

r. Q. M. D. p. c.				l. s. d.			
5 p. c. is	2	3	0	4	27	16	8
6 p. c. is	2	0	0	2	20	03	4
8 p. c. is	1	0	1	3	11	01	8
10 p. c. is	0	2	1	4	6	03	4
12 p. c. is	0	1	1	1	3	08	4

Which by the Table of Red. at 10 l. yearly Rent is

The Years *in esse*, as was said before, are valued as a Lease of so many Years, as in a Lease for 40 Years, if 14 Years are run out, then there are 26 *in esse*, whose Value are as a Lease of 26 Years, and may be found by the Table for Purchasing, &c.

The Value of some of the Years in Reversion, may be found in this Lease, by the same Rules that they were found by in the foregoing Leases; as if it were required to find the Value of 6 of the 14 Years in Reversion in this Lease of 40 Years, then because 6 wants 8 of 14, I take the Value of 8 Years in Reversion from the Value of 14 in Reversion, and the Remainder is the Value of the 6 Years required, which will make the Lease up to 32 Years.

A Table for the Renewing of any Number of Years lapsed
in a Lease for 20 Years.

This being the last Table for Renewing of Leases, is for the Term of 10 Years: The First part thereof is calculated according to the Rate of about 17 l. 18 s. per Cent. so that the Fine for renewing 4 Years lapsed is one Years Value, but at other Rates of Interest, the Fine for renewing 4 Years lapsed, is by the Table as followeth, viz. the Fine for renewing 4 Years lapsed

	Y.	Q.	M.	D.	p.	l.	s.	d.
at 5 p.c. is	2	2	1	7		26	68	4
6 p.c. is	2	1	2	3		24	68	4
8 p.c. is	2	0	1	0		20	16	8
10 p.c. is	1	3	0	4		17	16	8

The Years *in esse* are valued as before directed in the other Leases; as if there be 4 Years run out in this Lease of 10 Years, then there are 6 Years *in esse*, whose Value are as a Lease of 6 Years, &c.

The next Table is for the Reduction of the Values given in Years, Quarters, Months, and Decimal Parts of a Month, into Pounds, Shillings, and Pence, the Use of it is very plain and easie, as by Example will appear.

Example.

Suppose the Fine for renewing any Number of Years lapsed, in any Lease to be 6 y. 2 q. 2 m. 4 d.p. and the yearly Rent 55 l. What is this Fine in Pounds, Shillings, and Pence? Then by the Table I find

	l.	s.	d.
against 50 l. { under 2 Quarters	25	00	0
{ under 2 Months	8	06	8
{ under 4 Dec. parts	1	13	4
against 5 l. { under 2 Quarters	2	10	0
{ under 2 Months	0	16	8
{ under 4 Dec. parts	0	03	4
Summ of all is	38	10	0

Then for the 6 years Value I say, 6 times 55 l. is 330 l. which added to 38 l. 10 s. 0 d. the Summ is

368 00 0

Which is the Value reduced into Pounds, Shillings, and Pence required.

Suppose again the Fine for renewing any Number of Years lapsed in any Lease, to be 2 y. 3 q. 2 m. 9 d.p. and yearly Rent 156 l. then what is this Fine in Money? For Answer I say, twice 156 is 312 l. which is the 2 years Value, then by the Table I find

	l.	s.	d.
against 100 l. { under 3 Quarters	75	00	0
{ under 2 Months	16	13	4
{ under 5 Dec. parts	4	03	4
{ under 4 Dec. parts	3	06	8
against 50 l. { under 3 Quarters	37	10	0
{ under 2 Months	8	06	4
{ under 5 Dec. parts	2	01	8
{ under 4 Dec. parts	1	13	4
against 6 l. { under 3 Quarters	4	10	0
{ under 2 Months	1	00	0
{ under 5 Dec. parts	0	05	0
{ under 4 Dec. parts	0	04	0

Summ is 154 13 8

The 2 years Value add, viz. 312 00 0

The Summ is 466 13 8

Which is the Fine reduced into Money required. In like manner is any other Fine reduced, at any other yearly Rent from 1 l. to 600 l. a Year, or if it be more, it is but adding, after the same manner as is done in the Examples, as suppose the Rent to be 700 l. per Ann. then I must find the Values for 600 l. and for 100 l. and add them together, &c.

A Table for the Reduction of the Values given in Years, Quarters, Months, and Decimal Parts of a Month, into Pounds, Shillings, and Pence.

The way of purchasing by Lives was commonly to reckon one Life as a Lease of 7 Years, two Lives as a Lease of 14 Years, and three Lives as a Lease of 21 Years: But this way seeming Unequal, there is another way which is more agreeable to Reason, and it is this, viz. for every Life to decrease one Year, as if one Life be reckoned as a Lease for 10 Years, then two will be as a Lease of 19, and three as a Lease of 27 Years, &c. so that at 7 l. per Cent. one Life is reckoned worth a little above 7 Years Purchase, two Lives 10 Years, 1 Quarter, and 1 Month's Purchase, &c. as the Table for purchasing of Lives sheweth.

So if you reckon one Life as a Lease of 9 Years, then two will be as a Lease of 17, three as a Lease of 24, &c. as is evident by the Table; and one Life will be worth above 6 Years and 2 Quarters Purchase, 2 Lives 9 Years and 3 Quarters Purchase, 3 Lives 11 Years, 1 Quarter, 2 Months, and 6 Decimal parts Purchase, &c.

So if one single Life be reckoned as a Lease of 12 Years, then two will be as a Lease of 23, three as a Lease of 33 Years, &c. so that at 6 per Cent. one Life is worth above 8 Years and a Quarters Purchase, two Lives above 12 Years and a Quarters Purchase, &c. as the Table shews.

Now suppose any of those Persons which have their Lives upon an Estate should die, to take in others to make up the Number again, is done by the Table of Reversions at the Beginning of the

Vol II.

Book: Example, suppose there be three Lives upon an Estate, which at 7 Years Purchase for the first Life, are valued at almost 12 Years Purchase, and as a Lease of 27 Years, at 7 l. per Cent. and if one of those Persons should die, what must be given to make up the Number again? Then I say, one Life which is dead was as a Lease of 10 Years, and therefore to take in a New Life, I may reckon 10 Years of the 27 lapsed, and to take as it were a Fine for renewing 10 Years lapsed in a Lease of 27 Years: now to find this Fine, I take the Summ of the Reversions for 10 Years in the Table under 7 l. per Cent. counting 27 as 1, 26 as 2, and 25 as 3, &c. And so I find the Summ to be 2 l. 4 s. 5 d. 2 q. that is two Years, and almost one Quarters Purchase, which I may take for renewing or taking in a New Life; so if two Lives be dead I may reckon 19 Years lapsed in a Lease of 27 Years, and find the Summ of the Reversions for 19 Years, for a Fine for taking in two Lives: But if there be 4 Lives upon the Estate, then at 7 l. per Cent. and at 10 Years for one Life, they will be reckoned as a Lease of 34 Years, and so I must begin at 34 to summ the Reversions, or at 30 if one Life be reckoned as a Lease of 9 Years, and then if one Life be dead, I must reckon 9 Years lapsed in a Lease of 30 Years, if two Lives are dead I must reckon 17 Years lapsed in the same Lease, and if three are dead I must reckon 24 lapsed: So at 6 l. per Cent. reckon-

C c c c 2

A Table for the Purchasing of Lives.

Number of Lives.	Number of Years.	What they are worth at 7 l. per Cent.				Number of Lives.	Number of Years.	What they are worth at 7 l. per Cent.				Number of Lives.	Number of Years.	What they are worth at 6 l. per Cent.			
		Years.	Quarters.	Months.	Dec. parts.			Years.	Quarters.	Months.	Dec. parts.			Years.	Quarters.	Months.	Dec. parts.
1	10	7	0	0	3	1	9	6	2	0	2	1	12	8	1	1	6
2	19	10	1	1	0	2	17	9	3	0	1	2	23	12	1	0	6
3	27	11	3	2	6	3	24	11	1	2	6	3	33	14	1	2	6
4	34	12	3	1	1	4	30	12	1	1	8	4	42	15	0	2	7
5	40	13	2	0	9	5	35	12	3	2	2	5	50	15	2	2	7
6	45	13	2	1	2	6	39	13	1	0	1	6	57	16	0	0	8
7	49	13	3	0	2	7	42	13	1	2	4	7	63	16	0	2	8
8	52	13	3	1	3	8	44	13	2	0	6	8	68	16	1	1	2
9	54	13	3	1	6	9	45	13	2	1	2	9	72	16	1	2	0

reckoning one Life as a Lease of 12 Years, three Lives are as a Lease of 33 Years, and so if one of these Lives be dead, I may reckon 12 Years lapsed in a Lease of 33 Years, if two Lives are dead, I may reckon 23 Years lapsed in the same Lease, and begin at 33 to summ the Reversions, under 6 l. per Cent. because the Lives are valued according to the same Rate of Interest. This being understood, it will not be difficult to do the like for any other Number of Lives, and at other Rates of Interest, and Number of Years for one Life; for you may by the Table for purchasing of Leases, &c. make Tables for purchasing of Lives according to what Rate of Interest you think is most convenient; as suppose you reckon one Life as a Lease of 10 Years, and you would have 5 l. per Cent. profit, then that will be worth 7 Years and almost 3 Quarters Purchase, but at 8 l. per Cent. it is worth but 6 Years and almost 3 Quarters Purchase, &c.

The Table for purchasing is calculated for several Rates of Interest, that so the Purchaser may use that which is most convenient for him, as in purchasing of Free-hold Land, 5 l. per Cent. may be enough, but for Copy hold or Leases of Land 6 l. per Cent. for Leases of Land and good Houses 8 l. per Cent. and for Leases of ordinary Houses 10 l. or 12 l. per Cent.

The Use of the Table is very plain and easie, as by Example will appear, viz.

Example.

What is a Lease or Annuity of 20 Years worth at 5, 6, 8, 10, or 12 per Cent. per Annum?

A Lease for 20 Years at	p.c. is worth	l. s. d.			
		l.	s.	d.	
5	12	1	2	5	Which at 20 l. per Ann. Rent is
6	11	1	2	6	
8	9	3	0	8	
10	8	2	0	1	
12	7	1	2	6	

To increase the Number of Years in a Lease do thus: Suppose a Landlord would make a Lease of Land up to 40 Years, wherein his Tenant hath 20 Years to come, what is it worth? Then I say,

		l. s. d.			
		l.	s.	d.	
A Lease for 4 Years at 6 per Cent. is worth		15	0	3	}
20 Years at the same Rate are worth		11	1	2	
Which subtract					
The Remainder is		3	2	0	7

Which is the Fine to be given to make the Lease up to 40 Years.

To buy a Lease which is not to begin until your old Lease is out; as thus, suppose a Man's Lease is out within 4 Years, and he desires to have a New Lease of 21 Years, to begin when his 4 Years are out, what is this Lease worth in ready Money?

For Answer, I add 4 Years which is the Time he hath in his old Lease, and 21 together, the Summ is 25, then I find the Worth of these 25 Years, and subtract from it the Value of the 4 Years, the Remainder is the Value of the said Lease in ready Money.

Example.

T. Q. M. D. p.

A Lease for 25 Years at 6 l. per	}	12	3	0	3
Cent. is worth					
The 4 Years at the same Rate	}	3	1	2	6
are worth					

Which subtract

	}				

The Remainder is the Value of the Lease in ready

Money required,	}	viz.	9	1	0	7

A Table shewing how many Years, Quarters, Months, and Decimal Parts of a Months Purchase, any Annuity or Lease of any Land or House is worth, according to several Rates of Interest, viz. according to 5, 6, 8, 10 and 12 per Cent.

Number of Years to be purchased.	5 per Cent.				6 per Cent.				8 per Cent.				10 per Cent.				12 per Cent.

How

How to buy the Reversion of any Lease or Annuity.

Although this may be done by the Table of Reversions at the Beginning of the Book, yet I think it will not be amiss, if I shew how it may be done by the Tables of Purchasing also.

Suppose you are to buy the Reversion of a Lease after 6 Years, that is, if it be 6 Years before you commence, what is the present Worth of a Lease suppose of 30 Years at 6 per Centum? Then for Answer look the Value of the whole Lease, which

will be found to be $\begin{matrix} \text{Y.} & \text{Q.} & \text{M.} & \text{D.} & \text{p.} \\ 13 & 3 & 0 & 1 \end{matrix}$
Then find the Value of the 6 Years which will be $\begin{matrix} 4 & 3 & 2 & 0 \end{matrix}$
Which subtract

The Remainder in the Value of the Reversion required. $\begin{matrix} \text{viz.} & 8 & 3 & 1 & 1 \end{matrix}$

The Value of the Years lapsed or in Reversion of any Lease, may also be found by the Table for purchasing; for the Value of the Years *in esse*, subtracted from the Value of the whole Lease, the remainder is the Value of the Years in Reversion, as is shewed in the Preface; therefore, suppose in a Lease of 31 Years there be 12 Years lapsed, what must be given to renew this Lease again at 6 per Centum? Then I find the Value of

the whole Lease to be $\begin{matrix} \text{Y.} & \text{Q.} & \text{M.} & \text{D.} & \text{p.} \\ 13 & 3 & 2 & 2 \end{matrix}$

And because there are 12 Years lapsed, there are 18 Years *in esse* whose Value is $\begin{matrix} 10 & 3 & 0 & 9 \end{matrix}$
Which subtract

The Remainder is the Value of the Years in Reversion required, $\begin{matrix} \text{viz.} & 3 & 0 & 1 & 3 \end{matrix}$

Years.	The increase of 1 l. yearly at 6 per Cent.				The Value of 1 l. Annuity to be paid at the end thereof at 6 l. per Cent.				What Annuity 1 l. ready Money will purchase at 6 l. per Cent.			
	l.	s.	d.	q.	l.	s.	d.	q.	l.	s.	d.	q.
1	1	1	2	1	1	0	0	0	1	1	2	0

21	3	7	11	3	39	19	10	0	0	1	8	3
22	3	12	0	3	43	7	10	0	0	1	7	3
23	3	16	4	2	46	19	10	0	0	1	7	1
24	4	0	11	2	50	16	3	2	0	1	7	0
25	4	5	10	0	54	17	3	1	0	1	6	2
26	4	10	11	3	59	3	1	0	0	1	6	1
27	4	16	5	1	63	14	1	0	0	1	6	0
28	5	2	2	3	68	10	6	2	0	1	5	3
29	5	8	4	0	73	12	9	1	0	1	5	2
30	5	14	10	0	79	1	2	0	0	1	5	1

The Use of these Tables foregoing is easie, as by Example will appear.

The first is this, suppose 30 *l.* be put out for 20 Years, what will it amount unto in that time at 6 per Cent. Compound Interest?

Then I look against 20 Years, and find under the Increase of 1 *l.* &c. 3 *l.* 4 *s.* 2 *d.* which shews that 1 *l.* in 20 Years time will increase to 3 *l.* 4 *s.* 2 *d.* which I multiply by 30 thus,

	<i>l.</i>	<i>s.</i>	<i>d.</i>
30 times 3 <i>l.</i> is	90	0	0
30 times 4 <i>s.</i> is	6	0	0
30 times 2 <i>d.</i> is	0	5	0
Summ	96	5	0

That is, 30 *l.* in 20 Years time at 6 per Cent. Compound Interest, will amount to 96 *l.* 5 *s.* 0 *d.*

The Use of the Second is thus, What will an Annuity of 30 *l.* forborn 20 Years amount to in that time? Then for Answer I look against 20 Years, and under the Value of 1 *l.* Annuity, &c. I find 36 *l.* 15 *s.* 8 *d.* which 36 *l.* 15 *s.* 8 *d.* is the Value of 1 *l.* Annuity forborn 20 Years, then I multiply 36 *l.* 15 *s.* 8 *d.* by 30 *l.* thus,

	<i>l.</i>	<i>s.</i>	<i>d.</i>
30 times 36 <i>l.</i> is	1080	00	0
30 times 15 <i>s.</i> is	22	10	0
30 times 8 <i>d.</i> is	1	00	0
Summ	1103	10	0

That is, 36 *l.* Annuity forborn 20 Years will at the End of that Term amount to 1103 *l.* 10 *s.* 0 *d.*

The Use of the third Table is thus, suppose a Gentleman hath 300 *l.* by him, with which he's willing to purchase an Annuity for 20 Years. What Annuity will that purchase at 6 per Centum? For Answer, I look against 20 Years, and find under *What Annuity 1 *l.* ready Money, &c.* 1 *s.* 8 *d.* 3 *q.* which shews that 1 *l.* ready Money will purchase an Annuity of 1 *s.* 8 *d.* 3 *q.* for 20 Years, which I multiply by 300 *l.* thus,

	<i>l.</i>	<i>s.</i>	<i>d.</i>
300 Shillings are	15	00	0
300 times 8 <i>d.</i> is	10	00	0
300 times 3 <i>q.</i> is	00	18	9
Summ	25	18	9

That is, 300 *l.* ready Money will purchase an Annuity of 25 *l.* 18 *s.* 9 *d.* for 20 Years at 6 per Cent.

RENTS of *Affise* were the certain, and determined Rents of Ancient Tenants, and were paid in a set Quantity of Money or Provisions: They

were so called, because they were *affised*, and made certain; and so distinguished from *Redditus Mobiles*, or such variable Rents as did rise and fall, like the Corn-rent now reserved to Colleges.

RENTS *Resolute*, are accounted among the Fee Farm-Rents, to be sold by the Statutes of 22 *Car.* 2. c. 6. And are such Rents or Tenths as were anciently payable to the Crown from the Lands of Abbies, and Religious Houses: And after their Dissolution, tho' the Lands were demised to others, yet the Rents were still *Reserved*, and made payable to the Crown.

REPELLING Force: That there is such a thing in Nature, see *Attraction* towards the End.

REPLEVISH, Signifies in our Law the letting any one to *Main Priſe*, upon Surety, 3 *E.* 1. 11.

REPOSE, is a Term in Painting, signifying the Place where the *Masses*, or great Lights and Shadows are assembled: And this being well understood hinders the Confusion of Objects; suffering not the View to be contracted altogether, but to proceed gradually and successively without Disturbance.

REPOSITION of the Forest, was an Act whereby certain Forest Lands being made *Purſion* upon *View*; were on a *Second View* laid to the Forest again. *Manwood*, ph. 1. p. 178.

REP. *Silver*. The Ancient Servile Tenants were bound to reap their Lord's Corn: But to be acquitted from this Duty, they sometimes paid an Acknowledgment or Composition in Money, which Money was called by this Name of Rep-Silver.

REPULSE or *Reaction*. It is one of the Laws of Nature, (Sir *I. Newton's* third) that *Repuſe* or *Reaction* is always equal to Impulse or Action. That is, the Action of two Bodies one upon another, is always equal, but with a contrary Direction: in other words, the same Force with which one Body strikes upon another, is returned back by that other on it, and the Forces are impressed with Directions directly contrary. Thus if one Body press or draw another, 'tis just as much prest or drawn by it: If a Man press a Stone with his Hand, the Stone equally presses his Hand; if a Horse draw forward any Weight by a Rope, the Weight equally draws back the Horse: for the Rope being equally stretch'd both ways, acts upon both equally: So 'tis in all Blows and Strokes, the thing struck (suppose with a Hammer) strikes the Hammer with equal Force. The Iron draws the Load stone as much as the Load stone draws it; as will appear by Experiment, if you make them both float in Water. Thus also in the Descent of heavy Bodies the Stone attracts the Earth, as much as the Earth the Stone; or the Earth *gravitates* as much towards the Stone, as it doth towards the Earth. For the Motions produced by both these Gravitations are equal in *both*: Only the Stone being very inconsiderable in respect of the Bulk of the Earth, the Velocity of the Earth towards the Stone must be so too, and consequently insensible, in comparison of the Motion of the Stone towards it. And so it is Universally, in all the Actions of Bodies: For if one Body act on another, and change its Motion any manner of way, that other Body will make the same Change in the Motion of this Body, but with a contrary Direction: So that by these Actions there are made equal Changes, not of the *Velocities* but of the Motion: For the Changes made on the Velocities in contrary Directi-

thing there but stop and obstruct the *Vibrating Motions* of the Particles of Matter, in which their *Heat* and all their Energy and Active Power consists. And as it is of no use but to do Mischief, so there are no good Reasons at all to induce us to believe the Existence of any such thing as a *Materia Subtilis* in their Sense.

RESISTANCE of the Air to the Motion of Projects. In *Phil. Trans.* N. 186. There is the Measure of this given very largely and accurately by *Dr. Wallis*: He lays down at first this *Lemma*. *That the Resistance of Bodies is proportional to their Celerity*; and then branches out into all the particular Varieties that can well be imagined, and at last computing different Mediums one with another, he concludes their different Resistances to be as their Specific Gravities, obstructed from the Viscidity of the Particles of some Fluids: And also that the Specifically Heavier Project once in motion (being equally swift with another that is lighter, &c.) will move through the same Medium more strongly in proportion to its greater Intensive or Specific Gravity.

In the *Acta Eruditorum Lipsiæ* for July 1684, *Mr. G. G. Leibnitz* proposes some New Demonstrations about the Resistances of *Solid Bodies*; which are very Geometrical and Curious.

And in the *Leipsick Acts* for January 1689. He reduces his Thoughts on this Subject into a Dissertation. Entitled, A Discourse concerning the Resistance of *Mediums*, and the Motion of *Projects* in resisting Mediums.

As to the *Geometrical Considerations* of the Resistance of Bodies of different Figures in one and the same Medium: *Mr. James Bernoulli* in the *Acta Lipsiæ* for May 1693. gives these Rules.

1. If an *Isoceles Triangle* be moved in the Fluid according to the Direction of a Line which is Normal to its Base; First with the Vertex foremost, and then with its Base; the Resistances will be of the Leggs, and as the Square of the Base, and as the Summ of the Leggs.

2. The Resistance of a Square moved according to the Direction of its Side, and of its Diagonal, is as the Diagonal to the Side.

3. The Resistance of a Circular Segment (less than a Semi-circle) carried in a Direction perpendicular to its Basis, when it goes with the Base foremost, and when with its Vertex foremost (the same Direction and Celerity continuing, which is all along supposed) is as the Square of the Diameter, to the same less $\frac{1}{2}$ of the Square of the Base of the Segment.

Cor. Hence the Resistances of a Semi-circle when its Base, and when its Vertex goes foremost, are to one another in a Sefquialteral Ratio.

4. A Parabola moving in the Direction of its Axis, with its Basis, and then its Vertex foremost, hath its Resistances, as the Tangent to an Arch of a Circle whose Diameter is equal to the Parameter, and the Tangent equal to half the Basis of the Parabola.

5. The Resistances of an Hyperbola, or a Semi-Ellipsis; when the Base and when the Vertex goes foremost, may be thus computed: Let it be, as the Summ (or Difference) of the Transverse

Vol. II.

Axis, and *Latus Rectum*; is to the Transverse Axis :: So is the Square of the *Latus Rectum*, to the Square of the Diameter of a certain Circle, in which Circle apply a Tangent equal to half the Basis of the Hyperbola or Ellipsis. Then say again, as the Summ and Difference of the Axis and Parameter, is to the Parameter; so is the aforesaid Tangent to another Right-line. And further, as the Summ (or Difference) of the Axis and Parameter, is to the Axis :: So is the circular Ark corresponding to the aforesaid Tangent, to another Arch. This done, the Resistances will be as the Tangent to the Summ (or Difference) of the Right-line thus found, and that Ark last mentioned.

6. In General, the Resistances of any Figure whatsoever going now with its Base foremost, and then with its Vertex, are as the Figures of the Basis to the Summ of all the Cubes of the *Elementa* of the Basis divided by the Squares of the *Elementa* of the Curve-line.

All which Rules he thinks may be of Use in the Fabrick or Construction of Ships, and in perfecting the Art of Navigation universally. As also for determining the Figures of the Bobs of Pendulums for Clocks.

RESPECTU Computi Vice-Comitis habendo: Is a Writ for the Respiting a Sheriff's Accounts, on just Occasion delivered to the Treasurer and the Barons of the Exchequer. *Regist. fol. 139 & 179.*

RESPIRATION. How such Globules of the Blood as by uniting together in the Veins, from others too large for any Secretion, and are therefore necessarily afterwards broken on the Lungs by the Force of Respiration, *Dr. Keil* shews in his *Animal Secretion*, p. 24, &c. And to estimate the Force by which the Air is thrust out of the Lungs in Expiration he took a thin Hog's Bladder which he could easily blow up with the Breath of one Expiration; and having moistened it, that it might neither resist the Air in blowing up, nor the Weights which were laid upon it: He fix'd a small Tube, whose Diameter was $\frac{1}{10}$ part of an Inch, to the Neck of the Bladder; and then filling the Bladder with Air, he put a Weight of 2 lb. 4 z. on the Top of it: And repeating the Experiment several Times he found that this Weight squeezed all the Air out of the Bladder, through the small Tube in the Space of 25 Vibrations of a Pendulum, swinging Seconds, and by a Calculation which he there gives, he found the Force by which the Air is forced out of the Lungs at every Expiration to be equal to 100 lb. Weight: And therefore, *Action and Reaction being Equal*, the Pressure of the Air upon the Lungs every Expiration must be equal to the Pressure of 100 lb. Weight. That is, supposing the Gravity of the Air to be always the same, and the Diameter of the *Trachea* the same also in every Expiration. But since we find by the Barometer, that there is 3 Inches difference between the greatest and the least Gravity of the Air, which is the Tenth-part of its greatest Gravity; there must be likewise the Difference of 10 lb. Weight in its Pressure upon the Lungs at one Time more than at another. He thinks no one can doubt but that this Pressure of the Air on the Lungs in breathing, is sufficient to break the Globules of the Blood, and to dissolve all the Cohesions they might

D d d d

con-

contract in their Circulation through the Veins and Arteries. And when the Blood is thus dissolved and thrown out by the Heart into the *Aorta*; tis evident that the Re-union of the Particles requires more or less Time, according to their several Attractive Powers, even though they all moved with the same *Velocity*, and in the same *Direction*.

But neither doth this happen, for a Fluid moves through a Cylinder or Conical Vessel (such as the Arteries are) with a greater Velocity at the Axis, than at the Sides. And again, the Blood is thrust into the *Aorta*, by the whole Force of the Heart: And Fluids when they are pressed, press *undequaque*; by which means the Arteries are dilated, and the Blood moves not only forwards, but likewise presses perpendicular on the Sides of the Arteries: And as the Sides of the Arteries (being Elastick) return, they press the Blood from them every way, which must produce an Intestine Motion, and so hinder the Attraction of the Particles; and by this frequent and strong Cohesion of the Particles of the Blood against the Sides of the great Arteries, the Cohesions of the Particles, if any of them happen to unite, will be immediately dissolved. Again, this Intestine Motion must greatly increase on the Account that many of the Particles of the Blood are Elastick: For by this Resistance of the Sides of the Vessels, they must necessarily hit one against another, and being Elastick, reflect from one another, and so increase the Intestine Motion of the Blood.

On this Intestine Motion of the Blood its *Heat* depends; which therefore is every where proportional to the *Impetus* of the Particles against the Sides of the Vessels; supposing the Elasticity of the Particles every-where the same. But the *Impetus* of the Particles against the Sides of the Vessels decreases, as the Summ of the Cavities of the Vessels increases: And consequently where the Summ of the Cavities of the Vessels is greatest, there the Intestine Motion of the Blood is least, and the Attractive Power of the Particles (*ceteris paribus*) is greatest.

RESTITUTIO in Integrum, is a Writ of Restitution to put a Person into Re-possession of such Lands and Tenements, as whereof he had been wrongfully disseized.

RETENTION, is a Faculty of the Human Mind, whereby in Order to a farther Progress in Knowledge it keeps or retains those *Simple Ideas*, which it before received by *Sensation or Reflection*; and this is done two ways. First by keeping the *Idea*, which is brought into the Mind, for some Time actually in view, which is called *Contemplation*: And Secondly, by *Reviving* again in our Minds those *Ideas*, which after imprinting have disappeared, or have been as it were laid out of sight: And this we do, when we conceive Heat or Light, Yellow, or Sweet, the Object in which those Qualities are, being removed: And this is called *Memory*; which is as it were the common Store-house of all our *Ideas*. And our *Ideas* being nothing but *Actual Perceptions* in the Mind, which cease to be any thing, when there is no Perception of them; This *Laying up* of our *Ideas* in the Repository of the Memory, signifies no more than this: That the Mind hath a Power in many Cases, to revive Perceptions which it once had, with this Additional Perception annexed to them, *That it hath had them before*. And in this sense it is, that

our *Ideas* are said to be in our Memory; when indeed they are actually no where: But only there is an Ability in the Mind, when it will to revive them again; and as it were paint them a-new on it self.

RETRAXIT, in the Law, (so called from being the Effectual Word in the Entry,) is where the Plaintiff or Defendant comes into Court, and declares he hath *with-drawn* his Suit, and will proceed no further; and this is a Bar of all other Actions of a like or inferior Nature. The Difference between a *Retraxit* and a *Non-suit*, is that the former supposes the Plaintiff or Defendant to be actually present in Court; whereas a *Non-suit* is upon a Demand made, when he should appear, and he makes default. A *Retraxit* also is a *Bar*, but not a *Non-suit*; for then he may commence a New Action of the like Nature.

RETROGRADATION of a Planet. See an Account of the Reason of this Phenomenon, under the word *Direct*. in Vol. II.

RETROGRESSION of Curves: The same with what is otherwise called contrary Flexion; and is thus: when a Curve-line AFK is partly

Concave and partly Convex, in respect of the Right-line AB, or in respect of the determinate Point B; the Point F which separates the Concave part of the Curve from the Convex, or which is the end of the one, and the beginning of the other, is called the *Point of contrary Flexion*, when the Curve is continu'd from F towards the same side as before. But when the Curve is continu'd backwards towards A, then F is call'd the *Point of Retrogression*.

179. If we suppose the Ordinate PM to move from A towards B, and consider the various Af-

fections of the Fluxions thereof, as it moves along, it will be an easie matter to determine the Point of contrary Flexion or Retrogression.

In the first place, let AB be the Diameter of the Curve-line AMK; and let the Ordinate PM, EF be parallel between themselves; and draw the Tangents MT, FL; then tis evident, that in Curves having a point of contrary Flexion, the Inter-

Intercepted Diameter encreases continually, and the Portion of the Diameter AT Intercepted between the Tangent MT, and A the beginning of the Abscissa increases also, till the point P arrive at E, and afterwards decreases again; and hence 'tis plain, that the Portion of the Sub-tangent AT becomes a *Maximum*, when the points P and M fall in E and F.

180. But when the Curve AMF is continu'd backwards from F towards A, then the Sub-tangent AT increases continually; but the intercepted Diameter increases only, until the point T arrive in L, or until the Ordinate PM co-incides with EF; and afterwards it decreases again.

Hence to find a general Form which shall serve to Investigate the Points of contrary Flexion and Retrogression.

Suppose $AE = x$, $EF = y$; then is $AL = \frac{yx}{y}$, x ,

and the Fluxion thereof $\frac{y^2 x - y^2 x}{x^2}$ must

be $= 0$, and by Transposition, and Division (by x , supposing x an Invariable Quantity)

$\frac{y^2 x - y^2 x}{x^2} = 0$, and $\frac{-y^2 x}{x^2} = 0$, or

Infinity; and multiplying by y and dividing by

$-y$, we have $y = 0$, or *Infinity*: which for the future will serve for a General Form to find the points (F) of contrary Flexion and Retrogression; for the Nature of the Curve AFK being given, if

we find the Value of y in x , and again find the Fluxion of that Value (supposing x , to be Inva-

riable) we shall have the Value of y in x^2 , which being put equal to nothing or *Infinity*, will serve in either of these Suppositions, to find such a Value of AE, that the Ordinate EF shall intersect the Curve AFK in F the point of contrary Flexion or Retrogression.

181. The point A the beginning of x may be

so situated, that AL shall be $= x - \frac{yx}{y}$ instead

of $\frac{yx}{y} - x$, and that AL or AE may be a *mini-*
um instead of being a *maximum*, but because the consequence is still the same, and that this can create no difficulty, it shall be sufficient to observe,

That AL can never be $= x + \frac{yx}{y}$; for when the point T falls on the other side of P in respect of the beginning of x , then the Value of $\frac{yx}{y}$ will be Negative, and consequently, the Value of $\frac{yx}{y}$ will be Positive, and therefore in such a Case

$AE + EL$ is $= x - \frac{yx}{y}$.

182. The point of contrary Flexion or Retrogression may be found otherwise, in this manner:

It is evident that if x be supposed invariable, and that the Ordinate y be a flowing Quantity, then Sn is less than SH or Rm , when the Curve is Concave towards the Axis: and Sn is greater than SH or Rm , when the Curve is Convex towards the Axis. Whence it follows, that the Value of Hn or y from being Positive becomes Negative in F, the point of Inflexion or Retrogression; that is y is $= 0$, or *Infinity*.

183. And if the Curve AFK respect a single point B, then draw the Ordinates BM, BF, BM, all concurring in the given point B. Then if you draw any Ordinate as BM, and the Tangent MT intersect

intersecting BT perpendicular to BM in T, and if the point *m* be taken infinitely near to M, and the Ordinate BM, Bt a perpendicular thereto, and the Tangent *mt* be drawn; 'tis evident (if we suppose the Ordinate BM to increase as it comes to B*m*) that in F the concave part of the Curve, Bt surpasses BO, (*o* being the point where MT intersects Bt) and in the part of the Curve which is Convex towards B, Bt is less than BO; whence 'tis manifest that in F the point of contrary Flexion or Retrogression, the Value of Ot passes from being Positive to be Negative.

184. These things being premis'd: If on the Center B, and with the Radii BT, BM, the little Arches TH, MR be describ'd; then the Triangles

MR*m*, MBT and THO are similar, and the little Sectors BMR, BTH are also similar; whence

(supposing EM = *y*, MR = *x*, RM = *y*) *m* R

$$(\dot{y}) : RM (\dot{x}) :: BM (y) : BT = \frac{y \dot{x}}{y}$$

$$:: MR (\dot{x}) : TH = \frac{x^2}{y} :: TH \left(\frac{\dot{x}}{y} \right)$$

$$: HO = \frac{\dot{x}^2}{y^2}$$

And if we take the Fluxion of BT $\left(\frac{y \dot{x}}{y} \right)$

supposing *x* to be an Invariable Quantity, then is

$$Bt - BT = Ht = \frac{y^2 \dot{x} - y \dot{x} \dot{y}}{y^2} \text{ and } OH +$$

$$Ht = \frac{\dot{x}^2 + y^2 \dot{x} - y \dot{x} \dot{y}}{y^2} \text{ Now because in the}$$

point of contrary Flexion or Retrogression, Ot is either = 0, or Infinity, therefore in the said point

$$\frac{\dot{x}^2 + y^2 \dot{x} - y \dot{x} \dot{y}}{y^2} \text{ is } = 0, \text{ or Infinity, and multi-}$$

$$plying by y^2, \text{ and dividing by } \dot{x}, \text{ we have } \dot{x}^2 + y^2$$

— *y* *y* = 0, or Infinity; whence if the Nature of the Curve A FK be given, then the Value of *y*

may be found in *x*, and the Value of *y* in *x*²; and if the said Values be substituted in the general Form, there will remain one unknown Quan-

tity (*x*) and the Equation thus cleared, will serve to find such a Value of BF, that setting one foot of your Compasses in B, and with the other, at the distance BF, describing a Circle, it will cut the Curve in F, the Point of contrary Flexion or Retrogression; which was required to be done.

185. And to determine the said points another way, it must be observ'd, that in the Concave Part, the Angle P *m* E, is greater than the Angle P *m* *n*, and contrarily, in the Convex Part, the

Angle P *m* E is less than P *m* *n*, and consequently that the Angle P *m* E — P *m* *n* = E *m* *n*, or the Arch E *n*, from being Positive becomes Negative in F the point of contrary Flexion or Retrogression. And taking *x* for an invariable Quantity,

tity, the right angled Triangles HmS , Hnk are

similar; therefore $Hm (=z) : mS (\dot{x}) ::$

$Hn (-\ddot{y}) : nk = -\frac{\ddot{xy}}{z}$; and here it must be

observed, that Hn is Negative, because while

$Bm (\dot{y})$ Increases, $mR (\dot{y})$ Decreases. Now

because the Sectors PmS , mEk are similar, it

is $Bm (\dot{y}) : mS (\dot{x}) :: mE (\dot{z}) : Ek =$

$\frac{\dot{x}z}{y}$; and therefore $Ek + kn$ is $= \frac{\dot{x}z^2 - y\dot{x}y}{yz}$

and multiplying by yz , and dividing by $\dot{x}$, we

shall have $z^2 - y\ddot{y}$, or (substituting $\dot{x}^2 + \dot{y}^2$ for

z^2) because of the right angled Triangle mSn ,

$\dot{x}^2 + \dot{y}^2 - y\ddot{y}$, which passes from being Positive to be Negative, in the point of contrary Flexion or Retrogression.

And if we suppose y to be Infinite, then the

Terms $\dot{x}^2$, and $\dot{y}^2$ vanish, and are equal to no-

thing in respect of $y\ddot{y}$, and consequently the form

$\dot{x}^2 + \dot{y}^2 - y\ddot{y} = 0$, or *Infinity*, will become $-$

$y\ddot{y} = 0$, or *Infinity*, that is to say, dividing by

$-y$, $\ddot{y} = 0$, or *Infinity*; which is the form of the

first case; and this ought to be so, because the Ordinates BM , BF , BM are then parallel to one another.

Consectary 1.

186. When $\ddot{y} = 0$, then 'tis evident that the Fluxion of AL is nothing in respect of $\dot{x}$ the Fluxion of AE ; and that the two Tangents FL , fL being infinitely near each other, ought to make but one streight Line fFL .

Consectary 2.

And when $\ddot{y} = \text{Infinity}$, then the Fluxion of AL ought to be infinitely great in comparison of that of AE , or which is the same thing, the Flu-

xion of AE (or $\dot{x}$) is infinitely little in respect of that of AL ; and consequently we may draw

two Tangents FL , fL , to the same point F , comprehending the infinitely little Angle $L F f$.

Consectary 3.

In like manner, when $\dot{x}^2 + \dot{y}^2 - y\ddot{y} = 0$, 'tis evident that, ot ought to be equal to nothing in respect of MR ; and consequently, that the two Tangents MT , mt , infinitely near each other, must Co-incide, when the point M is the same with the point of contrary Flexion or Retrogression.

Consectary 4.

And when $\dot{x}^2 + \dot{y}^2 - y\ddot{y} = \text{Infinity}$, then ot is infinite in respect of MR , or which is the same thing, MR is infinitely little in comparison of ot , and consequently the Points M and m must Co-incide; that is when the Point M is the Point of Inflexion or Retrogression, we may draw two Tangents through M , comprehending an Angle infinitely little.

Consectary 5.

Hence it is evident also, that the Line which touches the Curve in the Point of contrary Flexion or Retrogression, being prolonged, touches and cuts the Curve AFK in one and the same Point.

Prop. 1.

If the Curve-line AFK be given, and its Diameter AB ; and if the Relation of the Abscissa AE (x) to the Ordinate EF (y) be express'd by this Equation $axx = xxy + aay$; 'tis requir'd to find the Value of AE , so that the corresponding Ordinate EF shall intersect the Curve AFK in the Point of contrary Flexion F .

187. The Equation Curve is $y = \frac{axx}{xx + aa}$ and

$\dot{y} = \frac{2ax\dot{x}}{xx + aa}$; and taking the Fluxion of this

Quan.

Quantity, and supposing x invariable, and putting the said Second Fluxion equal to nothing; we

$$\text{have } 2a^2x^2 + a^2 - 8a^2x^2 + a^2 = 0$$

$$= 0, \text{ and multiplying by } xx + aa, \text{ and divi-}$$

ding by $2a^2x^2 + a^2$, we have $xx + aa = 4xx = 0$. And $3xx = aa$, that is $x(AE) = a\sqrt{\frac{1}{3}}$.

If we substitute $\frac{1}{3}aa$ in place of xx in the Equation of the Curve $y = \frac{axx}{xx + aa}$, then $y =$

$\frac{\frac{1}{3}a^3}{\frac{4}{3}aa} = \frac{1}{4}a = EF$; so that we may determine the Point of Inflexion F, without supposing the Curve AFGK to be describ'd.

If AC be drawn parallel to the Ordinate EF, and equal to the given Line a , and if CG be drawn parallel to AB, it will be an Asymptote to the Curve AFGK. For if we suppose x to be infinite, then the Equation of the Curve $y = \frac{axx}{xx + aa}$ will become $y = \frac{axx}{xx} = a$, so that the Ordinate of the Curve EF cannot be $= a$ before the Abscissa AE be infinite.

Corollary.

188. If the Equation of the Curve be $y - a = x - a^{\frac{2}{3}}$ then $y = \frac{2}{3}x - a + \frac{2}{3}xx$, and $\ddot{y} = \frac{4}{3}$ (supposing x invariable) $= \frac{4}{3} - \frac{2}{3}x = 0$ when $x = 2$. Then $-6x^2$ is $= 0$; which because it makes nothing for the Resolution of the Question, therefore I put $\frac{-6x^2}{25\sqrt{x-a}}$ = Infinit

ty; whence the Denominator $25\sqrt{x-a}$ is $= 0$, and consequently, the unknown Quantity $x(AE)$ is $= a$.

Prop. 2.

If AFGK be a protracted Semi-cycloid whose Base BK is longer than the Semi-circumference of the generating Circle ADB, whose Centre is C; 'tis requir'd to find the Point E in the Diameter AB, so that the Ordinate EF shall cut the Semi-cycloid in F the Point of contrary Flexion.

189. Suppose the known Quantities $ADB = a$, $BK = b$, $AB = 2r$, and the unknown Quanti-

ties $AE = x$, $ED = z$, the Arch $AD = u$; and $EF = y$; then by the Property of the Cycloid

$$y = z + \frac{bu}{a}, \text{ and consequently } y = z + \frac{b^2}{a}; \text{ but}$$

by the Property of the Circle $z = \sqrt{2rx - xx}$ and consequently, $z = \sqrt{2rx - xx}$

$$\times 2rx - 2xx = \frac{rx - xx}{\sqrt{2rx - xx}} \text{ and } u = \frac{\sqrt{2rx - xx}}{rx}$$

$$\sqrt{x^2 + z^2} = \frac{bx}{\sqrt{2rx - xx}}, \text{ therefore substi-}$$

tuting for z and y their respective Values, we

$$\text{have } y = \frac{arx - axx}{a\sqrt{2rx - xx}} + \frac{brx}{a\sqrt{2rx - xx}}$$

$$= \frac{arx - axx + brx}{a\sqrt{2rx - xx}} \text{ and the Fluxion there-}$$

$$\text{of (suppposing } x \text{ invariable) is, } \ddot{y} = \frac{br - arr - br^2xx^2}{2rx - axx\sqrt{2rx - xx}}$$

$= 0$, whence $brx - arr = 0$, and dividing by x^2xr , we have $bx - ar - br = 0$, and by Transposition $bx =$

from the Nature of the Parabola, that the Curve must be concave towards that Tangent, and that afterwards the Curvature of the Circumference about its Centre becoming more and more sensible, the said Curve must be concave towards the said Centre B.

Scholium 2.

The Points of Retrogression of Curves may be found by help of first Fluxions in this manner,

192. If the Curve AMDB be such that the Ordinates PM intersect the same in two Points M and *m*, then that Curve must have a Point of Re-

trogression, viz. the Point D; and to determine the same it must be observ'd that if (the Abscissa) *x* be supposed invariable, then the Fluxion of the Ordinate (when it is greatest) which passes thro' the Point of Retrogression D, is equal to nothing; whence we may find the Value of AE the Abscissa corresponding to the same.

RETURNS of a Trench in Fortification, are the Turnings and Windings which runs from the Lines of the Trench, and are, as near as can be, parallel to the Place attacked, to avoid being enfiladed.

REVE alias Gereve, signifies with us the Bailiff of a Franchise or Mannor, especially in the Western Parts of England: Hence Sire-Reve or Sheriff.

REVEILLE. For the Drum to beat the Reveille in any Army, is to give notice that 'tis Day-break, and that the Soldiers should rise, and the Centries forbear challenging.

REVERSIONS, or Estates in Reversion. In the little Book of Tables for Renewing and Purchasing College and Church-Leases, Printed at Cambridge 1700, and recommended by Sir Is. Newton.

There is also shew'd the Construction and Use of the following Table of Reversions, which is calculated for several Rates of Interest. The Table shews the Decrease of 1 *l.* yearly, according to the said several Rates; or which is the same thing, it shews you what one Pound due at the End of any Number of Years to come (not exceeding 40, which is the longest Term such Lands can be leased for) is now worth in Ready Money at 5, 6, 7, 8, 10, and 12 per Cent. per Ann.

And first, What is 1 *l.* due a Year hence, worth in Ready Money now?

The Rule is this: Let 100 *l.* with the Interest of a Year added to it, be the first Term in the Rule of Three; 100 *l.* the Second, and 1 *l.* the Third. (For as 100 *l.* with its Interest going on to the End of the Year, is to a bare 100 *l.* then

due :: So must 1 *l.* with its growing Interest, be to the Decrease of 1 *l.* at the Years End. (Then at 6 *l.* and 10 *l.* per Cent. the Work will stand thus.

As 106. 100 :: 1. .94339 or 18s. 10d. $\frac{1}{4}$.
110. 100 :: 1. .90909 or 18s. 2d.

From whence it appears that 1 *l.* in a Years Time at 6 *l.* per Cent. decreases to 18s. 10d. $\frac{1}{4}$ and at 10 *l.* per Cent. to 18s. 2d. So that 18s. 10d. $\frac{1}{4}$ Ready Money is worth 20s. to be paid a Year hence at 6 *l.* per Cent. and 18s. 2d. Ready Money is worth 20s. to be paid a Year hence at 10 *l.* per Cent. And reckoning thus by a continual Geometrical Proportion decreasing, it comes to pass that 20s. to be paid 21 Years hence, is worth but 5s. 10d. $\frac{1}{2}$ Ready Money. That is, 5s. 10d. $\frac{1}{2}$ paid now, will in 21 Years at 6 *l.* per Cent. per Ann. compl. Interest increase to just 20s. But at 10 *l.* per Cent. 20s. in 21 Years decreases to 2s. 8d. $\frac{1}{2}$. So that at the Rate of Interest 2s. 8d. $\frac{1}{2}$ to be paid now, will amount to 20s. in 21 Years Time.

In order therefore to renew a Lease of 21 Years that hath but one Year lapsed, at the Rate of 10 *l.* per Cent. I look into the Table of Reversions below, and under the Rate of Interest mentioned, and right against 21 Years in the common Angle of meeting, I have 2s. 8d. $\frac{1}{2}$, which is the Fine to be paid to renew one Year lapsed in the said Lease, and supposing the Rent to be 1 *l.* per Ann. for it is 21 Yearse're the Lease is compleated; in which Time the Fine of 2s. 8d. $\frac{1}{2}$. will amount to 20s. and therefore by paying that Fine, the Lease may fairly be made up again.

Suppose again there be two Years lapsed in such a Lease, allowing the same Rate of Interest. Looking into the following Table of Reversions I find 20s. to be paid 20 Years hence, is now worth in Ready Money 2s. 11d. $\frac{1}{2}$, add this Summ to the former of 2s. 8d. $\frac{1}{2}$, and their Summ which is 5s. 8d. is the Fine to be paid to make the Lease to 21 Years again, supposing the Rent to be 1 *l.*

Suppose an Estate in Fee-Simple, whose real Value is 100 *l.* But that it is Mortgaged, or Leased out for 20 Years: What is the Reversion of it worth now, at 6 *l.* per Cent. Interest?

By the Table of Reversions I find 1 *l.* to be paid 20 Years hence, is worth but 6s. 2d. $\frac{1}{4}$, and multiplying that by 100, I find,

	<i>l.</i>	<i>s.</i>	<i>d.</i>
100 times 6 <i>s.</i> is	30	00	0
100 times 2 <i>d.</i> or 200 <i>d.</i> makes		16	0
And 100 times $\frac{1}{4}$, or 300 <i>q.</i> makes		6	3
Summ	31	2	11

Wherefore 31 *l.* 2s. 11d. is the true present Value of 100 *l.* to be paid 20 Years hence.

How to value the Reversion of any Lease or Annuity: See in the *Renewing of Leases*.

A Table

A Table of Reversions shewing what 1 l. due any Number of Years hence, under 41 is worth in ready Money at 5. 6, 7, 8, 10, and 12 l. per Cent.

Years.	5 per cent.			6 per cent.			7 per cent.			8 per cent.			10 p. cent.			12 p. cent.

REVER

REVERSION of *Series* in Algebra, is a Method to find a Number from its Logarithm, being given; or the Sine from its Ark: The Ordinate of an Elleplis, from an Area given to be cut off from any Point in the Axis.

REVOLUTION : In Geometry the Motion of any Figure quite round a fixt Line (which is called therefore its Axis) is called the *Revolution* of that Figure; and the Figure so moving is said to *Revolve*. Thus a Right-angled Triangle revolving round one of its Legs, as an Axis, generates by that Revolution a Cone. And to instance in a Case very wonderful; the Body called by *Torricellius Hyperbolicum Acutum*, tho' its self (as he

demonstrates) be *Finite*; is yet formed by the *Revolution* of an *Infinite* Area: As in the Figure annexed.

Let A be the Centre of the Apollonian common Hyperbola DCB. AZ one of the Assymptotes, GC an Ordinate equal to the *Abscissa* GA. Compleat the Square GH. And supposing Z to be at an Infinite Distance, imagine the Space DCHAZ to *Revolve* about the Assymptote ZA, generating thereby the Body DCHAKEd, called the *Hyperbolicum Acutum*: I say the Conick Body dEGCD is *Finite and exactly Equal* to the Cylinder EKHC: But yet the Assymptotick Space GCD, which its Revolution generates, is *Infinite*.

For let a Unit, or 1. represent the Ordinate GC or GA. Then will the *Fluent* of the Space ZGC be $\frac{x^0}{0} = \frac{1}{0} = \text{Infinite}$: And the *Fluent* of the Body dEGC is $\frac{x^*}{xx} = \frac{xyy}{xx} = \text{to the Cylinder EH.}$

RHANDIR in the Division of the Country of Wales before the Conquest; what they called a *Cantref* contained an hundred Towns, under which were so many *Commots*: Each Commot had 12 *Mannors* or *Circuits*, and two *Townships*: There were 4 *Townships* to every *Mannor*; and every *Township* comprehended 4 *Gavels*: And every *Gavel* had 4 *Rhandirs*, and in every *Rhandir* were 4 *Tenements*. *Taylor's Hist. of Gavel Kind*, p. 69.

RIAL, A Piece of Gold current, for ten Shillings: In 1 H. 6. by Indenture of the Mint, a

Pound-weight of Gold of the old Standard, was coined into 45 Rials going for 10 Shillings a piece, or a proportionable Number of half Rials going at five Shilling apiece: Or,

RIALS *Farthings*? which went at 2 s. 6 d. In 1 H. 8. The Golden Rial was ordered to go at 11 s. 3 d. In 2 Eliz. Golden Rials were coined at 15 s. a piece, when a Pound-weight of old Standard Gold was to be coined into 48 Rials. In 3 Jac. 1. The *Rose Rials* of Gold were coined at 30 s. a piece, and the *Spurr-Rials* at 15 Shillings.

RIBBING *Nails* are such as are used to fasten the Ribbing, or to keep the Ribs of a Ship in their Place.

RIDING *Clerk*, one of the six Clerks in Chancery, who in his Turn, for one Year, keeps the Controllment-Books of all Grants that pass the Great Seal that Year. *Cowel*.

RIGHT

RIGHT *Ascension of the Sun.* To find this by the Projection of Part of the Analemma readily; having given either his *Place*, or *Declination*.

In the Quadrant $E Q Z$, draw $r p$ representing the Parallel of the Sun's *Declination*; which ha-

ving taken $E \odot$ from the Chords $= 23^{\circ} 30'$, and so draw $n E Q$ will find $\odot$ for the Sun's place; or having the Point of $\odot$ first, if through it you draw the Parallel $r p$, you will have $E r$, the Sun's present *Declination*. This done, $\odot p$ will be the Sine of the Sun's right *Ascension* to the Radius $r p$

In the Quadrant $E Q Z$, draw $r p$ representing the Parallel of the Sun's Declination; which (ha-

ving taken $E \odot$ from the Chords $= 23^{\circ} 30'$, and so draw nEQ will find $\odot$ for the Sun's place; or having the Point of $\odot$ first, if through it you draw the Parallel rp , you will have $E r$, the Sun's present Declination. This done, $\odot p$ will be the Sine of the Sun's right Ascension to the Radius rp

Wherefore (by the Sector) lay as rp , to $\odot p$: : EQ to a 4th Term; which will be the true Sine of the Sun's right Ascension: But you may find it in the Diagram thus. Set rp from Q to R, on which Point R as a Centre, and with $\odot p$ as a Radius, sweep an Ark as B: Then a Ruler laid from Q, just to touch the Convexity of that Ark B, will find the Point A in the Limb. Then will EA, measured on the Chords be the Degrees of right Ascension of the Sun, from the next Equinoctial Point.

Here follow Tables of the Sun's Right Ascension, Declination, and Place in the Ecliptick, which I had from Mr. *James Hodgson*, the Worthy Master of the Queen's Mathematical School in *Christ's-Hospital*; Together with Tables of the Right Ascension, Declination, Longitude and Latitude of above Fifty of the principal fixed Stars: Most of the First and Second, and some few of the Third Magnitude. All which Tables are fitted for the Ensuing Year 1710, and will serve without any sensible Error for about Twenty Years to come. Their Use is so easie that it needs no Description; and their Benefit and Advantage is so Universally and so previously necessary in all Astronomical Calculations, that they must have a Place in a Collection of this Nature.

Here follow Tables of the Sun's Right Ascension, Declination, and Place in the Ecliptick, which

I had from Mr. *James Hodgson*, the Worthy Master of the Queen's Mathematical School in *Christ's-Hospital*; Together with Tables of the Right Ascension, Declination, Longitude and Latitude of above Fifty of the principal fixed Stars: Most of the First and Second, and some few of the Third Magnitude. All which Tables are fitted for the Ensuing Year 1710, and will serve without any sensible Errour for about Twenty Years to come. Their Use is so easie that it needs no Description; and their Benefit and Advantage is so Universally and so previously necessary in all Astronomical Calculations, that they must have a Place in a Collection of this Nature.

A Table of the Sun's Right Ascension in Hours and Minutes for the Year, 1709.

The Southern Horn of <i>Capricorn</i>	3	✓	00 00 46	4 41 27	N. 301 10 27	15 36 46 S.

RIGLET, is any square, flat, thin, Piece of Wood, like those which are designed to make the Frames of small Pictures of; which are so called, before they are *Molded*.

RINÆUS, a Muscle of the Nose, otherwise called *Nasalis*; which see

ROD-Knights, alias *Rad-Knights* were anciently certain Servitors, which held their Land by serving their Lord on Horse-back; or attending him in his Progress or Travels on the *Road*.

ROME-*Scot* was formerly here an annual Tribute of a Penny for every Family, and paid to *Rome* at the Feast of *St Peter ad Vincula*, being the First of *August*.

Cambden tells us it was first granted by *Offa*; but others attribute its Original to *Ina*, King of the West *Saxons*; who being in Pilgrimage at *Rome*, A. D. 725. gave it as an Alms. It amounted to three hundred Marks and one Noble yearly. Of this Mark of Slavery to *Rome*, our Ancestors frequently complained as a Burden and Scandal to the *English* Nation: It was first for bidden to be paid by *Edw. 3.* Tho' before complained of in Parliament as a Grievance in K. *John's* Time, A. D. 1206. This Payment was abrogated 25 H. 8. 25. But servilely restored again 1 and 2 *Phil.* and *Mary*; and at last utterly abolished, 1 *Eliz. 1.*

ROOT *Binomial*: To raise (easily) a Binomial Root up to any Power assign'd.

Suppose $a + b$. (1.) If it be $a - b$ 'tis called a *Residual*; and the Powers of such a *Residual* will be the same with the like Powers raised from a Binomial (affirmative) as $a + b$; except, that as the Signs of the Powers of a Binomial are all affirmative: Those of the *Residual* have the Signs + and - alternately annexed to every other Term; as will easily appear from multiplying $a - b$ by it self, and then the Square so found by the Root again, &c.

2. The Indexes of the Powers of the Leading Quantity, or *First Name* a , in all the Powers of the Binomial $a + b$ do continually decrease, and that in an *Arithmetical Progression*; as those of b , the other Names do after the same Manner increase.

So that if the Indexes of the Powers of $a + b$ only were required, when that Binomial is to be raised up to the seventh Power, you will easily perceive that it must stand thus.

$$a^7 + a^6b + a^5b^2 + a^4b^3 + a^3b^4 + a^2b^5 + ab^6 + b^7$$

3. Where 'tis easy to observe that the first and last Term are pure Powers of the single Quantities a and b , and are both of the same Height: As also that the Summ of the Indexes of any two Letters joined together in any of the *Intermediate Terms*, do always make up the Index of the highest Power.

4. The next Work therefore is only to find the *Unciæ*; which may be done by considering,

(1) That the *Uncia* of every single Letter, and of every single Power, how high soever it be, is an Unit, or (1), which neither multiplies nor divides. (2) That all the Powers of any Binomial are naturally raised by multiplying the *Preceding Power* into the *Original Root*: Which in Algebraick Mul-

Vol. II.

tiplication, is done by only joining each Letter in the Root to the Preceding Power with its *Uncia*; and then removing the said Power, when 'tis so joined to the second Letter, one Place forwards, either to the Right or Left-hand. Thus $aa + 2ab + bb$, the Square or Second Power of $a + b$ is found by joining to $a + b$ each Letter of $a + b$, and removing the Powers to the Right or Left-hand thus; a joined to a makes aa ; a joined to b makes ab ; and b joined to a makes another ab ; and b joined to b makes bb ; and it will stand thus; $aa + ab + ab + bb$ or $aa + 2ab + bb$. Now

from hence it will follow, (3) That the *Unciæ* of the second Term in any such Power will always be the Summ of so many Units added together (more 1.) as there hath been Multiplications of the *First Root*; which will always be determined by the Index of the first Term in the Power.

And because the *Unciæ* of all the Intermediate Terms are only removed along with their Letters; it also follows, that if they are added together, their respective Summs, must produce the true *Unciæ* of the intermediate Terms in the new raised Power, as is plain from the following Table, where the Numbers are so removed without their Letters,

1 1 } are the 2 *Unciæ* of $a + b$ and $a + b$.
1 1 } These added in the Order as they stand, produce the next Rank.

1 2 1 } The *Unciæ* of the Square, and these
1 2 1 } added again produce the next Rank or *Unciæ* of the Cube, &c.

1 3 3 1 } *Unciæ* of the Cube.

1 4 6 4 1 } The *Unciæ* of the Biqua-
1 4 6 4 1 } drate.

1 5 10 10 5 1 } The *Unciæ* of the fifth
1 5 10 10 5 1 } Power.

1 6 15 20 15 6 1 } The *Unciæ* of the
1 6 15 20 15 6 1 } sixth Power.

1 7 21 35 35 21 7 1 } The *Unciæ* of the
seventh Power,
and so on, as Mr. *Ward* hath well observed in his young Mathematicians Guide, p. 157, 158.

If therefore you take the Numbers in the last Row of the Table above, and prefix them to the several and proper Letters in the 7th Power of $a + b$, you will compleat all the Terms with their several *Unciæ*, and it will stand thus;

$$a^7 + 7a^6b + 21a^5b^2 + 35a^4b^3 + 35a^3b^4 + 21a^2b^5 + 7ab^6 + b^7$$

And further from observing that the *Unciæ* of the first Term in all the several Powers of a Binomial, are a Series of Units, whose Summ is every where the *Unciæ* of the second Term; and that the *Unciæ* of the second Term, are a Series of Numbers in natural Arithmetical Progression;

G g g g

fion; as 1, 2, 3, 4, 5, 6, 7, &c. Whose Summ is every where the *Uncia* of the next Superior Power in the Third Term, &c. He deduces this General Rule for finding the *Uncia* of any Power of a Binomial, *Viz.*

Multiply the Index of the *First Letter* of any Term into its own *Uncia*, and divide the Product by the Number of Terms to that Place, and the Question will be the *Uncia* of the next Succeeding Term, forward. Thus in the last Example,

1. The Index of a^7 (the *First Term*) will be the *Uncia* for $7 a^6 b$, the Second Term.

2. Then $\frac{7 \times 6}{2} = 21$. That is the Index of a^5 in

the *Second Term* multiplied by its *Uncia* 7; and the Product 42, divided by 2, the Number of Terms to that Place, quotes 21, the *Uncia* of the *Third Term*.

3. Again, $\frac{21 \times 5}{3} = 35$. The *Uncia* of the *Fourth*

Term, and $\frac{35 \times 4}{4} = 35$, will be the *Uncia* of the *Fifth Term*, &c.

4 You may observe here that the *Uncia* do increase, only 'till the *Indices* of the Two Letters become equal, or change Places; and then the Rest of the *Uncia* do decrease, as the former increased: So that 'tis enough to find the *Uncia* of half the Number of Terms in any Power, and then the Rest may be easily prefixed.

And when all this is considered, the Value and Expedition of that *Short Theorem* of Sir Isaac Newton, for finding the *Uncia* of a Binomial, will be understood and admired, *Viz.*

Suppose m the Exponent of any Power: Then

will $1 \times \frac{m-0}{1} \times \frac{m-1}{2} \times \frac{m-2}{3} \times \frac{m-3}{4} \times \frac{m-4}{5} \times \frac{m-5}{6} \times \frac{m-6}{7}$, &c. be a *Series* for the *Uncia* of the powers of any Binomial involved infinitely.

As, Suppose you would have the *Uncia* for the 7th Power of $a+b$. Then $m=7$, and by the

Theorem $1 \times \frac{m-0}{1} = 7$ will be the *Uncia*,

and that $7 \times \frac{m-1}{2} = 21$ will be the *Uncia* for

the Third Term: And again, That $21 \times \frac{m-2}{3} = 35$ will be the *Uncia* for the Fourth Term.

Also that $35 \times \frac{m-3}{4} = 35$ will be the *Uncia* of the Fifth Term; and consequently by going backwards (as in Art. 4. above) you will find that

the *Uncia* of the two Remaining Terms must be 21, 7, and 1.

A New, Exact and Easie Method, of finding the Roots of any Equations generally, and that without any previous Reduction. By Mr. Edm. Halley, Geometry Professor at Oxford.

The principal Use of the *Analytick Art*, is to bring Mathematical Problems to Equations, and to exhibit those Equations in the most simple Terms that can be. But this Art would justly seem in some degree defective, and not sufficiently *Analytical*, if there were not some Methods, by the help of which, the Roots (be they Lines or Numbers) might be gotten from the Equations that are found, and so the Problems in that respect be solved. The Ancients scarce knew any thing in these Matters, beyond *Quadratick Equations*. And what they writ of the *Geometrick Construction* of solid Problems, by the help of the *Parabola*, *Cissoid*, or any other Curve, were only particular things design'd for some particular Cases. But as to *Numerical Extraction*, there is every where a profound Silence; so that whatever we perform now in this kind, is entirely owing to the Inventions of the Moderns.

And first of all, that great Discoverer and Restorer of the Modern Algebra, *Francis Vieta*, about 100 Years since, shew'd a general Method for extracting the Roots of any Equation, which he publish'd under the Title of, *A Numerical Resolution of Powers*, &c. *Harriot*, *Oughtred*, and others, as well of our own Country, as Foreigners, ought to acknowledge whatsoever they have written upon this Subject, as taken from *Vieta*. But what the Sagacity of Sir *Is. Newton's* Genius has perform'd in this Business, we may rather conjecture (than be fully assur'd of) from that short Specimen given by Dr. *Wallis* in the 94th. Chapter of his *Algebra*. And we must be forc'd to expect it, 'till his great Modesty shall yield to the Intreaties of his Friends, and suffer those curious Discoveries to see the Light.

Not long since (*viz.* A. D. 1690.) that excellent Person M. *Joseph Raphson*, F. R. S. Publish'd his *Universal Analysis of Equations*, and illustrated his Method by plenty of Examples; by all which he has given Indications of a Mathematical Genius, from which the greatest things may be expected.

By this Example, M. *de Lagny*, an Ingenious Professor of Mathemanicks at *Paris*, was encourag'd to attempt the same Argument, but he being almost altogether taken up in extracting the Roots of pure Powers (especially the Cubick) adds but little about affected Equations, and that pretty much perplex'd too, and not sufficiently demonstrated. Yet he givestwo very compendious Rules for the Approximation of a Cubical Root; one a Rational, and the other an Irrational one. Ex. gr. that the side of the Cube $a a a + b$, is between

$$a + \frac{ab}{3 a a a + b}, \text{ \&c. } \sqrt[3]{\frac{1}{4} a a + b} - \frac{1}{2} a.$$

And the Root of the 5th Power $a^5 + b$, he makes

$$\sqrt[5]{\frac{1}{2} a + \sqrt[5]{\frac{1}{4} a^4 + b}} - \frac{1}{5} a \text{ (where note, that}$$

that 'tis $\frac{1}{4}aa$, not $\frac{1}{2}aa$, as 'tis erroneously Printed in the French Book. These Rules were communicated to me by a Friend, I having not seen the Book; but having by Trial found the goodness of them, and admiring the Compendium, I was willing to find out the Demonstration. Which having done, I presently found that the same Method might be accommodated to the Resolution of all sorts of Equations. And I was the rather inclin'd to improve these Rules, because I saw that the whole thing might be Explain'd in a *Synopsis*; and that by this means, at every repeated step of the Calculus, the Figures already found in the Root, would be at least Trebled, which all other ways, are increased but in an equal Number with the given ones. Now, the fore-mention'd Rules are easily demonstrated from the Genesis of the Cube, and the 5th Power. For, supposing the side of any Cube $= a + e$, the Cube arising from thence, is $aaa + 3aa e + 3a e e + e e e$. And consequently, if we suppose aaa the next less Cube, to any given Non-cubick Number, then eee will be less than Unity, and the Remainder b , will $=$ the other Members of the Cube, $3aa e + 3a e e + e e e$. Whence rejecting eee upon the account of its smallness, we have $b = 3aa e + 3a e e$. And since $aa e$ is much greater than $a e e$, the

quantity $\frac{b}{3aa}$ will not much exceed e ; so that

putting $e = \frac{b}{3aa}$ then the quantity $\frac{b}{3aa + 3ae}$ (to which e is nearly equal) will be found

$$= \frac{b}{3aa + 3ab} \text{ or } \frac{b}{3aa + b} \text{ that is } \frac{ab}{3aa + b} = e$$

And so the side of the Cube $aaa + s$ will be

$$a + \frac{ab}{3aa + b}, \text{ which is the Rational Formula of}$$

M. de Lagney. But now, if aaa were the next greater Cubick Number to that given, the side of the Cube $aaa - b$, will after the same man-

ner be found to be $a - \frac{ab}{3aa - b}$. And this easy

and expeditious Approximation to the Cubick Root, is only (a very small matter) erroneous in point of defect, the quantity e , the Remainder of the Root thus found, coming something less than really 'tis.

As for the *Irrational Formula*, 'tis derived from the same Principle, viz. $b = 3aa e + 3a e e$, or

$$\frac{b}{3a} = ae + ee, \text{ and so } \sqrt{\frac{1}{4}aa + b} = \frac{1}{2}a + e, \text{ and}$$

$$\sqrt{\frac{1}{4}aa + b} + \frac{1}{2}a = a + e, \text{ the Root sought.}$$

$$\frac{3a}{3a}$$

Also the side of the Cube $aaa - b$, after the same

manner, will be found to be $\frac{1}{2}a + \sqrt{\frac{1}{4}aa - b}$

$$\frac{3a}{3a}$$

And this *Formula* comes something nearer to the Scope, being erroneous in point of excess, as the other was in defect, and is more accommodated to the Ends of Practice, since the Restitution of the Calculus, is nothing else but the continual Addition or Subtraction of the

Quantity $\frac{aee}{3a}$ according as the quantity e can be known. So that we should rather write

$$\sqrt{\frac{1}{4}aa + b - \frac{aee}{3a}} + \frac{1}{2}a, \text{ in the former case, and in}$$

the latter, $\frac{1}{2}a + \sqrt{\frac{1}{4}aa + \frac{aee}{3a} - b}$. But by either

of the two *Formula's*, the Figures already known in the Root to be extracted, are at least Tripled; which I conclude will be very grateful to all the Students in Arithmetick; and I congratulate the Inventor upon the Account of his Discovery.

But that the Use of these Rules may be the better perceiv'd, I think it proper to subjoin an Example to two. Let it be propos'd to find the side of the double Cube, or $aaa + b = 2$

Here $a = 1$, and $\frac{b}{3a} = \frac{1}{2}$, and so $\frac{1}{2} + \sqrt{\frac{1}{4} - \frac{1}{2}}$, or 1, 26,

will be found to be the true side nearly. Now, the Cube of 1, 26, is 2, 000376, and so 0, 63 +

$$\sqrt{3969 - 0000376} \dots \dots \dots 3, 78$$

91005291 = 1, 259921049895 —; which in 13 Figures, gives the side of the double Cube, with very little Trouble, viz. By one only Division, and the Extraction of the square Root; when as by the common way of working, how much pains it would have cost, the Skilful very well know. This Calculus a Man may continue as far as he pleases, by encreasing the Square by

the Addition of the Quantity $\frac{eee}{3a}$, which Corre-

ction, in this case will give, but the encrease of Unity in the 14th Figure of the Root.

Exemp. 2. Let it be propos'd to find the sides or a Cube equal to that English Measure commonly call'd a Gallon, which contains 231 solid Ounces. The next less Cube is 216, whose side $6 = a$, and the Remainder $15 = b$; and so for the first Approximation, we have

$$3 + \sqrt{9 + 5} = \text{the Root. And since } \sqrt{9,8333} \dots$$

is 3, 1358..., 'tis plain that $6, 358 = a + e$. Now, let $6, 1358 = a$; and we shall have then for

its Cube 231, 000853894712, and according to the Rule, $3,0679 + \sqrt{9,41201041} = 5,000853894712$

18,4070

is most accurately equal to the side of the given Cube, which within the Space of an Hour, I determin'd by Calculation to be 6. 1357924 3966195897, which is exact in the 18th Figure, defective in the 19th. And this *Formula* is deservedly preferable to the *Rationale*, upon the Account of the great Divisor, which is not to be manag'd without a great deal of Labour; whereas the Extraction of the square Root, proceeds much more easily, as manifold Experience has taught me.

But the Rule for the Root of a pure Surfsolid, or the 5th Power, is of something a higher Enquiry, and does much more perfectly yet do the business; for it does at least Quintuple the given Figures in the Root, neither is the Calculus very large or operose. Though the Author no where shews his Method of Invention, or any Demonstration, although it seems to be very much wanting, especially since all things are not right in the printed Book, which may easily deceive the Unskilful. Now the 5th power of the side $a + e$ is compos'd of these Members, $a^5 + 5a^4e + 10a^3e^2 + 10a^2e^3 + 5ae^4 + e^5 = a^5 + b$; from whence $b = 5a^4e + 10a^3e^2 + 10a^2e^3 + 5ae^4$, rejecting e^5 because of its smallness.

Whence $\frac{b}{5a} = a^4e + 2a^3e^2 + 2a^2e^3 + e^4$, and

adding on both sides $\frac{1}{4}a^4$, we shall have $\sqrt[4]{\frac{1}{4}a^4 + b}$

$= \sqrt[4]{\frac{1}{4}a^4 + a^4e + 2a^3e^2 + 2a^2e^3 + e^4} = \sqrt[4]{\frac{1}{4}aa + ae + ee}$. Then subtracting $\frac{1}{4}aa$ from both sides,

$\frac{1}{2}a + e$ will $= \sqrt[4]{\frac{1}{4}a^4 + b} - \frac{1}{4}aa$; to which if

$\frac{1}{2}a$ be added, then will $a + e = \frac{1}{2}a + \sqrt[4]{\frac{1}{4}a^4 + b} - \frac{1}{4}aa$

$=$ the Root of the Power $a^5 + b$. But if it had $a^5 - b$ (the quantity of a being too great) the

Rule would have been thus, $\frac{1}{2}a + \sqrt[4]{\frac{1}{4}a^4 - b} - \frac{1}{4}aa$

and this Rule approaches wonderfully, so that there is hardly any need of Restitution.

But while I considered these things with myself, I light upon a General Method for the *Formula's* of all Powers whatsoever, and (which being handsome and concise enough) I thought I would not conceal from the Publick.

These *Formula's*, (as well the *Rational* as the *Irrational* ones) are thus.

$$\sqrt[4]{aa + b} = \sqrt[4]{aa + b}, \text{ or } a + \frac{ab}{2aa + \frac{1}{2}b}$$

$$\sqrt[4]{a^5 + b} = \frac{1}{2}a + \sqrt[4]{\frac{1}{4}aa + \frac{b}{3a}}, \text{ or } a + \frac{ab}{3aaa + b}$$

$$\sqrt[4]{a^4 + b} = \frac{2}{3}a + \sqrt[4]{\frac{2}{3}aa + \frac{b}{6aa}}, \text{ or } a + \frac{ab}{4a^4 + \frac{2}{3}b}$$

$$\sqrt[4]{a^3 + b} = \frac{3}{4}a + \sqrt[4]{\frac{3}{4}aa + \frac{b}{10a^3}}, \text{ or } a + \frac{ab}{5a^5 + 2b}$$

$$\sqrt[4]{a^2 + b} = \frac{4}{5}a + \sqrt[4]{\frac{4}{5}aa + \frac{b}{15a^2}}, \text{ or } a + \frac{ab}{6a^6 + \frac{4}{5}b}$$

$$\sqrt[4]{a + b} = \frac{5}{6}a + \sqrt[4]{\frac{5}{6}aa + \frac{b}{21a}}, \text{ or } a + \frac{ab}{7a^7 + 3b}$$

And so also of the other higher Powers. But if a were assumed bigger, than the Root sought (which is done with some Advantage, as often as the Power to be resolved, is much nearer the Power of the next greater whole Number, than of the next less) in this case, *Mutatis Mutandis*, we shall have the same Expressions of the Roots, *Viz.*

$$\sqrt[4]{aa - b} = \sqrt[4]{aa - b}, \text{ or } a - \frac{ab}{2aa - \frac{1}{2}b}$$

$$\sqrt[4]{a^5 - b} = \frac{1}{2}a + \sqrt[4]{\frac{1}{4}aa - \frac{b}{3a}}, \text{ or } a - \frac{ab}{3a^5 - b}$$

$$\sqrt[4]{a^4 - b} = \frac{2}{3}a + \sqrt[4]{\frac{2}{3}aa - \frac{b}{6aa}}, \text{ or } a - \frac{ab}{4a^4 - \frac{2}{3}b}$$

$$\sqrt[4]{a^3 - b} = \frac{3}{4}a + \sqrt[4]{\frac{3}{4}aa - \frac{b}{10a^3}}, \text{ or } a - \frac{ab}{5a^5 - 2b}$$

$$\sqrt[4]{a^2 - b} = \frac{4}{5}a + \sqrt[4]{\frac{4}{5}aa - \frac{b}{15a^2}}, \text{ or } a - \frac{ab}{6a^6 - \frac{4}{5}b}$$

$$\sqrt[4]{a - b} = \frac{5}{6}a + \sqrt[4]{\frac{5}{6}aa - \frac{b}{21a}}, \text{ or } a - \frac{ab}{7a^7 - 3b}$$

And within these two Terms, the true Root is ever found, being something nearer to the *Irrational* than the *Rational* Expression. But the quantity e found by the *Irrational Formula*, is always too great, as the Quotient resulting from the *Rational Formula*, is always too little. And consequently, if we have $+b$, the *Irrational Formula* gives the Root something greater than it should be, and the *Rational* something less. But contrary-wise if it be $-b$.

And thus much may suffice to be said concerning the Extraction of the Roots of pure Powers: which notwithstanding, for common Uses, may be had much more easily by the help of the Logarithms. But when a Root is to be determin'd very accurately, and the Logarithmick Tables will not reach so far; then we must necessarily have recourse to these, or such like Methods. Farther; the Invention and Contemplation of these *Formula's*, leading me to a certain Universal Rule, for adjected Equations

quations (which I hope will be of use to all the Students in *Algebra* and *Geometry*) I was willing here to give some account of this Discovery, which I will do with all the perspicuity I can, I had given at No. 188 of the *Transactions*, a very easy and general Construction of all adiected Equations, not exceeding the Biquadratic Power; from which time I had a very great desire of doing the same in Numbers. But quickly after Mr. *Raphson* seem'd in great Measure to have satisfied this Desire, till Mr. *Lagney* by what he had perform'd in his Book, intimated that the thing might be done more compendiously yet. Now, my Method is thus.

Let z the Root of any Equation, be imagin'd to be compos'd of the parts $a +$ or $-e$, of which let a be assum'd as near z as is possible; which is notwithstanding not necessary, but only commodious. Then from the Quantity $a + e$ or $a - e$, let there be form'd all the Powers of z , found in the Equation, and the Numerical Co-efficients be respectively affix'd to them: Then let the Power to be resolv'd, be subtracted from the Summ of the given Parts (in the first Column where e is not found) which they call the *Homogeneous Comparisonis*, and let the difference be $+b$. In the next place, take the Summ of all the Co-efficients of e in the second Column, to which put $=s$. Lastly, in the third Column let there be put down the Summ of all the Co-efficients of ee , which Summ call t . Then will the Root z stand thus

in the *Rational Formula*, viz. $z = a + \frac{sb}{ss + tb}$;
and thus in the *Irrational Formula*, viz.

$$z = a + \frac{\frac{1}{2}ss \pm \sqrt{\frac{1}{4}ss + bt}}{t}; \text{ which perhaps it}$$

may be worth while to Illustrate by some Examples. And instead of an *Instrument*, let this *Table* serve, which shews the Genesis of the several Powers of $a + e$, and if need be, may easily be continued farther; which for its Use I may rightly call a *General Analytical Speculum*. The forementioned Powers arising from a continual Multiplication by $a + e (= z)$ come out thus with their adjoined Co-efficients: See the *Table*. But now, if it be $a - e = z$, the *Table* is compos'd of the same Members, only the odd Powers of e , as e , e^3 , e^5 , e^7 are Negative, and the even Powers, as e^2 , e^4 , e^6 , Affirmative. Also let the Summ of the Co-efficients of the side e , be $=s$; the Summ of the Co-efficients of the Square $ee = t$, the Summ of the Co-efficient of $e^3 = u$; of $e^4 = w$; of $e^5 = x$; of $e^6 = y$, &c. But now, since e is supposed only a small Part of the Root that is to be enquir'd, all the Powers of e , will be much less than the correspondent Powers of a , and so far the first Hypothesis; all the superior ones may be rejected; and forming a new Equation, by substituting $a + e = z$, we shall have (as was said) $+b = +se + tee$. The following Examples will make this more clear.

Example 1.

Let the Equation $z^4 - 3z^2 + 75z = 10000$, be propos'd. For the first Hypothesis, let $a = 10$, and so we have this Equation,

$$\begin{array}{r} z^4 = + a^4 \quad 4 a^3 e + 6 a^2 e^2 + 4 a e^3 + e^4 \\ - d z^2 = - d a^2 \quad d a e - d e^2 \\ + c z = + c a e \\ \hline = + 10000 \quad 4000 e + 600 e e + 40 e^3 + e^4 \\ - 300 \quad 60 e - 3 e e \\ + 750 \quad 75 e \\ - 10000 \end{array}$$

$$+ 450 - \frac{4015 e}{s} + \frac{597 e e}{t} - 40 e^3 + e^4 = 0$$

The Signs $+$ and $-$ with respect to the Quantities e and e^3 , are left as doubtful, till it be known whether e be Negative or Affirmative; which thing creates some Difficulty, since that in Equations that have several Roots, the *Hermogenea Comparisonis* (as they term them) are oftentimes encreased by the minute quantity a , and on the contrary, that being increased, they are diminished. But the Sign of e is determin'd from the Sign of the Quantity b . For taking away the *Resolvend* from the *Homogeneous* form'd of a ; the Sign of se (and consequently of the prevailing Parts in the Composition of it) will always be contrary to the Sign of the difference b . Whence 'twill be plain, whether it must be $+e$, or $-e$; and consequently whether a be taken greater or less than the *True Root*. Now the quantity e is $= \frac{1}{2}s -$

$$\sqrt{\frac{1}{4}ss - bt}, \text{ when } b \text{ and } t \text{ have the same Sign,}$$

but when the Signs are different, e is $= \sqrt{\frac{1}{4}ss + bt}$

$-\frac{1}{2}s$. But after it is found that it will be $-e$, let the Powers e , e^3 , and e^5 , &c. in the Affirmative Members of the Equation be made Negative, and in the Negative be made Affirmative; that is, let them be written with the contrary Sign. On the other hand, (if it be $+e$) let those forementioned Powers be made Affirmative in the Affirmative, and the Negative in Negative Members of the Equation.

Now we have in this Example of ours, 10450 instead of the *Resolvend* 10000, or $b = +450$, whence it's plain that a is taken greater than the Truth, and consequently, that 'tis $-e$. Hence the Equation comes to be, $10450 - 4015e + 597ee - 4e^3 + e^4 = 10000$. That is, $450 - 4015e + 597ee = 0$; and so $450 = 4015e - 597ee$, or $b = se - tee$, whose Root $e = \frac{1}{2}s - \sqrt{\frac{1}{4}ss - bt}$,

$$\begin{array}{r} s \quad \sqrt{ss} \quad b \\ \text{or } \frac{s}{2t} \quad \frac{4tt}{4tt} \quad \frac{b}{t} \\ \hline 2007\frac{1}{2} - \sqrt{3761406\frac{1}{4}} \\ e = \frac{597}{597}, \text{ from whence we have} \end{array}$$

the Root sought, 9, 886, which is near the Truth. But then substituting this for a second Supposition, there comes $a + e = z$, most accurately 9, 8862603936495 scarce exceeding the Truth

by 2 in the last Figure, viz. when $\sqrt{\frac{1}{4}ss + bt}$

$$= \frac{1}{2}s$$

$-\frac{1}{2}s - e$. And this (if need be) may be yet much farther verified, by subtracting (if it be $+e$)

the quantity $\frac{\frac{1}{2}ue^3 + \frac{1}{2}e^4}{\sqrt{\frac{1}{4}ss + tb}}$, from the Root before

found; or (if it be $-e$) by adding $\frac{\frac{1}{2}ue^3 - \frac{1}{2}e^4}{\sqrt{\frac{1}{4}ss - tb}}$

to that Root. Which Compendium is so much the more Valuable, in that sometimes from the first Supposition alone, but always from the second, a Man may continue the Calculus (keeping the same Co-efficients) as far as he pleases. It may be noted, that the fore-mentioned Equation, has also a Negative Root, viz. $z = 10,26 \dots$ which any one that has a Mind, may determine more accurately.

Example II.

Suppose $z^3 - 17z + 54z = 350$, and let $a = 10$. Then according to the Prescript of the Rule,

$$\begin{aligned} + z^3 &= a^3 + 3a^2e + 3ae^2 + e^3 \\ - dz^3 &= da^3 - 2da^2e - da^2e^2 \\ + cz &= ca + ce \end{aligned}$$

$$\begin{array}{r} \text{That is, } + 1000 + 300e + 30e^2 + e^3 \\ - 1700 - 340e - 17e^2 \\ + 540 + 54e \\ \hline = 350 \end{array}$$

Or, $-510 + 14e + 13ee + e^3 = 0$. Now, since we have -510 , it is plain, that a is assumed less than the Truth, and consequently that e is Affirmative. And from (the Equation)

$$510 = 14e + 13e^2, \text{ comes } e = \sqrt{bt + \frac{1}{4}ss - \frac{1}{2}s}$$

$$= \frac{\sqrt{6679} - 7}{13}. \text{ Whence } z = 15,7 \dots, \text{ which}$$

is too much, because of a taken wide; therefore Secondly, let $a = 15$, and by the like way of

Reasoning, we shall find $e = \frac{1}{2}s - \sqrt{\frac{1}{4}ss - bt}$

$$= \frac{109\frac{1}{2} - \sqrt{11710\frac{1}{2}}}{28}, \text{ and consequently } z =$$

14,954068. If the Operation were to be repeated the third time, the Root will be found conformable to the Truth as far as the 25th Figure; but he that is contented with fewer, by writing $tb + te^3$ instead of tb , or subtracting or adding

$$\frac{\frac{1}{2}e^3}{\sqrt{\frac{1}{4}ss + tb}}$$

to the Root before found, will presently obtain his End. Note, the Equation proposed, is not explicable by any other Root, because the *Resolvend* 350, is greater than the

$$\text{Cube of } \frac{17}{3}, \text{ or } \frac{d}{3}.$$

Example III.

Let us take the Equation $z^4 - 80z^3 + 1998z^2 - 14937z + 5000 = 0$, which Dr. Wallis uses Cap. 62 of his *Algebra*, in the Resolution of a very difficult Arithmetical Problem, where by *Vieta's* Method he has obtain'd the Root most accurately; and Mr. *Raphson* brings it also as an Example of his Method, Page 25, 26. Now this Equation is of the Form, which may have several Affirmative Roors, and (which increases the Difficulty) the Co-efficients are very great in respect of the *Resolvend* given.

But that it may be the easier manag'd, let it be divided, and according to the known Rules of *Pointing*, let $-z^4 + 8z^3 - 20z^2 + 15z = 0,5$ (where the quantity z is $\frac{1}{10}$ of z in the Equation proposed) and for the first Snpposition, let $a = 1$. Then $+^2 - 5e - 2e^2 + 4e^3 - e^4 = 0$, $5 = 0$; that is, $1\frac{1}{2} = 5e + 2ee$; hence $e =$

$$\frac{\sqrt{\frac{1}{4}ss + bt} - \frac{1}{2}s}{t} \text{ is } = \sqrt{37 - 5}, \text{ and so } z =$$

1, 27; Whence 'tis manifest that 12, 7, is near the true Root of the Equation proposed. Now Secondly, let us suppose $z = 12,7$, and then according to the Directions of the Table of Powers, there arises

$$\begin{array}{r} b \quad s \quad t \quad z \\ -26014,4641 - 8193,532e - 967,74e^2 - 50,8e^3 - e^4 \\ + 163870,640 + 38709,60e + 3048e^2 + 80e^3 \\ - 322257,42 - 50749,2e - 1998e^2 \\ + 189699,9 + 14937e \\ \hline = 5000. \end{array}$$

That is, $+298,6559 - 5296132e + 82,26e^4 + 29,2e^3 - e^4 = 0$; And so $-298,6559 = -5296,132e + 82,26ee$, whose Root e (accord-

ing to the Rule) $= \frac{1}{2}s - \sqrt{\frac{1}{4}ss - bt}$ comes to

$$= \frac{2648,066 - \sqrt{6987686,106022}}{82,26}$$

,05644080331 = e less than the Truth. But that it may be corrected, 'tis to be consider'd that

$$\frac{\frac{1}{2}ue^3 - \frac{1}{2}e^4}{\sqrt{\frac{1}{4}ss - bt}}, \text{ or } \frac{,0026201 \dots}{\sqrt{\frac{1}{4}ss - bt}}$$

$$\text{is, } ,00000099,$$

$$\sqrt{\frac{1}{4}ss - bt} = 2643,423 \dots$$

and consequently e corrected, is $= 0564470448$.

And if you desire yet more Figures of the Root, from the e corrected let there be made

$$tue^3 - te^4 = 0, 43105602423 \dots, \text{ and}$$

$$\frac{\frac{1}{2}s - \sqrt{\frac{1}{4}ss - bt} - tue^3 + te^4}{t} \text{ or which is all one,}$$

$$= \frac{2648,066 - \sqrt{6987685,67496597577 \dots}}{82,26}$$

$$,05644179448074402 = e; \text{ whence } a + e = z$$

the Root is most accurately 17, 75644179448074402 ... as Dr. Wallis found in the fore-mentioned Place; where it may be observ'd, that

that the repetition of the *Calculus* does ever triple the true Figures in the assumed a , which the

first Correction, or $\frac{\frac{1}{2}ue^3 - \frac{1}{2}e^4}{\sqrt{\frac{1}{4}ss - bt}}$, does quintuple;

which is also commodiously done by the *Logarithms*. But the other Correction after the first, does also double the Number of Figures, so that it renders the *assumed* altogether Seven-fold; yet the first Correction is abundantly sufficient for Arithmetical Uses, for the most part.

But as to what is said concerning the Number of Places rightly taken in the Root, I would have it understood so, that when a is but $\frac{1}{2}$ part distant from the true Root, then the first Figure is rightly assumed; if it be within $\frac{1}{10}$ part, then the two first Figures are rightly assumed; if within $\frac{1}{100}$ and then the three first are so; which consequently manag'd according to our Rule, do presently become nine Figures.

It remains now that I add something concerning our *Rational Formula*, viz. $e = \frac{sb}{ss \pm tb}$

which seems expeditious enough, and is not much inferior to the former, since it will triple the given Number of Places. Now having formed an Equation from $a \pm e = z$, as before, it will presently appear, whether a be taken greater or less than the Truth; since se ought always to have a Sign contrary to the Sign of the Difference of the *Resolvend*, and its *Homogeneal* produced from a . Then supposing $+b + se + a - tee = 0$, the Divisor is $ss - tb$, as often as t and b have the same Signs; but it is $ss + tb$, when they have different ones. But it seems most commodious for

Practice, to write the Theorem thus, $e = \frac{b}{s}$ $\pm \frac{tb}{s}$ since this way the thing is done by one Mul-

tiplication and two Divisions, which otherwise would require three Multiplications, and one Division.

Let us take now one Example of this Method, from the Root (of the fore-mention'd Equation) 12, 7, where

$$\begin{array}{r} 298, 6559 - 5296, 132e + 82, 26ee + 29, \\ +b \quad -s \quad +t \quad +u \end{array}$$

$$2e^3 - e^4 = 0, \text{ and so } \frac{b}{s} - \frac{tb}{s} = e; \text{ that is, let}$$

$$\text{it be as } s \text{ to } t, \text{ so } b \text{ to } \frac{tb}{s} = 5296, 132 \text{) } 298,$$

$$6559 \text{ into } 82, 26 \text{ (} 4, 63875 \text{ . . . wherefore the}$$

$$\text{Divisor is } s - \frac{tb}{s} = 5291, 49325 \text{) } 298,$$

6559 (0,056441 = e , that is, to five true Figures, added to the Root that was taken. But this *Formula* cannot be corrected, as the foregoing *Irrational* one was; and so if more Figures of the

Root are desired, 'tis the best to make a new Supposition, and repeat the *Calculus* again: And then a new Quotient tripling the known Figures of the Root, will abundantly satisfy even the most Scrupulous.

ROOTS of Plants are, either

1. *Fibrous*, which send out only small Strings from the Bottom of the Plant, distinct from each other.
2. *More thick or Gross*, which have a Body thick and gross, either branched out into Subdivisions or Arms; or else sending out Fibres from it all along.

These last are either

Carnous, which are either

1. *Broad and Swelling*.
2. *Long and Slender*, which commonly are more hard and woody.

The *Broad and Swelling* are

1. *Bulbous*, which consist but of one Globe or Head, and send out Fibres from the Bottom, and are either
 - Squammose*, or *Scaly*, as *Lilies* or *Martagon*.
 - Coated*, which are involved in *Skins* or *Coats*, as *Cepa*, *Hyacinthus*, *Allium*, &c.
2. *Tuberous*, which are of a carnos, solid, and like-continued Consistence; and these either
 1. *Simple*, with but one Globe or Head, as *Rapa*, *Crocus*, &c.
 2. *Manyfold*, as *Asphodelus*, *Pæonia*, &c.

Long Roots are either

1. *Sarmentous* (i. e.) *Twiggy* or *Branching*, which shoot or creep out transverse, or in breadth: Of these some are *Geniculatæ*, *Knotty*, or *Jointy*, as *Couch-Grass*, *Mints*, &c.
2. *Cauliformes* (i. e.) *Stemmy* or *Stalky*, which shoot down deep directly; though often shooting out Fibres and Strings from the great Stem; which also itself is sometimes divided or branching.

ROTATION, is a Term commonly used in Geometry for the Circumvolution, or Motion of any Surface round a fixt and immoveable Line, which is called the *Axis* of its *Rotation*. How *Solids* which are thus, by the Rotation of a Plane round an Axis generated, may be *Measured* or *Cubed*: The ingenious Mr. *Abr. de Moivre* shews very expeditiously in his *Specimens of the Use of the Doctrine of Fluxions*, Printed in *Phil. Transf. N.* and in Vol. 2. of the *Miscellanea Curiosa*, P. 131 thus: For the Fluxions of such Solids take the *Product of the Fluxion of the Abscissa multiplied by the Circular Base*: and he gives this Instance: Suppose the *Ratio* of a Square to the Circle inscribed be as $\frac{n}{1}$: the Equation, expressing the Nature

Nature or Property of any Circle, whose Diame-

ter is d ; is $y y = d x - x x$. Theref. $\frac{4 d x x - x x x}{n}$

is the Fluxion of a Portion of the Sphere; and consequently the Portion it self $4 \frac{1}{2} d x x - \frac{1}{3} x x x$, $\frac{4 d x x - x^3}{n}$

And the Circumscribed Cylinder is $\frac{4 d x x - x^3}{n}$

Therefore the Portion of the Sphere is to the Circumscribed Cylinder, as $\frac{1}{2} d - \frac{1}{3} x$ to $d - x$.

ROTHERNAILS, or *Rudder-Nails*, are such as have a very full Head; and are used to fasten the *Rudder-Irons* in Ships.

ROUNDNESS, The round Globular or *Spherical* Form, which Pebbles, Fruits, Berries, &c. are adorned with; and which Drops of Water or Quick-silver, &c. Bubbles of Air under Water or some such Liquor, melted Oil, &c. do generally put on, seems to arise from the Incongruity of their Particles, with those of the ambient Fluid; which prevents them from coalescing together, and by pressing upon them, and environing them all round equally, turns them into a round Form. This seems plain, as Dr. Hook hath long ago well observed from the way of making small round Shot of several Sizes, without casting the Lead into any Molds, from Drops of Rain being formed in their falling into round Hail-stones; and from a Drop of Water falling upon small Sand, or Dust, which will strait produce an Artificial round Stone: And from the small round red-hot Balls (easily seen with a Microscope) which are formed by the Collision and Fusion of the Flint and Steel in striking Fire, and perhaps the Principle of Gravitation, is principally concerned in this Matter.

ROUNDS, in a Garrison, is a *Night-Watch* commanded by an Officer that goes round the Rampart of the Garrison, in order to listen if any thing be stirring without the Works, to see that the Centries are watchful, and upon Duty, and that all things be in good Order. In strict Garrisons, the Rounds go every quarter of an Hour, that the Rampart may be still furnished. The Centries ought to *challenge* at a Distance; and to rest their Arms as the *Rounds* pass, and to let no one come near them. When the *Round* is near the *Corps de garde*, the Centry calls aloud, *Who comes there?* And when the Answer is *The Round*, he says, *Stand*; and then calls for the Corporal of the Guard, who draws his Sword, and calls also, *Who comes there?* And when 'tis answered, *The Rounds*; he that hath the Word must advance, and deliver the Word to the Corporal who receives it with his Sword pointed at the Giver's Breast.

ROUT, in the Law-sense, is an Assembly of three or more Persons, who are going forcibly to commit an unlawful Act, though they do it not: For if it be done 'tis a *Riot*.

RUDDER of a Ship: The French Author of a late Book about the handling or working of Ships at Sea, in *Chapt. 7*. Proposes to demonstrate what the Angle is, which the Rudder of a Ship ought to make with her Keel, in order to *Stay or Bear up*, the soonest that is possible: And he saith the Tiller of a Rudder ought to make with

the Keel an Angle of nearly 55 Degrees. And in order that this may be precisely done, he advises to put a Cleat on the Sweep in the Gun-Room, and to dispose it so, that the Arch contain'd between the Keel and Cleat may be of this Number of Degrees; and that the Tiller of the Rudder ought to be some-how stopt, so that it cannot go beyond this Mark; for if it passes it, it will do more hurt than good.

RULE-Sliding. Of this useful and ready Instrument there are several Sorts made; as one by *Partidge*, another by *Everard*, a third by *Hunt*: The Ground and Reason of all which is one and the same; as may be seen in the several Treatises written by the Authors above-named; to explain and shew the Use of their several *Rules*. I shall give you here in short the several Uses and Advantages of all of them.

Seth Partidge calls his the *Double Scale of Proportion*; because the Scales or Lines upon it are all *Double*, which are the Lines usually call'd the *Artificial Lines*, of *Numbers*, *Sines*, and *Tangents*; whose Invention and Use is owing to Mr. *Gunter*: These you will find described, and their Nature explained in this *Lexicon*, under these words. On the Sides of his Double-Scale, are usually set a Line of Inches; or of Foot and Inch-measure; and there may be put a *Gage-Line*, a *Meridian-Line*, and a Scale of Equal Parts; *Lines of Chords*; and for *Board* or *Timber-Measure*, according as any one pleases, or his Occasions require.

Everard's and *Hunt's* Sliding-Rules, are thicker and squarer, so that there are two Sliding-Pieces, which can be fitted to either Face of the Rule; on one of which there are usually Two Double Lines of Numbers, made to slide against such another Double Line placed above them marked O, and a Single Line of Numbers placed below mark'd D. These in *Everard's*, which I shall describe, are marked with B and C, and on the Back of this Sliding-Piece, is a Treble Line of Numbers marked E, together with a Line of Segments.

The other Sliding-Piece hath on one Side a Line of Artificial Sines and Tangents, to slide against two such other on the Sides; and on the other Side is another such Line of Sines, and a Line of versed Sines. Either of these *Sliders* are made to fit in, on each *Face* of the Rule.

On one *Edge* or *Side* of the Rule, are usually placed the Natural Lines of Chords, Sines, Tangents and Secants, for Spherick Projection, with a small Scale of Equal Parts; and one of *Latitudes*, *Hours*, and *Inclination of Meridians* for Dialling: As also a Line of *Rumbs*, and M. L. for Navigation: and on the other Side or Edge, besides Inches and Foot-Measure, is a large Scale of Equal Parts, with a *Meridian Line* placed by, to graduate Sea-Charts, &c. The Uses of all which, you will find under their *Names*.

The first Thing to be learned on the Scale, or Rule, is how to count or number, in the several Lines of Numbers; for as for Sines, Tangents, &c. there all is easie.

1. Know then that every Line of Numbers is a Line of Geometrick Proportion, divided first into 9 Unequal Parts, which may be called *Primes*; these are marked with the 9 Digits, 1, 2, 3, 4, 5, &c. Each of these *Primes* is subdivided into ten other Parts

Parts, called *Tenths*: And each *Tenth* is either *divided*, or supposed to be so, into 10 other Parts which may be called *Centesms*, or Hundredth-parts.

In *Everard's Rule*, the Line D being about 11 Inches long, hath each *Tenth* in the first Prime, divided actually into 10 Parts. But between 2 and 4 each *Tenth* is divided into but *five* Parts; each of which *there* is one Fifth of an Hundred, or 20. Between 4 and the End of the Line, every *Tenth* is divided only into *Two* Parts, so that each Part is 50, or the Half of an Hundred. You may imagine or suppose also that each *Centesm* is subdivided into *Ten* Parts; which therefore will be *Thousandths*, &c.

The Figures 1, 2, 3, 4, 5, &c. by which the Primes are distinguished, are all Arbitrary Points; and may each of them represent so many entire Units, Tens, Hundreds, Thousands, &c. or so many Tenths, Hundredths, Thousandths, or Ten Thousandth Parts of an Unit.

2. Wherefore in Whole Numbers, if 1, at the beginning of the Line D signifie an *Unit*: Then 2, 3, 4, and 5, &c. will also signifie or stand for so many *Units*, and the *Tenths*, and *Centesms*, both be accordingly *Decimal*, or *Centesimal* Parts. If 1, then represent Ten Units, then the Primes 2, 3, 4, &c. will signifie 20, 30, or 40. If 1, stand for 10, or 100. Accordingly, the other Figures, will be 200, 300, 400; or 2000, 3000, 4000, &c.

3. In *Decimals*, If 10 in the Line D represent 1, then each Prime reckon'd backwards towards the Left-hand, will be (1) one Tenth; and in those Primes each *Tenth* will be .01, and in those *Tenths*, each *Centesm* will .001, &c. Part of an Unit.

To explain this a little further, draw out the Sliding-piece B: Till 1, at the beginning of B, stand exactly at 10, at the End of the Line A, for then you will have a Line of Numbers, 4 times repeated; of which let 1, at the beginning of A, stand for 1, or Unity. Then will the next 1, in the Middle of the Line A, stand for 10, and 10 at the End of A, or beginning of B, will represent 100, (1) in the Middle of B, will be 1000; and 10 at its End will stand for 10000.

On the contrary, if you suppose 10 at the End of the fourth Radius in B, to represent (1) then each Prime in that *Fourth* Radius, will be .1 (one Tenth,) in the *Third* Radius 'twill be .01; as the *Second* .001, and in the *First*, .0001 Parts of an Unit.

So also 2, in the First Radius will be .0002; in the Second Radius .002, in the Third .02, and in the Fourth .2 of an Unit.

4. All which being well understood, and considered, which a little Practice will render easie: 'twill be easie to distinguish that Point on the Line where any Number given, *Integer*, or *Decimal Part*, is represented. Thus you will find that the Point *ag*, on the Line D, represents 1895 Units; and the Point *wg*, represents 1715. But on a Line of this Length, you can't distinguish any Number, if it have above four Places, to any exactness: For all the Figures further will be represented at the same Point: Thus, if 189562 were required, you can have on the Rule only 1895.

Vol. II.

All Numbers which after the first Figure have only Cyphers, are represented at the same Point: As 20, 200, 2000, &c. are all represented by 2. If a Number of three Places, hath a Cypher for the Middle Figure: As suppose 308; you must count 3 on the Line (at the Third Prime) and then counting no Tenths, for the last Figure 8, you must reckon 8 Centesms, or Hundredth-parts.

If two Cyphers are in the Middle of a Number of 4 Places; as suppose 4005: after 4, you must neither go on to account Tenths, nor Hundreds, but for the last Figure 5, you must reckon so many Thousandth-parts.

Of the Uses of the Sliding-Rule.

1. To multiply one Number by another; As, suppose 68 by 26.

As 1. 26 :: 68. 1768.

Set 1, on the Line A, against 26, on B, and then against 68 on A; you will find the Product 1768, on B.

You may begin with either Factor, as a Multiplier; and the Product will have as many Places as are in both Factors; except the two first Figures exceed, or are greater than the least Factor: And then it will have one less, as in multiplying 68 by 14,

As 1. 14 :: 68. 952.

Where the Product 952 hath but three Places; because the Figures 1 and 4 in 14, are both less than 9 and 5 in 952.

2. To multiply Decimal Fractions, or Mixt Numbers;

As 27. 8 and .8.

Make the Mixt Number, or Whole one (if such there be,) the Multiplier; and setting it on B, against 1: in A: Seek the Product towards the Left-hand against .8 on B; which will be 22 in A.

3. To divide one Number by another; as 750 by 25.

In Division, As 25. 1 :: 750. 30, the Quotient. Set 25 on B, against 1 on A; and then against 750, on B, will be 30, the Quotient upon A.

N. B. These Examples will instruct you, that at one setting of the Rule, you do both Multiply and Divide.

As suppose 25 a Multiplier; set 1, on B, against 25, on A; and then against any Multiplier in B, you have the Product on A.

And without moving the Rule, if you suppose 25 to be a Divisor against any Dividend on A, you will have a proper Quotient in B.

4. Having, Two, Three, Four, &c. Numbers given, to find a Third, Fourth, Fifth, &c. in Geometrical Proportion to them: Let the Numbers be 2, and 4.

Set 2 in B, against 4 in A, and then you will find against 4 in B, there will be 8 in A; against 8 in B, 16 in A; against 16 in B, 32 in A, &c. and so you may go on either forward or backward, as far as you please.

H h h h

5. To

5. To reduce Vulgar Fractions to Decimals :

As, suppose $\frac{63}{84}$.

Set 84 in B, against 63 in A ; and then against 1 in B, you will have .75, the Decimal required. And 'tis .75, not 75 because 'tis on the Left-hand of Unity, or 1 in A.

6. To reduce .7625 a Decimal Fraction to the known Parts of an Integer.

First let the Decimal of a Pound be reduced to Shillings, Pence or Farthings.

Set 1 in the Middle, or 10 at the End of B, against 20 (the Shillings in a Pound) in A ; and then against .7625 in B, you will have 15. 25 in A : That is 15 s. 3 d.

If you would have reduced it to Pence, you must have set 1 in B, against 240 (the Pence in a Pound) in A, you would have had 183, the Pence in .7625.

If you would have the Farthings, set 960 (the Farthings in a Pound) in B, against 1 in A, and then against the Decimal .7625 in B, you have 732, the Farthings contained in it, on A.

If .7625 were the Decimal of an Ale Barrel, Set 32 (the Gallons in a Barrel of Ale) in B, against 1 at the beginning of A ; and then against .7625 in A, will be 24. 4. the Gallons in that Fraction.

7. To work the Rule of Three, or Three Numbers. being given to find a Fourth Proportion, either Directly or Inversely.

1. Directly.

If 6 Quarters of Malt make 18 Barrels of Beer, how much will 30 make?

Set 6 on B, to 18 on A, and then against 30 on B, you will have the Fourth Term, 9 on A.

2. Inversely.

If 8 Men can do a Peice of Work in 9 Days, in how many Days would 12 Men dispatch the same Work?

Set 12 on A, to 8 on B ; and then against 9 on A, will be 6 on B, which is the Fourth Number sought.

3. If the Question had been in how many Days could 6 Men have done the same Work? then 'twould have been, as 6 on B, to 8 on A :: So 9 upon B, to 12 upon A.

8. Between two Numbers given to find a mean Geometrical Proportional.

Suppose 50 and 72.

Set 50 in C, against 50 in D, and then against 72 in C, will be 60 in D, the mean required ; or set 72 on C, against 72 on D ; and then against 50 on C, will be 60 on D.

9. To extract the square Root of any Number under 1000000.

Apply the Lines C and D; so that 10 at the End of C be against 1 in D, and then will the Square

Root of any Number in C, be found by Inspection against it in D.

Only observe when the Number of Places in the given Number is even, *i. e.* when the Number consists of 2, 4, 6, or 8 Figures (being Integers) you must find it in the Second Radius of the Line C ; and against it you have the Root in D : Thus against 16 in C, you will find 4 in D, against 81 in C, 9 in D.

Against 2304 in C 48 in D ; and against 784996 in C, you will have 886 in D, as well as those Numbers can be expressed on the Rule : And in this Case the Root will always consist of half as many Figures as the Number given.

But if the Integers in the Number given are odd, as 1, 3, 5, or 7 ; then it must be sought in the First Radius on C, and against it in D will be the Root sought. So bring 1 at the beginning of C, to 1 in the Middle of D ; and then against 576 in C, will be 24 in D, and against 20736 in C, will be its Square Root 144 in D.

10. To extract the Cube-Root of any Number under 1000000000.

Apply the Triple Line of Numbers E against D, as C was in the Square Root ; and then against any Numbers in E, are the corresponding Cube-Roots in D.

N. B. When the Number consists of 1, 4, or 7 Places, you must find it in the First Radius in E.

But when it hath 2, 5, or 8 Places, it must be found in the Second Radius of E.

As if it have 3, 6, or 9 Integers, it must be found in the Third Radius.

11. Either the Diameter or Circumference of a Circle being given to find the other.

When the Diameter is 1 Inch, Yard, Foot, &c. the Circumference is 3. 1415 of such Inches, Yards, Feet, &c.

Wherefore as 1, to 3. 1415 :: So is the Diameter of any Circle to its Circumference.

Set therefore 1, on A, to 3. 1415 on B ; and then against any Diameter in A, you have the corresponding Circumference in B, and *vice versa*.

12. Having the Diameter to find the Area of a Circle.

Set 1 on D, to .7854 on C ; and then against the Diameter in Inches on D : (Suppose 20,) you will have the Area in Square Inches, (*viz.* in this Case 314. 15.) on C ; and so against any Diameter in D, you will have a corresponding Area in C.

13. To Three Numbers given to find a Fourth in Triplicate Proportion.

If a Bullet whose Diameter is 4 Inches, weigh 9 lb. What will one of the same Matter weigh, whose Diameter is 8?

Set 4 in A against 8 in B ; and then against 9 in A you have 18 in B, against 18 in A 36 in B ; and

and against 36 in A 72 in B; which Third Number in continual Proportion from 18, is the Number sought, shewing the Weight of such a Bullet to be 72 lb.

Simple Interest.

14. *Given Principal, Time, and Rate, required the Amount.*

What doth 15 l. 5 amount to in 12 Years Time at 6 per Centum?

Set 1 in A to 6 in B; and then against 12 in A, you have 72 in B; which because it was .06, will be .72 the Interest of one Pound for 12 Years at 6 per Cent. Then set .72 in B, against 1 in A; and you will have against 15. 5 in A, 26. 66: the Amount in B. And so from any Three of these given, you may find the Fourth.

15. *Given an Annuity, Time, and Rate; to find the Amount.*

What is the Amount of an Annuity of 62 Pounds per Annum, at 6 per Cent. at 4 Years End?

1. Set 1 on B to 6 on A; and then against 62 in B will be 3. 72, the Interest of 62 l. for one Year.

2. Set 1 on B to 3. 72 in A; and then against 2 in B (viz. half the Time given) will be 7. 44, the Interest of the Annuity for half the Time in A.

3. Set 1 on B to 7. 44 in A; and then against 3 in B (then all the given Years but one) to 22. 32 the Interest of the Annuity in A.

To which adding 248, (the Summ of the 4 Annual Payments) the Summ will be 270. 32. The whole Amount.

Compound Interest.

In Compound Interest the Respective amounts for each Respective Year, are so many Geometrick Mean Proportional Numbers.

For as 100 l. at the End of the First Year is 106 l. at 6 per Cent. and that is now become a Principal; and at the Second Years End will amount to 112 l. 36. and this being made a Principal will at the Third Years End amount to 119 l. 10 16; and these 4 Numbers 100. 106. 112. 36, and 119. 10 16, are in Geometrick Proportion continued.

Wherefore 'tis easie by the Rule to solve this Problem.

16. *Of any Summ of Money to find the Amount in any Time, and at any Rate of Compound Interest.*

As suppose the Amount of 100 l. for 5 Years at 6 per Cent. Compound Interest.

Set 100 on B against 106, (or 108, &c. according to the First Years Amount at any Rate of Interest) and then against 106 on B, you will

Vol. II.

have 112 l. 36. the Amount in Two Years; and against 112. 36. on B, will be 119 l. 10 16 on A, the Amount in Three Years; and against 119. 10 16 in B, will be 126. 247, the Amount in 4 Years. And lastly, against 126. 247 in B, you will have 133 l. 822 on A, which is the whole Amount at the Five Years End.

And from it 'twill be easie to answer this Question.

17. *What is a Summ worth now in Ready Money, which is due at any Time to come, and at any Rate of Interest?*

As what is the present Value of 133 l. 822 due Five Years hence, at 6 per Cent. Compound Interest?

For you need only reverse the former Practice: Set therefore 106 on A against 100 on B; and then against 133 l. 822 on A, you will have 126. 247 on B; which is the Worth of 133. 822 at the End of the First Year: Then against that on A, you will have 119. 10 16 on B, for the present Worth at the End of the Second Year; and against 119. 10 16 on A, you will have 112. 36 on B, for the Third Year; and against that Number on A, you will have 106 on B for the Fourth Year; and at last against 106 on A, you will have 100 l. on B; which is the present Worth of 133 l. 822 due Five Years hence at Compound Interest of 6 per Cent.

18. *What are the Arrears due on an Annuity or Rent of 9 l. per Annum, and forborn 12 Years, at the Rate of 6 per Cent. Compound Interest?*

Set 6 in A to 100 in B; and then against 9 in A will be 150 in B; which is a Principal whose Interest is 9 l. Then work as in Problem 16 above, to find the Amount of 150 l. in Twelve Years, which will be 301 l. 828; from which you must deduct 150 l. (the principal first found) and the Remainder 151. 828 answers the Question, and is the Summ of the Arrears sought.

19. *What is the Ready Money worth of a Rent or Annuity of 9 l. per Annum to continue for Twelve Years only; allowing the Buyer to have 6 per Cent. for his Money, Compound Interest?*

By the last Question the Arrears of a Rent of 9 l. per Ann. and forborn for Twelve Years were 151 l. 828.

And the present Worth of 151 l. 828. (by Quest. 17.) due at the End of Twelve Years, is 75 l. 443. Wherefore so much may be given for an Annuity of 9 l. per Ann. to continue for Twelve Years.

N. B. If the Annuity is not to commence till after a certain Number of Years; as suppose 6 are expired: Then you must add that Term to the Twelve Years, which makes it 18. Then seek what the Arrears, of 151 l. 828 being forborn Eighteen Years are now worth in Ready Money, which (by Quest. 18.) you will find 53 l. 185, which is the Answer; So that a Yearly Rent of 9 l.

to

to begin Six Years hence, and to continue Twelve Years, is in Ready Money worth but 53 *l.* 185; whereas if it were to commence immediately, 'twere worth 73 *l.* 443.

Purchasing of Annuity.

20. *What Annuity, to continue Twelve Years will 300 *l.* buy; allowing the Buyer 6 per Centum, Compound Interest for his Purchase Money?*

By Quest. 19. I find that 75 *l.* 443 will purchase 9 *l.* per Ann. for Twelve Years, (or you may find the Value of any other Annuity in Ready Money) and then say as the present Worth or Value, is to the Annuity taken :: So is the Summ proposed to the Annuity required.

Set therefore 75 *l.* 443 on B to 9 on A; and then against 300 *l.* on B, will be 35 *l.* 776, or 35 *l.* 15 s. 6 d. and such an Annuity to continue Twelve Years to come, is worth now in Ready Money 300 *l.*

21. *What is the Value of a Free-hold Estate of 75 *l.* per Ann. allowing the Buyer 6 per Cent. for his Money, Compound Interest?*

As the Annual Interest of 1 *l.* is to 1 *l.* :: So will the Annual Rent be to the Summ required.

Wherefore against .06 on B, set 1 on A; and then against 78 on B, you will have 1300 on A, the Value of the Estate required.

In Trigonometry.

It will be very easie to work any Cafes or Questions by this Sliding-Rule, in either Plain or Spherick Triangles; of which one Instance in each will be sufficient.

Suppose the common Cafe in Plain Sailing.

22. *Where Course and Distance are given; and Difference of Latitude and Departure are required. (See Plain-Sailing in Vol. I.)*

The Canon is, As Rad. to Distance run in Miles :: So Co-Sine of the Course to Difference

of Latitude in Miles :: And so Sine of the Course to Departure in Miles.

Bring then 90° in the Line of Sines against 108 (the Distance run) in A; and then against 56° 15' (the Co-Sine of the Course) in the said Line of Sines, you will have 90^m in A, the Difference of Latitude in Miles.

If you would have the *Departure*.

Bring as before 90° in the Line of Sine against 108 in A; and against 33° 45' (the Angle of the Course) in the Sines will be 60 Miles in A, the Departure required.

Suppose 2^{dly}. The Sun's Place in the Ecliptick to be 30° of γ , and his greatest Declination to be 20° 30', I require his present Declination.

The Canon is, As Rad. Sine of the Sun's Longitude or Distance from γ :: So Sine of greatest Declination to Sine of the present Declination.

Set therefore 90° in the Sliding-Line of Sines against 30° in the fixt one; and then against 23° 30' in the Sliding-Line, you will find 11° 30' in the fixt Line of Sines; which is the Sun's Declination sought.

In Dialling.

23. *To calculate the Horary Distances from the Meridian, in either Horizontal or particular Dials.*

The Canon is, As Rad. to Tangent of 15° (one Hours Equinoctial Distance) :: So is the Sine, or Co-Sine, of the Latitude, suppose 51° 30' of the Place, to the Tangent of the Distance sought 11° 51'.

Set 90° in the Sliding-Sine to 15° in the fixt Tangent; and then against 51° 30' in that Sine, will be 11° 51' in the Tangent.

RUMBS; Here is a Table of Rumbs or Points of the Compass; shewing how many Degrees and Minutes each Point contains.

A Table

A Table of *RUMBS*.

RUMB.

R U M

*So is the Difference of Longitude : To the De-
parture from the Meridian, in the Course
between the two Places ::*

The latter Proportion of this Division, of which we make no use, is :

As the Difference of Latitude :
Is to the aforesaid Departure from the Meri-
dian : :
So is the Radius : To the Tangent of the Rumb : :

And in the Second Proportion :

Let the Rumb be required between *Cape Finisfire*, Latitude 43 Degrees, Longitude 7 Degrees 20 Minutes, and *St. Nicholas Isle*, Latitude 38 Degrees, Longitude 352 Degrees, the Middle Latitude is 40 Degrees 30 Minutes, the Complement is 49 Degrees 30 Minutes, and the Difference of Longitude is 15 Degrees 20 Minutes, or 33 Centesims.

*As the Diameter : Is to the Summ of the Co-
sines of both Latitudes ::*

the greater Chord is almost 22 Degrees, the Complement whereof is 68 Degrees, and so much is the Rumb from the Meridian between these two Places, which is 6 Points and about 30 Minutes more, wherefore *St. Michaels Isle* bears from *Cape Finisfre* West-South-West, half a Degree more Westwardly.

If the two Places had been both in the Latitude of 40 Degrees 30 Minutes, having the same Difference of Longitude, to wit, 15 Degrees 20 Minutes, then had the Extent LM been their Distance, to wit, 11 Degrees 68 Centesims, at 20 Leagues to a Degree, is 233 Leagues and a half, and thus we supply the want of the Scale of Longitudes.

gitudes, in finding the Distance of Places that bear East and West, as those that are in the same Latitude must needs do.

An Example of the latter Proportion.

Let it be required to find the true Rumb and

Distance between the *Lizard* and the *Bermudas*. Mr. *Norwood* in his *Sea-man's Practice*, p. 110, maketh the Latitude of the *Lizard* to be 50 Degrees, and of the *Bermudas* 32 Degrees 25 Minutes, or 32 Degrees 41 Centesims, and the Difference of Longitude between these Places to be 55 Degrees.

Draw the Lines A C and C D at Right-angles, now for want of room I use the lesser Chord, and with 60 Degrees thereof I describe the Quadrant H I, and prick the Radius from I to D, so is C D the Diameter, then count both Latitudes from H to F and G, the nearest Distance from F to C I, is the Co-sine of *Bermudas* Latitude, which prick from C to E: Again, the nearest Distance from G to C I, is the Co-sine of the *Lizard's* Latitude, which place from C to S, so is C S the Summ of both Co-sines; draw D S, and prick down 55 Degrees the Difference of Longitude from C to V, out of the greatest equal Parts, and draw V B parallel to D S, so is C B the Departure from the Meridian in the Course between both Places, then making that one Leg of a Right-angled Triangle, prick down 17 Degrees 59 Centesims, the Difference of Latitude between those Places out of the same Equal Parts from C to L, and draw B L, which represents the Course and Distance truly between the *Lizard* and *Bermudas*, and the Extent L B measured on the same Equal Parts, shews the Distance to be 44 Degrees 31 Centesims, which allowing twenty Leagues to a Degree, is 886 Leagues.

Then to find the Course: with 60 Degrees of the Chords, setting one Foot in L, with the other make a Mark at Y and Z, then the Extent Z Y measured on the Chords, sheweth the Rumb to be 66 Degrees 37 Minutes from the Meridian, which is almost 6 Points, and in this Example the Proportion doth not err any thing from the Truth, according to *Mercators Chart*, whereas if you use

the former Proportion by the middle Latitude, the Rumb would have been 67 Degrees 2 Minutes from the Meridian, and the Distance 902 Leagues; if you make C A equal to C V, then a Line joining L A should be the Course and Distance according to the same Longitudes and Latitudes laid down on the *Plain Chart*, and thereby the Course should be 72 Degrees 17 Minutes from the Meridian, and the Distance 1155 Leagues; however when two Places are laid down true at first in their Rumb, Distance and Latitudes on the *Plain Chart* if you sail home, in, or near the same Rumb, the *Plain Chart* will very well serve to keep the reckoning upon, and to sail by in the greatest Voyage.

What the Nature of this Rumb Line is on the Globe, and how to Delineate it there, and in a Chart Mr. *Collins* shews in the same Book, page 55, and 64.

RUMINANT Animals, are such as chew the Cud; and these are Quadrupeds, Hairy and Viviparous, and in general, Mr. *Ray* observes of them, that some have *hallow and perpetual Horns*; others *Deciduous* ones, or such as are shed every Year; and all the Horned Ruminant Animals have four Stomachs. 1. The *Koilia Mezala* of *Aristotle*; the *Venter Magnus*, or what we call the *Paunch* or *Inward*. This receives the Meat slightly chewed, retains it a while, and then delivers it back again into the Mouth, which is what we call the *Cud*, to be re-chewed and rendred more fit to make Chyle, 2. The *Kekryphalos*, or *Reticulum*, which we call the *Honey-Comb*; from its Internal Coat, being divided

divided so into Cells like Honey-Combs. 3. The *Εχινος*, which Er. Ray thinks hath been wrong Translated, *Omasus*; and therefore he would have it called the *Echinus*: This is so difficult to clear, that our People throw it away, and call it the *Manifold*. 4. The *Ἰνδυσος* of Aristotle, by Gaza called the *Abomasus*. The Stomach in Calves is that which contains the Acid Ferment, which we call the *Runnet*, and is used to coagulate Milk into Cheese.

Also all Horned Ruminant Animals want the *Dentes Primores*, or broad Teeth in the Upper Jaw. These Kind of Animals have also that Kind of Fat which we call *Suet*; *Sebum*, *Στεας*, which is much harder and firmer, and less liquifiable in them, than the *Adeps* of other Animals.

RUNCINUS, and *Runcilus*, in Doomfday-Book is used for a Load-Horse: Sumpter-Horse, or Cart-Horse: This Kind of Horse, *Chaucer* in his *Seaman's-Tale*, calls a *Rowney*.

RURAL-Deans. There were formerly in the Church, *Arch-Presbyters*, as well as *Arch-Deacons*; and they were called *Rural-Deans*. Our Diocesses are still divided into Deanries, and he who under the Bishop and Arch-Deacon, had the peculiar Care and Inspection of the Clergy and Laity of such a District as is now called a *Deanery*, was the *Rural-Dean*. He had Power to visit and to hear Causes, they had a Seal of their Office, but were removeable at pleasure, but jointly by the Bishop and Arch-Deacon. The Rest of the Clergy within the Deanry were called the *Rural-Dean's Chapter*.

SAGIBARO, or perhaps *Sachbaro*, anciently signified the same as *Justiciarius*, from *Sac causa*: So that *Sac-baro* is as much as the *Cause-hearer*, or the Man that hears Causes.

gard to a Surface on which it is to strike, must be after one of these three ways, either *Perpendicular*, *Parallel*, or *Oblique*. In the first Case, let the Line *DC*, in Fig. 1. represent a Plain Surface, and let the Line *AB* be Perpendicular to it, describing the direct Impulse of the Body *A* upon it; 'tis plain here that the Body *A* strikes upon it with all its force, and this Force may be called *Absolute*, and may be expressed by the Line *AB*, which the moving Body *A* describes: And this Absolute Force will be *greater* or *less*, according as the Body *A* moves *swifter* or *slower*. (3.) If the Motion of the Body *a* be Parallel to the Surface *DC*, then 'tis plain the Line of Motion *ab* will not affect the Surface at all because it is no way opposed to it; nor can the moving Body strike upon it, or touch it. (4.) If the Line of Motion *AD* be Oblique to the Surface *DC*, so that the Angle of Incidence be *ADC*. then the Motion of the Body in the Line *AD*, may be resolved into two Forces, *viz.* into *AE*, or *DB*, and into *AB*, (*See Composition of Motion*.) But the Direction or Line of Motion *AE*, being Parallel to the Surface *DC*, cannot affect it at all; so that the whole Motion of the Body *A* in that Oblique manner of Striking on the Surface, will be expounded by the Perpendicular Line *AB*. And if *DA* be made the Radius of a Circle, whose Centre is at *D*, *BA* will be the Sine of the Angle of Incidence *ADC*, and consequently, you may conclude that the Force of a Particle of *Air* or *Water*, as *A*, striking against the Surface *DC*, which may represent either a Sail, or the Rudder of a Ship, in the Oblique Direction *AD*, will be to the Perpendicular Force there, as *BA* is to *DA*: that is, *as the Sine of the Angle of Incidence is to Radius*. And since what is thus true of one Particle *singly* considered, will be true of all the Particles of any Fluid Body *Collectively*; it will follow, that the force of the Air or Water falling Perpendicularly upon a Sail or the Rudder, to the force of the same in any Oblique Impingency, will be as the Square of the Radius, to the Square of the Sine of the Angle of Incidence; And consequently, that all Oblique Forces of the Wind against the Sails, or of the Water against the Rudder, will be to one another *as the Squares of the Sines of the Angles of Incidence*. Here is no regard had to the different Degrees of Velocity, with which the Wind or Water may impinge against the Sail or Rudder; but only of the *Position* of the Surface so struck, with regard to the Impinging Force: But when that Matter is considered, it will be found that the different Forces then *will be as the Squares of the Velocities of the moving Air or Water*: that is, that a Wind that blows thrice as strong, or moves thrice as swift as another, will have nine times the force upon the Sail: And it being also, saith he, indifferent, whether you consider the Motion of a Solid in a Fluid, whose Particles are at rest, or of those Particles moving all Parallel against a Solid that is at rest, the Reciprocal Impressions being always the same: So that if a Solid be moved with different Velocities in the same Fluid Matter (as suppose Water) the different Resistances which it will re-

ceive from that Water, will be in the same *Proportion as the Squares of the Velocities of that Body.*

Let H M represent a Ship, C D the Position of the Sail, A B the Course of the Wind blowing towards B. Draw B G Perpendicular to the Sail D C, and G K Perpendicular to the Line of the Keel produced H M K.

By what he hath said above, the Sail C D will be driven by the Wind A B, according to the Direction of the Line B G: So that if she could divide the Water every way with the same Facility, as she doth with her Head, the Ship would go directly to the Point G, along the Line B G. And if H K represent her direct Course, she would have got forward the length B K, and sideways she would have gone the Quantity G K. But as her Length is much greater than her Breadth, so she will divide the Water, or make her way in it much more difficultly with her Side, than with her Head or Stem; on which account, she will not run sideways so far as K G, but fall short of it in Proportion to the said Difficulty of dividing the Water with her Side: That is, if the Resistance she finds in passing thro' the Water sideways, be to that of passing lengthways, suppose as 10 to 1, then will not the Ship get sideways above a 10th part of the Line G K. Wherefore if K G can be found to G L, in the Ratio of the Resistance of the Side to that of the Stem, and the Line B L be drawn, the Ship will go to the Point L, along the Line B L, in the same time as it would have gone to G, if it could have divided the Water every way equally. This Part K L is called the *Drift*, or *Lee-way* of a Ship, and the Angle K B L is her Degrees of *Lee-way*; as the Angle A B K expresses how near the Wind she lies. [Now from hence it follows, saith our Author, That if we could but find the Ratio between these two Resistances of a Ship's dividing the Water sidewise and lengthwise, we might determine the *Line of a Ship's true way*.] But as this is very difficult to be done, from the knowledge of a Ship's Figure and Proportions; so he gives another Method, whereby he saith, it may be effected, as you may find in *Art. 2. of Chap. 2.*

After this he undertakes to demonstrate in *Art. 3. of Chap. 4.* That the best Position or Situation of a Ship, so that she may make the best *Lee-way*, but go to Windward as much as is possible, is this: Let the Sail have what Situation it will, the Ship must always be in a Line bisecting the Complement of the Winds Angle of Incidence upon the Sail. That is, let the Sail be in the Position B C, the Wind blowing from A to B, and consequently

the Angle of the Winds Incidence on the Sail A B C, therefore its Complement will be C B E; then must the Ship be put into the Position B K, or more in the Line B K, bisecting the Angle C B E.

And that the Angle which the Sail ought to make with the Wind or the Angle A B C, ought to be but of 24 Degrees. That being the most advantageous Situation to go to Windward the most that is possible, and in order to bring this to bear in Practice, he directs to put Marks to the *Sheets*, *Braces* and *Bowlines* of the lower Sails, to know when they are in their best Situation; and then, even in the Night, when the Marks of a *Brace*, or of a *Sheet* shall come to the Cleat, one may be pretty well assured that the Sail *Trims* well.

SALT, Sir *Is. Newton* shews that Salt is compounded of a dry Earth, and an Aqueous Acid joyned together by *Attraction*, and that Earth can't be turned into Salt, unless by the mixture of so much of an Acid, as may make it capable of a Dissolution in Water. And as it is owing to the Force of Gravity, that the Sea flows round the more dense and ponderous Globe of the Earth, so will the Principle of Attraction (see that word) occasion that the Aqueous Acid may flow round the more compact Terrestrial Particles, and so compose the Particle of Salt. For by no other way (saith he) can we account for Acid, being in place of a Mean, between Earth and common Water, in order to render Salt dissolvable in the latter. And as in the great Terraqueous Globe, the most dense Bodies will by their Gravity subside in Water, and do always tend towards the Centre of the Globe, so in the Particles of Salt, the most Dense Matter always endeavours to get to the Centre of the Particle. So that a Particle of Salt is a kind of *Chaos*, dense, hard, dry, and earthy at the Centre, but rare, moist, soft, and watery at the Surface. And hence it appears, Salts are of so durable and lasting a nature as they are: for they can scarce be destroy'd, unless the Aqueous Parts be either drawn off by a great force, or by Putrefaction and a moderate Heat, permitted to get down into the Occult *Meatus*, or Pores of the Central Earthy Parts, and at last dissolve them by cutting them into small pieces.

If Salt in a small quantity be dissolved in a great deal of Water, the Saline Particles, tho' specifically heavier, will not subside, but diffuse themselves equally throughout all the Water, and render it equally Salt in all places; which seems to shew that the Parts of the Salt do mutually recede one from another, and endeavour to expand themselves all manner of ways and to part and separate

rate as far as the space will permit: And this *Endeavour* shews that they have some kind of *Repelling Force*, by which they fly from one another, or at least are more strongly *attracted* by the *Parts* of the Water, than by one another. For as all Bodies *ascend* in Water, which do gravitate less towards the Earths Centre than the Parts of the Water; so all the Particles of Salt which swim in Water, and are less attracted by any one Particle of Salt, than they are by the Water it self, must necessarily recede from that Particle, and give place to the Water, which is more forcibly attracted.

When a Liquor impregnated with Salt, hath its Moisture so far Evaporated by Heat, that a *Pellicle*, *Cuticle*, or little Skin appears upon its Surface, if then it be set to cool, the Salt will shoot into Chrystals, which will be of some regular Figure: From whence it appears, that the Saline Particles before their Concretion, were placed in the Liquor in *some certain Order*, and at equal Distances or Intervals; and consequently that they *did act one upon another by some kind of Force*, which is *equal at equal Intervals*, and *unequal at unequal Distances*. For the Supposition of some such Force will occasion their being disposed every where into such Orders; but without it they would ramble about and be dispersed, perfectly irregularly in the Fluid.

In the *French Memoirs* of the Academy of Sciences for the Year 1699, there is a Method, by Mr. *Homburg*, of finding the exact quantity of the Volatil Acid Salt that any Liquor contains.

(2) Their way of making Salt at *Nantwyche* in *Cheshire*, is thus, (saith Mr. Ray) The Salt-spring, or as they call it the *Brine-pit* is near the River, and is so plentiful, that were all the Water boiled out that it will afford, it is thought it would yield Salt enough for all *England*.

The Brine-pits belong not all to one Lord; but some have one *Lead-wall*, some two, three, four, &c. A *Lead-wall*, is the Brine of 24 Hours boiling for one House.

Two hundred and sixteen *Lead-wallings*, or thereabouts, belong to all the Owners of the Pits. No Tradesman, Batchellor, or Widower, can Rent more than 18 *Lead-wallings*.

They have 4 Sworn Officers chosen Annually, which they call *Occupiers of Walling*; whose Duty it is to see equal Dealing between Lord and Tenant, and all Persons concerned, to appoint how many Houses shall work at a time (which is 12 at most) to appoint a Crier (when Salt is to be made;) to make Proclamation so, that all Parties concerned may put to their Fires at the same time, and so also when they shall cease: which is at a determinate Hour: And he that doth not leave off then hath his Salt spoiled, by throwing Dirt, &c. into it.

In the Town are about 50 Houses, and every House hath 4 Pans, which the Officers are to see must be all exactly of the same Measure.

The Salt Water taken out of the Brine-pit, in boiling 2 Hours $\frac{1}{4}$, will be Evaporated, and boiled up into Salt.

When the Liquor is more than luke-warm, they take Strong-ale, Bullock's-blood, an Egg-shell full, the White of one Egg, and of Ale a Pint: This Mixture is put into a Pan of 24 Gallons, or thereabouts; the Whites of Eggs, and the Blood serve to Clarify the Brine, by raising the Scum; which

they take off just upon the boiling of the Pans, otherwise it boils in and spoils the Salt. The older the Blood is the better, *ceteris paribus*, when the Liquor boils too fast, they don't put in any Blood, but allay it with Brine that hath been before boiled, and drain'd from its Salt. Crude Brine, they say, will diminish their Salt; and they say, the Ale serves to harden the *Corn* of the Salt.

After one hours boiling, the Brine will begin to *Corn*, or Granulate. Then they take a small quantity of clear Ale, of which they sprinkle about an Egg-shell full into the Pan, but if you put in too much Ale, it will make the Liquor boil over the Pan; a little while before they put in the last Ale, they cause the Pan to boil as fast as they can; but after that very gently, till the Salt be almost dry, For they do not Evaporate quite, *ad siccitatem*, but leave 2, 3, or 4 Quarts of Brine in the Pan, lest the Salt should burn, and stick to its sides.

The Brine thus sufficiently Boiled and Evaporated, they take out the Salt and pour it into Conical Baskets (which they call *Barrows*) and in them let the Water drain from it an hour, more or less, and then set it to dry in the Hot-house behind the Furnace.

A Barrow containing 6 Pecks, is sold there for 16 Pence.

Out of 2 Pans of 48 Gallons they expect 7 Pecks of Salt, *Winchester* Measure.

The House in which the Salt is boiled, they call the *Wyche-house*; the Vessel whereinto the Brine is by Troughs conveyed from the Brine-pit, is called the *Ship*. 'Tis raised out of the Pit by a Pump. Between the Furnace and the Chimney-tunnels, which convey the Smoke, is their *Hot-house*, where they set their Salt to dry; along the Floor whereof run 2 Funnels from the Furnaces, almost Parallel to the Horizon, and then they arise Perpendicularly; in these the Flame and Smoak running along from the Furnaces, heat the Room by the way.

At *Droitwyche* in *Worcestershire*, the Salt is boiled in shallow Leaden-pans.

They first put in the Salt-water out of the Brine-pits, and then after an hours boiling they fill up the Pan with the Water that drains from the Salt set to dry in the Barrows, and after a second hours boiling, they fill up the Pans again with the same. In five hours boiling the Pan grows dry, and then they take out the Salt.

In 24 hours they boil out 5 Pans, and then draw out the Ashes; after which they put in the White of an Egg to make the Scum arise (which is partly Dust and Ashes, falling into the Pan when they are taking out the Ashes.) The Scum they take off with a Scummer, and after 4 hours they begin to take out the Salt, and once in 24 hours they take out a Cake which sticks to the bottom of the Pan, and which they call *Clod-Salt*, otherwise the Pan would melt. They use there neither Blood nor Ale, and the Salt made there is extraordinary fine and white.

In *Lancashire* they make Salt of Sea-Sand, thus, They pare off in dry Summer-weather, the upper part of the Sand in the Flats and Washes (which are cover'd at Full-Sea, and bare when the Tide is out) and lay it up on great heaps.

Of this Sand they put into Troughs, bored with holes at the bottom, a sufficient quantity, and then pouring Water upon it, they make a *Lee* or *Lixivium*, and the Water draining thro' the Sand,

carries the Salt with it down into Vessels placed underneath. As long as this Liquor is strong enough to bear an Egg, they keep pouring more Water still upon the Sand in the Troughs, but as soon as the Egg begins to sink, they cast the Sand out of the Troughs, and put in new from the Heap.

This Water thus impregnated with Salt, they boil in Leaden-pans, wherein (as above) the Water Evaporating leaves the Salt behind.

At *Newcastle, Preston-pans, in Scotland, Whitehaven in Cumberland*, and other Places, they make Salt in great Plenty, by Boiling and Evaporating the Sea-water, and in the Operation they make use of Ox's Blood, as at *Nantwyche*.

From Dr. *Jackson's* Account of the Salt-works and Springs in *Cheshire*, in the *Philosophical Transactions*, I find that now they have changed their 6 Leaden-pans into 4 Iron ones, something better than Yard square, and about 6 Inches deep; which are set upon Iron-bars, and made up on all sides very close, to hinder the Flame or Smoke to break thro', with Clay and Bricks. Their Fuel is *Staffordshire* Pit-coal. They never cover their Pans at all, during the whole time of boiling; and their Houses are like Barns, open up to the Thatch, with a *Louvre-hole* or two to carry off the Steam, which is so great, that probably it would warp Boards, and rust Nails, so that no Timber covering would last long; what Tiles would do, no one yet hath tried there.

The Sweepings of such Salt as is shed and scatter'd about on the Floor, takes up with it a good deal of Dirt, and is called *Grey-Salt*. This sells but at half the Price of white Salt, and is only used by the Poor to Salt Cheese, Bacon, &c. *Catts of Salt* are made of the worst Salt, when yet wet from the Pans, 'tis molded and made up with some Cummin-seed and Ashes, and so baked into Lumps at the Mouths of their Ovens; they are only used in Pigeon-houses. But *Loaves of Salt* are the finest of all for Table use.

At *Droitwyche in Worcestershire*, they use no Blood, but only Whites of Eggs (a quarter of one White to a Gallon of Brine) to Clarify their Brine; and to Granulate it, they use no Ale, nor any thing else; this Salt is much whiter and better than the *Cheshire* Salt, and a *Winchester* Bushel of it weighs half a hundred Weight.

The way of making *Bay-Salt* in *France*, is described in *Philosophical Transactions*, N. 51, with Figures. The Water is let in from the Sea into a first and second Receptacle, and then into a third, which is called the *Marish*. In these Beds or *Marishes* the Water is not above an Inch and half deep; each Bed of the *Marish* is 15 Foot long, and 14 Broad. When it rains much on any day, no Salt can be made in 3 or 4 days after, and then they have Stops to hinder the Sea-water from coming into the *Marishes*. But if it rain for 5 or 6 days, they are necessitated to empty all the Water out of the Beds by a peculiar Channel, which cannot be opened but at Low-water.

The hottest Years make the most Salt, and in the hottest part of Summer, Salt is made in *France* even in the Night: Less Salt is made in *Calm* than in Windy Weather, and the *West* and *North-west* Winds are best for that Purpose. The People draw the Salt every day, and each day more than an hundred Pound weight.

SALT-SILVER, was one Penny, formerly

paid at the Feast of *St. Martin*, by the Servile Tenants to their Lord, by way of Commutation, for the Service of carrying their Lord's Salt from Market to his *Lardar*.

SALVAGE-Money, is a Recompence allowed by the Civil Law, in lieu of all Damages sustained by that Ship, that saves or rescues another which was set upon or taken by the Enemy, or by Pirates.

SALUTE, SALUS, was a Coin of Gold, Stamp'd by *K. Henry 5.* in *France*, after his Conquests there, it had on it the Arms of *England* and *France* quarterly.

SANCTUARY, was formerly a Place Privileged by the Prince for the Safeguard of Mens Lives that were Capital Offenders: Our ancient Kings of *England*, permitted the Sanctuaries to protect Traytors, Murderers, &c. if within 40 Days they acknowledged their Fault, and submitted themselves to Banishment: And during that time, if any Layman Expelled them he was Excommunicated, and a Clerk was made irregular by it. But after 40 days, no Man might relieve them. Of these there were many in *England*, and one more famous than the rest, at *St. John's at Beverly*. How these were taken away by degrees, you may find by reading the Statutes of 26 H. 8. 13. 28 H. 8. 7. 32 H. 8. 15. 1 E. 6. 12. 2 E. 6. 2. and 33. 5 E. 6. 10.

SAND-bags, in Fortification, are Bags holding about a Cubick Foot of Sand or Earth: They are used for raising Parapets in haste, or to repair what is beaten down; they are of use when the Ground is Rocky, and affords no Earth to carry on their Approaches; because they can be easily brought on and off at pleasure: There are a lesser sort of these which hold half what the former do, which are placed upon the upper *Talus* of the Parapet, to cover those which are behind, and who fire thro' the *Embrasures*, or Intervals that are between them.

SAP, in Fortification, is digging deep under the Earth, in order to pass under the *Glacis*, and to open a way to come under cover to the Passage of the *Moat*. When they are got near the foot of the *Glacis*, the Trench is carried on directly forwards, the Workmen covering themselves as well as they can, with *Blinds, Wool-packs, Sand-bags*, and *Mantelets* upon Wheels: When they are got to the foot of the *Glacis*, they make *Epaulments*, or *Traverses* on each side to lodge a good Body of Men. The *Sap* is made 5 or 6 Fathom from the *Saliant Angle* of the *Glacis*, where the Men are only cover'd sideways; wherefore they lay Planks overhead with Hurdles and Earth above them. When they have forced the Enemy to quit the Cover'd Way, the Pioneers make immediately a Lodgment, and cover themselves as well as they can from the Fire of the opposite Bastion.

SAPHETA, in Architecture, is the Board over the top of a Window, and placed Parallel, and opposite to the Window board at the botom.

SARPLER, otherwise called a *Pocket*, is a half Sack of Wooll, a Sack is 80 Tod, a Tod 2 Stone, and a Stone 14 Pounds. This in *Scotland* is called *Serpliath*, and contains 80 Stone.

SATURN, in the *Leipsick Acts* for September, 1684. there is a new Sytem of the Phenomena of Saturn and his Ring, by Mr. *Gallet*, and taken from the *French Journals* of June, 1684.

It doth not appear by any Astronomical Observations, that *Saturn*, like the other Planets, which

which have Satellites, revolves round his own Axis; but the contrary seems to be the Case. For in *Jupiter* and the *Earth*, which do turn round their *Axes*, the Equatorial Diameters are longer than Polar ones, or their *Axes*, but no such thing hath been found in *Saturn*.

Each Surface of the Ring of *Saturn* seems to be plain and smooth, without any such Mountainous Inequalities as the *Earth's* Surface, and the *Moons* hath; because it is not visible, tho' Illuminated by the *Sun*, but only when the Eye is elevated some few Degrees above its Plane. 'Tis either Fluid therefore like Water, or Polite, like Ice or Glass. If it be a *Fluid*, it moves round *Saturn* with a Circular Motion; but if it be of a Solid Substance, it is not yet determined, whether it move round the Planet or not. And since the Figure of *Saturn's* Ring is exactly Circular, it must have no *Linea Apfidum*, nor any Progression of it: But because the Plane of the Ring hath a large Elevation above the Plane of the *Ecliptick*, viz. making with it an Angle of 31 Degrees, the *Nodes* will recede, but yet very slowly, according to the manner of the other Planets.

SATELLITES. Dr. *Gregory*, in his Excellent Astronomy, hath demonstrated, that if a Satellite describe an Elliptick Orbit round a Planet, placed in one of the *Foci* of that *Ellipsis*; the greater *Axis*, or the *Line of the Apfes* will with an Angular Motion twice advance forwards, viz. in the 2 *Syzygies*, and twice recede backwards, viz. when in *Quadrature* to the *Sun*.

And that this Force of Progression is near twice as great as that of the *Recess*, and therefore the *Line of the Apfes* in every Revolution of the Satellite, will advance more forward than it recedes backward; and that by the Excess of this Progression, the *Apfes* will move in *consequentia*, p. 298.

If a Satellite move round a Planet in an Eccentric Orbit, the Eccentricity will be twice changed in every Revolution, and in each Revolution will be greatest, when the Satellite as in the *Syzygies* with the *Sun*, and least when it is in the *Quadratures*; and will be continually encreasing from the *Quadratures* to the *Syzygies*, and decreasing from the *Syzygies* to the *Quadratures*, p. 302.

If a Satellite revolve round a Planet in an Orbit, whose Plane is inclined to the Plane of the Orbit of the Planet round the *Sun*, then will the *Line of the Nodes* move in *antecedentia*, with an unequal Angular Motion; swiftest when the *Nodes* are in *Quadrature* to the *Sun*, after this slower, and at last when the *Nodes* are in the *Syzygies*, will be quite at rest. In the intermediate Places between the *Quadratures* and *Syzygies*, the *Nodes* will recede slower; and in every Revolution of the Satellite, will either be Retrograde or Stationary, be carried backward, or move in *antecedentia*, and in each Revolution will recede fastest, all things considered, when the Satellite is in the *Syzygies*, p. 304.

The Inclination also of the Plane of the Orbit of the Satellite, to that of the Planet, will be continually changing, and will be greatest when the *Nodes* are in the *Syzygies* with the *Sun*, and least *cæteris paribus*, when they are in the *Quadratures*, p. 307.

And all the Inequalities in the Motions of the Satellites will be a little greater when they are in Conjunction with the *Sun*, than when they are in opposition to him, p. 310.

SAW, is an Instrument very well known in the general, as well as its use. But they reckon these several sorts of Saws. 1. The *Pit-saw*, which is used to Saw Timber and Boards, and to cut off Scantlings, Quarters or Battens from any piece of Timber. The Matter to be Sawed is sometimes lain over a Pit, and sometimes on great Trusses above ground. 2. The *Whip-saw* is used by Joyners, to cut off such pieces of Stuff as the Hand-saw will not easily notch thro'. 'Tis drawn by two Men, and the Timber is placed on Trusses in order to be cut. 3. The *Hand-saw*, which is to be used by a single Man, and usually with one hand. 4. The *Frame-saw*, or *Bow-saw*, is a Saw with Cheeks made to it, and with a twisted Chord, and Tongue in the middle to draw the upper ends of the Cheeks closer together, that the lower ends may be farther asunder, and so strain the Saw the straighter. 5. The *Tennon-saw*, which is a thin Saw with a Back to it, to keep it from bending. 6. The *Compass-saw*, which is design'd to cut a Round, or any Compass-kerf; wherefore its Edge must be made broad, and the Back thin, and the Blade narrow, that the Back may have a wide Kerf to turn in, and so the easier follow the Edge.

SCALES Proportional: See *Proportional Scales*.

SCALE of Musick, tho' we find mention of several Distances of Musick among the *Greeks*, yet I rather think them to be *Leaps* in a single part, than *Concords* in Composition. The Distances talk'd of among the *Greeks*, are the *Tón* or Second, the *Δίτον* or third, the *Τρίτον* or fourth, the *Τετάρτον* or fifth, and *Πεντάρτον* or eighth. But if these were design'd to denote the *Concords*, they were in the wrong to place the fourth, and more so to place the second among them. Or if such were admitted, 'tis a wonder that the sixth, which is known to be a *Concord*, was refused. But if they were used to shew the Distances, by which a Voice may rise or fall, it is no wonder that they left out the sixth and seventh (being Distances not to be used without better Judgment and Design than those Times would admit of) and made mention of the rest, as being common in their Musick.

The Scale of Musick among the *Greeks*, consisted but of fifteen Notes, or the Distances of two Octaves, viz. The first from their *Μεσολαμβανόμενον*, (which I suppose was the Key of their Musick,) to their *Μέση*, and the second from their *Μέση* or Middle Note to their *Νήτη ὑπερβαλλών*, or highest Note, by which I suppose they designed only the utmost Extent of a single Natural Voice.

And their Seven Moods, so much talk'd of, were no more than the seven different Methods of altering their Tunes, by *Flats* and *Sharps*, placed at the beginning of a Lesson; which therefore they called *μεταβολὴ κατὰ τόνον*. Besides the Names of their Notes in the upper Octave, have no Affinity with the Names in the other; whereas in *Guido Aretinus* his Scale of 20 Notes (tho' our modern Composers in many Parts often exceed the Scale, both above and below) and the Notes in every Octave begin with the same Letter; that we may thereby more readily compute the *Concords* and *Discords*.

SCARAGE, *Scaragium*, otherwise called *Eschorage*, *Shewage* and *Scheawing*; and in a Charter of H. 2. to *Canterbury*, 'tis written *Scewinga*, was formerly a kind of Toll or Custom, exacted by Her Majesties Sheriffs, &c. of Merchant Strangers for Wares

Wares, *shewed* or offered to Sale within their Precincts. This is now Prohibited by Statute, 19 H. 7. c. 8. But the City of London doth still retain the Custom, *Cowel's Interpreter*. The Officer that Collected this Toll, was called the *Scabaldue*.

SCALA. William I. appointed the *Arms*, which before him had been usually answered in Victuals, to be converted into Money numbred, and directed the whole in every County to be charged on the Sheriff, who brought it into the *Exchequer*; adding, that the Sheriff should make the Payment *ad Scalam*, i. e. as *Gervase of Tilbury* expounds it, he should pay six Pence over in every Pound to make up the full Weight, and nearly the Intrin-sick Value. And this was agreed on, as an easie way to remedy the defective Weight of Money, and to avoid the trouble of weighing all Money which was brought into the *Exchequer*.

SCALENOUS Cones. See Cone.

SCEPPE, an old Word, omitted in our Glossaries, signifying a *Busbel*.

SCENOGRAPHICK Projection, or Perspective, is the Transcription of any given Magnitude, into a Plane which intersects the Optick Pyramid at a proper distance: For in Projection, there is to be consider'd, 1. The Object, or Foundation, or Ground of the Projection, from whence the Pyramid, Cone, or Pencil of Rays go. (2.) The Eye of the Spectator, and 3 the Plane Table, or *Diaphanum*, which intersects the Rays, some where between the Object and the Eye: And the Representation or Appearance of the Object in that Plane, is the *Projection or Perspective* of the Object. This Plane is always supposed to be at Right Angles with the Horizon. And from hence it will follow, that (1.) A Point will be projected there in the Diaphanous Plane where the Optick Ray cuts it. (2.) That Right Line will be projected where the Optick Triangle and the Plane do mutually Intersect each other. 3. That a Plane or Superficies will be represented where the *Diaphanous Plane* cuts the Optick Pyramid of Rays coming from that Surface. And that Representation of it called its *Image*.

SCHAR-Penny, *Scharn-penny*, and sometimes *Schorn-penny*. It appears from our old Books, that formerly some Customary Tenants were obliged to pen up their Cattle at Night in the Pound or Yard of their Lord, for the benefit of their Dung, or *Scearn*, as is the *Saxon* Word. And if they did not do this, they were obliged to pay a small Compensation; which therefore was called by this name of *Scharn-penny*, that is, *Muck-penny*, or *Dung-penny*.

SCHEAME, or *Skeen*, in Architecture, is the Workmens Word for the middle part of an Elliptical Arch.

SCHIRE-MOTE, was anciently a Solemn Meeting of all the Free Tenants and Knights in any County, to do Fealty to the King, and Elect an Annual Sheriff. See *Folk-mote*.

SCHIRE-WYTE, was an Annual Tax or Imposition, paid to the Sheriff of any County or Shire, for holding the Assizes or County-Courts.

SCREW, } See *Cochlea*.
SCRUE, }

SCRATCH-work, in *Italian*, *Sgrasitti*, was a way of Painting in *Fresco*, by preparing of a black Ground, on which was placed a white Plaster; and this White being taken off with an Iron Bodkin, the Black appears thro' the Holes, and serves

for Shadows: This kind of Work is lasting, but being very rough, is unpleasant to the sight. 'Twas used in *Rome* by *Polidoro de Caravagio*.

SCRIBING, when the Joiners would fit a piece of Board, &c. to an irregular Surface, or any other irregular Piece: They open their stiff Iron Compasses to the greatest distance, any where between the 2 Boards, &c. and then carrying one Leg along all the irregular Indentings, &c. of one, the other Leg moving parallel to it, describes that irregular Figure on the other Board; which being in that manner cut will fit and joyn.

SCUTAGE, all Tenants who held from the King by Military Service, were either bound to attend Personally in Wars and Expeditions, or for default of such Service, to pay a *Scutage* or Composition in Money, which was Levied on every *Scutum Militare*, or Knights Fee, and the Proportional Parts for the King's Use. And the Barons and Knights, which then paid a *Scutage* to the King, had a Power to Levy the same Tax on those Tenants who held from them in Military Service.

SCUTAGIO habendo, was a Writ that lay for the King, or other Lord, against the Tenant that held by Knight-Service, to serve by himself, or else to send a sufficient Man in his Place.

SCULPTURE, may be distinguished into three several Arts, each of which hath its Specifick Difference. For (saith Mr. *Evelin* in his History of *Chalcography*) besides *Sculptura*, as it relates to *Chalcography*, there is both *Sculptura* and *Coelatura*; both which, according to *Quintilian*, differ from the first, with respect to the Matter, on or out of which any thing is wrought. For it was applied to cutting or carving in Wood or Ivory; and then was called *Tomice*, and the Artists *Desectores*; to working in Plaster, and then called *Paradiagrammaticæ*, and the Artists *Gypsoschi*; to Cutting or Carving in Stone, and then called *Colap-tice*, and the Workmen *Lithoxoi*, and lastly in Metals, *Glyphice*. And it may be described to be an Art, which teaches us to cut or take away all that is superfluous of the subject Matter, reducing it to that Form or Body, which was designed in the Mind of the Artist.

SCUPPER-Nails, see *Scopper-holes*.

SCYRE-GEMOTE, was anciently a Court held twice a Year (as the Sheriffs turn is now) by the Bishop of the Diocess and the *Ealderman*, i. e. in such Shires as had *Ealdermen* and by the Bishops and Sheriffs, in such as were committed to the Sheriffs that were immediate to the King; where both the Ecclesiastical and Temporal Laws were given in Charge to the Country.

SEALER, is an Officer in *Chancery*, appointed by the Lord Chancellor, or Keeper of the Great Seal, to Seal the Writs and Instruments there made in his Presence.

SECTOR, besides the Uses of the several Lines Circular and others; which you will find dispersed under their proper Names. Some Problems may properly come in here under the general Word Sector. As 1. To open the Sector to any given Angle.

Here must be noted, that 'tis one thing to open the several pairs of Lines thereon drawn to the same Angle; for in *Gunter's* Sector the Line of Lines on the one side, and the Line of Sines on the other, make an Angle of 2° , when the Edges of the Sector are close shut. So also the Line of Superficies,

persicies, and the Lines of Solids make an Angle of 10° , tho' the Edges are close shut.

The *Lines of Lines* may be opened to a Right Angle, if the whole lateral Length be applied over between 8 and 6. Because $\square 8 \times \square 6 = 100$, by 47. ϵ 1. *Eucild*.

The *Lines of Sines* may be opened to a Right Angle, if the Lateral Sine of 90° be applied over Parallelly between 45° . and 45° . in the Sines, or if the Sine of 45° . be applied over in the between 30° . and 30° , in the Line of Sines.

If you would open the Lines of Sines to any particular Oblique Angles, take out the Chord of the Angle required, and apply it over in the *Semi-Radius*, or at the end of the Line of Chords of 60° Degrees: V. gr. to open the Sines to an Angle of 40° Degrees, take out the Lateral Chord of 40° . and to it open the Sector in the Parallel Chord of 60° . or if you apply the same Chord of 40° . over between 50 and 50 in the *Line of Lines*, it will open them to the same Angle.

On the contrary, if the Sector be opened to an Angle at a venture, you may find the quantity of that Angle, thus: Take the *Parallel Chord* of 60° . and measure it in the *Lateral Chord*, and it shall there give the Angle, *i.e.* the Angle that those Lines of Chords are opened to: But that will be different from the Angle of the Edges of the Sector. N. B. If you can apply the Centre of a *Protractor* to the Centre of the Sector, you may easily and readily find the Quantity of any of these Angles.

SECTA *Curia*, is Suit and Service done by Tenants at the Court of their Lord.

SECTA *Schirarum & Hundredorum*, was the Attendance, Suit and Service done by Tenants in the County and Hundred Courts; and *Quietos esse de hac Secta*, was a Privilege to be exempt from such Customary Service.

SECTIONS *Conick*, see *Conick Sections*.

SECTIONES *Sequentes*, is a Term in Conicks arising thus:

Let there be two Right Lines, as AB, CD, mutually intersecting each other in E; which Point E, is supposed to be the Common Centre of the opposite Hyperbolick Sections, FG, HI, and whose common Asymptotes the proposed Lines AB, CD, also are. In this particular Case, the Sections GF, and HI, are called *Sectiones Sequentes*, because they are placed following one another in the Contiguous Angles of two Intersecting Right Lines.

And if the determinate Diameter HG, of one of the *Sectiones Sequentes* (which is coincident with the supposed Indeterminate Diameter of its Opposite) be equal to the Vertical Tangent KL, applied between the Asymptotes in the Point G, of the

Diameter GF, then *Apollonius* calls such Sections *Conjugate Sections*.

SEGMENTS, on *Gunter's Sector* there are usually placed two Lines, called *Lines of Segments*, they are numbred with 5, 6, 7, 8, 9, 10, and lie between the Lines of *Sines*, and those of *Superficies*. They represent the Diameter of a Circle so divided into 100 parts, as that a right Line drawn thro' those Parts, and normal to the Diameter, shall cut the Circle into 2 Segments, of which the greater shall have that Proportion to the whole Circle; as the Parts cut have to 100. Their uses are

1. To divide a given Circle into two Segments, which shall have a given Ratio, which is done by opening the Sector, and applying the given Circles Diameter in the Points of 100 in these Lines; for then a Parallel taken from any Points proportional to the greater Segment required, shall give the depth of the greater Segment, accounted on a Diameter bisecting the Segment.

2. To find the Proportion between the Circle and any given Segments of it.

Open the Sector, as before, and then take the depth of the greater Segments, and apply Parallel to the Diameter, and the Points where it fits in exactly, will shew the Proportion to 100.

SEEING. The Sense of Seeing is probably caused thus, the Rays of Light exhibiting all Colours; fall upon the bottom of the Eye, and there cause or excite *Vibrations* in the *Tunica Retinae*: which Vibrations being communicated, or propagated along the Solid Fibres of the Optick Nerves into the Brain, do there cause that Sensation, which we call Vision or Seeing. For because dense Bodies conserve their Heat a long while, and the Densest, the longest time, the Vibrations of their Parts are of a lasting nature, and therefore may be propagated along solid Fibres of Uniform Density to a great distance, for conveying into the Brain, the Impressions made upon all the Organs of the Sense. For that Motion which can continue long in one and the same part of a Body, can be propagated a long way from one part to another, supposing the Body Homogeneous, so that the Motion may not be reflected, refracted, interrupted, or disordered by any unevenness of the Body. *Newton's Opticks, Book 3.*

The same Author renders it probable, that the Species of Objects seen with both Eyes, are united in that Place where the Optick Nerves meet and joyn, before they come into the Brain: The Fibres on the right side of both Nerves uniting there, and after Union, going thence into the Brain in the Nerve, which is on the right side of the Head; and the Fibres on the left side of both Nerves uniting in the same place, and after Union going into the Brain in the Nerve, which is on the left side of the Head: And these two latter Nerves meet and unite in the Brain, in such a manner that their Fibres make but one entire Species or Picture: Half of which, *viz.* that on the right side of the *Sensorium*, comes from the right side of both Eyes, thro' the side of both the Optick Nerves, to the Place where these Nerves meet, and from thence on the right side of the Head into the Brain: But the other half, *viz.* that on the left side of the *Sensorium*, comes in like manner from the left side of both Eyes. For the Optick Nerves of such Animals as look the same way with both Eyes, (as of Men, Dogs, Sheep, Oxen, &c.) meet before they come into the Brain; but the Optick Nerves of such Animals as do not look the same

same way with both Eyes (as of Fishes, and of the Chamælion, do not so meet and unite. If I am rightly informed.

When a Man in the dark, presses either corner of his Eye with his Finger, and at the same time turns his Eye a contrary way, he will see a Circle of Colours, like those in the Feather of a Peacock's Tail; which variegated Circle of Colours, seems to arise from the same kind of Motions excited in the bottom of the Eye by the Pressure of the Finger, as at other times are excited there by *Light* for causing Vision. And when a Man by a stroke upon his Eyes sees a Flash of Light, are not the like Motions excited in the *Retina* by that Stroke?

SEIGNOURAGE, 9 H. 5. Stat. 2. c. 1. seems to have been a Royalty or Prerogative of the Prince, whereby he challenged allowance of Gold and Silver brought into the Mints for his Exchange for Coin. Out of every Pound Weight of Gold, the King had for his Coin five Shillings, out of which he paid to the Master of the Mint for his Work, sometimes 1 Shilling, and sometimes 18 Pence. Upon every Pound Weight of Silver the *Seignourage*, answered to the King, in Edw. 3. Time was eighteen Penny-weight *pondere*, which about that time amounted to about a Shilling, and out of which he paid sometimes 8, sometimes 9 Pence to the Mint-master. In H. the 5th's Time the King's *Seignourage* for every Pound Weight of Silver was 15 Pence.

SELL, in Architecture, is the Term both for the lowest piece of Timber in a Timber-building, or for that on which the whole Superstructure is erected, and also for the bottom-pieces in a Window-frame; the former is called a *Ground-sell*, the latter a *Window-sell*.

SEME, *Summa*, is an Horse-load, a *Seme* of Corn is 8 Bushels,

SENECHAL, was the Word anciently for the Chief Steward or Head Bailiff of a Baron, that kept his Courts, and managed his Demesne-lands, and hath been the Title of the Lord High Steward, and of the Steward of the King's Household, &c.

SEPTUAGESIMA, is always the third Sunday before *Quadragesima* exclusive: from which, until the Octaves after *Easter*, Marriage is forbidden by the Canon-Law. It takes its name from its being above 70 Days before *Easter*.

SEPTUM Medium, is properly the inside of the left Ventricle of the Heart, because its Fibres are continued with the Fibres of the opposite side of the same Ventricle; it divides the left Ventricle of the Heart from the right.

SEQUELA Causa, is the Process and depending Issue of a Cause or Trial.

SEQUELA Molendini, is owing Suit to a particular Mill, or being bound to grind Corn in that Place only; which formerly was a Duty and Service laid upon many Tenants; wherefore *Concedere Sequelam Molendini*, was to grant all the Toll and Profits arising from such Customary Rights.

SERGEANT, is a word diversely used in our Law, and applied to sundry Offices and Callings. A *Sergeant at Law*, or of the Coif, is the greatest Degree taken in that Profession, as that of a Doctor is in the Civil Law. As these are the most Learned and Experienced, there is one Court appropriated to Plead in by themselves, which is the *Common-pleas*, where the Common Law of England is most strictly observed: But tho' they have

this Court to themselves, they are not prohibited Pleading in other Courts; where the Judges (who must be first Sergeants) call them *Brothers*. These Sergeants are call'd by the King's Mandate, or Writ directed to them, and commanding them, under a great Penalty, to take upon them that Degree by a Day Assigned. Out of these one is (more may be) made the *King's Sergeant*, to Plead for him in all Causes, especially in Treason.

SERGEANT at Arms, is an Officer appointed to attend the Person of the King, An. 7 H. 8. c. 3. to Arrest Traytors, &c. and Persons of Quality Offending, and to attend the Lord High Steward when he sits in Judgment on any Traytor, &c. By the Stat. 13 Richard 2. c. 6. There cannot be above 30 in the Realm. Two of these by the King's Allowance attend the two Houses of Parliament. The Office of him in the *House of Commons* is to keep the Door, and to execute such Commands as the House shall direct, especially as to the apprehension of Offenders, &c.

Another of these attends on the Lord Chancellor or Keeper in the *Chancery*, and one on the Lord High Treasurer, one to attend on the Lord President of *Wales*, and another on the Lord President of the *North*. Another sort of *Sergeants*, are chief Officers executing several Functions in the King's Household; of which you may find many in Stat. 33 H. 8. c. 12. There is also an inferior kind of *Sergeants of the Mace*, whereof there is a Troop in the City of *London*, attending the Lord Mayor.

SERJEANTRY, was a Service formerly done for the holding of Lands, and was either *Grand Serjeantry*, which was some Honourable Military Service paid only to the King; as to carry his Banner, bear his Sword, &c. Or *Petty-Serjeantry*, which was some less Noble Service paid to the King, or any other Lord. Some will have *Grand Serjeantry*, to be where a Man holds Lands of the King by Service, which he ought to perform in Person, and *Petty-Serjeantry*, to be where he holds his Lands of the King, to yield him Yearly some small thing towards his Wants.

SERVICE-Royal, was the Rights and Prerogatives that within such a Mannor belonged to the King, if Lord of it; and were generally reckoned to be these 6. 1. Power of Judicature in Matters of Property. 2. Power of Life and Death in Criminal Causes. 3. A Right in Wayfs and Strays. 4. Assessments. 5. Minting of Money, 6. Assize of Bread, Beer, Weights and Measures.

SERVICE, (which is sometimes called *Servage*) is divided into Personal and Real, and into Military and Base; as also into *Intrinsic* and *Extrinsic*. *Intrinsic* Service they reckon due to the Capital Lord of the Mannor. Service is again divided into *Frank* and *Base*, the one is termed *Liberrum Servitium*, the other *Villanagium*. 'Tis also divided into *Continual* or *Annual*, and into *Casual* or *Accidental*; the former being the *Seisin* of Rent, and the latter *Seisin* of Reliefe.

SERVICE, in a Legal Sense, is a right by which one thing is subject to another thing or Person. And of these some are,

SERVICES Predial or *Real*, which are *Rights* that one Estate sometimes owes another: And these *Predial* Services, they reckon to be some *Rustical* or *Rural*, such as the Right of Riding or Walking, or going with a Carriage thro' another Man's Ground;

Ground; the Right of drawing Water, or bringing it thro' his Ground, &c. And some Services are called *Urbanæ*, which are the Rights that are preferred to Mens Houses, built contiguous to one another, &c.

SERVICES *personal*, are those Services which are due from a Thing to a Person; and of these they account 3 by name, viz. *Usufruct*, *Use* and *Habitation*; but there are very many and various ones which have no distinct Names.

SERVITIUM *Regale*, Royal Service, are the Rights and Prerogatives that within such a Mannor belong to the King as Lord of it; and these are generally reckon'd 6. As, 1. Power of Judicature in Matters of Property. 2. Power of Life and Death in Cases of Felony and Murder. 3. A Right in Waifs and Strays. 4. Assessments. 5. Mintage of Money. And 6. Assize of Bread and Beer, Weights and Measures.

All these entire Privileges were annexed to some Mannors, in their Grants from the King, and were sometimes conveyed in the Charters of Donation to Religious Houses.

SERVITORS of Bills, are such Servants or Messengers of the Marshal of the *King's-bench*, as were sent abroad with Bills or Writs, to Summon Men to that Court. They are now commonly called *Tip-staves*.

SESAMOIDEA *Offa*, the Use of these Bones, which are placed at the Articulations of the Bones of the Fingers and Toes, is that they may serve as so many Pullies about which the Tendons pass, at some distance from the Centre of the Articulation, whereby the Directions of the Motions of these Tendons are kept always at the same distance from the Centre of Motion of the Articulation.

SEWERS, are Passages, Canals, or Gutters to carry Water into the Sea or some River. And therefore the Commissioners of the *Sewers* are such Persons, as by Authority under the Great Seal of *England*, do see Ditches and Drains in Marshes and Fenny-places, well kept and maintained for the better preserving the Grass upon the Land for feeding of Cattle, &c. by conveying the Water off the Ground into the Sea or River.

SEXTANT. *The Description of a New Sextant, lately made for the Observatory in Trinity-College, Cambridge, by Mr. John Rowley.*

a a a Iron Bars set edge and flat-ways, composing and framing the Body of the *Sextant*, whose Radius is five Foot.

b b Are two Telescopes, the one fixt on the right Edge of the *Sextant*, from which the Divisions on the Limb are numbred, and the other moveable with the Index.

c c Two large Brass Semi-circles on the Back-side of the *Sextant*, which by Nuts and Screws can bring the Instrument into any Position in any Plane, *Horizontal*, *Vertical*, or *Reclining*.

d d The Place of the Cross-Hairs within the Telescope, which are made to be moved (from the Out-side) for the better adjusting them to the Instrument.

e The Revolution-Work, which proves the Index gradually (by the help of a Screw) and sensibly shews its Progress, to the thousandth Part of an Inch.

f The Centre of the Instrument, from which a Plumb-Line falling on the Line (*i*) at the lower End of the Right Edge of the *Sextant*, takes Distances from the Zenith.

g Is another Centre, from which a Plum Line falling on the Line (*h*) takes Altitudes from the Horizon.

k Is the Brass Limb of the Instrument, being Diagonally divided into every 5 Minutes, and by proportional Parts on the Index, shews every 10 Seconds.

l Is a *Lignum-Vitæ* Axis, upon which the *Sextant* turns; and is made so, as to be plac'd either parallel to the Axis of the Equator, or of the Horizon.

m m Is a Contrivance by the Motion of Wheels, Nuts and Screws, so as to make the whole *Sextant* move answerably to the apparent Diurnal Motion of the Heavens.

n n n Three strong Iron Feet, fix'd to an Iron Collar, to hold the aforesaid Axis (*l*).

o o o Are Three Pieces of Timber, to which the Iron Feet are screw'd, and which serve to compleat the Pedestal of the Instrument.

p An Arch of Iron, which shifts the Axis (*l*) to its Parallelism with either the Axis of the Equator or Horizon.

The Limb of this Noble Instrument is very accurately divided, Diagonally, and by the way of unequal Divisions, used by Hevelius; so that the Angle may be taken either of those ways, as well as be found by the Revolution-Work.

SEXTAR of Wheat or other Corn (from *Sextarius*) was that quantity anciently which we now call a *Quarter*, containing a Bushel. In some Countries 'tis called a *Seame*.

SHAFT, is the hollow Entrance into a Mine which is *sunk* or *dug* to come at the Ore. In the Tin Mines, after this is sunk about a Fathom, they leave a little long square Place, which is called a *Shamble*.

SHAMBLE, see *Shaft*.

SHELF, is what the *Miners* (especially in the Tin-Mines) call the *Fast-Country*, by which they mean an Imaginary Surface of the Earth, which at the Concussion of the Waters in the general Deluge of *Noah*, was never moved; and to the *Shelf*, they think all the *Loads* or *Mineral Veins* at first lay even and parallel; tho' after the Flood they were some elevated, some depressed, &c. And by *Shelf* now they mean that hard Surface or Coat of the Earth which lies under the *Mold*, usually about a Foot deep; for they suppose, that since the Flood the Earth hath gotten a new Coat of Vegetable Earth, or such as is made by the Corruption of Vegetables and Animals.

SHERIVE or Sheriff, *Vice-Comes*, is the Chief Officer of the King in any Shire or County, formerly the Sheriff was chosen by the People in the County-Court by Vote, as the Knights of the Shire for Parliament now are; but now the Sheriff is nominated by the King. *Camden* in his

K k k k

Brit-

Britannia, describes this Office, and the Antiquity and Authority of this Officer. See *Co. Rep. lib.* 4. And *Spelman's Glossary* under the word *Vice-Comes*. His Oath is extant in *Reg. Orig. fol. 331.*

SHERIFF-TOOTH, seems anciently to have been a Tenure by the Service or Duty of providing Entertainment for the Sheriff at his County-Turns or Courts. For it appears by *Ryley's Placita Parliament. fol. 653.* that in *Derbyshire* the King's Bayliffs did formerly take 6 Pence of every *Bouate* of Land, in Name of *Sheriff-tooth*.

SHILLING, *Solidus* in the *Latin* is a word of very uncertain Signification, and differs almost in every Nation. But the word *Scylling* or *Shilling* in *England*, never signified any thing but 5*d.* with the *Saxons*, and 12*d.* ever since. When it first went for 12*d.* 'tis hard to find: But there was no 12 Penny Piece of that name Coined in *England* till 1504. and then *Stow* calls them *Groats*: tho' *Fabian* mentions them under the name of *Shillings*. In 34 *H. 8.* there were 12 Penny Pieces struck, but they were called *Testons*.

SHINGLING Tongs, are used in the *Finery* of an Iron-forge, to take out the *Loop*, in order to bring it under the Hammer into a *Bloom*.

SHIP. The Description of the several Parts and Rigging of a First Rate Ship, lying at Anchor.

H Her Hull.

- A The Cut-water.
- B The Stem.
- C The Hawse Holes.
- D The Cat-Head.
- E Waste Cloaths.
- F The Fore Chain-wale.
- G The Main Chain-wale.
- H The Mizzen Chain-wale.
- I The Chefs Tree.
- K The Entring Port.
- L The Head.
- M The Gallery.
- N The Tafferel.
- O O O The Three Poop Lanterns.
- P The Ensign Staff.
- Q Its Truck.
- R The Ensign or Antient.

Z The Mizzen Mast and Rigging.

- 1 The Mizzen Mast.
- 2 The Mizzen Yard and Sail.
- 3 The Mizzen Sheet.
- 4 The Mizzen Shrouds and Laniards.
- 5 The Mizzen Bow-lines.
- 6 The Mizzen Brayles.
- 7 The Geer.
- 8 The Mizzen Peak Halliards.
- 9 The Cross Jack-Yard.
- 10 The Lifts.
- 11 The Braces.
- 12 The Mizzen Puttock Shrouds.
- 13 The Mizzen Top.
- 14 The Mizzen Top Armour.
- 15 The Cap.
- 16 Crow-feet.

- 17 The Mizzen Stay and Sail.
- 18 The Halliards.

Mizzen Top-Mast and Rigging.

- 19 Mizzen Top-Mast.
- 20 Its Sails furl'd.
- 21 Its Braces.
- 22 Its Lifts.
- 23 Its Shrouds.
- 24 Its Halliards.
- 25 Its Back-Stay.
- 26 Its Bow-lines.
- 27 Its Sheet.
- 28 The Clew-lines.
- 29 The Stay.
- 30 The Cross-Trees.
- 31 The Cap.
- 32 The Stump.
- 33 Its Stay.
- 34 Its Truck.
- 35 The Spindle.
- 36 The Vane.
- 37 The Slings of the Cross Jack-Yard.

M The Main Mast and its Rigging.

- 38 The Main Mast.
- 39 Runners and Tackles.
- 40 Tackle.
- 41 The Main Shrouds and Laniards.
- 42 The Main Stay and Sail.
- 43 The Stay-Sail Halliards.
- 44 The Main Yard and Sail.
- 45 The Geers.
- 46 The Main Sheets.
- 47 The Main Tacks.
- 48 48 The Bunt-lines.
- 49 49 The Main Bow-lines.
- 50 The Main Braces.
- 51 51 The Leech-lines.
- 52 The Main Puttock Shrouds.
- 53 The Crow-foot.
- 54 54 The Main Lifts.
- 55 The Main Top.
- 56 The Top Armour.
- 57 The Top Rope.
- 58 The Main Cap.
- 59 The Main Yard Tackles.

Main Top-Mast and Rigging.

- 60 The Main Top-mast.
- 61 61 Tackles.
- 62 The Main Top-mast Shrouds.
- 63 The Back Stays.
- 64 The Main Top-sail Halliards.
- 65 The Main Top-sail Stay and Sail.
- 66 The Main Top-Stay-sail Halliards.
- 67 The Main Top-sail Yard and Sail.
- 68 The Main Top-sail Braces.
- 69 The Main Top-sail Bow-lines.
- 70 The Main Top-sail Sheets.
- 71 71 The Main Top-sail Clew-lines.
- 72 72 The Main Top-sail Lifts.
- 73 The Runner.
- 74 The Bunt-lines.
- 75 The Cross Tree.
- 76 The Cap.
- 77 The Stump.

 143 *The Cap.*
 144 *The Jack-Staff.*
 145 *The Truck.*
 146 *The Jack.*
 147 *The Buoy of the Best Bower Anchor.*
 148 *The Cable of the Best Bower Anchor.*
 149 *The small Bower Buoy.*

SHOALD, is the Miners Term in the Tin Mines, for such Fragments of Ore, which by Rains, Currents of Water, &c. are torn off from the *Load* or Veins of Ore. These are washt down from the Mountains, and by finding of them, they guess where to look for a *Load* of Ore. Sometimes 'tis called *Squod*, sometimes *Squad*.

SHORT Sails, in a Man of War, are the same with the Fighting-sails, and are the Fore-sail, Main-sail, and Fore-top-sail: These are all that are used in a Fight, lest the rest should be fired or spoiled: And besides they would be troublesome to handle, and would hinder the sight and use of Arms. When a Ship gives Chase to another, if the Chase hath a mind to fight, they say, the Chase *strips* her self into her *short* or *Fighting-Sails*; that is, puts out her Colours in the Poop, her Flag at the Main-top, and her Streamers or Pendants at her Yard-arms; Furls her Sprit-sail, Peeks her Mizzen, and Slings her Main-yard, and when the Chaser sees this, he is to prepare for an Engagement.

SIGNALS, are Signs made at Sea by the Admiral or Commander in Chief of any Squadron of Ships, either in the Day or by Night, either for Sailing or Fighting, or for the better Security of the Merchants Ships that are under the Convoy of His Majesties Men of War. These Signals are appointed and determined by Order of the Lord High Admiral, and are as follows:

SIGNALS by Day, when Ships are at an Anchor, in weighing Anchor, Sailing, &c. When the Admiral or Commander in Chief would have the Fleet *prepare for Sailing*, he first looses his *Fore-Top-sail*, and then the whole Fleet are to do the same.

2. When he would have them *Unmoor*, he looses his *Main-top-sail*, and fires a Gun; which in the Royal Navy is to be answered by every Flag Ship.

3. When he would have them *Weigh*, he looses his *Fore-top-sail*, and fires a Gun, and sometimes hawls home his Sheets; the Gun is to be answered by every Flag Ship, and every Ship to get to Sail as soon as it can. If with the Leeward side, the Stern-most Ship is to weigh first.

4. When the Admiral or Commander in Chief would have the Weather-most and Head-most Ships to *Tack* first, he hoists the Union-flag at the *Fore-top-mast-head*, and fires a Gun, which each Flag Ship must answer.

But if he would have the Stern-most and Leeward-most Ships to *Tack* first, he hoists the Union Flag at the Mizzen-top-mast-head, and fires a Gun. And when he would have all the whole Fleet *Tack*, he hoists an Union, both on the Fore and Mizzen-top-mast-head, and fires a Gun.

5. When in bad Weather, he would have them *Wear and bring to the other Tack*, he hoists a Pen-

dant on the Ensign-staff, and fires a Gun : And then the Leeward-most and Stern-most Ships are to *Wear* first, and bring on the other Tack and lie by, or go on with an easie Sail till he comes a Head. Every Flag is to answer with the same Signal.

6. If they are lying by, or Sailing by a Wind, and the Admiral would have them *beat up* and Sail before the Wind, he hoists his Ensign, and fires a Gun, which the Flags are to answer. And then the Leeward-most Ships are to bear up first, and to give room for the Weather-most to *Wear*, and Sail before the Wind with an easie Sail, till the Admiral come a Head.

But if it should happen when the Admiral hath occasion to *Wear* and Sail before the Wind, that both Jack and Ensign be abroad, he will hawl down the Jack before he fires the Gun to wear, and keep it down till the Fleet is before the Wind.

7. When they are Sailing before the Wind, and he would have them *bring to* with the Star-board Tacks Aboard, he hoists a *Red Flag* at the Flag-staff, on the Mizzen-top-mast-head, and Fires a Gun ; but if they are to bring too with the Lar-board-tack, he hoists a *Blue Flag* at the same Place, and Fires a Gun. Every Ship to answer the Gun.

8. When any Ship discovers Land, he is to hoist his Jack and Ensign, and keep it aboard till the Admiral or Commander in Chief Answer him by hoisting his ; on sight of which he is to hawl down his Ensign.

9. If any discovers Danger, he is to Tack, or bear up from it ; and to aw Jack abroad from the Main-top-mast Cross-trees downward upon the Back-stay, and Fire two Guns : But if he should strike or stick fast, then besides the same Signal with his Jack, he is to keep Firing till he sees all the Fleet observe him, and endeavour to avoid the Danger.

10. When any sees a Ship or Ships more than the Fleet, he is to put abroad his Ensign, and there keep it, till the Admiral's or Commander's is out, and then to lower it as often as he sees Ships, and to stand in with them, that so the Admiral may know which way they are, and how many : But if he be at such a distance that the Ensign can't well be discovered, he is then to lay his Head towards the Ship or Ships so descryed, and to *brail* up his low Sails, and continue hoisting and lowering his Top-sails, and making a *West* with his Top-gallant-sails, till he is perceived by the Admiral.

11. When the Admiral would have the Vice-Admiral, or he that Commands in the second Post of the Fleet, to send out Ships to Chase, he hoists a Flag, Striped White and Red, on the Flag-staff, at the Fore-top-mast-head, and fires a Gun. But if he would have the Rear-Admiral do so, he then hoists the same Signal on the Flag-staff at the Mizzen-top-mast-head, and fires a Gun.

12. When the Admiral would have any Ship to chase to *Windward*, he makes a Signal for speaking with the Captain, and hoists a *Red Flag* in the Mizzen-shrouds, and fires a Gun.

But if to chase to *Leeward*, a *Blue Flag* ; and the same Signal is made by the Flag in whose Division that Ship is. When he would have them give over Chase, he hoists a *White Flag* on his

Flag-staff at the Fore-top-mast-head, and fires a Gun : Which Signal is to be made also by that Flag Ship, which is nearest the Ship that gives Chase, till the Chasing Ship sees the Signal.

13. In Case of Springing a Leak, or any other Disaster that disables their Ship from keeping Company, you are to hale up your Courses, and fire two Guns.

14. When any Ship would speak with the Admiral, he must spread an *English* Ensign from the Head of his *Main* or Fore-top-mast downwards on the Shrouds, lowering his Main or Fore-top-sail, and firing Guns till the Admiral observe him : And if any Ship perceives this, and judges that the Admiral doth not, that Ship must make the same Signal, and make the best of his way to acquaint the Admiral therewith, who will answer by firing one Gun.

15. When the Admiral would have the Fleet to prepare to Anchor, he hoists an Ensign striped Red, Blue and White on the Ensign-staff, and fires a Gun ; and every Flag-Ship makes the same Signal.

16. If he would have the Fleet *Moor*, he hoists his Mizzen-top-sail with the Clew-lines haled up, and fires a Gun.

17. If he would have the Fleet Cut or Slip, he looses both his Top-sails, and fires two Guns ; and then the Leeward Ships are to cut or slip first, to give room to the Weather-most to come to Sail.

So if he would have any particular Ship to cut or slip, and to *Chase to Windward*, he makes the Signal for speaking with that Ship, hoists a *Red Flag* in the Mizzen-shrouds, and fires a Gun : But if the Ship is to Chase to *Leeward*, he hoists a *Blue Flag*, as before.

18. If he would have the Fleet Exercise their *Small Arms*, he hoists a *Red Flag* on the Ensign-staff, and fires a Gun ; but if the *great Guns*, then he puts up a Pendant over the Red Flag.

SIGNALS by Night, to be observed at an Anchor, in Weighing, Anchoring and Sailing.

1. When the Admiral would have the Fleet to *Unmoor* and *Ride short*, he hangs out 3 Lights one over another in the Main-top-mast-shrouds, over the constant Light in the Main-top, and fires two Guns, which are to be answered by the Flag-Ships ; and each private Ship hangs out a Light in the Mizzen-shrouds.

N. B. All Guns fir'd for Signals in the Night must be fir'd on the same side, that they may make no alteration in the Sound.

2. When he would have them *Weigh*, he hangs a Light in the Main-top-mast-shrouds, and fires a Gun, which is to be answered by all the Flags ; and every private Ship must hang out a Light in his Mizzen-shroud.

3. When he would have them *Tack*, he hoists 2 Lights on the Ensign-staff, one over another, above the constant Light in his Poop, and fires a Gun ; which is to be answered by all the Flags : And every private Ship is to hang out a Light extraordinary, which is not to be taken in till the Admiral takes in his.

After the Signal is made, the Leeward-most and Stern-most Ships must Tack as fast as they can ; and the Stern-most Flag-Ship, after he is about upon the other

other Tack, is to lead the Fleet, and him they are to follow, to avoid running thro' one another in the dark.

4. When he is *upon a Wind*, and would have the Fleet *Wear* and *bring to* on the other Tack, he hoists up one Light at the Mizzen-peak, and fires 3 Guns: which is to be answered by the Flag-Ships, and every private Ship must answer with one Light at the Mizzen-peak. The Stern-most and Leeward-most Ships are to bear up so soon as the Signal is made.

5. When he would have them in blowing Weather to *lie a try, short*, or a *Hull*, or with the *Head-sails braced to the Mast*, he will shew 4 Lights of equal height, and fire 5 Guns; which are to be answered by the Flag-Ships, and then every private Ship must shew 4 Lights. And after this, if he would have them to make Sail, he then fires 10 Guns; which are to be answered by all the Flags, and then the Head-most and Weather-most Ships are to make Sail first.

6. When the Fleet is Sailing *large*, or before the Wind, and the Admiral would have them bring too, and lie by with their *Star-board* Tacks Aboard, he puts out 4 Lights in the Fore-shrouds: and fires 6 Guns; but if with the *Lar-board* Tacks Aboard, he fires 8 Guns, which are to be answered by the Flag-Ships, and every private Ship must shew 4 Lights. The Wind-most Ships must bring too first.

7. Whenever the Admiral alters his Course, he fires 1 Gun (without altering his Lights) which is to be answered by all the Flag-ships.

8. If any Ship hath occasion to *lie short*, or *by*, after the Fleet has made Sail, he is to fire 1 Gun, and shew 3 Lights in his Mizzen-shrouds.

9. When any one first discovers Land or Danger, he is to shew as many Lights as he can, to fire 1 Gun, and to Tack, or bear away from it. And if any one happen to spring a Leak, or any be disabled from keeping company with the Fleet, he hangs out 2 Lights of equal height, and fires Guns till he is relieved by some Ship of the Fleet.

10. If any one discovers a Fleet, he is to fire Guns, make false Fires, put one Light out on the Main-top, 3 on the Poop, to Steer after them, and to continue firing Guns, unless the Admiral call him off, by Steering another Course, and fire 2 or 3 Guns, for then he must follow the Admiral.

11. When the Admiral Anchors he fires 2 Guns, a small space of Time one from the other, which are to be answered by the Flag-ships; and every private Ship must shew 2 Lights.

12. When the Admiral would have the Fleet to *Moor*, he puts a Light on each Top-mast-head, and fires a Gun; which is to be answered by the Flag-ships, and every private Ship is to shew one Light.

13. If he would have them *lower* their Yards and Top-masts, he hoists one Light upon his Ensign-staff, and fires one Gun; which is to be answered by the Flag-ships, and every private Ship must shew 1 Light. And when he would have them *Hoist* their Yards and Top-mast, he puts out 2 Lights, one under the other, in the Mizzen-top-mast-shrouds, and fires a Gun; which is to be answered by the Flag-ships, and each private Ship must shew 1 Light in the Mizzen-shrouds.

14. If any strange Ship be discovered coming into the Fleet, the next Ship is to endeavour to speak with her, and bring her to an Anchor, and not suffer her to pass thro' the Fleet. And if any one discovers a Fleet, and it blow so hard that he cannot come to give the Admiral notice timely, he is to hang out a great number of Lights, and to continue firing Gun after Gun, till the Admiral answers him with one.

15. When the Admiral would have the Fleet to Cut or Slip, he hangs out 4 Lights, one at each Main-yard-arm, and at each Fore-yard-arm, and fires 2 Guns; which are to be answered by the Flag-ships, and every private Ship is to shew one Light.

SIGNALS used when a Fleet Sails in a Fog.

1. If the Admiral would have them weigh, he fires 10 Guns, which every Flag-ship is to answer.

2. To make them *Tack*, he fires 4 Guns; which are to be answered by the Flag-ships, and then the Leeward-most Ships, and Stern-most Ships must Tack first. And after they are about, to go with the same Sail they tack'd with, and not to lie by, expecting the Admiral to come a Head: And this is to avoid the Danger of running thro' one another in thick Weather.

3. When the Admiral *brings to*, and lies with his Head-sails to the Mast; if with the *Star-board* Tack Aboard, he fires 6 Guns; but if with the *Lar-board* Tack Aboard, 8 Guns, which the Flag-Ships are to answer: And after this, if he makes Sail, he fires 10 Guns, which the Flag-ships must answer; and then the Head-most and Weather-most Ships are to make Sail first.

4. If it grow thick and foggy Weather, the Admiral will continue Sailing with the same Sail set that he had before it grew foggy, and will fire a Gun every hour; which the Flag-ships must answer, and the private Ships must answer by firing of Muskets, beating of Drums, and ringing of Bells.

But if he be forced to make either more or less Sail than he had when the Fog begun, he will fire a Gun every half hour, that the Fleet may discern whether they come up with the Admiral, or fall a Stern of him; and the Flags and private Ships are to answer, as before.

5. If any one discovers Danger which he can avoid by Tacking and standing from it; he is to make the Signal for tacking in a Fog; but if he should chance to *strike* and tick fast, he is to fire Gun after Gun, till he thinks the rest have avoided the Danger.

6. When the Admiral would have the Fleet to Anchor, he fires 2 Guns, which the Flags are to answer; and after he hath been half an hour at an Anchor, he will fire 2 Guns more, to be answered by the Flags, as before, that all the Fleet may know it.

SIGNALS for calling Officers on Board the Admiral.

1. When the Admiral puts abroad a Union-Flag in the Mizzen-shrouds, and fires a Gun, all the *Captains* are to come Aboard him: And if with the same Signal there be also a *West* made with the Ensign, then the *Lieutenant* of each Ship is to come on Board.

2. If

2. If an Ensign be put Aboard in the same Place, all the Masters of the Ships of War are to come on Board the Admiral.

3. If a Standard on the Flag-staff be hoisted at the Mizzen-top-mast-head, and a Gun fired, then all the *Flag-Officers* are to come Aboard the Admiral. If the *English* Flags only, then a Standard in the Mizzen-shrouds, and fire a Gun: If the Flags and Land General Officers; then the Admiral puts Aboard a Standard at Mizzen-top-mast-head, and a Pendant at Mizzen-peek, and fires a Gun.

4. If a *Red Flag* be hoisted in the Mizzen-shrouds, and a Gun fir'd, then the Captains of his own Squadron are to come on Board the Admiral; and if with the same Signal there be also a *West* with the Ensign, a *Lieutenant* of each Ship must go on Board.

5. If he hoists a *White* Flag as before, then the Vice-Admiral, or he that Commands in the second Post, and all the Captains of his Squadron are to go on Board the Admiral. If a *Blue-Flag*, &c. then the *Rear-Admiral*, and the Captains of his Squadron must come on Board; and if there be a *West* as before, the *Lieutenants*.

6. When a Standard is hoisted on the Ensign-staff, and a Gun fired, the Vice and Rear-Admirals must both come on Board the Admiral's Ship.

7. When the Admiral would speak with Captains of his own Division, he will hoist a Pendant in the Mizzen-peek, and fire a Gun; and if with the *Lieutenants*, a *West* is made with the Ensign, and the same Signal. For whenever he would speak with *Lieutenants* of any particular Ship, he makes the Signal for the Captain, and makes a *West* also with the Ensign.

8. When the Admiral would have all the *Tenders* in the Fleet come under his Stern and speak with him, he hoists a Flag, striped *Yellow* and *White*, at the Mizzen-peek, and fires a Gun. But if he would speak with any particular Ship's Tender, he makes a Signal for speaking with the Captain she tends upon, and a *West* with his *Jack*.

9. If all the Pinnaces and Barges are to come on Board, Manned and Armed, the Signal is a Pendant on the Flag-staff, hoisted on the Fore-top-mast-head, and a Gun; and if he would have them Chase any Ship, Vessel, or Boat in View, he hoists the Pendant, and fires 2 Guns.

10. The Signal for the *Long-boats* to come on Board him Mann'd and Armed, is the Pendant hoisted on the Flag-staff at the Mizzen-top-mast-head, and a Gun; and if he would have them Chase any Ship, Vessel, or Boat in open View, without coming on Board him, he hoists the Pendant, as aforesaid, and fires 2 Guns.

When the Admiral would have all the *Boats* in the Fleet come on Board him, Mann'd and Arm'd, he hoists a Pendant on the Flag-staff, both on the Fore-top-mast, and Mizzen-top-mast-head, and fires 1 Gun; but if he would have them Chase, he hoists his Pendants, as before, and fires 2 Guns.

11. When the Admiral would speak with the Victualler, or his Agent, he puts an *English* Ensign in the Mizzen-top-most-shrouds; and when with him that hath charge of the Gunner's Stores, he will spread an Ensign at his Main-top-sail yard-arm.

S I G N A L S for managing a Sea-fight.

When the Admiral would have the Fleet form a Line of Battle, one Ship a head of another, he hoists an Union-flag at the Mizzen-peek, and fires a Gun, and every Flag-ship does the same.

But when they are to form a Line of Battle, one a breast of another, he hoists a *Pendant* with the Union-flag, &c.

2. When he would have the Admiral of the White, or he that Commands in the Second Post, and his whole Squadron, to Tack, and endeavour to gain the Wind of the Enemy, he spreads a white Flag under the Flag at the Main-top-mast-head, and fires a Gun; and when he would have the Vice-Admiral of the Blue do so, he doth the same with a blue Flag.

3. If he would have the Vice-Admiral of the Red do so, he spreads a Red Flag from the Capon the Fore-top-mast-head, downward on the Back-stay: If the Vice-Admiral of the Blue is to do so, he spreads a blue Flag, &c. and fires a Gun. If he would have the Rear-Admiral of the Red do so, he hoists a Red Flag at the Flag-staff at the Mizzen-top-mast-head; if the Rear-Admiral of the White, a white Flag; if the Rear-Admiral of the Blue, a blue Flag, and under it a Pendant of the same Colour, with a Gun.

4. If he be to Leeward of the Fleet, or any part of it, and he would have them to bear down into his Wake or Grain, he hoists a blue Flag at the Mizzen-peek, and fires a Gun.

5. If he would be to Leeward of the Enemy, and his Fleet, or any part of it, be to Leeward of him; in order to bring these Ships into the Line, he bears down with a blue Flag at the Mizzen-peek, under the Union-flag (which is the Signal for Battle) and fires a Gun; and then those Ships which are to Leeward of him, must endeavour to get into his Wake or Grain, according to their Station in the Line of Battle.

6. When the Fleet is Sailing before the Wind, and he would have him that Commands in the second Post, and the Ships of the Star-board Quarter to clap by the Wind, and come to the Star-board Tack, he hoists a *Red* Flag on the Mizzen-top-mast-head; but a *Blue* one, if he would have Ships of the Lar-board Quarter come to the Lar-board-tack, with a Gun.

7. If the Van are to Tack first, he spreads the Union-flag at the Flag-staff on the Fore-top-mast-head, and fires a Gun, if the Red Flag be not abroad; but if it be, then he lowers the Fore-top-sails a little, and the Union-flag is spread from the Cap of the Fore-top-mast downwards; and every Flag-ship doth the same.

8. If the Rear be to Tack first, he hoists the Union-flag on the Flag-staff at the Mizzen-top-mast-head, and fires a Gun, which all the Flag-ships are to answer.

9. If all the Flag-ships are to come into his Wake or Grain, he hoists a Red Flag at his Mizzen-peek, and fires a Gun, and all the Flag-ships must do the same.

10. If he would have him that Commands in the second Post of his Squadron to make more Sail (tho' he himself shorten Sail) he hoists a white Flag on the Ensign-staff: But if he that Commands in the third Post be to do so, he hoists a Blue

a Blue Flag at the same places, and fires a Gun, and all the Flag-ships must make the same Signal.

11. When ever he hoists a Red Flag on the Flag-staff at the Fore-top-mast-head, and fires a Gun, every Ship in the Fleet must use their utmost endeavour to engage the Enemy, in the Order prescribed them.

12. When he hoists a white Flag at his Mizzen-peak, and fires a Gun, then all the small Frigats of his Squadron that are not of the Line of Battle, are to come under the Stern.

13. If the Fleet be Sailing by a Wind in the Line of Battle, and the Admiral would have them brace their Head-sails to the Mast, he hoists up a yellow Flag on the Flag-staff, at the Mizzen-top-mast-head, and fires a Gun, which the Flag-ships are to answer, and then the Ships in the Rear must brace first.

14. After this, if he would have them fall their Head-sails and stand on, he hoists a yellow Flag on the Flag-staff at the Fore-top-mast-head, and fires a Gun; which the Flag-ships must answer, and then the Ships in the Van must fall first, and stand on. If when this Signal is made, the Red Flag at the Fore-top-mast-head be abroad, he spreads the Yellow Flag under the Red.

15. If the Fleets being near one another, the Admiral would have all our Ships to Tack together, the sooner to lie in a posture of Engaging the Enemy, he hoists a Union-flag on the Flag-staves at the Fore and Mizzen-top-mast-heads, and fires a Gun, and all the Flag-ships in the Fleet are to do the same.

16. The Fleet being in a Line of Battle, if he would have the Ship that leads the Van, hoist, lower, set, or hawl up any of his Sails, the Admiral spreads a Yellow Flag under that at his Main-top-mast-head, and fires a Gun; which Signal the Flag-ships are to answer, and then the Admiral will hoist, lower, set, or hawl up the Sail, which he would have the Ship that leads the Van do; which is to be answered by the Flag-ships of the Fleet.

17. When the Enemy runs, and he would have the whole Fleet follow them, he makes all the Sail he can after them himself, takes down the Signal for the Line of Battle, and fires 2 Guns out of his Fore-chase, which the Flag-ships answer, and then every Ship is to endeavour to come up with, and Board the Enemy.

18. When he would have the Chase given over, he hoists a white Flag at the Fore-top-mast-head, and fires a Gun.

19. If he would have the Red Squadron draw into a Line of Battle, *one a breast* of another, he puts abroad a Flag, striped Red and White on the Flag-staff, at the Main-top-mast-head, with a Pendant under it, and fires a Gun: If the white or second Squadron are to do so, the Flag is striped Red, White and Blue; if the Blue or third Squadron are to do so, the Flag is a *Genoueze* Ensign and Pendant. But if they are to draw into a Line of Battle, *one a Head of another*, the same Signals are made without a Pendant.

20. If they are to draw into a Line of Battle, *one a Stern* of another, with a large Wind, and he would have the Leaders go with the Star-board-Tacks Aboard by the Wind, he hoists a Red and White Flag at the Mizzen-peak, and fires a Gun: But if they should go with the Lar-board-tacks

Aboard by the Wind, he hoists a *Genoueze* Flag at the same Place; which Signals must be like others, answered by the Flag-ships.

SIGNET, is one of the King's Seals, wherewith his private Letters are Sealed, and is always in the Custody of the King's Secretaries; and there are 4 Clerks of the Signet Office always attending.

SILVER, of the ways of Smelting and Refining of Silver, I find these Accounts. 1. From Mr. Ray, at the end of his Catalogue of *Englisk* Words about the Silver Mines in *Cardiganshire* in *Wales*.

The Mine first beaten into small Pieces, is brought from the Mine to the Smelting-house, and there melted with *black and white Coal*, i. e. with Charcoal and Wood slit into small Pieces, and dried in a Kiln for that Purpose: And they use both Wood and Coal, because the Coal alone makes too violent a Fire, and the Wood alone too gentle. After the Fire is made, the Mine is cast on the Coals, and so again, Mine and Coals interchangeably. The Mine, when melted, runs down into the *Sump*, which is a round Pit of Stone lined with Clay within; thence 'tis laden out and cast into square Bars with smaller ends, fit to lift and carry them by.

These Bars they bring to the Refining Furnace, which is covered with a thick Cap of Stone bound about with Iron, and moveable, that so they may lift it up, and make the *Test* at the Bottom anew, (as they do at every Refining.) In the Middle of the Cap there is a Hole, in which the Bar of Silver hangs in Iron-slings above the Furnace, that so it may be let down by degrees as it melts off. Besides this Hole, they have another in the side of the Furnace, Parallel to the Horizon, and bottom'd with Iron; at which Hole they thrust in another Bar. The *Test* is of an Oval figure, and fits at the bottom of the Furnace. The Fire is put in by the side of the Bellows, when the Furnace is come to a true Temper of Heat, the Lead converted into *Litharge*, is blown off by the Bellows, the Silver subsiding to the bottom of the *Test*.

As soon as all the *Glut* (as they call it) of *Litharge* is blown off, the Silver in the bottom of the *Cuple* or *Test* grows cold, and the same Degrees of Heat will not keep it melted, as before. The Cake of Silver after it grows cold, *springs or rises up into Branches* (saith Mr. Ray, but I question his Information as to this Point.) The *Test* is made of Marrow-Bones, burnt to small Pieces, then powdered and made into a Past with Water. The *Test* is about a foot thick, laid in Iron: After the Cake of Silver is taken out, that Part of the *Test* which is discoloured, they mingle with new Ore to be melted; the rest they pound and powder, and use again for another *Test*.

The *Litharge* is brought to a Reducing Furnace, and there with Charcoal only melted into Lead. The *Litharge* is cast upon the Charcoal in the *Bing* of the Furnace; and as the Charcoal burns away, and the *Litharge* melts, more Charcoal is thrown on, and *Litharge* put upon it, as at first Smelting.

Another Furnace they have, which they call an *Almond Furnace*, in which they melt the *Slugs* (or Refuse of the *Litharge*) not stamped or pounded with Charcoal only.

The

The Slugs or Cynders of the first Smelting, they beat small with great *Stamps*, lifted up by a Wheel moved by Water, and falling down by their own Weight. First they are stamped with dry Stamps, then sifted with an Iron-sieve in Water. That which lies at the bottom of the Sieve is returned to the Smelting-furnace, without more ado; that which swims over the Sieve is beaten with wet Stamps.

What hath pass'd thro' the Sieve, and also what after being beaten with the wet Stamps, passes thro' a fine Grate, or Strainer of Iron, goeth to the *Buddle*; which is a Vessel made like a shallow Tumbrel, and stands a little shelving.

On this the Matter is laid, and Water runs constantly over it, the Matter being moved to and fro with an Iron-rake; by which means the Earth and Dross being carried off by the Water, the Metal remains behind.

That which is thus *Buddled*, they lue with a thick Hair-sieve, close wrought in a Tub of Water, rolling the Sieve about, and inclining it this way and that with their Hands: The light Part which swims at top of the Sieve, or rather over it, is returned again to the Buddle; and that which subsides goes to the Furnace to be Smelted again.

They have also an *Assay Furnace*, wherewith they try the Value of the Metal, of what Proportion the Lead bears to the Silver; which they do by cutting off a Piece from every Bar, and melting it in a small Cupel: First they weigh the Piece cut off, and then after the Lead is separated, the Silver. A Tun of Metal sometimes will yield 10, 15, and if rich, 20 Pound Weight of Silver.

All Lead Ore digg'd in *England*, hath a Proportion of Silver mixt with it; but some so little, that it will not quit cost to Refine it.

At the first Smelting they mingle several sorts of Ore together, some Richer, some Poorer, else they will not melt so kindly. The Silver made here is exceeding good and fine. These six Mountains in *Cardiganshire*, not far from one another, afford Silver Ore; *Talabout*, *Geginnon*, *Comsom-lack*, *Gedarren*, *Bromesloid* and *Cummer*. But when Mr. Ray was there, they digg'd only at *Talabout*.

Their Way of Digging and Collecting the Ore, was thus: They sink a Perpendicular square Hole, or *Shaft*, the sides of which they strengthen round from top to bottom with Wood, that the Earth may not fall in. The Transverse Pieces of Wood, they call *Stemples*; and on these, catching hold with their Hands and Feet, they descend without using any Rope: They dig the Ore thus, one holds a little Pique, or Punch of Iron, having a long Handle of Wood, which they call a *Gad*; and another with a great Iron-sledge drives it into the Vein.

The Vein of Metal runs *East* and *West*; it rises *North*, and dips or slopes to the *South*. There is a white *Fluor* about the Vein, which they call *Spar*, and a black one, which they call *Blinds*: This last covers the Vein of Ore; so that when it appears, they are sure to find Ore.

There are several Silver Mines at *Schemnitz* in *Hungary*, the chiefest of which are *Windschaht* and *Trinity*. Of which Dr. Edward Brown gives us this Account in *Philosophical Transactions*, No. 58. *Trinity Mines* are 70 Fathom deep, built and

kept open with Under-work at a great Expence. Much of this Mine being in an Earthy Soil, its Ore is much esteemed. Diverse Veins lie *North*, and others run to the *North-east*. The blackish Ore is esteemed the best; much of it hath a mixture of a yellow shining Substance, called *Marchasite*; which if not in too great quantity, disposes the Ore to Fluidity, and makes it melt and run the better. There is often found growing to the Ore a red Substance, called *Cinnabar*; this Substance, ground with Oil, makes a Vermillion equal to, if not exceeding that Cinnabar which is made by Sublimation of Mercury and Sulphur.

An hundred Pound Weight of Ore sometimes yields but half an Ounce, or an Ounce of Silver; sometimes 2, 3, 4, 5 and 20 Ounces.

There is an Officer in the Works, whom they call the *Probeirer* or *Essayer*, who proves the Richness of the Ore, thus: Of all sorts of Ore he takes the same Quantity, and having first dried, burned, and powdered them, then he gives an equal Proportion of Lead to all, melteth and purifieth them; and then by exact Scales he takes notice of the Proportion between the Ore and the Metal contained in it, and reports it to those concerned in the great Melting-furnaces.

If the Ore be found to hold 2 Ounces and a half, or more of Silver in an 100 Pound Weight, they ordinarily melt it, without any previous Preparation by the help of *Iron Stone* (which, by the by, is not Iron Ore, but a Stone found thereabouts, of which the Livered-colour is the best.) *Kys*, (which is a sort of *Pyrites*) and *Slacken*, (a Scum or Lake taken off the Top of the Pan, into which the melted Mineral runs, and is a Substance made out of the former, melted by Fusion) which are thrown with it into the Melting-furnace.

If the Ore be poorer, holding but 2 Ounces in 100 Pound Weight, or less: Then 'tis first pounded and wash'd, till it become richer, or hath a greater Proportion of Metal, with respect to the Ore, much of the Earthy Parts being washed away. Then 'tis thrown into the Furnace with the former Materials; and the *Marchasite*, which remains still with it, as sinking always to the bottom with the Silver in the *Wash-works*, helps to quicken the Fusion of the Ore.

Whatever is melted in the Melting-furnace, is let out thro' an hole at the bottom thereof into the Pan, which is placed in the Earth before it. And thus exposed, it immediately acquires an hard Scum, Dross, Loaf or Cake; which being taken off from the Top, the Metal remaining becomes the purer; to which is added *Lead*, and after some time the melted Metal is taken out. Then being again melted in the *Driving-furnace* (as they call it) the *Lead*, or what else remains mixt with the Silver is *driven* off by the Blast of two great Bellows, and runs over in the form of *Litharge*. That which first comes over is the *White*, and that which is last, being longer in the Fire, is *Red*; the former is called *Litharge of Silver*, the last of *Gold*; but are both blown off the same Metal.

Most of this *Schemnitz* Silver Ore holds some Gold, which is separated from the Silver by Granulation and Dissolution in *Aqua Fortis*.

When Silver is generated (as 'tis in some Places of *America*, and perhaps elsewhere) in Rocky Stones, abounding with Bituminous Mixtures, so as that it can't be forced from its Impurities

ties by the violent way of Melting; tho' *Lead*, and even Artificial Salts or Fluxes be added: In this Case the Use of Quicksilver hath been found most advantageous. The way of applying it is thus:

They Calcine the Ore, first broken into small pieces, in a Reverberatory Oven; but with a moderate Fire for fear of Fusion, and driving away into the Air part of the Metal. This Calcination frees the Mineral from such Mixtures as would hinder the Power of the Quicksilver upon it, and also renders the Ore more tractable and pliant under the Millstone; where 'tis reduced to a fine Powder, before the Application of the Mercury upon it. For the Ore being Ground, Calcined, Powder'd, and finely sifted, they divide it into several heaps, and then by lesser Essays they find how much Silver is contained in each heap; where 'tis very ordinary to find not above 6 Ounces in 100 Pound Weight, sometimes 12; but if it arises to 18, 'tis esteemed a very rich Vein: Yet sometimes there are great Masses found of pure Silver, which they call Virgin Metal.

Then proportionable to the quantity of Silver in each heap, they besprinkle them with Quicksilver, and that not all at once, but at several times, stirring the Ore up and down. If the Mercury give Signs of its being *Tocado* (as they call it) *i. e.* if it appear *mortified*; not in small and clear Spherical Figures (which is a good Prognostick) but in the form of long Worms, of a wan, pale, dark and Leadish Colour (which indicates that the Ore abounds with *Lead*, &c.) it is cured by certain Magistral, which have for their Basis or Master Ingredient, Calcined Copper mingled with Salt.

The heaps of Ore being thus mingled with Quicksilver, are often stirred about, the better to incorporate the Mercury and Silver. They seem to have only Conjectural Signs to know when the Quicksilver hath done its Office in separating the Silver from these Heterogeneous Substances; which occasions by its uncertainty great Losses, especially when they Work this way on Gold. But when by the Colour of the Mercury, Coagulated by the Silver in clear Massy Lumps, they conjecture the Work done, they wash it by means of *three Vessels*, standing in order, one under another: So that the Matter in the first and highest, being worked and stirred about with a *Molinet*, all the Dust of the Heterogeneous Matter that imbody not with the Mercury, is carried away together with the Water into the other Vessels, and from thence is quite thrown out by the continual Current of the Water: While the Silver in clotted Lumps (called *Pella's*) is by the Weight of the Mercury carried down to the bottom of the Tubs. Then the Mercury, with the Silver is taken out of the Vessels, and diligently squeezed in strong coarse Linen-cloths, and even with Strokes of a Beetle, that the Quicksilver may be separated as much as may be from the Silver. And this Mass is afterwards reduced in Molds of the shape of the *Indian Pine-apple*, into a Pyramidal or Conical Figure, which they call *Pineas de la Plata*: They are thus fashioned for the easier placing them round the edges of a great Earthen, Vessel of the form of a blind, Alembick: Round about the top of which a Fire is made, and then all the rest of the Mercury forthwith abandons the Silver and falls to the bottom; from whence its recovered and kept for the like use again.

The Silver last of all is melted down with *Liga*, as 'tis called, which the King of *Spain* allows, by which he returns to the People in Copper the fifth part, which they allow him of all the Silver. *Philos. Transf. No. 41.*

SIMILAR Light, according to Sir *Is. Newton*, is such, whose Rays are all equally Refrangible; and this he calls also Simple and Homogeneous.

SIMILAR Sections in Conicks, are such whose Diameters make equal Angles with their Ordinates; and also where the Triangles *ADE*, *ABC*, are Similar to the Triangles *ade*, *abc*, and the Bases *DE* to *BC*; as *de*, *bc*. Their Diameters also, as *AF*, and *af* are called Similar.

SIMPLE Light. See *Homogeneous*.

SINCERITY, in Ethicks, is defined to be that *Virtue*, *Power*, or *Act* of the Mind, by which the Will is determined to follow and perform that which the Intellect determines to be best and most proper to be done in all Cases, and to do it because it is so.

SINE-CURES, are Ecclesiastical Benefices without Cure of Souls. No Church where there is but one Incumbent, can properly be a Sine-cure: And tho' the Church being down, or the Parish being become destitute of Parishioners, the Incumbent may thereby be necessarily acquitted from the actual Performance of Publick Duty, yet he is still under an Obligation to do it, whenever a Church shall be built, and there are a competent number of Inhabitants. And in the mean while, if the Church be *Presentative*, as most such Churches are, the Incumbent is Instituted in *Curam Animarum*; and such Benefices are rather *Depopulations* than *Sine-cures*, and 'twill be proper for the new Incumbent to read the 39 Articles, and the Liturgy in the Church-yard, &c. and to do what other Incumbents usually do. But a *Rectory* or a *Portion* of it may properly be a *Sine-cure*, if there be a Vicar Endowed, and then it doth not come within the Statute of Pluralities of 21 H. 8. c. 13. Which declares that no Parsonage which hath a Vicar Endowed, shall be comprehended, &c. So that here no Dispensation is necessary to hold this *Sine-cure* with a former Living. Nor need he read the Articles or Divine Service, as required by 13 Eliz. c. 12. which extends only to a *Benefice with Cure*. A *Sine-cure* Donative wants no Institution and Induction. But one *Presentative* must have both; especially if it consist in *Glebe* and *Tithes*, and not in a Portion of Money. But the Institution must not run in *Curam Animarum*, but in

Reftoriam five Portionem Reftoriarum de A. B. &c. By the abovementioned Stat. 21 H. 8. not only Prebends and Reftories, with Vicarages Endowed, but Deanries and Archdeaconries are declared to be Benefices without Cure.

SINES on the *Plain Scale*, *Gunter's Scale*, and almost all *Scales* have a *Line*, called the *Line of Sines*. This on the *Sector* is double, one on each Leg, and hath there many excellent Ufes; some of which are thefe:

1. *The Radius of a Circle being known to find the Sine of any Arch or Angle.*

Fit in the Radius between 90 and 90 in the Lines of Sines, and the Parallel distance between the Numbers of Degrees, answering to any Works or Angles, will give their *Sines*. Thus the Parallel Distance between 60, 30, 45, &c. will give the Sines of 60°, 30°, 45°, &c. And *vice versa*, from the Sine given you may find the Radius, by fitting the Sine into the *Sector* Parallel-wise, between the Numbers expreffing its Degrees. For then the Parallel Distance between 90 and 90, will be the Radius fought.

2. *The Radius of a Circle being given, and any Right Line less than it, to know of what Ark it may be the Sign.*

Apply in the Radius between 90 and 90, in the Lines of Sines, and taking the Length of the Line in the Compasses, carry it Parallel to the Radius, till it fall exactly on like Sines on each fide; and the Degrees and Minutes where it fits, shall give you the Sine it represents.

SINUS, in the *Dura Mater*, is that strong and thick Membrane which covers all the Cavity of the *Cranium*. There are feveral eminent *Sinus's* or Channells, which run between its External and Internal Membrane: Of thefe four principal ones are usually defcribed; as 1. The *Sinus Longitudinalis*, 2 and 3 *Sinus Laterales*; and 4 *Sinus Vertebralis*. (Keil, p. 133.)

SI *Recognoscant*, is a Writ that lies for a Creditor againft his Debtor, for Money Numbred, and owned before the Sheriff in the County-court by the Debtor, to be due to the Creditor.

SIXAIN, is an ancient Order of Battle for 6 Battalions, which fupposing them all in a Line, is formed thus: The 2d and 5th Battalions advance and make the *Van*. The 1st and 6th fall into the Rear; leaving the 3d and 4th to Form the main Body. Each Battalion fhould have a Squadron on its Right, and another on its Left. Any Number of Battalions which are Multiple of 6, may be drawn up by this Order, i. e. 12 Battalions may be put into 2 *Sixains*, and 18 Battalions into 3, &c.

SIZING, is a curious way of *Dreffing* the Tin Ore, after it comes from the *Launder* of the Stamp-mill; which is by fifting it thro' an Hair-Sieve, cafting back the remainder in the Sieve into the *Tails*, to be *Trambled* over again. See *Buddle* and *Tin*.

SKIN. As foon as the *Cuticula* or Scarf-skin is separated from the *Cutis* or true Skin of a humane Body, there are thefe three parts appear first, an infinite number of *Papilla Pyramidales*, which are the ends of all the Nerves of the Skin, each of

which are enclosed in two or three Covers of a Pyramidal Figure. Between thefe *Papilla* are an infinite number of Holes, which are nothing but the Orifices of the Excretory Veffels of the *Miliary Glands* underneath.

Secondly, There appears a Web of Nervous Fibres, and other Veffels, differently interwoven: This is always covered with a Mucous Substance, ferving to fupport and moisten the *Papilla Pyramidales*. And this is the *Parenchyma*, or that part of the Skin that *Parchment* is made of.

The third part is an infinite number of *Miliary Glands*, about whom there is much Fat usually: Thefe Glands feparate the Matter by Sweat and Infenfible Perfpiration. Each Gland receives a *Nerve* and *Artery*, and fends out a *Vein*, and an *Excretory Duct*; which laft paffes thro' the other two Parts to the *Cuticula*, in order to moisten it and the *Papilla Pyramidales*, left they fhould be fo dry as to hinder the Senfe of Feeling; and alfo to difcharge that Matter out of the Body.

The ufe of the Skin is to cover and wrap up all the Parts of the Body, to be the Organ of Touching or Feeling, and to be the Emunctory of the whole Body. For thro' the Glands of the Skin, paff not only fuch Particles of the Veffels, as decay, by reafon of the continual Motion of the Blood, but likewise the greateft part of the Liquors which we drink; which having perform'd part of their Office, in conveying the Aliments into the Blood, are in the next place to difsolve the Saline and Terreftrial Particles to be carried off thro' the Glands of the Skin and Kidneys. *Sanctorius* computes, that about 50 Ounces a Day are thus carried off thro' the Cutaneous Glands: So that if a Man's Body be fupposed to weigh 160 Pound in 51 Days he may perfpire a Quantity equal to the weight of his whole Body. *Keil's Anatomy*.

Above the *Cutis* or thick Skin of the Body lies the *Cuticula* or Scarf-skin, and is compofed of feveral Plates of fmall *Scales*, which cover one another, more or lefs, or lie thicker, according as it is thicker in one part of the Boey than in another: Between thefe *Scales* the *Excretory Duct* of the *Miliary-Glands* of the *Cutis*, or thick Skin, open. *Lewenhoeck* reckons, that round about one Cuticular 500 fuch Ducts may lie, and that a Grain of Sand will cover 250 of thefe *Scales*: So that one Grain of Sand will cover 125000 Orifices of thefe little Ducts; and yet into every one of thefe *Miliary Glands* an Artery, Vein and Nerve do certainly enter. Thefe Glands fecern the Sweat, and what goes off by infenfible Perfpiration: And they muft be very many in number, fince, as *Sanctorius* obferves, 15 Ounces of a Fluid Matter paffes in 24 hours time. Next under the Scarf-Skin lie the *Papilla Pyramidales*, which alfo are prodigioufly numerous, being the Extremities of all the Nerves of the Skin, and do more immediately ferve for the Senfe of Feeling, and to convey the Impulfe received, by means of the Nerves to the Brain. About thefe the Nerves and all other Veffels make a fine Web, all covered over with a Mucous Substance, to moisten thefe *Papilla Pyramidales*; and then under thefe the *Miliary Glands* are placed, protruding their *Secretory Ducts* up to the Surface of the Scarf-skin, on which there are many Parallel Lines, and thefe Interfected by others, and in each Interfection there is an Hair usually placed. The *Scales* of the Scarf-

Scarf-skin defend the Orifices of the Excretory Ducts of the *Miliary Glands*, and hinder Objects from making too exquisite and painful an Impression upon the Nerves, and so to save them from External Injuries. The Skin itself is designed to enwrap the whole Body, and to sustain the *Papillæ Pyramidales* in their Places, and the Miliary Glands from being disordered; also to receive the Impression of external Objects, and to be the Organ of the Sense of Touching and Feeling.

SLAM; a Term used in the *Alum-Works*: which see.

SLEDGE; is a large Smith's Hammer to be used with both Hands: Of this there are two sorts, *The Uphand Sledge*, which is used by under Workmen, when the Work is not of the largest sort: This is used with both the Hands before, and they seldom raise it higher than their Head. But the other, which is called the *About-Sledge*, and which is used for battering or *drawing out* the largest Work, is held by the handle with both Hands, and swung round over their Heads, at their Arms-end, to strike as hard a Blow as they can.

SLOOP, is a Vessel of the Shallop-kind. In our Navy such attend upon the Men of War. They are usually about 60 Tun, and carry about 30 Men.

SMACK, *Smaka* in Latin, is a small Vessel with but one Mast. Sometimes such are employed as Tenders on a Man of War, and they are also used for Fishing upon the Coasts.

SMOKE-farthings, the Pentecostals, or Customary Oblations offered by the Inhabitants within any Diocese, when they made their Processions to the Mother or Cathedral Church, and came by degrees into an annual standing Rent, called *Smoke-farthings*.

SOFITTO, is the Italian Term in Architecture, for the *Eaves* of the *Corona* of the Capital of a Column.

SOLIDS: there are usually placed on the Sector 2 Lines (one on each Leg) which are called by *Gunter* very properly, the *Lines of Solids*. These are graduated, either by finding 2 mean Proportionals between the whole side, and each 1000 part of the like side, all of them cutting the same 2 Right Lines; and then the former of the 2 Lines so cut, shall contain the Divisions required. Or the Lines of Solids may be made out of the Line of Lines, (or rather out of a Diagonal Scale, equal to it in length) by a Table of Cubick Roots, and this is the readiest way; for the Roots taken out of the Scale of equal Parts, shall give the Cubes in the Lines of Solids, *c. gr.* To inscribe the Place of 125 in the Line of Solids, affix 12 Cyphers to it, and then extract the Cubick Root, which will be 50000; and that taken out of the Line of Lines, will find the Point of 125 in the Line of Solids, &c.

The Use of the Lines of Solids.

1. *To find the Proportion between two or more Similar Solids.*

In the Sphere, in regular Parallels, and other like Bodies, whose Sides adjoining to the equal Angles are proportional; proceed thus: Take one of the Sides of the greater or greatest Solid, and open the Sector to it in the Points of 10 and 10, in the Line of Solids: And then taking the like Sides of the lesser Solids severally, and carrying them parallel to the former, till the Feet of the Compasses stay in like Points; the Numbers be-

longing to those Points, will express the Proportions to 10000; that is, the Solids will be to each other as these Numbers are to 10000.

2. *To Augment or Diminish a Solid in a given Ratio*; as suppose in that of 2 to 3.

Open the Sector to the side of the Solid given in the Points 2 of the Number given; and then keeping it at that Angle, the parallel Distance between 3 and 3, the Points of the Number required, shall give the like side of a Solid similar to the former, and in the Ratio required.

3. *To Add or Subtract one Solid to, or from another.*

Find the Ratio between them (by Prob. 1.) and then Add or Subtract those Proportions, and accordingly augment or diminish (by the precedent.) Thus, if *A* and *B* be the sides of 2 Cubes to be added or subtracted; I first find the Proportion of *A* to *B* to be, suppose, as 100 to 40, or as 5 to 2; then adding 5 to 2, it makes 7: wherefore I augment the side *A*, in the Ratio of 5 to 7, which will give a new side, as *C*, on which a Cube being made, will be equal to them both. Proceed *vice versa*, in Subtraction.

4. *To find 2 Mean Proportionals between 2 given Lines*; as suppose between *A* and *D*.

First find (by the Line of Lines) the Ratio between the 2 given Lines, which are the Extreams, and let that be in Numbers as 27 to 8; and then open the Line of Solids on the Sector, so that the greater Extream *A*, may be applied in the Points 27 and 27. Then keeping the Sector at that Angle, take the Distance between 8 and 8, and that shall give you *B*, suppose the former of the 2 Means. Next, apply that Mean *B* over in the Line of Solids on the Points 27 and 27, and then the parallel Distance between 8 and 8 will give you *C*, the other Mean sought.

5. *To find 2 Mean Proportionals between 2 Numbers given*: Suppose between 27 and 8.

Reckon 27 and 8 on both sides in the Lines of Solids from the Centre. Then taking 27 from the Centre also in the Line of Lines, put it over in the Line of Solids in the Points 27 and 27. So shall the parallel Distance between 8 and 8 in that Line, reckoned in the Line of Lines from the Centre, give 18, the former of the 2 Means sought. Apply over then 18 between 27 and 27 in the Line of Solids, and keeping the Sector at that Angle; the Parallel between 8 and 8 in the same Line, will give a Length to be reckoned, as before on the Line of Lines from the Centre, which will be 12, the latter Mean Proportional required.

6. *To find the Cubick Root of a Number given, or the Cube of a Number assigned.*

In the Extraction of the Cube Root, you must point from the Right-hand towards the Left, the first, and then every third Place; and then there will be as many Places in the Root, as there are such Points over the Cube Number given. Wherefore if the Number be under 1000, the Root can consist but of one Figure. If less than 100000, it can consist but of 2 Places; and if less than 100000000, it will have but 3 Places in the Root, &c. Wherefore the Line of Solids is divided first into 1000 unequal Parts: And therefore, if the Number given be greater than 1000, the first Division of the Line, which before signified but one, will now stand for 1000, &c. as in the Line of Numbers. By this means, if the last Point over a Cubick Number, fall on the last Fi-

This being premised, the Extraction of the Cube Root will be easy, without opening the Sector: Set one Foot in the Sector, and extend the other to the Point representing the Numbers. That Distance will reach in the Line of Lines from the Center to the Root.

And the Extent from the Centre of the Line of Lines to any Number for a Root, will reach in the Solids from the Centre to the Cube.

Then the Solid, which may be generated by the Revolution of this Curve round its Axis AB, when moved most swiftly in a rare and elastick Medium, shall meet with less Resistance from the Medium, than any Circular Solid whatsoever, described after the same manner, and whose Length and Breadth are the same.

After this, in the Year 1699, *M. le Marquis de L'Hospital*, produced an easy Method of finding a round Solid, which being placed in a Fluid, whose Parts are at rest, shall, when moved in that Fluid parallel to its Axis, meet with less Resistance from the Medium, than any Solid whatever, whose Length and Breadth are the same, and which shall be moved with the same Velocity.

And this he doth by finding a Curve, which revolving round its Axis, shall generate the Surface of such a Solid. See *Memoires de l'Academ. Royale des Sciences*, 1699. In the latter end of the Year 1700, Mr. *John Craig* sent to the Publisher of the *Philosophical Transact.* a *Latin Letter*, in which there is a Solution of this Problem, of finding the *Solid of least Resistance*. (See *Philos. Trans.* N°. 268) and which is introduced by this *Lemma*.

To find the Ratio between the Resistance of the Right Angled Triangle AIG , and the Rectangle $AIGB$, circumscribing it, when each is moved in a Fluid, according to the Direction of the Line IA , from I towards X .

From any Point, as *B*, draw the right Line *BG*, perpendicular to the Diagonal *GA*, *Bb* parallel to *AI*, and also *BM* normal to *AI*; then take in *Bb*, *bH* = *CM*² / *BC* and *bE* = *BC*, and thro' the Points *H*, *E*, let the right Lines *HA*, *EA*, be produced till they cut *Gg* in *k* and in *F*.

Then I say, that the Resistance of the $\triangle AIG$, is to the Resistance of the Rectangle AIG , as the Area of the Triangle AIG , is to the Area of $\triangle AFG$, and the Resistance in any part of the Line AG , is to the Resistance in the corresponding part of the Line Ag (suppose in AB and Ah , &c.) :: as the Area AHB , to the Area AEB . The Demonstration of this depends on a general Theorem, which I did very easily deduce from the 35 Prop. of Sir *Is. Newton's Princip.* p. 324.

Cor. 1. Let BG, and hg, be infinitely small Parts of the Lines AG, and Ag, and produce bB to L; then I say, that the Resistance in BG, (which let us call e) is to the Resistance in bg, (which call E) as GL^2 is to GB^2

For $e. E :: KH bg. FE bg$; that is, $e. E :: bg \times bH. bg \times bE$ (by the preceding Lemma)
wherefore $e. E :: bH. bE$. (that is) $e. E :: \frac{CM^2}{BC}$

BC. (by the Construction of that Lemma) wherefore $e. E :: CM^2. BC^2$. But $CM^2. BC^2 :: GL^2. GB^2$, (from the similar Triangles BMC, GLB) wherefore $e. E :: GL^2. GG^2$. Q. E. D.

Cor. 2. *The Resistance against the infinitely small part GB, is equal to the Cube of the Line GL, divided by the Square of the Line GB.* For if all the infinitely small Parts of the Line Ag, (as bg, &c.) be supposed equal; then the Resistance in bg might be expressed by bg: that is, $E = bg$, and therefore $E = GL$. Wherefore, by Cor. 1. e. $GL :: GL^2 \cdot GB^2$. wherefore $e = \frac{GL^3}{GB^2}$. Q.E.D.

Cor.

Imagine the little Lines MN , NO to be two Sides of the Infinito-lateral Polygon, which constitutes the Curve required : Draw MP , NQ Ordinates to the Axis AL , and draw RNF Parallel to the same Axis AL , and let OR , MF be perpendicular to RNF , and MD perpendicular to the Side MN .

towards L, is to the Force of the same Particle to move MN from A towards L : : $\overline{DM}^2 : \overline{DP}^2$: : $\overline{MN}^2 : \overline{FM}^2$. The Proportion between the Force of the Particle of the Fluid to move MF (or Qv) from A towards L, and the Force of the same Particle to move MN from A towards L may be found thus: If FN represent the Force of the Particle against QNv in the Direction from A towards L, then FS will represent the Force of the same Particle against MNs in the Direction of MD; and if FS represent the Force of the Particle against MN from M towards D, then mS will represent the Force of the same Particle against MN in the Direction of AL from A towards L : therefore the Force of the Particle of the Fluid to move MF (or QN) from A towards L, is to the Force of the same Particle to move MN from A towards L, as EN is to mS, that is, as FNq is to FSq, or as MDq is to DPq.

Whence if the given right Line AB (a) represent the Velocity of the Particles of the Fluid striking against the Right Lines MN , MF , then the Force of the same Fluid upon the Plane described by MF revolving about the Axis AL at the distance MP , and directly opposed to the Motion of the Fluid, will be as the Surface described, and Velocity jointly; that is, as $a \times MF \times MP$, whence to find (from A towards Q) the Force of the Fluid on the Surface MN ; say, $\overline{MN}^2$:

$$\overline{FM}^2 :: a \times MF \times MP : \frac{a \times \overline{MF} \times MP}{MN^2} =$$

to the Force (in the Direction of AL from A towards L) of the Fluid on the Oblique Surface described by the Rotation of MN about the Axis AL ; or, which is the same thing, the Quantity

$\frac{a \times \overline{MF} \times \overline{MP}}{\overline{MN}^2}$ expressing the Resistance which

the same Surface moving from L towards A, suffers from the Fluid at rest. In like manner the Resistance, which the Surface described by NO revolving about the Axis AL, meets with from the quiescent Fluid, may be represented by

$$\frac{a \times \overline{OR} \times \overline{NQ}}{\overline{NO}^2},$$

Now if we suppose the Points MO , and the right Line RF , to be given by Position, and that they are in the same Plane with the Axis AL ; it remains only to determine the Point N in the Line RF , so that the Surface generated by the right Lines MN , NO revolving about the Axis AL shall suffer the least Resistance.

Let the invariable Quantities MF be $=m$, MP $=r$, OR $=n$, NQ $=q$; and the variable Quantities FN $=v$, and NR $=z$; then $\overline{MN}^2 = mm + vv$, and $\overline{NO}^2 = nn + zz$; therefore the Resistance which the Surface described by

the Line MN meets with, viz. $\frac{a \times \overline{MF}^3 \times MP}{MN^2}$

is $= \frac{a + m^2 \times r}{m m + v v}$, and that which the Surface
described by NO (revolving about the Axis AL)
viz.

viz. $\frac{a \times OR^3 \times NQ}{NO^2}$ is $= \frac{a \times n^3 \times q}{nn + zz}$, whence

it is evident (from the Nature of the Question)

that the Quantity $\frac{a \times m^3 \times r}{mm + vv} + \frac{a \times n^3 \times q}{nn + zz}$ ought

to be a *minimum*, and (*Art.* 198.) consequently

the Fluxions thereof must be $= 0$. Whence

$\frac{2m^2 r \times vv}{mm + vv} = \frac{-2n^2 q \times zz}{nn + zz}$. Now because

$vv + zz = RF$ an Invariable Quantity, therefore

$\dot{v} = -\dot{z}$, and consequently $\frac{m^3 \times r \times v}{mm + vv} =$

$\frac{n^3 \times q \times z}{nn + zz}$. Whence if $AB(a)$ be erected Per-

pendicular to the Axis AL , and if the right Lines

BC, BH , be drawn Parallel to the Infinitely lit-

tle Sides MN, NO , it will be $4AB^2 \times AC$:

$BC^3 :: BC : MP$; and in like manner $4AB^2 \times$

$AH : BH^3 :: BH : NQ$; for because the

Triangles MFN, BAC are Similar, therefore

$AC = \frac{av}{m}$, and $BC = \frac{a \times mm + vv \frac{1}{2}}{m}$, whence

$4AB^2 \times AC \left(\frac{4a^3 v}{m} \right) : BC^3 \left(\frac{a^3 \times mm + vv \frac{1}{2}}{m^3} \right)$

$:: BC \left(\frac{a \times mm + vv \frac{1}{2}}{m} \right) : MP(r)$ and conse-

quently $\frac{r m^3 v}{mm + vv} = \frac{1}{4}a$. In like manner, be-

cause the Triangles ORN, BAH , are Similar,

$AH = \frac{az}{n}$, and $BH = \frac{a \times nn + zz \frac{1}{2}}{n}$. Whence

$4AB^2 \times AH \left(\frac{4a^3 z}{n} \right) : BH^3 \left(\frac{a^3 \times nn + zz \frac{1}{2}}{n^3} \right)$

$:: BH \left(\frac{a \times nn + zz \frac{1}{2}}{n} \right) : NQ = q$. Whence

$\frac{qn^3 z}{nn + zz} = \frac{1}{4}a$; and consequently, $\frac{m^3 \times r \times v}{mm + vv} =$

$\frac{n^3 \times q \times z}{nn + zz}$. Which is the very same Equation

that we first found.

Whence 'tis manifest; that the Nature of the

Curve MD (which being revolved about its Axis

AL , generates the Solid of least Resistance) is

such, that drawing AK Perpendicular to the Axis

AL , and taking $AB = a$, and drawing BC

parallel to any Tangent of the Curve, *v. g.* in the

Point M , then it will always be $4AB^2 \times A$

$C : BC^3 :: BC : MP$ the Ordinate passing thro'

the Point M , which is the Property of the Curve that

generates the Solid of least Resistance, discover'd

by Sir Isaac Newton.

And having thus discovered the Property of the

Curve MD , it may be Constructed by help of the

Logarithmetical Line in this manner:

In the Perpendicular AK assume $AB = a$, and

in the Axis AL produc'd, take $AE = \sqrt{\frac{1}{2}aa}$,

and through the Point E describe the Logarithme-

tical Line EN , and let AK be the Asymptote,

and $\frac{1}{4}a$ the Sub-tangent; then take AC at plea-

sure, which suppose $= z$, and draw CN parallel

to AK , until it meet the Logarithmetical Curve in

N ; then if AK be taken $= \frac{aa}{4z} + \frac{1}{2} + \frac{z^3}{4aa}$, and

$AP = \frac{zz}{4a} + \frac{3z^4}{16a^3} - \frac{5a}{48} + CN$ (*viz.* $+ CN$

when $AC > AE$ and $-CN$ when $AC < AE$)

and compleat the Parallelogram PK , I say, the

Angle M , or the Point wherein KM intersects

PM will be in the Curve requir'd.

For AC being $= z$, if $AP = x$, and $PM = y$,

then by the Property of the Curve AK or

$PM = y$ is $= \frac{a^4 + 2aaa zz + z^4}{4aaa z}$, and conse-

quently, $\dot{y} = \frac{1}{2}z + \frac{3zzz}{4aa} - \frac{aaz}{4zz}$, and be-

cause BC is parallel to the Tangent in M , there-

fore the Triangle ABC is Similar to the little

Triangle at M , and consequently $a : z :: y : \frac{zy}{a} =$

$\dot{x} = \frac{zz}{2a} - \frac{3z^3 z}{4a^3} - \frac{az}{4z}$, and the flowing Quan-

tity or $AP(x)$ is $= \frac{zz}{4a} + \frac{3z}{16a^3} - S \frac{az}{4z}$, but

by the Property of the Logarithmetical Line

$z : \frac{1}{4}a :: z(Rn) : \frac{az}{4z} = RN$, whence $S \frac{az}{4z} =$

CN , therefore $AP(x)$ is $= \frac{zz}{4a} + \frac{3z^4}{16a^3} - CN$

$\pm$ an Invariable Quantity $\frac{5a}{48}$, and consequently,

when CN vanishes, then AP or x will vanish

also, therefore CM is the Curve requir'd.

SOLSTICE: how to find the exact Times of

Solstices, see under *Tropick* in Vol. 1.

SOUND, Mr. Carre, of the R. Academy of Sci-

ences at *Paris*, hath published this Year a Book

Sur la Theorie General du Son, &c. In which he

shews that *Sound*, when considered with relation

to Body, consists only in the Motion of the Air;

but in such a Motion as is very different from the

Wind. The first Motion from whence Sound

comes, is produced (he thinks) by little Vibrati-

ons, or Shakings repeated, which the Parts of the

Sonorous Body occasions in the Air; whereas

Wind consists in a Local Motion of the Air, with-

out Vibrations; and this he proves by several Ex-

periments. The Motion of the Air in Winds,

will act strongly on Flame, but will not affect the

Ear with Sound, but on the Interposition of some

Body which may occasion some Vibrations:

Whereas the Agitation of the Air in Sounds af-

fects not Flame; for a lighted Candle put near a

Bell

Bell which hath been struck, will not have its Flame agitated by the Sound.

He concludes also, that Sound is not produced by a total and sensible Vibration of the sonorous Body; but by insensible Vibrations of the little Parts, always helped, and sometimes occasioned by total Vibrations. Thus, when a Chord hangs loose, it will move forward and backward quick enough (when struck) without making any Sound; because thro' want of being straitly extended, each little Part can't make its Vibrations by itself, and communicate them to the Air.

In sonorous Bodies, in the same, or of different Matter, the difference of Sound, as to *Grave* or *Acute*, flows from the greater or lesser Spring of each Part, and from the more or less quickness with which these Parts do bend and unbend. Two Strings or Wires, one of Gold and the other of Steel, of the same *Length*, *Thickness*, and *Tension*, yet will give a different Sound, viz. the Gold one more *Grave*, the Steel-wire one more *Acute*; because the Parts of the Gold are more soft and flexible, and have less Spring than those of the Iron, and therefore will have less speedy, and weaker Vibrations. But yet Sound, be it *flat* or *sharp*, is still *strong* or *weak*; and 'tis not the *Strength* or *Weakness* of Sound, that renders it *flat* or *sharp*: *strong Sound* arises from *great Vibrations* in the Air, and from a *great Quantity* of it, moved in the same time; and the weak Sound is occasioned by the just contrary. So that the *Strength* or *Weakness* of Sound, is in proportion to the *Quantity of Air struck*, and the *Strength* of the Vibrations: But *Grave* and *Acute* Sounds follow the Proportion of greater or lesser *Number of the Vibrations of the Air* in the same time.

The Reverend Mr. *William Derham*, a very industrious and useful Member of the *Royal Society*, in *Philosophical Transactions*, N° 313. hath obliged the World with some very curious and careful Observations and Experiments about the Motion of Sound; being furnished with very good Instruments, and many Advantages to make them, which others have not been.

He observes, first, that there hath been a considerable difference in the Accounts given by good Authors, about the Velocity of the Motion of Sound. Sir *Is. Newton*, in *Princip. Lib. 2. Prop. 50.* allows but 968 Feet for the Progress of Sound in a Second of Time.

The Hon. Mr. *Fr. Roberts*, *Phil. Trans.* N° 207. 1300 Feet.

Mr. *Boyle*, in his *Essay on Languid and Unheeded Motion*, 1200 Feet.

Dr. *Walker*, in *Phil. Trans.* N° 247. 1338 Feet.

Mersennus in *Balistic. Prop. 39.* 1474 Feet.

Flamstead and *Halley*, 1142 Feet.

The *Florentine Academy*, 1148 Feet.

The *French Observ. Hist. Acad. Regie*, 1172 Feet.

The Reason of this Diversity he judges to arise, (1.) From these Gentlemen using not good Pendulum Clocks ordinarily, but a String and Plummet only; of such a length as to swing Seconds. But this latter way can't be so exact as that by a Movement; because the Observer's Eye must first observe the Flash of the Gun, &c. fired; and then the Swing of the Pendulum, which takes up Time, and occasions much Confusion. (2.) From there not being distance enough between the Sound and the Place of Observation. And, (3.) From there being no regard had to the

Winds, of which more below. And he judges, that the little difference there is between the three last Numbers of 1142, 1148, and 1172, arises from there being good Pendulum Clocks made use of in these Observations, and the Distances being considerable.

After this, he proposes to answer the following Questions:

1. How far a Sound moves in a Second of Time, and consequently in any Time assigned?

2. Whether the Report of a Gun, discharged with its Mouth *towards*, comes *sooner*, than when its *Muzzle* is *from* the Observer?

3. Whether Sounds move in the same Time, the same Spaces, in all States of the Atmosphere, and Heights of the Barometer?

4. Whether they move faster by *Day*, or by *Night*?

5. Whether they move swifter with, or slower against the Wind? And how the Wind affects them?

6. Whether Sounds move faster in calm or still, then in windy and turbulent Weather?

7. Whether a strong transverse Wind accelerates or retards the Motion of Sound?

8. Whether Sounds have the same Degree of Velocity in Summer and in Winter.

9. Whether they have the same in snowy and clear Weather?

10. Whether a great Sound and a small one have the same Velocity?

11. Whether the Sound of a Gun move equally swift at all the Elevations of the Gun?

12. Whether different Strengths of Gun-powder change the Motion of the Sound of the Report?

13. Whether the Velocity be the same in all Heights of the Atmosphere above the Earth?

14. Whether the Report be in the same Time, if the Piece be discharged in an *Acclive* or *Declive* Position?

15. Whether all kinds of Sounds, as of Guns, Bells, Bees, &c. have the same Velocity?

16. Whether Sounds be swiftest in the beginning of their Motion, and slowest in the end?

17. Or whether they be not rather *equable*, moving equal Spaces in equal Times?

18. Whether Sound move equally swift in all Regions? in *North*, *South*, &c. Climates?

19. Whether Sound move in a right Line the nearest way, or whether along the Earth's Surface?

To solve these Problems, Mr. *Derham* was at the trouble of getting, and had the advantage of hearing and seeing from the Tower of his Parish-Church at *Upminster* in *Essex*, many Muskets fired at the distance of 1, 2, 3, and so far as to 8 Miles; beyond which he could not hear in that woody Place, the Report of a Musket. But tho' the Firing of these small Arms did him much Service in his Design, he was much better served by the Ordnance, or great Guns, on *Black-Heath*; for he could from his Church aforesaid, always by Night with his naked Eye, and by Day with a Telescope, see the Flashes of the *Sakers* (a sort of Cannon) there fired, to exercise her Majesty's young Engineers, and hear their Report very plainly. On these he made many repeated Observations; and at last, by favour of the Board of Ordnance, he got leave to have two *Sakers* (see that word in

Vol. I.) to be placed one by another on the Heath, but with their Muzzles quite contrary ways; and on the 15th of Feb. 1704 to be discharged continually every half Hour, from 6 in the Evening, till 12 at Night: There was a small Gale of Wind blowing directly against the Sound.

The Interval between the Flash and the Report of each Gun, he always found to be about 120, or 122 half Seconds of Time. He mentions both these Numbers, because the Sound of the Report always came double; the first within 120 half Seconds; the second (which he takes to be an Echo from the Wind-Mill, or adjacent Houses on *Black-Heath*) within 122.

He observed no difference in the Time of the Sound's Progress, when the *Saker* was fired towards him, or from him, which answers his second Question.

Nor did he find that any different Elevation of the several Muskets made any alteration in the Motion of the Sound; which is an Answer to his 11th Problem. And to solve the 12th Query, he found that different Quantities or Strengths of Powder, made no alteration in the Velocity of the Sound's Motion; tho' it manifestly did so in the Strength of the Noise. Nor did he find that there was any Variety in the Time of the Motion of the Sound, either by Night or Day; whether it were clear or cloudy; whether it rained or snowed, whether the Barometer were high or low, and whether it were Summer or Winter; which solves his 3, 4, 6, 8, 9 Queries. He found also, in answer to his 15th Question, that all kinds of Sounds, as of Bells, Beetsles, Muskets, &c. from the same Distance came to his Ear in the same Time.

And the same he found, as to intense or strong, and languid or weak Sounds; which answers his 10th Question.

By repeated and very accurate Observations, he also found the Motion and Time of the Progression of Sound to be in all respects equable; which solves the 17th Problem: that is, that Sound moves just an *English* Mile in $9\frac{1}{4}$, or 9, 25 half Seconds; two Miles in $18\frac{1}{2}$, three Miles in $27\frac{3}{4}$, &c. and so on uniformly.

As to his last, or 19th Question, he is confirmed, that Sound moves the nearest way, and that it doth not creep along the Earth's curved Surface: And he believes (in answer to the 14th Query) that the Velocity of the Sound is the same in *Acclivities* and *Declivities*; tho' he hath not had opportunity of making Experiments enough to determine it exactly.

From the Communications which his Friends in *Italy* have afforded him, he thinks the Difference of Regions or Climates, makes no difference in the Motion of Sounds; which is an Answer to his 18th Question.

He found that very thick cloudy and snowy Weather, did always lessen and dull the Noise made by the Discharge of Guns, &c. whereas in frosty and clear Weather, they were much more audible, clear, and distinct, than at any other times.

By many repeated and accurately made Experiments, he discovered, that contrary Winds do always retard the Motion of Sounds, and that in proportion to their Strength; which is what the *Florentine Virtuosi*, and many others have formerly been entirely mistaken in; asserting, that Contrariety of Winds occasion no Retardation of the Motion of Sound.

By Observations and Experiments, made with proper Instruments, about the Velocity of the Motion of Wind, he concludes, that in the greatest and most rapid Storms that ever blew, the Wind moves not above 60 Miles an Hour, and perhaps not above 50; whereas Sounds may go above 700 Miles in the same time: and consequently they cannot be the same Particles of the Air or Atmosphere, which carry both; at least they can't be moved after the same manner. He concludes, as above said, that the Velocity of Sound is such, that it ordinarily moves 5280 Feet, or an *English* Mile, in $9\frac{1}{4}$ half Seconds: And that it moves 571 in a half, and 1142 Feet in a whole Second of Time. But that the Winds may so affect it, by conspiring with its Motion, as to carry it 600 Feet in half a Second; or, by being contrary to it, to retard it so, that it may not move more than 560 Feet in a half Second of Time.

He concludes with shewing the Uses that may be made of this Knowledge of the Velocity of the Motion of Sound, in measuring the Distances of Ships at Sea from one another, or of a Ship from Shore; of Forts and Batteries one from another, or of any Places at Land within the hearing of the Report of a Gun; of the Distances of Thunder, Clouds, &c.

In *Philosophical Transactions*, N^o. 156, you have an Account of the Doctrine of Sounds, by *Narcissus* Bishop of *Ferns* and *Leighlin*; and in N^o. 247, of the Swiftneſs of Sounds, and their Reflections by Echoes.

In the History of the Royal French Academy for A.D. 1700, they say it hath been experienced, that a Sound moves 180 of their Toises in a Second, or 283 middle French Leagues in an Hour. (1.) Therefore they conclude, that the Air must be moved or struck at first with a very great Smartness or Swiftneſs. (2.) All Conjectures and Physical Reasons persuade us, that this Motion or Stroke on the Air, must be impressed by very brisk Vibrations of the small Parts of the sonorous Body, in order that they may exert their Spring or elastick Force (3.) In *Philosophical Transactions*, N^o. 297, you have an account of some Experiments of Mr. *Hawksbee's*, whereby it appears plainly, that as exhausting the common Air out of a Receiver, doth very much lessen the Noise made by the Bell there hung and struck, so crowding or conveying more Air into a Vessel, made on purpose for such Condensations of Air, did very sensibly augment the Sound of the included Bell.

SOVERAIGN, was a Piece of Gold Coin, Current at 22 Shillings and Sixpence, in 1 H. 8. when, by Indenture of the Mint, a Pound Weight of Gold of the old Standard was to be coined into 24 Sovereigns. In 34 H. 8. Sovereigns were coined at 20 Shillings, and half Sovereigns at 10 Shillings. In 4 Ed. 6. Sovereigns were coined at 24 Shillings a-piece, and in 6 E. 6. at 30 Shillings; and also in 2 Eliz.

SOWNE, is a Term of Art used in the *Exchequer*, and seems a Corruption from the French *Souvenu*, i. e. *remembred*: For the Stat. 4 H. 5. c. 7. in the Original French, hath *Des Estreats oriens Souvenu*. And such Estreats and Casualties as are not to be remembred, run not in Demand, i. e. are not leviable. So now in the *Exchequer* they say, such Estreats as the Sheriff by his Industry cannot get, are *Estreats that Sowne not*; and *Estreats that Sowne*, are such as he may gather.

SPHERE,

SPHERE: 1. The Surface of a Sphere is equal to the Periphery of a great Circle, multiplied by its Diameter; *Hayes*, p. 73.

2. The Area of any Segment of a Sphere cut off by a Plain, or by two Plains which are parallel, is to the whole Spherical Surface, as the intercepted Portion of the Diameter is to the whole Diameter. Wherefore putting r = Radius, c = Periph. and x = the intercepted Diameter; the Area of any Segment may be found by this Proportion.

$$\frac{2r \cdot x}{2rc \cdot cx}$$

The Part of the Sphere's Surface contained between the Semi-circular Arks of any two (Great) Intersecting Circles, is to the whole Surface, as the Angle of Inclination of the Planes of those Circles is to 4 right Angles.

3. When the Diameter of any Sphere is equal to the Radius of any Circle, then the Area of that Circle will be equal to the Surface of the corresponding Sphere.

4. The Convex Area of a Cylinder Circumscribing a Sphere of the same Diameter with its own Altitude (which in this Notation will be $2rc$) is Quadruple of the Area of the Base; and consequently = to the Area of the Surface of the Sphere, and the Surface of an Hemisphere is = to twice the Area of one of its great Circles.

5. Suppose the Square A L, together with the Semi-circle A B D, to revolve round A D as an Axis; then will the Line K L generate a Cylindrick Surface = to the Hemispherical one generated by the Semi-circle (by 3.) Wherefore if any Point, as M, be assigned, and thro' it P N be drawn Normal to A D; I say, the Surface or Ring described by K N, will be equal to the Segment described by the Ark A M. For the Ring described by K N, will be to the whole Cylindrick Surface described by K L, as K N, K L. And the Segment made by the Revolution of the Ark A M, is to the whole Spherick Surface, as A P, A D, that is, as K N, K L. Wherefore, &c.

About the Dimensions of the Sphere and Cylinder; see Dr. Wallis in *Philosophical Transact.* N^o. 263. p. 547.

SPIGURNEL, was anciently (*Spigurnellus*) he that had the Office of the *Espigurnantia*, or Sealing of the King's Writs. This Word *Spelman* and *Du Fresne* recite, without interpreting it. But it seems to be taken from the Saxon, *Sparrau*, which signifies to shut up, Seal or Secure. *Kenet's Gloss. in Paroch. Antiquit.*

SPIRITUALITIES of a Bishop, are such Profits as arise to him from the Benefit of his Jurisdiction in his Diocess, and not as a Baron of the Parliament; such as those of his Visitations, Institutions, Ordinations, &c.

SPIRAL Line. See on this Subject further, *Stephano de Angelis de Infinitis Spiralibus inversis*, &c. *Petavii*.

Il. Bullialdi Demonstrationes Novæ de Spiralibus.

SPLEEN. The Vessel which in Beasts they call the *Milt*, is situated in the left *Hypochondrium*, under the *Diaphragm*, between the Ribs and the Stomach, above the left Kidney; it is tied to the *Peritonæum*, to the *Diaphragm*, and to the *Omentum*. 'Tis of a blueish or leaden Colour, of an oblong Figure, thick at the edges, and not thin as the *Liver*: It hath two Membranes, the External comes from the *Peritonæum*; the Internal Membrane is finer and thicker than the External: for if you blow into the Splenick Artery, the Air will pass thro' the one, but not the other. Its Fibres are not regularly woven, as those of other Membranes seem to be, but they come from innumerable Points, as *Radii* from so many Centres; and the Fibres of one Point are regularly woven with the Fibres of the Points surrounding it. It receives Veins, Nerves and Arteries from those that enter the Spleen.

The Substance of the Spleen is not only kept together by its two Membranes, but also by innumerable Fibres which come from the Points of the Internal Membrane, and are inserted in the Points of the opposite side of the same Membrane; and Expansion of the Extremity of these Fibres seem to compose the Internal Membrane.

The Spleen is composed of an infinite Number of Membranes, which form little Cells and Cavities of different Figures and Bignesses, which communicate with one another, and are always full of Blood.

At the Extremities of the Blood Vessels in the Spleen of Sheep, we find several white soft Specks, which *Malpighius* calls *Glands*.

The Spleen hath Arteries from the *Cœliaca*, whose Capillary Branches make frequent Inosculation upon the Membranes of the Cells. Its Veins, whose Extremities communicate with the Cavities of the Cells, as they come out of the Spleen, unite and make the *Ramus Splenicus* of the *Porta*, which carries the Blood from the Spleen to the Liver. These, with its Nerves, which are considerable, from the *Plexus Splenicus*, are equally distributed thro' the whole Substance of the Spleen, being all included in a *common Capsula*. There are likewise a few Lymphatick Vessels which arise from the Spleen, and discharge themselves into the *Lumbary Glands*.

The true Use of the Spleen is yet uncertain; the Antients thought it to be the Receptacle for the melancholick Humour: some since considering that in the Spleen there are a great Number of Membranes and Fibres, and also many Nerves, have thought that the Blood is attenuated, and becomes more spirituous in the Spleen: And considering that the most of the Blood in the Liver comes immediately from the Spleen and *Omentum*, they think that one furnishes the Oleaginous, the other the Spirituous part of the Bile.

SPOTS,

SPOTS in the Sun: Besides what may be concluded about these Solar Spots, being no Planets revolving round the Sun's Body, as some have thought; Dr. Hooke, in his *Opera Post.* draws these further Conclusions: (1.) That these Bodies are either opake, and so hinder the Sun's Light from passing thro' them; or else are incombustible and dark Bodies, which will afford no Light at all for a certain time, and do, as it were, quench and deaden that part of the Sun where they rise. (2.) There appear in some Parts of the Sun's Face, also *Nebulae* or Clouds; in some others *Faculae* or Blazes, which give a clearer Light than the other Parts of his Body. The Spots are subject to increase and decrease, having sometimes covered a part of the Sun bigger than all *Europe*, and sometimes bigger than the whole Surface of the Earth. (3.) The Motion of these Spots is always from *East to West*, according to the Order of a Line of Sines, beginning from the Center, of which the Semi-diameter of the Sun is Radius. And this Motion appears to be in a straight Line in the beginning of *June* and *December*; when the Earth is in that part of the Plain of the Ecliptick, which cuts the Plain of the Equinoctial of the Sun's turbinated Motion. At other times the Line of their Motion is incurvated and bent into an Ellipsis; which is greatest when the Earth happens to be in those Parts of the Ecliptick, which are the extreme Limits of it, compared to the Plain of the Sun's Equinoctial: And this also is twice a Year, viz. in the middle between the Nodes, both Plains passing thro' the Centre of the Sun, that is, about the beginning of *March* and *September*. Whence he deduces, by undeniable Demonstration, that the Sun is of a Globular Figure, and that it moves on its own Axis from *East to West*: As also, that the Axis of his turbinated Motion remains fixed, and is always directed towards the same Point in the Heavens, as the Earth's Axis is found to do; as also the Axis of *Jupiter* and *Saturn* is, as far as can yet be discovered by the Spots, Satellites, and Ring of these Planets. (4.) He observes also, that there is a kind of Torrid Zone, or certain Space or Breadth on each side the Sun's Equator towards the Poles, in which these *Maculae*, *Nebulae* and *Faculae*, do appear most. Whereas, without these Limits, or in the temperate Zones (as with regard to our Earth they may be called) they appear but seldom, and never towards the Polar parts.

SQUADRON of Ships, is a Division, or part of a Fleet, commanded by a Vice or Rear Admiral, or some other Commander or *Commadore*, as they call it; but the Number of Ships in it is uncertain.

SQUADRON, is a Body of Horse, whose Number is not fixed; but usually is from 100 to 200 Men, according to the General's pleasure, the strength of the Army, and as occasion serves. Usually a Squadron consists of 3 Troops, each of 50 Men, and it never exceeds 200 Men; because a greater Number than that can't be advantageously posted, nor have room to act in narrow Ground, Woods, Marshes, Defiles, &c. The Eldest Troop takes the Right of the Squadron, and the Second the Left, and the youngest the Center. A Squadron is always drawn up 3 deep, or in 3 Ranks, with the length of a Horse between each Rank. The Standard is always in the Center of the first Rank.

SQUARE Battel, or *Battalion* of Men, is one that hath an equal Number of Men in Rank and File.

To form any Number of Men into a Square Battle, as suppose 500, extract the nearest Square Root of 500, which is in Integers 22; and that will give the Number of Men for Rank and File. There will be a Remainder of 16 Men, who may be disposed of as the Commander thinks best.

SQUARE Battalion of Ground, is when the Ground of the Flanks is of the same extent as the Ground of the Front and Rear. To make a square Battalion of Ground; as suppose the Number were 60, multiply 60 by 3, the Number of Feet which every Man takes up in Front, the Product will be 180; divide that by 7, which is the Number of Feet each Man takes up in depth, or which is the distance of the Ranks, the Quotient without a Fraction will be 25, whose square Root is 5; which will give the Number of Men in File. And if you divide the first given Number 60 by this Root 5, you will quote 12, which is the Number of Men in each Rank.

SQUARE Hollow, or *hollow Square*, in the Art Military, is a Body of Foot drawn up with an empty space in the middle, for the Colours, Drums and Baggage, facing and covered by the Pikes every way to keep off Horse.

STABLE-STAND, is the Term for one of the four Evidences or Presumptions whereby a Man is convicted, to intend the stealing the King's Deer in the Forests. The other three are *Dog-draw*, *Back-bear*, and *Bloody-hand*. This *Stable-stand* is, when a Man is in *Stabili Statione*, at his *Standing* in the Forest with a *Cross-bow*, or *Long-bow*, ready to shoot at a *Deer*; or else when he is *standing* close up by a Tree, &c. with Grey-hounds in a Leash ready to slip.

STAKE, is the Name of a small *Anvil* used by Smiths; sometimes it stands on a broad Iron-foot, on the Work-Bench, to be moved up and down occasionally; and sometimes it hath a strong Iron Spike at the bottom, by which 'tis fixed to some place on the Work-Bench. Its use is to set small and cold Work *Strait*, by hammering it on the Stake, or to cut or punch upon with the cold Chissel, or cold Punch.

STALLAGE, was a customary Rent paid in Fairs or Markets, for the Liberty of a Stall or *Standing*, by the *Stallangers* or the *Creamers*, i.e. those Traders who exposed their Goods to Sale on the said Stalls. In *Scotland* they call it *Stallenge*; the *Romans* called it *Siliquaticum* from *Siliqua*, which was their first and least Weight, a kind of Caract of 4 Grains.

STAMPING-MILL, called also a *Knocking-Mill*, is a Mill used in the Tin-works to bruise the Ore small. See the Description of it under *Tin*.

STANDARD for Gold-Coin in *England*, is 22 Caracts of fine Gold, and 2 Caracts of Copper; and the *French* and *Spanish* Gold are nearly of the same Standard. See *Caract*.

For *Silver-Coin*, 11 Ounces and 2 Penny Weight of fine Silver, and 18 Penny Weight of Copper, being melted together is the true Standard, and such Silver is called *Sterling*. When either Gold or Silver is finer than Standard, they call it *better*; if coarser, *worse*; and they reckon the excess or defect by Caracts, and Grains of a Caract in Gold, and by Penny-weights in Silver. And it is thus discovered: They take a small Quantity and assay it; that is, weigh it very exactly, and then melt it in a Crucible with a strong Fire, so long

E e e e e

till

till the Copper, or other *Allay* mixed with it, be burnt away. When cold, they weigh it again accurately; and if it hath lost nothing of the first Weight, they call it *fine Gold*; if it hath lost $\frac{1}{24}$ part of its Weight, they call it Gold of 24 Caracts, or one Caract better than Standard; if it have lost $\frac{2}{24}$ parts, then 'tis 22 Caracts fine, or Standard; if it hath lost $\frac{3}{24}$ parts, 'tis called 21 Caracts fine, or 1 Caract worse than Standard, &c. And so they assay Silver, only they compute its loss by Penny-weights, &c.

STANNARIES; are the Mines and Works where (*Stannum*) Tin is dug and smelted; as in *Cornwall*, and other Places. There are several Laws about, and Liberties granted to the *Stannary Courts* in several Acts of Parliament; as in the time of *Edw. 1.* and afterwards, as abridg'd by *Edw. 3.* and in 17 *Car. 1. c. 15.*

STAPLE, signifies this or that Town, City or Place where the Merchants of *England* were, by Act of Parliament, to carry their Wool, Cloth, Lead and Tin, &c. and such like *Staple* or *Standing* Commodities of this Land, in order to their being sold by the Great. These Places you will find in several Statutes, appointed and altered by the Kings of *England*, from the second Year of *Edw. 3.* to the fifth of *Edw. 6.* and what Officers these *Staples* had belonging to them, you may see in *Anno 27 E. 3. Stat. 3. c. 21.* The Staple Commodities of this Land, are Wool, Leather, Woolfells, Lead, Tin, Butter, Cheese and Cloth; as appears by 14 *Rich. 2. c. 1.* tho' some will allow only the first five.

STAR. All Deeds, Obligations, Contracts, Releases, &c. of the *Jews*, were antiently called *Stars*, from the *Hebrew Sheetar*, a Deed or Contract. These were sometimes written in *Hebrew* and *Latin*, but usually in *Hebrew* alone.

STAR-CHAMBER; was a Chamber at *Westminster*, formerly so called, from its Roof being painted with Stars. *Henry* the Seventh and Eighth, ordered by several Statutes, that the Chancellor, assisted by others there named, (*vid. 3 H. 7. c. 1.* and 21 *H. 8. c. 2.*) should have Power to punish *Routs, Riots, Forgeries, Embraceries, Perjuries*, and such other Misdemeanors, as were not sufficiently provided for by the Common-Law; and for which the inferior Judges are not so proper to give Correction. But this Court, by 17 *Car. 1. c. 10.* was entirely dissolved and determined, and so continues to this day.

STATIONARY; how to an Eye placed at the Earth, a Planet appears to stand still or be Stationary, see under the word *Direct* in this Vol. 2.

STELLIONATE, in the Civil Law, is all kind of Cozenage, and Knaveish Practice in Bargaining; and all sorts of Frauds that have no peculiar Names in the Law. And 'tis so called from *Stellio*, a Lizard with great variety of Spots, and very prejudicial to Mankind.

STERLING Money; this Word seems to come, as *Mr. Somner* hath derived it, from the *Saxon* Word *Steore*, that is, a Rule or Standard; and therefore it signifies that Coin or Money, which for Metal and Value, was to be a common Standard of all Current Money. And this is the more probable, because such Money, at the coming in of the *Normans*, was called *Sterilensis*. As *Orderic Vital. sub Anno 1082. Porrigam quindecim Sterilensium*, *Dr. Kennet's Glossary.* *Esterling* in *Stow* is used for a Penny-weight, signifying a Penny of fine

Silver, such as we now call *Standard*. But the word *Sterling*, as being a Piece of Money, generally, if not always, signifies a Penny. And as for a good while together there was no other Coin but Pennys; and that *Denarius* signifies, in many Authors, the same as *Nummus*; all good *Standard* Silver came to be called *Sterling Silver*, and good Money, *Sterling Money*, as it is to this day.

STILES; the upright Pieces which go from the bottom to the top in any Wainscot, are by the Workmen called *Stiles*.

STILOBATUM, is, in Architecture, the Body of the Pedestal of any Column.

STIPULATION, in the Civil Law, is a Contract made by Words, and not in Writing, by asking a Question, and receiving presently a proper Answer: And in this Contract the Obligation is only upon one side, i. e. on the side of the Promiser, who was called *Reus Debendi*, or *Promittendi*; as the *Stipulator*, or *Creditor*, to whom the Promise is made, was called *Reus Credendi*, or *Stipulandi*. This was the old Sense, but now with us the Word *Stipulation* is commonly used for the Act of the Person obliged; and some say that the Word *Stipulator* is common both to Debtor and Creditor.

STOMACH, see *Ventriculus*. *Monfieur Chirac*, Professor of Medicine at *Montpellier*, hath by an easy Experiment shewn, that the Force of the Stomach alone (in Vomiting) without taking into consideration the Muscles of the *Diaphragm* and *Abdomen* (whose force together is more than that of 248000 Pound weight) is equal to that of 12000 Pound weight.

STRAIKS, in Gunnery, are Plates of Iron of the length and breadth of one of the six *Felloes*, which serve for the Round of the Wheel of a Gun-carriage, and fixed on the Circumference of the Wheel with strong Nails, which are called the *Straik-nails*; these *Straiks* cover the Joints of the *Felloes*, and defend the Wheel.

STRIÆ, are the Lifts or Rays which run between the *Flutes*, *Channels* or *Striges*, in Fluted Pillars. These are 20 in the Dorick, and 24 in the Ionick Order.

STRIGES, in Architecture, are the hollow Channels in the Shaft of a Column, called by our Workmen *Flutings* and *Grooves*. They more properly belong to the Ionick Order, tho' they are found sometimes in the Dorick, and often in the Corinthian and Composite. They are generally at right Angles with the Plane of the Base, but are sometimes found winding about the Pillar. Sometimes the *Striges* are filled up with a swelling a third part from the Base, lying in the hollow like a Stick shot of a round form: These *Mr. Evelyn* thinks we should call *Staved* or *Cabled Columns*.

STUCCO: Painting in *Stucco* was revived from the Antients by *Giovanni d'Udine*, a Scholar of *Raphael's*; he found the true Matter which the Antients made use of, which was a Composition of Lime and Marble powder'd very fine.

STRUT, is a Term used by some Builders for that *Brace*, which is framed into the *King-Piece* and the *principal Rafters*.

STUDDING-SAILS, in a Ship, are Bolts of Canvas, or any Cloth that will hold Wind, extended in a fair Gale of Wind along the side of the Main-sail, and boomed out with a Boom; they are sometimes also used to the Clew of the Main-sail, Fore-sail and Sprit-sail, when the Ship goes either before the Wind, or Quartering.

STYLO-

STYLO-Chondrohyoidæus, vel *Stylo-Hyoides alter*, is a Muscle of the *Os Hyoides*, which arises fleshy and tendinous from the *Styloid Process*, near the Origin of the *Stylo Pharyngæus*, and runs under the *Cerato-Glossus*. It is inserted into the Cartilaginous Appendix of the *Os Hyoides*; and its Use is to assist the *Stylo-Hyoidæus*, in putting the *Os Hyoides* upwards and laterally. Dr. Douglass.

STYLO-Hyoidæus, is a Muscle of the *Os Hyoides*, arising by a round Tendon from near the middle of the *Processus Styloformis*, and is inserted tendinous into the Basis of the *Os Hyoides*, near its *Cornu*; to which also it often adheres fleshy. Its Use is to put the Bone of the Tongue on one side, and a little upwards, when both act in Concert.

SUBNORMAL, is a Line, determining in any Curve, the Intersection of the Perpendicular to the Tangent in the Point of Contact, with the Axis. And this Subnormal, in the common or *Apollonian* Parabola, is a determinate invariable Quantity; for 'tis always equal to half the *Parameter* of the Axis.

SUBROGATION, in the Civil Law, is putting another Person into the Place and Right of him, that, in any Case, is the proper *Creditor*. This is also called *Cession*.

SUBSTITUTION, is, in Algebra or Fluxions, the putting in the room of any Quantity in an Equation, some other Quantity which is really equal to it, but express'd after another manner; and this is done, in order to find, at least, such a proper Expression in the Equation, as shall solve the Problem, or Question proposed. And in the Knack of doing this readily, consists the chiefest Business of the Operations in Fluxions.

SUB-TANGENT, in any Curve, is the Line which determines the Intersection of the Tangent in the Axis. And in any Equation if the value of the Sub-tangent come out *Positive*, 'tis a sign that the Point of Intersection of the Tangent and Axis, falls on that side of the Ordinate where the Vertex of the Curve lies; as in the *Parabola* and *Paraboloids*. But if it come out *Negative*, the Point of Intersection will fall on the contrary side of the Ordinate, in respect to the Vertex or beginning of the *Abscissa*; as in the *Hyperbola*, and *Hyperboliform* Figures.

And universally, in all *Paraboliform* and *Hyperboliform* Figures, the *Sub-tangent* is equal to the *Exponent of the Power of the Ordinate multiplied into the Abscissa*.

Thus, in the common Parabola, whose Property is $px = yy$, the Sub-tangent is in length equal to x the *Abscissa* multiplied by 2, the Exponent of the Power of yy , the Square of the Ordinate; that is, 'tis equal to twice the *Abscissa*: and by the former Rule for *Paraboliform* Figures, it must be taken above the Ordinate in the Axis produced. Thus also in one of the cubical *Paraboloids*, where $pxx = yyy$, the length of the Sub-tangent will be $\frac{2}{3}$ of the *Abscissa*.

Thus, in the Figure annexed, you will see that the

SUB-TANGENT, in any Curve, is a Line which determines the Intersection of the Tangent

in the Axis. Thus, if TM be a Tangent in the Point M , and PM an Ordinate to the Axis, the TP is the Sub-tangent, because it determines the Point T , where the Tangent cuts the Axis produced beyond the Vertex of the Curve V . And the Line PC , which determines the Intersection of the Perpendicular MC (to the Tangent in the Point of Contact M) in the Axis VD , is called the *Sub-normal*.

SUBURBICARIE *Regiones*, called also *Suburbane*, *Urbicarie vicine*; were such Regions or Cities of the Roman Empire, as lay within an hundred Miles of *Rome*, and were under the Jurisdiction of the Prefect of that City: Wherefore they are sometimes called *Regiones Solite*, because in these the Governour of *Rome* was wont to exercise his solemn Jurisdiction. This also was the antient Extent of the Power and Charge of the Bishops of *Rome*, before the Papal Usurpation.

SUCTION; there are many Effects vulgarly attributed to *Suction*, which, in reality, have very different Causes. As when any one sucks Water, or any other Liquor up thro' a Pipe, 'tis commonly thought, that by that Action the Person draws the Air up into his Mouth, and that the Water, which is contiguous to it, follows it by a kind of *Attraction*, as if the Air and Water hung together: And others fancy that the Air moves into the Mouth of the Sucker, and the Water moves up after the Air, to prevent a *Vacuum*, which they say, *Nature abhors*. Whereas the true Cause of this Phenomenon, is only that the Air and Atmosphere presses with its whole weight, uniformly on the Surface of the Liquor in the Vessel, and consequently prevents any one part of the Water to rise higher than the other there: And if a Pipe be put in of any tolerable large Bore, and be open at both ends, the Water will rise within the Pipe to the same height as without, and indeed a little higher, because the Pressure of the Air within the Pipe is a little taken off by bearing against the sides of the Pipe. Now when any one applies his Mouth to the upper end of the Pipe and sucks, his Lips so strongly enclose the Pipe, that no Air can get between them and it; and by the voluntary Motion of the Spirits in the Muscles, the Cavity of his *Thorax*, or Breast, is opened and enlarged; by which means the Air included there, hath now a much larger Space to dilate itself in, and consequently cannot press so strongly against the upper end of the Pipe, as it did before the Cavity of the *Thorax* was so enlarged, and when the Weight of the whole Atmosphere kept its Spring bent. And that Weight or Pressure being now taken off by the Lips of the Man that sucks, the Equilibrium is destroyed, the Air gravitates on the Surface of the Water, but cannot do so on the upper Orifice of the Pipe, because the Junction of the Lips takes it off; and the Spring of the Air included in the *Thorax*, being weakened

by the Dilatation of its Cavity, it cannot press so hard against the upper Orifice of the Pipe, as the Water will do against the lower, and consequently the Water must be forced up into the Pipe. 'Tis much the same thing in the Suction of a common Pump: The Sucker being tight, takes off entirely the Pressure of the Atmosphere on the Surface of the Water within the Barrel of the Pump; and consequently the Atmosphere by its weight must force the Water up to make the *Æquilibrium*. See *Hydrostaticks*.

SUFFRAGAN; is a titular Bishop appointed to aid and assist the Bishop of the Diocese, and by 36 H. 8. c. 14. every Bishop is empowered to elect two honest and discreet Spiritual Pastors, which shall be called *Bishops Suffragans*.

SULPHUR: Sir *Is. Newton*, on very good grounds, concludes, that the common Sulphur is composed of volatile and fixed Parts, strictly adhering to one another by mutual *Attraction*, so that they will both sublime together; for by dissolving Flowers of Sulphur in Oil of Turpentine, and then distilling the Dissolution, 'tis found, that Sulphur consists of a thick, volatile and inflammable Oil, or of a *fat Bitumen*, an *acid Salt*, and a very fixed Earth, with a little Metal. The three first of which are found there in nearly an equal Quantity; but there is only a very small Proportion of the last. The *acid Salt* being dissolved in Water, is the same with the *Oleum Sulphuris per Campanam*.

SUMMATORY Calculus, according to some, is the same with the *Calculus Differentialis* of *Leibnitz*: but more properly *Summatory Arithmetick*, is the Art of finding the flowing Quantity, from the Fluxion; and so it is the same with the *Calculus Integralis*. See *Hayes's Fluxions*.

SUMMONER, or *Summonitor*, an Apparitor, who is to cite in Offenders, to appear at a certain Time and Place, to answer to the Charge exhibited against them.

SUMMUM Bonum, or the chiefest Good of human Nature, is that, which, by its enjoyment, renders truly and compleatly happy. The Schools distinguish this chief Good of Man, into that which is simply and adequately so, and beyond which there can be no other; and into a lesser and subordinate one, which is in some measure attainable in this imperfect State; and this last they call *Felicitas Viatorum*, and the former *Felicitas Comprehensivum*.

SUN: Dr. *Hooke*, in *Opera Post. p.* 89. from all his, and others Observations, thinks it reasonable to conclude, That the Superficies of the Sun is covered with an Air, or Atmosphere, or some other Fluid Body: And that this Atmosphere, tho' possibly 80 times thicker and higher than that about our Earth; yet in comparison of the vast Diameter of the Solar Body, becomes wholly invisible to us, tho' assisted by the best Telescopes: He supposes it also to look as bright as the Body of the Sun it self, and that it is really the Shell of this Atmosphere, and not the very Body of the Sun that shines. And from hence he saith, that all the Phenomena of the *Macule* and *Facule* of the Sun will be solved; and that they are only Clouds or Smoaks in this Atmosphere.

The Sun it self, within this Atmosphere, he concludes to be a Solid and Opacous Body, (*p.* 91.) from these Reasons. (1.) The Constancy of its Rotation. (2.) The Fixedness of its Axis. (3.) The Power of its Gravitation or Attraction to-

wards its Centre. These prove its Solidity; and its Opacity, he concludes, from the disappearing of the Solar Spots in the Limb, and their not returning backwards, as they would seem to do if the Body were transparent as the Atmosphere is, or the Flame of a Candle, or the Radiation or hazy Light about the *Nucleus* of a Comet, thro' which, as well as thro' its Beard, the small fixed Stars may be seen.

He thinks the superficial Parts of the Sun, to consist of Bodies similar to our Nitre and Sulphur, and that these are set on fire; and consequently, that the Physical Cause of its Light, is the actual burning or fire of its superficial Parts. Nor can there be any Objection of Moment brought against this Hypothesis, from the danger of the Sun's Fire being burnt quite out in so many thousand Years as it hath been in being; for, (*saith he*) supposing it to have grown some Minutes less since it began to give Light, none can contradict it by any Observations we have on Record: For, supposing we had Observations Astronomical of 4000 Years standing, as we have none above 2000 of that kind; and allowing that the Sun's Diameter had been then observed to be as many Minutes as it is now; yet could it not be thence concluded, that the Sun did not lose a Mile in Diameter every Year, and consequently be now 4000 Miles less in Diameter than it was then. For since his Diameter is near 87 times greater than that of the Earth; which latter he supposes 8000 Miles, then the Sun's must be 696000 Miles. Now 4000 is but a 174th part of that Diameter, and consequently would have diminished it but $\frac{1}{174}$ of a Minute; which is a much less Quantity than the Antients pretended to observe to.

But, supposing they could have observed even to Seconds, yet that could not have contradicted it; because 'tis possible the Sun may have approached as much nearer us as that Diminution amounts to; and for which, *he saith*, he could shew a Reason.

Sir *Is. Newton* also, in his Opticks, gives good Reasons, to suppose the Sun and fixed Stars to be great Earths, vehemently hot; whose Heat is conserved by the Greatness of their Bodies, and the mutual Action and Re-action between them and the Light which they emit; and whose Parts are kept from fuming away, not only by their *Fixity*, but also by the vast Weight and Density of the Atmospheres incumbent on them, and every way strongly compressing them, and condensing the Vapours and Exhalations which arise from them. The Light seems to be emitted from the Sun and fixed Stars (which probably are Suns to other Systems) much after the manner as Iron, when heated to such a degree as to be just going into Fusion by the vibrating Motion of its Parts, emits with Force and Violence, copious Streams of Liquid Fire all around: Great Bodies must preserve their Heat longest; and that, perhaps, in the Proportion of their Diameters.

Sir *Is. Newton* hath made it probable, that the great Comet in the Year 1680, in its *Perihelion*, went so near the Sun, as that it acquired a Heat which would not entirely go off in 50000 Years. Whence we may guess, that if the Sun and fixed Stars be only Collections of dense and solid Matter, like the Planets, but heated to a very intense degree, they may be many Millions of Years without losing any considerable part of their Heat.

Accord

According to *Cassini*, the Sun's distance from the Earth is 172,800,000 Miles *English*.

The Phenomena of the Sun's apparent Motion round the Earth, on which the Theory of this vast Body is established, are by Astronomers observed to be these:

1. *That the Centre of the Sun's Body moves annually in the same Plane of the Ecliptick, and never deviates from the Line so called.*

Which apparent Motion of the Sun doth in reality belong to the Earth; which being at first put into such a Motion, and with such a Direction by the Great Creator, will always continue to move after the same manner; since here none of those *disturbing Forces* have any Place, which render the Motion of the Moon so irregular. Of which in its proper Place.

2. But the apparent Motion of the Sun in the *Ecliptick* is very unequal; for a little after the *Vernal*, and a little before the *Autumnal Equinox*, he is in the Mean between the Extremes of his Motion; but his Motion is most swift a little after the *Winter Solstice*, as 'tis always most slow a little after the *Summer* one every Year.

All which arises from the Earth's revolving not in a Circle, but an Ellipsis, in one of whose *Foci* or *Umbelici* the Sun is placed. And with this Law also, that the Areas described by Lines drawn from the Earth to the Sun, shall always be equal, in equal and proportional times.

In the Figure annexed, let the Sun be in the Point I, and let the Curve FDEK be an Ellipsis, or the annual Orbit of the Earth's Centre revolving round the Sun, and represented by B.

Let the Point H be the other *Focus*, and C the Centre of the Ellipsis; K D its great Axis, or the *Linea Apfidum*; and D the Aphelion; and K the Perihelion of the Earth. F E is the lesser Axis, I C, or C H is the *Eccentricity*, or the distance between the Centre and the *Foci*. Let M N, or O P, be the *Latus Rectum* of the Ellipsis, and let the right Line A B bisect the Angle H B I: Now since by Lines drawn from its Centre to the Sun, the Earth describes always Areas proportional to the Times of its Motion in the Orbit, it will describe equal Areas in equal Times. But seeing the Line B I grows *longer* towards and at the Aphelion, and *shorter* at and about the Perihelion, the Earth must move slower in the former, and swifter in the latter Case. And indeed the Velocity of the Earth's Course in her Orbit, will always be in a reciprocal Ratio of her distance from the Sun; so that if the distance between D and I

be double to that between K and I, she will move twice as fast in the Perihelion as in the Aphelion.

3. And from this Figure 'twill be apparent, that the Sun's Diameter will appear *greater* when the Earth is in her Perihelion, which is a little after the Winter Solstice, and *less* when she is in her Aphelion, which is a little after the Summer Solstice, as is found by Observation. And this difference in his apparent Diameter, shews also that the Earth moves not in a Circle, but an Ellipsis round the Sun.

4. Those Places in the Ecliptick, in which these greatest Differences of the apparent Motions and Diameters of the Sun happen, in process of time are *changeable*, and do move forward (or *in consequentia*) equally. For tho' the *Aphelia* and *Nodes* of the Planets are really at rest and immoveable; yet because of the annual Cession of the Equinoxes *in antecedentia*, they appear to be moved forward just the same Quantity.

5. If you suppose the Ecliptick to be bisected in the Equinoctial Points, the Sun appears to stay about 8 Days longer in the *Northern* than in the *Southern* half of that Circle.

For the Elliptick Orbit of the Earth will be cut unequally by a Line passing thro' the 2 Equinoctial Points: The Perihelion not being far from the Winter Solstitial Point, the Equinoctial Points will not be coincident with the longer Axis, but almost with the *Latus Rectum*; for in the Figure above the Line of the Equinoxes, QR is not much different from NM the *Latus Rectum*.

But this Inequality of the Sun's apparent Motion, is not now the same as it was in *Ptolemy's* Time, and is continually changing, and in process of Time the Equinoctial Points will come to be in K and D; and then there will be no difference in the time of the Sun's stay in either Segment of the Ecliptick: But after this it will encrease again, and then again decrease as now, if the Earth's annual Motion be continued.

6. And yet the Spaces or Times of the Earth's entire Revolution in her Orbit, are all equal one to another, and are what we call *Years*, containing each 365 Days, 5 Hours, and 49 Minutes nearly.

7. The Angle of the Inclination of the Planes of the Ecliptick and Equator, or the Sun's greatest Declination hath been always invariably the same, viz. 23, 30.

8. The Sun's Diurnal Parallax is almost insensible, and his Mensrual Parallax is scarce 15 Minutes of a Degree.

And this is of the greatest use in Astronomy throughly to understand; nay, of such an absolute necessity, that, without its Knowledge, neither the Distances nor Magnitudes of the Sun or Planets, can be obtained to any tolerable Certainty.

There have been three Ways made use of by Astronomers, to find the Sun's Horizontal Parallax.

1. That of the famous *Hipparchus*, which proceeds on the Theorem which our Mr. *Horrox* hath accurately described and explained, and which is exactly and geometrically certain, and would do if the Parallax of the Sun were any considerable quantity: but all that we can accurately conclude from it, is, that it is not so; and consequently that the Distance of the Sun is vastly great. See

Mr.

Mr. Whiston's *Praelect. Astron.* p. 61. where there is a short account of this Method.

2. The second way of finding the Sun's Horizontal Parallax, is that which 'tis said *Aristarchus Samius* first used, and hath been followed by *Kepler*, *Vendeline*, and more especially by *Ricciolus*. This supposes that you have the exact Moment of the Time of the *Half-Moon*, or the *Dichotomization*, or *Bisection* of her Disk, by the Light and Shadow; and some other things, as difficult to obtain as what you seek for: And therefore I shall say no more of it, than only to refer you to Mr. Whiston's Book, p. 66. where you have a good account of this Method; because I must give you an account of

3. A third way of finding this Horizontal Parallax of the Sun; which tho' it be not so direct, is yet more accurate and exact than either of the former.

And this depends on a Method of determining first the Parallax of *Venus* or *Mars*.

The annual Parallax of the fixed Stars, being by late Observation established, the *Copernican* System is so too, and the *Proportions* of the Distances of all the Planets from the Sun are given. And since 'tis clear in that System, that not only *Mars* and *Venus*, but even *Mercury*, do sometimes come nearer to the Earth than the Sun ever doth, and consequently must have all of them a greater Parallax than the Sun at such times; from hence it is manifest, that if we can get the Parallax of *Mars*, when in opposition to the Sun, or that of *Venus* and *Mercury*, when in conjunction with him; the Sun's Parallax will be discovered. Indeed, as to *Mercury*, he is usually so hid in the Sun, and his Motion is yet so indetermin'd, that nothing certain can be established about his Parallax. And the Conjunctions of *Venus* and the Sun are so rare (and that time only is proper for it) that its Parallax is as yet not accurately enough determined.

There remains then *Mars* only, who being sometimes distant from the Earth, but half as far as the Sun; and being at such times, when he is in opposition to the Sun, very conspicuous and fit for Observation, is much the most fit Planet for our present Purpose. *Cassini* seems to have been the first that thought of, and practis'd this Way; but our Mr. *Townley*'s Invention of the *Micrometer* hath been very serviceable to him in it, as well as of the greatest use in other Astronomical Observations. Before we describe the Method of *Cassini* for finding the Sun's Parallax, I must remind you, that the Parallax of *Mars*, for instance, is only the difference between the apparent Place of that Planet, with respect to the Earth's Centre, and to a Point on its Surface, when the Planet is exactly in the Observer's Horizon; that is, you must suppose two Observers, one with his Eye at the Earth's Centre, and the other Eye at the Earth's Horizon, at the other Extremity of a Semidiameter of the Earth, whose Position is normal to that Line which connects the Earth's Centre, and that of *Mars*, the latter being accurately in the Horizon of that Observer, who is supposed at the Surface. And thus, for instance, the Moon's Parallax may be obtained by the Observations of two Astronomers at the same Minute of Time, if she be *Vertical* to one of them, and *Horizontal* to the other; because the Moon's Place to the Vertical Observer will be the same as if he

had seen her from the Centre of the Earth. And this Method, with good Instruments, will do for any other Planet or fixed Star. But the Method of *Cassini* for finding the Parallax of *Mars* (v. gr.) hath this great Advantage in it, That it may be performed by the Observation of but one Astronomer furnished with a good Telescope and Micrometer; since the Part of the other may be supplied by means of the fixed Stars: Of which now take *Blanchinus*'s Account, in the *Leipsick Acts* of October, 1685, with some few Explications and Corollaries. Let the Circle *A F B C* represent the Earth's Equator, *H K M* the Diurnal Ark of *Mars*, when he moves in the Equator; *L V R*, as the Equinoctial in the Heavens, extended infinitely in the Region of the fixed Stars. Let *Mars* be in *A*, in the Plane of the Equator; then his Diurnal Revolution will be truly represented by the Motion of the Line *D H*, round *D* as a Centre, in the Plane of the Equinoctial, so as to form the Circle *H M K*,

which the Planet is supposed to describe in 24 Hours round the Earth, without any regard now to any other Motion. Then if you suppose this Circle to be divided into 24 equal Parts, thro' each of which a Plane shall pass at right Angles to the Equator, and also thro' the Centre *D*; these Planes will be the Planes of the Hour Circles, and will also be *Meridians*, with respect to Places on the Earth. Let the right Line *L H A V* be one of these Planes, or the Meridian of the Place *A* in the Earth's Equator, where an Observer sees the Planet *Mars*, and the fixed Star *L* in one and the same right Line. Now if the Star and the Planet had only the same Diurnal Motion, they would be both together again at the same Place, or in the same right Line, at the end of 24 Hours;

Hours; and if the Diurnal Motion be supposed equable, in six Hours the Planet and Star would be in the right Line FDMR, at right Angles with the Meridian LHD, or in the Astronomical Hour-Circle of 6. Wherefore an Eye placed at the Earth's Centre, would always see the Planet and the Star in one and the same right Line, or in conjunction together, whether in the Meridian, or any other Hour-Circle. But it can't be so to an Eye at the Earth's Surface, as suppose at A; for tho' under his proper Meridian, both the fixed Star and the Planet will appear to him in the same right Line AHL, yet in any other Meridian, as suppose that of DR, (which, in respect of the Place at A, may be considered as the Hour-Circle of 6) *Mars* will appear to him in the Plane AM, but the fixed Star in the Plane AR. To him therefore *Mars* will either appear *Retrograde*, or to move in *Antecedentia*, or the Star to move in *Consequentia*; altho' in reality both are supposed to have the same Diurnal Motion. And tho' he knows that they are both at the 6 Astronomical Hour-Circle, yet *Mars* will appear to be past it, before the 6 Hours are expired: Because the *sensible* 6th Hour, with regard to the Place A, is not the Plane FDR, but APN. And the difference of Time intervening between *Mars* coming to the *sensible* Hour-Circle of 6, and the *rational* or *real* one, which may be called the Planet's *Horary Parallax*, is measured by the Ark of the Equator PM, which *Mars* by his Motion describes. And the Quantity of this Ark is equal to that of the Angle PAM, or its Alternate AMD; that is, equal to the Angle of the Earth's Semi-Diameter, when seen in *Mars*, and this is that *Parallax* of *Mars* which we have been seeking. Wherefore if the Ark PM be just one Degree, *Mars* will appear to have passed the Plane AP, 4 Minutes of an Hour before the 6 Hours would be expired in his passing by the Meridian.

The further *Mars* moves from the Earth, the lesser will be the Angle of its apparent Semi-diameter in *Mars*, and consequently the lesser will be the above-mention'd difference of Time between the Transit of the Planet by the *sensible* and *rational* Hour-Circle of 6.

And if his Elongation from the Earth could come to be so great as that of the fixed Stars, the Angle ARD, or its Equal NAR would then come to be so very small, as to be scarce sensible; so that when the Star is in the Plane DR, it would appear in that of AN.

And by this means a fixed Star, or rather a good Pendulum Clock, made to move with the Star's Hour, will supply the Want of another *Observer*, in the Place represented by C; for all that an Astronomer there could do, is only to assure us, that he had seen *Mars* in the same Plane of his Meridian, or of our 6th Hour Circle, when he appears to us in another Position. But this our Clock can inform us of, by shewing us that Time after *Mars* hath transited our Meridian. For since 'tis plain that the Star L, in 6 Hours after it hath passed our Meridian, will be in the Plane of the Hour Circle DR, we shall know the Star is actually in that Plane, by our Clock's shewing us, that the Time is elapsed. And because, with regard to the fixed Stars (whose distance is so immense) the Plane of the *sensible* Hour Circle of 6 is coincident with that of the *real* one; if, when 6 Hours are past from the Star's transiting our Meridian, a Plane

be imagined to pass thro' our Eye, and the Star parallel to the Earth's Axis; that Plane must be that of the *sensible* Hour-Circle of 6, and in which the Star must necessarily be. But *Mars* will appear to differ from this, by so many Minutes of his Parallel, as are the Number of his Parallax. Counting therefore by the Pendulum, the Seconds of Time, which intervene between the Transit of *Mars*, and of the fixed Star, and allowing four such Seconds for every Minute of a Degree, you will have the Quantity of the Angle MAN, or AMD, which is the Parallax of the Plane sought.

But how this difference of Time is observed, I must next shew you. In the common Focus of the *Object* and *Eye-glasses* of the Telescope you observe with, there must be placed at least 4 fine Threads,

or Hairs, intersecting one another at right Angles; and the Telescope furnished with its *Micrometer*, must be so moved up and down, till that fixed Star which is then nearest the Planet *Mars* shall appear to pass along one of the Hairs, as the Image of the Planet moves in the Telescope, as it must do, parallel to the Equator; for then the Hairs will, in that Position, be also parallel to the Equator; and the other Hairs which cross them at right Angles, will answer to the Circles of right Ascension. As in the Figure annexed, where the two parallel Threads AB and CD, have 2 others, AC and BD, placed at right Angles to them, just as the Equator and all its Parallels do intersect the *Meridians*, or Circles of right Ascension always at right Angles; the Observer then must wait a while with his Telescope and Micrometer adjusted, till the Planet and fixed Star, being both carried together by the same apparent diurnal Motion, come to one and the same Meridian: and then the exact Time of the Appearance must be noted. After 6 Astronomical Hours, the fixed Star will be come into the Plane of the 6th Hour Circle, but *Mars* will be got thither a little before the Star. About the Hour of 6 therefore the Telescope must be used again, and the Hairs retaining their former Position, must be brought into the Plane of the Hour Circle of 6, and there fixed. Then the exact Moment of Time must be noted when *Mars* appears by his diurnal Motion to move along by the transverse Hair AC; and the exact Difference in Time also between the Planets and the Star's coming thither afterwards, must be nicely counted, as being the Time of the *Horary Parallax* of *Mars*: which being turned into Parts of a Degree, as above shewed, is the *Hori-*

Horizontal Parallax of the Planet required.

By this Method, our *Flamsteed*, and *Cassini* at *Paris*, found the Parallax of *Mars* to be about 25 Seconds, and certainly not more, but probably a little less.

Having thus gain'd the Parallax of *Mars*, let us next endeavour to obtain by it the thing at first proposed, that is, the Sun's Horizontal Parallax; which will be easily had from that of the Planet *Mars*. For since at this time of Observation of the *Martial* Parallax, i. e. when *Mars* is in opposition to the Sun, the Sun must be more than twice as far distant from the Earth as the Planet *Mars* is, the Sun's Parallax can't be quite half so much as that of *Mars*, and therefore may be accounted not to be above 10 or 12 Seconds at the most. And this agrees with the Observations of *Vendeline*, and those made by *Cassini* about the Parallax of *Venus* also.

Supposing then the Sun's Horizontal Parallax to be about 10 Seconds, his *Distance from the Earth* will be thus found: As the right Sine of 10 Seconds is to Radius, so is the Earth's Semi-diameter in *Englisch* Statute Miles, to the Sun's Distance in the same Miles; and this Way the Sun's Distance is found to be about 81,000,000 of our Miles.

The Sun's true Diameter may also by this means be had; for as Radius is to the Sine of the Sun's apparent Diameter, viz. 31 Minutes and a half, so is the Sun's Distance above found to his real or true Diameter, or about 800,000 Miles *Englisch*.

Indeed the true Magnitude of the Sun's Body cannot be determined from hence, because that depends also on his Density, which cannot be found this way.

From this usual way of finding the Sun's Horizontal Parallax, the Astronomers draw these and such like Consequences:

1. That it is easier to determine the annual Parallax of the fixed Stars, than the Sun's diurnal one. For since the annual Parallax of the fixed Stars is at least quadruple of the Sun's diurnal one, as the Parallax of *Mars*, by whose Knowledge the solar one was found, is almost double of it; it must be better subject to Astronomical Observation, and be capable of a Determination twice as accurate.

2. In Astronomical Calculations by the Tables, this Parallax of the Sun may generally and safely be neglected. For since it doth not arise to above a sixth part of a Minute of Time, it will be scarcely considerable; our present Astronomical Tables not being capable of bringing us to a greater Accuracy and Exactness.

3. The Earth's Distance from the Sun being given, the Distances of the other Planets, both from the Sun and the Earth, are also given; and in the following Table you have their Distances from the Sun, their Diameters, and the Times of their Periodical Revolution.

<i>Mercury</i>	} is distant from the Sun, of <i>Englisch</i> Miles	32,000,000
<i>Venus</i>		59,000,000
The Earth		81,000,000
<i>Mars</i>		123,000,000
<i>Jupiter</i>		424,000,000
<i>Saturn</i>		777,000,000

The Diameter in <i>Englisch</i> Miles of	<i>Mercury</i>	4240
	<i>Venus</i>	7906
	<i>Earth</i>	7935
	<i>Mars</i>	4444
	<i>Jupiter</i>	81155
	<i>Saturn</i>	67870
	<i>Sun</i>	763460

The Time of the Periodick Revolution of	<i>Mercury</i>	} is	Days.	Hours.
	<i>Venus</i>		87	23
	<i>Earth</i>		224	17
	<i>Mars</i>		365	6
	<i>Jupiter</i>		686	23
	<i>Saturn</i>		4332	12
			10759	7

SUPERIOR Planets, are *Mars*, *Jupiter*, and *Saturn*: They are so called, because they move in Orbits round the Sun, which are larger than that of our Earth, and so are above us with regard to the Sun, and never can come between the Earth and him. The Theory of the Motions of these superior Planets, to an Eye placed on the Earth, are these:

1. That, besides their apparent Motion from East to West, which the diurnal Rotation of the Earth occasions, they appear usually to move also slowly from West to East, and to make entire Revolutions this way; as in reality they do in their Orbits round the Sun: But *Mars* moves faster than *Jupiter*, and *Jupiter* than *Saturn*, in proportion to their several Distances from the Sun.

2. But sometimes they will also to an Eye at our Earth, appear to move the contrary way from East to West, which was a great difficulty in the old Astronomy, but may easily be solved by the consideration of the following Diagram; in which let A be the Sun, M G B the Orbit of the Earth, in which it moves annually from M by G, towards B,

B from *West* to *East*; let the Circle QRS be the Orbit of any Superior Planet moving the same way as the Earth. Let the Circle TVX represent the Sphere of the fixed Stars supposed at an immense distance, and with respect to which, the Retrogradation and Stations, &c. of the Planet are accounted. For tho' to an Eye placed in the Sun at A, the Planets would appear to move always uniformly and equally forward in their Orbs; as in reality they do; yet to an Eye placed on the Surface of our Earth, the Phenomena will be very different, and the Planets will appear sometimes to be *Retrograde* and *Stationary* in their Motions, as well as at other times *Direct*. For, suppose the Earth at M, and *Jupiter* in C, while *Jupiter* moves from C to R, and describes the Ark CR, a part of its Orbit round the Sun in A: The Earth, because its Angular Motion is much more swift, will describe the Ark MG; so also while *Jupiter* describes the Ark RE, the Earth will move from G to B. Now while the Earth is describing the Ark MK, *Jupiter* will appear to be moving a little forward; but whilst the Earth moves thro' the Ark KG, *Jupiter*, tho' in reality still progressive or direct, will appear to be Retrograde, and to move backward from F to O. Nor can it be otherwise, while the Earth moves from G to D, and while *Jupiter* describes the Ark RE. But when the Earth comes towards B, then the Planet will appear a little *direct* again, and his apparent Progressive Motion will for a while continually encrease. And when the Earth is near K or D, the Planet will appear to be Stationary in F or H. So that 'tis obvious to see that the apparent Motion of the Planets will be very irregular and unequal, sometimes swifter, and sometimes slower, according to their Position, with respect to the Earth.

3. The Progressive Motion of every Superior Planet will be swiftest in his Conjunction with the Sun, as his Retrograde Motion will be swiftest in his Opposition. For the apparent direct Motion of the Planet in his Conjunction, arises from the *Sum* of the Motions of the Earth and Planet then moving directly contrary one to another; and the Retrograde Motion in the Opposition arises from the greatest *Excess* of all the Terrestrial Motions above the Planetary, both from there being then the least Distance between the Earth and the Planet, and from the Parallelism of their Motions at that time, as is clear from the Consideration of the Figure.

SUPERFICIES; they are frequently placed upon a Sector, 2 Lines (one on each Leg) which Mr. Gunter calls very properly *Lines of Superficies*. They are made by finding mean Proportionals between the two Homologous Sides, and the hundredth part of such a Side, or by a Table of Square Roots; which Roots may be taken out of the Divisions of the Lines of Lines, and they will give the proper Distances from the Centre, where the 10 (or 100) unequal Divisions must be placed.

The Uses of the Line of Superficies.

1. To find the Proportion between two or more Similar Superficies.

Take one of the Sides of the greater Surface, and put it over from 10 to 100, at the end of the Line of Superficies. Then take the corresponding Sides of the Similar Surfaces severally, and carrying the Points of the Compasses so that they fall on the same Number on each Leg, they will there shew the Proportion which they bear to 100.

2. To augment a Surface, or to diminish it in a given Ratio, as suppose in the Ratio of 2 to 5.

Take the Side of the Surface, and to it open the Sector in the Points 2 and 2, in the Line of Surfaces; and, letting the Sector lie, the Distance between 5 and 5, will give you the Side of a Similar Figure, whose Area shall exceed that of the given one in the Proportion required. And proceed *vice versa*, for diminishing.

3. To Add together, or to Subtract one from another, Similar Surfaces.

Find first the Ratio between the Surfaces by Prop. 1. and then Add or Subtract the Numbers, expressing those Proportions by Prob. 2. and then augment or diminish by the precedent Problem.

4. To find the Ratio between Unlike or Non-Similar Surfaces.

First find Squares equal to those Surfaces, and then those being Similar Figures, you may easily find the Ratio they bear by Prob. 1.

SUPREMACY of the Queen within her Dominions, is declared by the 37th Article of the Church of England, by Can. 1. and 2. by Stat. 25 H. 8. c. 19, 20, 21. and by Stat. 1 Eliz. 1. to be Power of Sovereignty and Rule over all Persons born within her Majesty's Dominions and Realms, of what Estate soever they be, whether Ecclesiastical or Civil (or Temporal) so as no Foreign, nor other Power, shall, or ought to bear any Superiority over them. This Supremacy chiefly consists in the following Instances.

1. That the Archbishops of either Province cannot summon their Bishops and Clergy to Convocation, nor enact any Canons, without the Queen's express Consent, by 25 H. 8. c. 19. Whereas before that Act the Convocation was often called, and Laws were made by it for Governing the Church, without any Authority from the Crown.

2. In that there lies now an Appeal from the Archbishop to the Queen in *Chancery*; and on such an Appeal, a Commission under the Great Seal is to be directed to certain Persons, whereof commonly half are Lay-men, and half Clergymen; which is called the Court of *Delegates*; and which finally determines all Ecclesiastical Causes, by 25 H. 8. c. 19. tho' sometimes a Review is granted. Before this Statute, the Appeal from the Archbishop's Court lay to the People only.

3. The Queen can grant Commissions for visiting such Places as are exempt from the Jurisdiction of the Bishops and Archbishops, and Appeal lies from thence to the Queen in *Chancery*: Whereas before 25 H. 8. the Pope could only visit them, and receive Appeals from those Courts.

4. Persons in Holy Orders are not, as formerly, exempt from the Queen's Temporal Laws, any more than Laymen. And,

5. Now the Bishops and Clergy neither Swear, nor pay any Obedience to the Pope, but must take the Oaths of Allegiance and Supremacy to the Queen, &c.

SURFACE Line, or Line of *Superficies*, is a Line placed by Mr. Gunter on each Leg of his Sector; 'tis divided into 100 unequal Parts, and numbred with 1, 2, 3, 4, &c. to 10. See *Superficies*.

SWALLET, in the Lead-Mines in *Mendip*, is their Term for a Quantity of Water which breaks in upon them in their Work; when they meet with it, they drive an Adit on a level till it is dry. See *Lead*.

SYMPATHY, is an Agreement of Affections between two or more Persons; some have thought that there is also a Sympathy between some Natural Bodies, or their Particles. But this ought rather to be called a *Congruity*. See that Word.

SYNDICK, in the Civil Law, is sometimes the Title of a single Person, deputed to act for any Corporation or Community.

SYNODALS, or *Synodies*, were a pecuniary Rent (commonly two Shillings) paid to the Bi-

shop at the Time of the annual Synod, by every Parochial Priest. For the Bishops used to hold their Diocesan Synods, and to visit all at once; from whence these Synodals are accounted amongst the Bishop's Procurations at this Time.

SYNODALES Testes, the Urban and Rural Deans were at first so called, from informing against, and attesting the Disorders of the Clergy and People in the Episcopal Synod. But when they sunk in their Authority, the *Synodical Witnesses* were a sort of impanelled Jury, consisting of a Priest and two or three Laymen for every Parish. And, at last, two for every Diocese were annually chosen, till, at last, this Office came to be devolved upon the Church-wardens. Some think our Questmen, who are assistant to the Church-wardens, were called *Sides-men*, from hence *quasi Synod-men*.

SYNODALE Instrumentum, was the Solemn Oath that these *Synodical Witnesses* took, as now our Church-wardens are Sworn to make their just Presentments.

SYZIGIES; how to calculate the exact Time of the *True* and *Mean* Syzigies of the Sun and Moon, in order to the determination of Eclipses, *vid. Whiston*, p. 145.

T A L

TABERDERS, or *Tabiters*, for so, by Corruption, 'tis now pronounced, are the Batchelor Scholars of the Foundation of *Queen's* in *Oxon*. They were so called from a short Gown, called *Taberd*, or *Tabert*, in those Days, reaching no lower than their Middle-leg; which these Batchelor Scholars were then obliged to wear.

TACTICKS, is the Art of disposing any Number of Men into a proper form of Battle: The *Greeks* were very skilful in this part of the Art Military; having Publick Professors of it, who were called *Tactici*, who were to teach and instruct their Youth in this Matter. *Aelian* hath a particular Book on this Subject; and there is a great deal of it in *Arrian*, in his History of *Alex. M.* and in *Mauritius* and *Leo Imperator*.

TAILLE Douce, a Term in Painting, signifying, as Mr. *Evelyn* in Chalcography tells us, the Art of Sculpture or Chalcography it self. In *French* it signifies *sweetly or tenderly cut*; and this, whether done with the *Burin* (or Graver) or with *Aquafortis*, which we call *Etching*. He saith, the *Italians* call it *Intaglia* or *Stamp*, without any Epithet or Adjunct; and also *Bolino*, which he takes to be the more antient and unwarrantable, as implying the use of the *Point* and *Needle*, and of *Etching* with *Aquafortis*; which is sometimes so happily performed, as scarce to be discerned from the finest Stroaks of the *Bolio*, or *Graver* it self.

TALLAGE, was formerly a certain Rate or Proportion, according to which Barons and Knights were tax'd by the King, and inferior

T A N

Tenants by their Lords. And this latter *Tallage* of the Customary Tenants was sometimes fixed and certain, and sometimes at the arbitrary Pleasure of the Lord; and it was also sometimes compounded for.

TALUS Superior, in Fortification, is the Slope on the top of the Parapet; for the top of the Parapet is made sloping, that the Soldiers may defend the Covert-way with small Shot, which they could not do if it were level.

TANGENT; a Plane is said to be a Tangent to a Cone, when 'tis coincident with two Lines, one of which is drawn on the Surface of the Cone, and thro' its Vertex, and the other a Tangent to the Circle of the Base, meeting the former Line in the Point of Contact.

TANGENT Line, how the Line of Tangents and half Tangents are made, you'll find under *Scales*; and their Uses in *Projecting* and *Measuring* the Parts of *Right Circles* in Spherical Projection, you have under *Spherick Projection*. And the Use of the Line of artificial Tangents, in concert with the Line of Sines and Numbers, you have in *Plain Trigonometry*, &c. But there are some other Uses of the Lines of Tangents and half Tangents in *Dialling*, &c. Sometimes on the edge of *Gunter's Sector* you have a *Tangent Line*, in whose end a Pin or Gnomon, equal to Radius, is normally placed; and by that means the Sun's Altitude may be had, by holding the Sector erect, and the Pin parallel to the Horizon; for then the Shadow of the Gnomon, when turned to the Sun, will, in the Divisions of the

the Tangent shew the Degree of the Sun's height.

This Tangent-Line is used also to draw the Hour-Lines on the Planes of Dials; and is commonly known and shewn in almost all Books of Dialling.

On the Cross-staff there are also Lines of Tangents drawn; one usually of 36 deg. 3 min. and another of 49 deg. 6 min. which, because their middle Points are at 20 and 30, are, by Mr. Gunter, called the Tangents of 20 and 30. These Tangents are used in taking of Angles, the Altitude of the Sun or Stars, &c. as you will find under Cross-staff.

Dr. Wallis gives an Abstract of his two Methods of drawing Tangents to Curves, in *Philosophical Transactions*, N^o 81. which are taken from his *Conick Sections*, and other Parts of his Mathematical Works. And Dr. Barrow, in his fourth Geometrical Lecture, p. 40. gives a general Method of determining the Tangents to all *Cycloids*, and all other Curves described, or generated after the manner of a *Cycloid*. In Lect. 9, 10. he shews how to determine Tangents to all manner of *Spiral Curves*, and to many Curves of other kinds. In *Philosophical Transactions*, N^o 284. you have a Method of Tangents, by Mr. H. Ditton, taken from the Theory of *Maxima* and *Minima*, which is very simple and universal.

TARTANE; is a small Vessel, much used in the *Mediterranean*, with but one Mast, and the three-cornered Sail, like a Galley; they fish with them on the Coasts of *Spain*.

TASSELS, in a Building, are those Pieces of Boards that lie under the Ends of the Mantletrees.

TAXERS; are two Officers chosen in *Cambridge*, to look after the true Gage of all Weights and Measures.

TEETH: Mr. de la Hire observes, that the Bone of the Tooth doth not grow in Adult Persons, but only the *Periostium*; which is a Substance very different from the Bone every way. 'Tis composed, he saith, of an infinite Number of small Threads, which are fastened to the Bone by their Roots, much like the Horns and Nails of Animals; these little Threads grow as the Nails. When a part of the *Periostium* is broke, and the Bone is laid bare, the Tooth usually perishes.

TELESCOPES: (1.) Sir Isaac Newton, in his admirable Treatise of Opticks, p. 59. demonstrates, That the Perfection of Telescopes is impeded by the different Refrangibility of the Rays of Light; and not, as hath been vulgarly supposed, by the Spherical Figures of Glasses: and consequently, they will not be perfected by Glasses of the Figures of the Conick Section, i. e. by Parabolick, Hyperbolick Glasses, &c. For having shewed the Ratio between the less and greater Refractions of the different Rays to be very nearly as 27 to 28, he saith, those that are skilled in Opticks, will easily understand, that the least circular Space, into which the Object Glasses of Telescopes can collect all sorts of parallel Rays, is about the $27\frac{1}{2}$ part of half the Aperture of the Glass; or the 55th part of the whole Aperture; and that the Focus of the most refrangible Rays, is nearer to the Object Glass than the Focus of the less refrangible ones, by about $27\frac{1}{2}$ part of the Distance between the Object

Glass, and the Focus of the mean refrangible ones.

And if Rays of all sorts, flowing from any one lucid Point in the Axis of any Convex Lens, be made by the Refraction of the Lens to converge to Points not too remote from the Lens, the Focus of the most infrangible Rays shall be nearer to the Lens than the Focus of the least refrangible Rays, by a Distance which is to the $27\frac{1}{2}$ part of the Distance of the Focus of the mean refrangible Rays from the Lens, as the Distance between that Focus and the lucid Point from whence the Rays flow, is to the Distance between the lucid Point and the Lens very nearly.

After this, he shews, by Experiments, made with very great accuracy, that the Rays of Light, which differ in Refrangibility, do not all converge to the same Focus; but if they flow from a lucid Point as far from the Lens on the one side, as their Foci are on the other, the Focus of the most refrangible Rays shall be nearer to the Lens, than that of the least refrangible, by above the 14th part of the whole Distance: And if they flow from a lucid Point so very remote from the Glass, that, before their Incidence, they may be accounted parallel; the Focus of the most refrangible Rays, shall be nearer to the Lens, than the Focus of the least refrangible, by a 27th or 28th part of their whole Distance from it. And the Diameter of the Circle in the middle Space between these two Foci, which they illuminate when they fall there on any Plane, perpendicular to the Axis (which Circle is the least into which they can all be gathered) is about the 55th part of the Diameter of the Aperture of the Glass. So that 'tis a wonder that Telescopes do represent Objects so distinctly. But were all the Rays of Light equally refrangible, the Error arising only from the Sphericity of the Figures of Glasses, would be many hundred times less. And expressly by Calculation, p. 70. he proves, that the Error arising from the spherical Figure of Glasses, to that arising from the different Refrangibility of the Rays, is as 1 to 8151; and consequently is so little, as deserves not to be considered.

There is another Argument, (saith our excellent Author, p. 73.) which proves, that the different Refrangibility of the Rays, is the true Cause of the Imperfection of Telescopes. For the Errors of the Rays arising from the spherical Figures of the Object-Glasses, are as the Cubes of the Apertures of such Object-Glasses: And thence to make Telescopes, of various Lengths, magnify with equal Distinctness, the Apertures of the Object-Glasses, and the Charges, or magnifying Powers, ought to be as the Cubes of the square Roots of their Lengths; which doth not answer to Experience. But the Errors of the Rays arising from the different Refrangibility, are as the Apertures of the Object-Glasses: And thence to make Telescopes of various Lengths magnify with equal Distinctness, their Apertures and Charges ought to be as the Square Roots of their Lengths: And this answers to Experience, as is well known. For instance; a Telescope of 64 Feet in Length, with an Aperture of $2\frac{1}{2}$ Inches, magnifies about 120 times with as much Distinctness, as one of a Foot in Length, with $\frac{1}{2}$ of an Inch Aperture, magnifies 15 times.

By reason of this different Refrangibility, he concludes that there can scarce be any other means of improving Telescopes by Refractions alone, besides that of *increasing their Lengths*; for which end the late Contrivance of *Hugenius* seems well accommodated. (See *Philosophical Transactions*, N^o. 161.) For in his *Aerial Telescope*, the Glasses are readily manageable, and the Object-Glass being upon a strong upright Pole, becomes more steady.

Sir *Is. Newton*, in his *Opticks*, p. 76, acquaints us how he polished his reflecting Metal, which he used in his reflecting Telescope; and which, because it appears to be a much better way than in any common Use, I here give the Reader.

I had two round Copper-plates, each of six Inches in Diameter, the one Convex, and the other Concave, and ground very true one to another; on the Concave I ground the Object Metal or Concave, which was to be polished, till it had taken the Figure of the Convex, and was ready for a Polish; then I pitch'd it over thinly, by dropping melted Pitch upon it, and warming it, to keep the Pitch soft, whilst I ground it with the Concave Copper, wetted to make it spread evenly all over the Convex. Thus, by working it well, I made it as thin as a Groat, and after the Convex was cold, I ground it again, to give it as true a Figure as I could. Then I took Putty, which I had made very fine, by washing it from all its gross Particles, and laying a little of this on the Pitch, with the Concave Copper, I ground it upon the Pitch, till it had done making a noise; and then on the Pitch I ground the Object Metal with a brisk Motion, for about two or three Minutes, leaning hard upon it. Then I put fresh Putty upon the Pitch, and ground it again, till it had done making a noise, and afterwards ground the Object-Metal upon it, as before; and this Work I repeated, till the Metal was polished, grinding the last time with all my Strength for a good while together, and frequently breathing upon the Pitch, to keep it moist, without laying on any more fresh Putty.

But because Metal is more difficult to polish than Glass, and is afterwards very apt to be spoiled by tarnishing, and besides reflects not so much Light as Glass, Quicksilver'd over, does; I propound, instead of Metal, to use a Glass, ground Concave on the fore-side, and as much Convex on the back-side, and on the back-side well Quicksilver'd over; the Glass also must be exactly all over of the same thickness, otherwise the Object will look coloured and indistinct.

With such a Glass I tried, about five or six Years ago, to make a Reflecting-Telescope of four Feet in length, to magnify about 150 times: And I satisfy'd myself, that there wants nothing but a good Artist to bring this Design to Perfection: For the Glass being only after the common manner of grinding Glasses for Telescopes, tho' it seem'd as good as Object-Glasses used to be, yet when it was Quicksilver'd, the Reflection discover'd innumerable Inequalities all over the Glass: And by reason of these Inequalities, Objects appear'd indistinct in this Instrument. For the Errors of *Reflected Rays*, caused by any Inequality of the Glass, are about six times greater than the Errors of *Re-*

fracted Rays, caused by the like Inequalities. But I however found by this Tryal, that the Reflexion on the concave side of the Glass, which I fear'd would disturb the Vision, did really no sensible prejudice to it; and consequently, that nothing is wanting to perfect these Telescopes but good Workmen, who can grind and polish Glasses truly spherical. I once mended a common fourteen Foot Object-Glass considerably, by grinding it with Pitch or Putty, and leaning very easily on it in the grinding it, lest the Putty should scratch it: besides, leaning too hard on the Glass in grinding it, is apt to bend it; and then the Figure cannot be truly spherical.

Sir *Isaac Newton's* Method of shortning Telescopes, *vid.* his *Opticks*, p. 29.

Let *abde* represent a Glass spherically concave on the Fore-side *ab*, and as much convex on the Back-side *cd*, so that it be every where of an equal thickness; for it must not be thicker on one side than the other, lest it make Objects appear coloured and indistinct: it must also be very well wrought and quicksilver'd over on the Back-side: Place this Glass in the Tube *xyz*, which must be made very black within. Let *efg* represent a Prism of Glass or Chrystal, placed near the other end of the Tube, in the middle of it, by means of an Handle of Brass or Iron *fgk*, to whose end, made flat, it is cemented. Let this Prism be Right-Angled at *e*, and the other two Angles exactly equal, and consequently each 45 Degrees. Let the Sides *ef* and *ge* be exactly plane and Squares, and by consequence the third Side *fg*, a rectangled Parallelogram, whose Length is to its Breadth in a subduplicate Proportion of 2 to 1.

Let this Prism be so placed in the Tube, that the Axis of the Concave Speculum may pass thro' the middle of the square side *ef* perpendicularly, and consequently thro' the middle of the side *fg*, at an Angle of 45 deg. And let the side *ef* be turned towards the Speculum, and the Distance of this Prism from the Speculum be such, that the Rays of the Light *pq*, *rs*, &c. which are incident upon the Speculum in Lines parallel to the Axis thereof, may enter the Prism at the side *ef*, and be reflected by the side *fg*, and thence go out of it thro' the side *ge* to the Point *t*, which must be the common Focus of the Speculum *abcd*, and of a Plane Convex Eye-glass *b*, thro' which those Rays must pass to the Eye. And let the Rays at their coming out of the Glass pass thro' a small round Hole, or Aperture, made in a little Plate, Lead, Brass, or Silver, wherewith the Glass is to be covered; which Hole must be no bigger than is necessary for Light enough to pass thro': for so it will render the Object distinct; the Plate in which it is made, intercepting all the erroneous Part of

the Light which comes from the Verges of the Speculum *ab*.

Such an Instrument well made, if it be 6 Foot long (reckoning the Length from the Speculum to the Prism, and thence to the Focus *t*.) will bear an Aperture of 6 Inches at the Speculum, and magnify between 2 and 300 times. But the Hole *b*, here limits the Aperture with more advantage, than if the Aperture were placed at the Speculum.

If this Instrument be made longer or shorter, the Aperture must be in proportion, as the Cube of the square Root of the length, and the magnifying as the Aperture. But it's convenient, that the Speculum be, at least, an Inch or two broader than the Aperture; and that the Glass of the Speculum be thick, that it bend not in the working. The Prism *efg*, must be no bigger than is necessary, and its backside *fg* must not be Quicksilver'd over; for without Quicksilver it will reflect all the Light incident on it from the Speculum.

In this Instrument the Object will be Inverted, but may be erected by making the sides *ef*, and *eg* of the Prism *efg*, not plain but spherically Convex, that the Rays may cross as well before they come at it, as afterwards between it and the Eye-Glass.

If it be desired that the Instrument bear a larger Aperture, that may be also done, by composing the Speculum of two Glasses, with Water between them.

The reason why four Glasses in a Telescope represent the Object erect, Mr. Molyneux shews plainly in *Philosophical Transactions*, N^o 183.

Mr. Auzout saith, in *Philosophical Transactions*, N^o 4. That the Apertures of Telescopes ought to be in a Sub-duplicate Ratio of their Lengths; but this must be taken, so as to allow for the Quantity of Light which comes into the Tube; for the more Light comes in, the greater the Aperture must be, saith Dr. Hook. *ibid*. And Dr. Hook also doth there shew a way to make a Plane Convex-Glass of a small Sphere collect the Rays at a great Distance; but I don't find that he ever made any considerable Use of it afterwards.

Mr. De la Hire saith, in the *Memoirs de l'Academie Royal des Sciences*, for May 1699. That to prevent the Dew falling on the Object-Glass of a Telescope in a nocturnal Observation, 'tis a very good way to make a Tube of coarse brown Paper.

TELLER; is an Officer in the *Exchequer* (of which there are four) who receive all Moneys due to the Queen, and gives the Clerk of the Pell a Bill to discharge him therewith. They pay also all Money payable to the Queen, by Warrant from the Auditor of the Receipt, and make weekly and yearly Books of all Receipts and Payments, which they deliver to the Lord Treasurer.

TEMPORALTIES of Bishops; are such Revenues, Lands, Tenements, or Lay-Fees, which have been laid or annexed to Bishops Sees by our Kings, or other Persons of high Rank in the Kingdom.

TENAILE of the Foss or Ditch; is a low Work raised before the Curtain, in the middle of the Foss: It is of three sorts; the first is composed of a Curtain, two Flanks and two Faces: The Ram-part

part of the *Curtain*, including the *Parapet* and *Talus*, is but five Fathom thick, but the Rampart of the *Flanks* and *Faces* is seven. The Second, which *Vauban* saith he found to be of very good Defence, is composed only of two Faces made on the Lines of Defence, whose *Rampart* and *Faces* are parallel. The Third fort differs from the Second, only that its Rampart is parallel to the *Curtain* of the Place. All three forts are good Defences for the Ditch, and lie so low, that they cannot be hurt by the Besiegers Cannon, till they are Masters of the Covert-way, and have planted their Cannon there.

TENON, in Architecture, is the square end of a piece of Timber fitted into a Mortise.

TERRER, or *Terrier*, is a Book or Roll where-in the several Lands, either of a private Person, or of a Town, College, Church, &c. are described; and this should contain the Number of Acres, the Site, Boundaries, Tenants Names, &c.

TERRÆ *Testamentales*; Lands that were held free from *Feodal Services*, in *Allodio*, in *Soccage*, descendable to all the Sons, and therefore called *Gavel-kind*, were deviseable by Will, and therefore called by this Name, *Terræ Testamentales*.

TESSELATA *Pavimenta*; were the Pavements in the Tents of the Roman Generals, a rich *Mosaick Work*, made of curious small square Marbles, Bricks, or Tiles, called *Tessellæ*, from the Form of *Dice*.

TESTONS, or, as we commonly call them, *Testors*, from their having an Head (*Testa*) upon them, were in 34 H. 8. coined either here, or in France; and *Spelman* saith, their value in France was 18 d. and he doth not know but that they might go for as much here. He saith it was Brass, and cover'd over with Silver, (which perhaps gave rise to the Iniquity of *Plating Money*.) They went with us in H. 8th's time for 12 d. but in *Edw. 6th's* they sunk down to 9 d. and then to 6 d. (which still retains the Name of a *Testor*.) In *Anno Dom. 1559*, they fell to 4 d. ob. and *Stow* saith, there was a second sort of *Testons*, which in that Year were *Cried down* to 2 d. q. and that there was a third sort, which were made *unpassable* at any rate. *vid. Chron. Precios. p. 41.*

TETRACTYS *Pythagorick*, was a Point, Line, Surface and Body.

TETRAGONISTICK *Calculus*, is the same with the summatory or differential Calculus of *Leibnitz*; which see.

THANE, anciently in the *Saxons* time, was a military Servant; the King's Thane was a *Saxon* Lord or Nobleman: but after the Conquest the Word came to be used sometimes to denote all Persons of Superior Degree.

THORUS. See *Tore*.

THRAVE of Corn, in most parts of *England*, consists of four Shocks; and each Shock contains six Sheaves; but in some Places they reckon but twelve Sheaves to a *Thrave*.

THRIMSA, was an old piece of Money of the value of a Groat, or the third part of a Shilling; being seemingly a Corruption from *Tremissis*, which was a *German* Coin, of the value of Four-pence. Some will have it to be a Three Shilling Piece, but it seems a Mistake.

THUNDER and *Lightning*. The *Phænomena* of this very common, but oftentimes dreadful

Meteor, are thus accounted for, and solved by *Dr. Hooke, Opera Posth. p. 169.*

The Atmosphere about the Earth abounds with nitrous Particles of a spirituous Nature, which are every where carried along with it; besides which sort of Particles, there are also others raised up into the Air, which may be somewhat of the Nature of Sulphureous, Unctuous, or other combustible Bodies; as we see Spirit of Wine, Spirit of Turpentine, Camphire, and almost all other combustible Bodies, will by Heat be rarefied into the form of Air or Smoak, and be raised up into the Air. All which, if they have a sufficient Degree of Heat, will catch Fire, or be turned into Flame by the nitrous Parts of the Air; as thousands of Experiments might be brought to prove. There are also other sorts of these sulphureous Steams, which arise from subterraneous and mineral Bodies; which, only by their coming to mix with the Nitre of the Air, tho' they have no sensible Heat in them, will so ferment and act one upon another, as to produce an actual Flame: which is a thing that hath been often found in Mines, and more especially if any part of them be kindled, then the whole Train which is mingled with the contiguous Air, will immediately take fire, like a Train of Gun-powder, and run from one end of those Vapours to the other, be they ever so long; as I could prove by a multitude of relations from Coal-Mines, and several other Mines. The Accension of which Vapours is so sudden, and with such violence and swiftness runs from one end to the other, as often to kill the Miners, blow up their Props, Turns, Stays, Houses, &c. and produceth as prodigious Effects, as if a vast Quantity of Gun-powder had been fired in the Mine. Now Lightning in the Air seems to be much of the same Nature; for the Air is continually furnished with spirituous nitrous Parts; and the Summer Heat, whenever extraordinary, raises up out of the Earth (and to this the subterranean Heat also is continually concurring) a great Quantity of sulphureous Vapours, which are of such a nature, as that meeting with the Nitre of the Air, they work upon each other, and thereby begins a further Degree of Heat, which gradually encreases, till at last it arrive at a certain pitch; and then they fall upon and work on one another, producing an actual Fire and Flame, which with wonderful swiftness fires the whole Train, and so produces the Flash and Noise.

Dr. Wallis in *Philos. Trans. N° 231. p. 655.* saith, That Thunder and Lightning are so very like the Effects of fired Gun-powder, that we may reasonably judge they proceed from the like Causes. Now the principal Ingredients in Gun-powder, are Nitre and Sulphur, (the admission of Charcoal being chiefly to keep the Parts separate, for the better kindling of it.) So that if we suppose in the Air a convenient mixture of Nitrous and Sulphurous Vapours, and those by accident to take fire, such Explosion may well follow with such Noise and Light, as in the firing of Gun-powder; and being once kindled, it will run from Place to Place, as the Vapour leads it, like as in a Train of Gun-powder, with the like Effects.

This Explosion, if high in the Air, and far from us, will do no mischief, or not considerable; like a parcel of Gun-powder fired in the open Air, where nothing is near enough to be hurt by it. But if the Explosion be near to us, or amongst us, it may

may kill Men or Cattle, tear Trees, fire Gun-powder, break Houses, or the like; as Gun-powder would do in all like Circumstances. This *Nearness*, or *Farness*, may be estimated by the *Distance* of Time between seeing the Flash of Lightning, and hearing the Clap of the Thunder; for tho' in their Generation they be *Simultaneous*, yet Light moving faster than Sound, they come to us successively. I have observed, that commonly the Noise is about seven or eight Seconds after the Flash; but sometimes 'tis much sooner, in a Second or two, or less than that, just after the Flash; and then the Explosion must needs be very near us, and even amongst us. And in such Cases I have more than once presaged the Expectation of Mischief, and it hath proved accordingly.

Now that there is in Lightning a sulphureous Vapour, is manifest from the sulphureous Smell that attends it, and the sultry Heat in the Air, which is commonly a Fore-runner of Lightning soon after. And that there is a *nitrous* Vapour in it, we may reasonably judge, because we do not know of any Body so liable to a sudden and violent Explosion.

As to the kindling of these Materials, in order to such an Explosion, I am told that a Mixture of Sulphur, and Filings of Steel, with the Admission of a little Water, will not only produce a great Effervescence, but will of itself break forth into an actual Fire. I say a *little Water*, because too much will hinder the Operation, or quench the Fire: And this I take to be the Cause of the *Bath-Waters*, and other hot Springs, where Steel and Sulphur cause a great Effervescence, but no Flame. So that there wants only some *Chalybeate*, or *Vitriolick* Vapour (or somewhat equivalent) to produce the whole Effect, (there being no want of Aqueous Matter in the Clouds.) And there is no doubt, but that amongst the various Effluvia from the Earth, there may be copious Supplies of Matter for such Mixtures.

The same Account may also be given of *Aetna*, and other burning Mountains, where the Mixture of Iron and Sulphur may give a Flame; which is often attended with prodigious Explosions and Earthquakes, from great Quantities of Nitre, as in Springing a Mine.

THYREO-STAPHILINUS, is a Muscle of the *Uvula*, arising fleshy from the edge of the upper part of the *Cartilago Thyreoïdes*, between the *Thyreo-pharyngeus*, and the *Membrana Faucium*; from thence it ascends straight upwards, being much dilated as it approaches the *Uvula*, on the upper side of which it is spread very broad. In Swallowing, when this Pair of Muscles act, the *Foramina Narium* are in a great measure shut, to hinder the passing of anything thro' into the Nose, that is taken in at the Mouth. *Douglas Miogr. Comp. Specim.*

TICHONIAN *Hypoth.* See *Tychonian*.

TIDES: The Tides of the great Ocean being caused (as you may see in Vol. I.) by the Action or Attraction of the Moon upon it (chiefly) and because that part of the Ocean, which is directly under the Moon, will be more attracted by it than the rest; there the Ocean must swell or rise, and the Water will run from other Parts thither.

But from hence only it will not follow, that there should be Tides produced in Rivers and in

Land, Seas, Lakes, &c. of little or no breadth; because they are so narrow, that the Moon can't act stronger on one Part than on another: and so there being no difference of Attraction, there is no reason why one part should swell or rise more than another; for, the Attraction being equal, the Water cannot *shift* or move from one Place to another.

TIGE, in Architecture, is the Shaft of a Column from the Astragal to the Capital.

TIN-KILN, is used for the burning of the *Mundick* from the Tin-Ore. See its Description under Tin.

TIN: In *Philosophical Transactions*, N^o 69. and N^o 138. you have the following Account of the manner of *Finding*, *Digging for*, *Pressing* and *Blowing* of Tin.

The Miners imagine, that, before the Deluge, the uppermost Surface of the *Mineral Veins*, or *Loads*, lay parallel to the upper Surface of the Earth; but that, in the Flood, they were moved, loosened, and torn off; and that by the descending of the Waters into the Valleys, both the Earth or *Gravel*, and those Mineral Stones or Fragments so torn off from the *Loads*, (and which they call *Shoad*) were, together with, and by the Force of the Waters, carried beneath their proper Place, and from some Hills, even to the bottoms of the neighbouring Valleys, and from thence by Land-Floods down into the Rivers.

On these Suppositions, they proceed thus in *Trayning* or pursuing of a *Load*: Where they suspect any Mine to be, they diligently search that Hill and *Country* (as they call the Place where the *Mine* lies) that they may the better know the *Gravel* and the Stones, when they meet them at a distance in the bottom of a neighbouring Valley. They take notice also of the *Frets*, or Openings which are made in the Banks of Rivers, newly made by great Land-Floods, which usually are then very clean, to see whether there be any Metal-line Stones in the Sides, or Bottoms; together with the *Cast* of the *Country*, as they call it, *i. e.* any Earth of a different Colour from the rest of the Bank. And this is a great help to them, to discover which Hill, or which side of it to search. The Mineral Stones are discovered, either by their Weight, or their Porosity; for most Tin-Stones are Porous, not unlike great Bones, almost thoroughly Calcined. Yet Tin sometimes lies in very firm Stones; and Dr. Chr. Merret saith, that they are usually found betwixt two Walls of Rocks, which are commonly of an Iron Colour, of little or no Affinity with the Tin. *Vid. Phil. Trans. N^o 138.*

Another Way they have to discover whether the Stones contain any Ore, is, what they call *Vauning*, which is, to powder the Stone, Clay, &c. or whatever is suspected to contain any Metal, and then placing it on a *Vauning Shovel*, then will the Gravel remain in the hinder part, and the Metal at the Point of the Shovel; whereby the Nature, Kind, and Quantity of the Ore is very nearly guess'd at.

If there be no *Shoad* found in these *Frets*, they trust not to any found in the River, it being uncertain from whence the Water may have brought them. But then they go to the sides of the Hills most suspected, where there is a convenience of bringing a little Stream of Water (the bigger the better) and then they cut a *Leat* or *Gurt*, as they call

call it, that is, a Trench about two Foot over, and as deep as the *Shelf*; and by this means turn the Water, running two or three Days, that by washing away the Earth from the Stones, it may discover the *Shoad*. If they find any, they conclude there is a *Load* in the upper part of the Hill, or at least a *Squat*. Then at the foot, or bottom of the Hill, they sink what they call an *Essay-hatch*, i.e. a Hole about six Foot long, and four broad, and always as deep as the *Shelf*; and if they find no *Shoad* there, when they come to the *Shelf*, there is none to be expected: Tho' sometimes the *Shoad* is washed clean away, when you come within two or three Foot of the *Load*, which then lies so much further up in the Hill. But if they find *Shoad*, they are almost at a Certainty; and this is held as an infallible Rule, that the nigher the *Shoad* lies to the *Shelf*, the nigher the *Load* is at hand, and *vice versa*.

If they find no *Shoad* in the first Hatch, they ascend usually about twelve Fathom, and then sink another, as before; and if no *Shoad* appear here, then they go as far on each hand side-ways, and sink there, as before. And so they ascend proportionably with three or more Hatches (if the Space of Ground require it) as it were in Breast, till they come to the top of the Hill. And if they find no *Shoad* in any of these Hatches, farewell to that Hill.

But if they find any *Shoad* in any Hatch, then they keep their ascending Hatches from thence in a right Line; and as they draw nearer the *Load*, they lessen the first Proportion of twelve Fathom to six, or yet less, as Conjecture directs them. If they find *Shoad* lying near the *Shelf* in one Hatch, and none in the next ascending, they conclude they have over-shot the *Load*, and then they sink nigher that Hatch, in which they last found the *Shoad*. Sometimes they find two different *Shoads* in the same Hatch, at different Depths, and then they have a Certainty of another *Load* above the former; and it may be in *Training* up to the second, they meet with the *Shoad* of a third. Some Tinners affirm, that the seven *Loads* may lie parallel one to another in the same Hill, but yet only one *Master-Load*; the other six, three on each side, being the lesser Concomitants; and so may five lie, three are common.

Every *Load* hath a peculiar coloured Earth or *Grewt* about it, which is found also with the *Shoad* in a greater quantity, the nearer the *Shoad* lies to the *Load*; and so lessens by degrees to near a quarter of a Mile's distance; but further than that, the peculiar *Grewt* is never found with the *Shoad*.

A Valley may lie so, at the Feet of three several Hills, that they may find three several *Deads*, i.e. common loose Earth, in which the *Shoad* lay, and which is not only contiguous to the *Load*: This they call the *Run* or *Cast* of the Country, or of each Hill; and the Knowledge of this is very necessary, in order to surer *Training* of them one after another, as they lie in order, according to the foregoing Rules of *Essay-Hatches*; for the uppermost will direct you which Hill to begin first.

It may be, after they have trained up the Hill, they find nothing but a *Bonny* or *Squat*, which likewise have their *Shoad*. Their Form is about two or three Fathom long, and half as broad, few larger, and most less: These communicate with

no other *Load* or Vein, neither doth it send forth any of its own, but is entire of itself, and perhaps will go down into the *Shelf*, five or six Fathom deep, and there terminate.

The Manner of their Digging the Ore, is thus:

When they have found the *Load*, and last *Essay-hatch*, 'tis then called a *Tin-shaft*, or *Tin-hatch*, which is sunk down about a Fathom, and then is left a little long square Place, called a *Shamble*; and so they continue sinking from *Cast* to *Cast*, (that is, as high as a Man can conveniently throw, or cast up the Ore with a Shovel) till they either find the *Load* to grow small, or degenerate into some sort of *Weed*, which are divers; as *Mundick*, or *Maxy*, corrupted from *Marchasite*; and this is white, yellow, and green. *Daze*, which is a kind of glittering Stone, enduring the Fire, of different Colours; as white, black, and yellow: *Iremould*, black and rusty; *Caul*, which is red, differing both from *Mundick* and *Daze*, or *Spar*, (enduring the Fire) which *Marchasite* will not; *Glister*, which is Blood-red and Black.

Then they begin to make a Drift three Foot wide, and seven Foot high; and if the *Load* be not broad enough of itself, as some are scarce half a Foot, then they usually break down the *Deads*, or that part of the *Shelf* which contains no Metal, but encloseth the *Load*, as a Wall between two Rocks, and then they begin to rip the *Load* itself.

The Instruments they use, are, 1. A *Beele*, or *Cornish Tubber*, i.e. double Points of eight or ten Pounds, sharp'ned at both ends, steeled and holed in the middle. This, in a hard Country, will last about half a Year, but must be new pointed every fourteen Days.

2. A *Sledge*, flat-headed, from ten to twenty Pound, will last about seven Years, new ordered once a Quarter. 3. *Gadds*, or *Wedges*, of two Pounds, well steeled at the Points, and four-square; these will last three or four Days, or a Week; and then must be new sharpened. 4. *Ladders*. 5. *Wheelbarrows* to carry the *Deads* and Ore out of the *Drifts* or *Adits*, to the *Shambles*. There are two Shovel-men, and three *Beele*-men, which are as many as one *Drift* can contain, without hindering one another. The *Beele*-men rip the *Deads* and Ore, the *Shovel*-men carry it off, and land it, by casting it up with Shovels from one *Shamble* to another; unless where there is a *Winder* with two *Kecbles* or Buckets, one of which comes up as the other goes down.

It is usually observed, that the *Tin Loads* run East and West, and then they constantly dip towards the North, and sometimes as much as three Foot in eight perpendicular. But in the higher Mountains of *Dartmoor*, there are some considerable *Loads* that run North and South, and these dip to the East.

Four or five *Loads* may a while run parallel to one another in the same Hill, as hath been known in *Hingston* in *Cornwall*, and then turn in and meet altogether in one Hatch, and after separate again, and run parallel, as before.

The Breadth of *Master-Loads* is generally from three to seven Feet, seldom larger, unless where several *Loads* unite, and make a Knot, or send forth Springs and Veins: But they don't retain the same Breadth in all Places.

The

The *Load* is usually in a hard rocky *Country*, made up of *Metal*, *Spars*, and other *Weeds*; as it were all along in a continued Rock; but it hath many *Veins* and *Joints*.

In most Places they meet with Water at some *Feet* deep from the *Load*, at others not at many *Fathoms*; it runs continually thro' the Heart of the *Load*.

When it begins to trouble us, we begin at the Foot of the Hill, a *Drift* scarce half so big as that of the *Load*, and work it on a Level, till we come up to the *Load*. But where they have not this Convenience, or if they pass that Level, then they are forced to draw it up with *Winders* and *Keebles*, or force it up with *Pumps*. Some, but very few *Pumps* may be dry. They observe, that when they have Water, they never want Air sufficient for *Respiration*, and for their *Candles* to burn in; yet sometimes in a soft clayey *Country*, the Air is so condensed, as to become in a manner a *Damp*, and to require an *Air-Shaft* for a *Vent*: which *Damps* are sometimes enlarged by working of the *Mundick* with the *Ore*.

If the *Country* be not strong enough, they underprop their *Drifts* with *Stemples* and *Wall-plates*, placed much like a Carpenter's Square, on the one side, and over-head.

To know which way the *Load* inclines, to bring an *Adit*, or to sink an *Air-Shaft* in the desired Place, the Use of the *Dial* is needful; which they call *Plumming* and *Dialling*, and is thus performed. A skilful Person first fastens the end of a long Line at a known Place, and then exactly observes the Point at which the Needle of his *Dial* or *Compass* rests; and at the next Flexure, or Winding, he makes a Mark on the Line, and again notes the Point at which the Needle stands at this second Station; and so he proceeds from turning to turning, still marking the Points and his Line, till he comes to the intended Place. Then he repeats above ground what he had done below, and his *Dial* and Line leads him, till he come exactly over the Place where he ended the *Mine*.

The Manner of *Dressing the Tin*, is thus:

When the *Ore* is landed, and the greater Stone broken at the top of the *Mine* by the *Shovel-men*, 'tis brought on Horses to the *Stamping-mill*, whence the *Ore* is landed at the head of the *Pass*, (*i.e.* two or three Bottom-boards, with two Side-ones, set slope-wise) in which the *Ore* slides down into the *Coffer*; but that it may not tumble down all at once, there is placed a *Hatch* nigh the lower end of the *Pass*, (that it is a Thwart-board to keep up the *Ore*.) Beneath that, comes in the *Cock-water* in a Trough, cut in a long Pole, which, with the *Ore*, falls down into the *Coffer*, (*i.e.* a long Square of the firmest Timber, three Foot-long, and one Foot and half over) wherein are the three usual *Lifters*, placed between two strong broad *Lones*, having two *Braces*, or Thwart-pieces on each side, to keep them steady as a Frame, with *Stamper-heads*, weighing about thirty or forty Pound each of Iron, which serve to break the *Ore* in the said *Coffer*. These *Lifters*, being about eight Foot long, and half a Foot square, of Heart of Oak, and having as many *Timbers* or *Guiders* between them, are lifted up, in order, by double the number of *Tap-pels* (fastened to as many *Arms*, passing diametri-

cally to a great Beam, turned by an *Over-shot Water-wheel* on two *Bousters*) which exactly, but easily meet with the *Tongues* so placed in the *Lifters*, as that they quickly slide from each other, suffering the *Lifters* to fall with great force on the *Ore*, thereby breaking it into small Sand, which is washed out by the *Cock-water*, thro' a *Brass Grate*, holed very thick, and placed within two Bars of Iron at one end of the *Coffer*, into the *Launder*, *i.e.* a Trench cut out in the Floor, eight Foot long, and ten over, and stopped at the other end with a *Turf*: so that the Water runs away, and the *Ore* sinks to the bottom; which, when full, is taken up and emptied with a *Shovel*.

The *Stamping-Mill* is thus contrived to go two Hours, or more, after they give over attending it. There is a *Tiller*, or long Pole, fastened without at one end to the *Slew* or *Ponder*, *i.e.* that loose and last part of the Trough, that conveys the Stream to the *Over-shot Wheel*. Then, at the other end, there is tied a short Rope, with a transverse Stick at the end of it, curiously, but *Trap-ways*, hitched at both ends, under two little Pins, fastened in the *Lones* for that Purpose: There is another Pin set in one of the *Lifters*, at such an exact height, as that if there be no *Ore* in the *Coffer*, to keep that *Lifter* high enough, the purposed Pin, in descending, knocks out the Water, carrying it quite over the *Mill-wheel*; so that when the *Coffer* is emptied, the *Mill* rests of course. The *Launder* is divided into three parts, the *Fore-head*, the *Middle*, and the *Tail*. That *Ore* which lies in the *Fore-head*, or within one Foot and a half of the *Grate*, is the best *Tin*, and is taken up in a Heap apart; the *Middle* and *Tail* is another Heap, which is accounted the worst. This latter Heap is thrown up by the *Trambling Buddle*, that is, a long square *Tye* of Boards, or *Slate*, about four Foot deep, six long, and three over; wherein stands a Man with a *Trambling-shovel* in his Hand, to cast up the *Ore*, about an Inch thick, on a long square Board, just before him, and as high as his *Middle*, which is called the *Buddle-head*; and with the Edge of his *Shovel*, he dexterously cuts and divides it long-ways, in respect of himself, about half an Inch asunder; in which little Cuts, the Water coming gently from the edge of an upper plain Board, carries away the Filth, and lighter part of the prepared *Ore* first, and then the *Tin* immediately after, all falling down into the *Buddle*; where, with his bare Foot, he smooths it transversely, to make the Surface the plainer, that the Water, and other Heterogeneous Matter, may, without lett, pass away the quicker.

When this *Buddle* grows full, they take it up; here distinguishing again the *Fore-head* from the *Middle* and *Tails*, which are *trambled* over again: But the *Fore-head* of this, with the *Fore-head* of the *Launder*, are *trambled* in a second *Buddle*, but not different from the first. In like manner, the *Fore-head* of this being likewise separated from the two other Parts, is carried to a third, or the *drawing Buddle*; whose difference from the rest is only this, that it hath no *Tye*, but only a plain sloping Board, whereon 'tis once washed with the *Trambling-shovel*, and so it new names the *Ore Black Tin*, *i.e.* such as is compleatly ready for the *Blowing-house*.

G g g g g

There

There is also another more curious way, called *Sizing*; that is, instead of a *Drawing Buddle*, they use a Hair-sieve, thro' which they sift the Ore, casting back the remainder into the Tails, and new *trampling* it.

After the second *trampling* it, they take that Fore-head in the second *Buddle*, and *dilve* it, (i. e. putting it into a Canvas-sieve, in a large Tub of Water, and shaking it lustily) so that the Filth gets over the Rim of the Sieve, leaving the black Tin behind, which is put into Hogsheds, covered and locked, till the next *Blowing*.

The Tails of both *Buddles*, after two or three *Tramblings*, are cast out into the first *Strake* or *Tye* (which is a Pit made purposely to receive them) and what over-small Tin else may wash away in *Trampling*.

There are commonly three or four of them successively, which contain two sorts of Tin, the one which is too small, the other too great. The latter is new ground in a *Craze-mill* (which is just like a Grist-mill, with two Stones, an upper and an under) and after that, *trambled* in order. The former, by reason of its exceeding Smallness, is dressed on a *Reck*, or Frame of Boards, about three Foot and a half broad, and six long, and which turns upon two Iron-Pins, fastened in both ends, and the whole placed between two Posts; so that it hangs in an *Æquilibrium*; and may, like a Cradle, be moved easily either way with the Shovel and Water.

Blowing of Tin.

When they perceive much *Mundick* in their Tin, which makes it brittle and hard, they are necessitated to burn away the *Weed* in a *Tin Kiln*. This Kiln is four-square, and at the top hath a large Moor-stone about six Foot long, and four broad; in the middle of which is a square Hole of about half a Foot in Diameter: About a Foot beneath this Stone, is placed another, which is not so long by half a Foot; because it must not reach the innermost, or back part of the Wall, which is the open Place, thro' which the Flame ascends from a lesser Place below that, where a very strong Fire of Furze is constantly made. The Fore-part is like a common Oven; but near the back, on one side, there is another little square Hole. When the Kiln is thoroughly heated, the black Tin that is to be burnt, is laid on the Top-stone, and as much of it is cast down by the square Hole, on the second, or Bottom-stone, as will cover it all over, about three or four Inches thick. Then the Hole at the top is immediately covered with green Turfs, that the Flame may reverberate the stronger; and a Rake-man, with an Iron Coal-Rake, constantly spreads and moves the Tin, that all Parts of the *Mundick* may get uppermost of the Tin, and so be *burned* away; which we certainly know by this, that then the Flame will become yellow (as usual) and the *Stench* lessen'd: for whilst the *Mundick* behind burns, the Flame is exceeding blue. Then with the Rake he thrusts it down at the open Place into the open Fire, and receives a new Supply of Tin from above. Now when the Place beneath, where the Fire is made, grows full of Tin, Coals, and Ashes, with the Rake he draws it forth with the Coals at the little square Hole, on the one side, near the back; where the Ore, fiery hot and red, lies in the open Air to cool; which it

will scarce be in three Days, because of the Coals, that lie hid in it; but when they cannot stay so long, they quench it with Water, and it is like Mortar. And whether it cool of itself, or be quenched, they must new *trample* it, or wash it, before 'tis put into the Furnace; which is no other than an *Alman-Furnace*.

Moor-Tin, or such as is digged up in the *Moors*, runs or melts best with Moor-coal charred; but other Tin which lies in the Country, runs best with an equal Proportion of Charcoal and Peat (or Moor-coals) for the first Running: but when they re-melt their Slugs, then they use Charcoal. When all is melted down, and re-melted, there sometimes remains a different Slug in the bottom of the Float, which they call *Mount-egg*; and this is mostly an Iron Body, tho' of a Tin Colour; as was tried, by applying one of the Poles of a Load-stone to it, which it quickly attracted, tho' not so strongly as Iron.

Tho' Tin, for the most part, be made from the Stones, in which it is incorporated, yet 'tis sometimes mixed with a gravelly Earth, sometimes white, but usually red; from whence 'tis easily separated by bare *Washing*. This gravelly Tin is called *Pryan Tin*, and has scarce half the Goodness of the other.

The *Mundick Ore* is usually discovered by its Glittering, yet sad-coloured Brownness, where-with it will soon discolour their Fingers. This is said to nourish the Tin; and yet they say, where much *Mundick* is found, there is little or no Tin. Certain it is, that if there be any *Mundick* left in melting the Tin, it makes it thick and curdy; that is, not so ductile as otherwise. The *Mundick* seems to be a kind of *Sulphur*; for Fire only separates it from the Tin, and evaporates it into Smoke.

The *Cornish Diamonds* lie intermixed with the *Tin-Ore*, and sometimes on heaps; they are hard enough to cut Glass; and some of them are of a transparent red, and have the Lustre of a deep Ruby. They seem to be only a fine hard Spar.

The best *Tin Ore* is that which is in Sparks, and next to this, that which hath bright Spar in it. The Furnace where they melt, and from whence they cast their Tin, they call a *Blowing-house*. See also Mr. Ray's Collection of *English Words*.

TIP-STAVES, are the Warden of the Fleet's Officers, attending the Queen's Courts with a painted Staff, for taking into Custody such Persons as are committed by the Court; and to attend such Prisoners as go at large by Licence. By this Name also are the Judges Officers called, who carry a Rod, or Staff, tipped with Silver, and take charge of such Prisoners, as are either committed, or turned over at the Judges Chambers.

TOD of Wool, is a Weight mentioned in 12 Car. cap. 23. containing 28 Pound, or 2 Stone Weight.

TOFT, *Tofum* in the Law signifies a Mesuage, or rather perhaps a Place where a Mesuage stood: 'Tis a Word much used in Fines.

TOMICE, the Art of Carving in Wood, or Ivory. The Artist in this Work was called *De-sector*.

TOMPION, is the Stopple of a great Gun or Mortar, being made of Wood, and put into the Mouth, to keep out Rain; also in loading of a Mortar, there is a Tompion of Wood, which is fitted exactly to the Bore of the Piece at the Mouth of

of the Chamber, and this is drove in hard after the Powder, and the Bomb is placed upon it.

TONGUE Grafting, is a way of Grafting in Roots, thus: The Root is cut sloping about an Inch in length, and the Graft as much, both very smooth; then each is cleft an Inch in length also, and then they are made to enter into one another, so that the Sap of the Graft may join to that of the Root as much as can be. Lap the jointed part about with a little Hemp, or Flax Hurds, and set the Root so grafted into the Ground, about ten or twelve Inches deep, so as the Joint may be about four Inches at least covered under the Earth, that it may not be bared at any time, but kept moist by the Earth. The Root you graft on, may be a piece of the Root of an Apple or Pear-tree, about six Inches in length; it should not be less than the Graft, but it may be bigger; but 'tis best when they are both of the same size. *vid. Phil. Trans. Numb. 95.*

About twenty-nine Years ago, saith Mr. *Lewis*, who communicated the Method above, I sowed a Bed of Apple-kernels in *March*, the Spring following I plucked up forty of these Seedlings, grown to the thickness of a fair Graft; I grafted them in this manner of *Tongue Grafting*, and planted them again: they all grew, and four of them bare Fruit to perfection that Year; so that in a Year and a half, from an Apple-kernel I had ripe Fruit. Some of these Trees will now bear two Quarters of Apples upon a Tree, and are bigger than most of those Trees among which they stand, which cost twelve Pence a Tree, when these were Kernels. I conceive, saith he, that Plumbs, Cherries, Apricocks, Peaches, and all sorts of Fruit-Trees, may be thus raised.

TORNADO, is the Name given by the Seamen for a violent Storm of Wind, and sometimes followed by Rain; it usually swifts or turns about to almost all Points of the Compass, whence I suppose its Name.

TORT, is a *French Word*, signifying *Wrong or Injury*, and is often used in our Law; as, *de son Tort, is in his own Wrong.*

TRAINING a Load, in the Miner's Language, is searching for, and pursuing a Vein of Ore.

TRAMBLING, is the Term used in dressing of *Tin-Ore*, for washing it very clean in Water, which is done with a Shovel, that they call a *Trambling-shovel*, and in a Frame of Boards, which they call a *Buddle*; see *Buddle* and *Tin*.

TRANSFORMATION of Curves.

The Abbot *Galloys* of France, having in the Year 1693, maintained, that Mr. *James Gregory*, and our excellent Dr. *Barrow*, had borrowed their general Propositions about the Transformation of Curves from Mr. *Roberval*; Dr. *David Gregory*, Astronomy Professor in *Oxon*, doth in *Philosophical Transactions*, N^o 214. p. 233. fully refute that Assertion, by shewing that Mr. *James Gregory's* Book was published at *Padua*, 1668; and Dr. *Barrow's Lectiones Geometr.* 1674. And therefore 'tis more than probable, that Mr. *Roberval* had seen those Books, since he did not die till Oct. 1675; and yet we find not that he makes any such Complaint.

TRANSCENDENTAL Quantities, Mr. *Leibnitz*, in the *Act. Erud. Lipsie*, for June 1686, hath a Dissertation, in which he proposes to shew the Origin and Rise of such kind of Quantities, viz.

Why some Problems are neither *Plain, Solid*, nor *Sur-solid*, nor of any certain Degree, but do transcend all Algebraical Equations: As also to shew how it may be demonstrated without a *Calculus*, that an *Algebraical Quadratrix* for the Circle or *Hyperbola* is impossible. For if such a *Quadratrix* could be found, it would follow, that by the help thereof, any *Angle, Ratio, or Logarithm*, might be divided in the given Proportion of one right Line to another; and this by one *universal Construction*. And consequently, the Problem of the *Section of an Angle*, or the *Invention* of any number of mean Proportionals, would be of a *certain Degree*. Whereas the different Numbers of Parts of an Angle, or of mean Proportionals, do necessarily require *different Degrees* of *Algebraical Equations*. And therefore the Problem, understood in general of any Number of Parts of an Angle, or mean Proportionals, is of an *indefinite Degree*, and transcends all *Algebraical Equations*.

However, since such Problems as these may really be proposed in Geometry (nay, and ought to be reckoned amongst the most principal) and besides are *determinate*; therefore 'tis necessary that such Lines should also be received into Geometry, as are alone sufficient for the Construction of these Problems.

And further, since they may be described exactly by a *continual Motion* (as is apparent in the *Cycloid, &c.*) they ought not to be accounted *Mechanical*, but *Geometrical Curves*; especially too, since they are of much greater use than all the Lines of the common Geometry (except the right Line and Circle) and have also some very important Properties, which are altogether capable of Geometrical Demonstration.

Des Cartes therefore was no less out in excluding these from Geometry, than the Ancients were, who neglected the *Loca Solida & Linearia*, as not Geometrical.

Now, because the Method of discovering *indefinite Quadratures*, or their *Impossibilities*, is with me but a particular Case (and indeed an entire one) of a much sublimer Problem, which I call the *Inverse Method of Tangents*, in which the greatest part of the whole Transcendental Geometry is contained; and which, if it could be always Algebraically solved, all that is wished for would be done; since also I find nothing satisfactory, as yet, extant about it: I will now shew you how this may be done, as well as the *Indefinite Quadrature* itself.

Whereas then Algebraists used before to assume some general Letters, or Numbers for the Quantities sought, I (in these Transcendental Problems) assume *General or Indefinite Equations*, for the Lines sought. *Ex. gr.* putting *x* and *y* for the *Abscissa* and *Ordinate*, the Equation I use for a Line sought, is, $a + bx + cy + exy + fxx + gyy, \&c. = 0$. By the help of which indefinite Equation (which in reality is *finite*; for it may always be determined, how far soever 'tis necessary to raise it) I enquire the Tangent, and that which results comparing with the given Property of Tangents, I find the Value of the assumed Letters, *a, b, c, &c.* And thus I define the Equation of the Line sought.

In which Equation, sometimes there are some things which remain *arbitrary*, and in that Case innumerable Lines may be found that will satisfy the Problem.

And this was the Reason that a great many, observing the Result, believed the Problem not to be sufficiently determined, nor indeed possible. The same things are also done by Series; but with respect to the *Abridgment* of the Calculus, I have several helps; of which, more in some other place.

Now, lastly, if the *Comparison* above-mentioned doth not proceed, I pronounce the Line sought, not to be an *Algebraical*, but a *Transcendental* one.

This supposed, the next Work is to find the *Species of the Transcendency*; for some *Transcendentals* depend on the general Division or Section of a *Ratio*, or upon the Logarithms; others upon the Arks of a Circle; and others on more indefinite and compounded Enquiries.

Here therefore, besides the Symbols x and y , I assume a third, as v , which denotes the Transcendental Quantity; and then of these three, I form a general Equation for the Line sought, from which I find the Tangent, (according to my Method, which proceeds even in Transcendental Quantities;) then what I find, I compare with the given Properties of the Tangents, and so discover not only the Values of a, b, c , &c. but also the particular Nature of the Transcendental Quantity.

And tho' it may sometimes happen, that the several *Transcendents* are so to be made use of, and those of different Natures too from one another; also, tho' there be *Transcendents of Transcendents*, and a Progression of these in infinitum, yet we may be satisfied with the most easy and useful one, and, for the most part, may have recourse to some peculiar Artifices for shortning the Calculus, and reducing the Problem to as simple Terms as may be.

Now this Method, applied to the Business of *Quadratures*, or to the Invention of *Quadratrices*, (in which the Property of the Tangent is always given) 'tis manifest, not only how it may be discovered, whether the indefinite Quadrature be algebraically impossible, but also how (when this Impossibility is discovered) a *Transcendental Quadratrix* may be found, which is a thing which has not yet been shewn. So that it seems, I may without vanity assert, that Geometry is by this Method carried infinitely beyond the Bounds, to which *Vieta* and *Des Cartes* brought it: Since, by this means, a certain and general Analysis is established, which extends to all these Problems, which are of no certain Degree, and consequently are not comprehended within *Algebraical Equations*.

Again, in order to manage Transcendental Problems (wherever the Business of Tangents or Quadratures occurs) by a Calculus, there is hardly any that can be imagined shorter, more advantageous or universal, than my *Differential Calculus*, or *Analysis of Indivisibles and Infinites* (a very small Specimen of which, is contained in my *Method of Tangents*, formerly published.) From this Calculus may be derived all those Theorems and Problems that have been so much admired; and this with so much ease too, that there is now no more need of their being learned and kept in memory, than for a Man that understands Algebra to learn a great many of the Propositions of the common Geometry.

Thus, for example, in that Theorem of Dr. Barrow's, That the Sum of the Intervals between the Ordinates and Perpendiculars to the Curve, taken in, and applied to the Axis, is equal to the Semi-Square of the last Ordinate:

Let the Ordinate be x , the Abscissa y , the Interval between the Ordinate and Perpendicular p ; it appears presently, by my Method, that $p dy = x dx$, which Differential Equation, turned into a Summatory one, makes $Sp dy = Sx dx$. But, from what I have shewn in the Method of Tangents, $d\frac{1}{2}xx = x dx$, therefore contrarily, $\frac{1}{2}xx = Sdx$, (for as in the vulgar Calculus, Powers and Roots are reciprocal; so in this, Sums and Differences, viz. S and d are reciprocal.) It follows therefore, that $Sp dy = \frac{1}{2}xx$. Q. E. D.

In the Notation I had rather make use of dx , and such like Symbols, to denote the differential Quantities, than other Letters, because that Expression dx , is a certain Modification of x : And so by this means it comes to pass, that the Letter x alone (when 'tis necessary) together with its Powers and Differentials, enters the Calculus, and the Transcendental Relations between x and any other are expressed.

By the same Method we may also explain the Nature of Transcendental Lines by an Equation; ex. gr. Let a be the Ark of a Circle, and x the

versed Sine; then will $a = \frac{Sdx}{\sqrt{2x-xx}}$, and

if the Ordinate of the Cycloid be y , then will

$y = \sqrt{2x-xx} + \frac{Sdx}{\sqrt{2x-xx}}$, which Equa-

tion perfectly expresses the Relation between the Ordinate y , and the Abscissa x ; and from it all the Properties of the Cycloid may be demonstrated.

And thus is the Analytical Calculus extended to those Lines which have hitherto been excluded, for no other Cause, but that they were thought incapable of it.

Also Dr. Wallis's Interpolations, and innumerable other things are derived from hence.

As to what remains, that I may not seem to ascribe too much to myself, or to detract too much from others, I will briefly shew what seems to me to be due to the chief Mathematicians of our Age, with respect to this kind of Geometry.

First of all, *Galileus* and *Cavallerius* began to explain the most involved Methods of *Conon* and *Archimedes*; but *Cavallerius's* Geometry of Indivisibles was no more than the Infancy of the Science: Greater Improvements were made yet by those three famous Persons; Mr. *Fermat*, in his *Method de Maximis & Minimis*; *Des Cartes*, by shewing how to express the Lines of vulgar Geometry (for he excluded the Transcendental ones) by Equations; and *Gregory St. Vincent*, by several noble Discoveries: to which I add *Guldinus's* admirable Rule about the Centre of Gravity. But all these stopped within certain (comparatively) narrow Bounds, which the famous Geometers, Mr. *Hu- gens* and Dr. *Wallis*, went beyond, opening new Ways. For 'tis probable enough, that *Hu- gens's* Inventions gave rise to that of *Heuraet*; as those of *Wallis* might to those of *Neil* and *Wren*, who were

were the first that rectified Curve Lines, and this without any Detraction from the just Praise of these noble Discoverers. These were follow'd by Mr. *James Gregory*, and Dr. *If. Barrow*, who wonderfully increased the Science with admirable Theorems of this kind. In the mean time, Mr. *Nicholas Mercator*, a *Holsatian*, and most excellent Mathematician, was the first that I know of, who exhibited any Quadrature by an infinite Series. Which Invention that profound Geometer, Sir *If. Newton*, did not only reach by himself, but also compleat, by an universal way; and would he make publick the Thoughts he has yet further on this Subject, he would certainly open new ways to us, to the great increase, and yet abridgment, of the Science. As for myself, it happened when I was yet but a *Tyro* in these Studies, that the sight of a certain Demonstration concerning the Magnitude of a spherical Substance, suddenly gave me some Light; for I saw in general, that the Figure made, by applying the Perpendicular to the Curve, as *Ordinates* to the *Axis* (which Perpendiculars in the Circle are the *Radii*) was proportional to the Surface of the Solid, generated by the Rotation of the Figure about the *Axis*. With which first Theorem being wonderfully delighted, and not knowing that the same was known to any one else, I presently invented a Triangle, which in every Curve I called the *Characteristick Triangle*, the Sides of which should be *indivisible* (or speaking more properly) *infinitely small* or *differential Quantities*; from whence I presently, and with ease, derived a vast *Copia* of Theorems, part of which I found afterwards in *Barrow*, and the *Gregories*. And as yet I made no use of an *Algebraical Calculus*, which when I did apply, I soon after found my *Arithmetical Quadrature* and several other things. But, I know not how, an *Algebraical Calculus* did not satisfy me in this Business, and I was forced to do a great many things (that I had a mind to in the *Analytick* way) by long *Ambages* of Figures, till at last I found out the true *Supplement of Algebra for Transcendental Quantities*, viz. my *Calculus Infinitus parvorum*, which I also call the *Differential*, *Summatory*, or *Tetragonistick Calculus*: And, if I am not mistaken, aptly enough, the *Analysis of Indivisibles* and *Infinities*. Which Method, once discovered, all those things which I formerly had so much admired in this kind, seem'd meer Play and Sport to me. For from hence I was able, not only to find out admirable *Compendiums*, but also to attain that most universal Method above explained; by the help of which, either *Quadratrices*, or any other Lines sought, whether *Algebraical* or *Transcendental*, are determined as far as is possible.

Before I conclude, I would yet add this one Caution, that in managing *Differential Equations*,

such as this before mentioned, $a = \frac{Sdx}{\sqrt{2x - xx}}$,

a Man should not rashly neglect the dx on this account, that it may be neglected when the x are taken as increasing uniformly: For by this means a great many have gone wrong, and precluded the Way to themselves, in not allowing the Differentials, as dx , their own Universality: So that the Progression of the x might be assumed at liberty. Whereas from this one thing alone arise innumerable Transfigurations and Equipollencies of Figures.

TRANSCRIPT, *An. 34* and *35 H. 8. c. 14.* is the Copy of any Original, written again, or exemplified; as the Transcript of a Fine.

TRANSIRE, *14 Car. 2. c. 11.* is the Term given in the Custom-house to a Warrant or Pass, to let Goods be removed from place to place.

TRANSMUTATION. Sir *If. Newton*, at the end of his Book of *Opticks*, *Edit. Lat.* seems to be of opinion, That *Craffe*, or thick Bodies, and Light may be mutually converted and transmuted into one another; and that all Bodies receive their active Force from the Particles of Light which enter into their Composition. For all fixed Bodies, when well heated, emit Light as long as they continue so: And on the other hand, Light intermingles itself, and inheres in Bodies as often as its Rays fall upon the solid Particles of those Bodies, as he shews before. There is no one Body (saith he) which is less apt to shine than *Water*: But yet *Water*, as Mr. *Boyle* found by repeated Distillations, is capable of being transmuted into a fixed Earth; and that Earth will be capable of bearing Heat enough to be made by that means to emit Light, and shine as well as other Bodies. And he thinks this mutual Transmutation of Bodies and Light into one another, to be very agreeable to the Order of Nature, which seems to delight in such Transmutations.

Water, which is a Salt very fluid, volatile, and tasteless, is by Heat changed into *Vapour*, which is a kind of Air; and by Cold, into *Ice*, which is a hard, transparent, fragile Stone, easily meltable; and this Stone is convertible into *Water* again by Heat, as *Vapour* is by Cold. *Earth*, by Heat, becomes *Fire*, and by Cold is turned into *Earth* again. *Dense Bodies*, by Fermentation, are rarefied into various kinds of *Air*; and that *Air*, by Fermentation also, and sometimes without it, reverts into dense Bodies again. *Quick-silver* sometimes puts on the form of a fluid Metal, sometimes of a hard and fragile one: Sometimes it appears in the shape of a pellucid and fragile Salt, which they call *Sublimate*, and sometimes in that of a pellucid, volatile, tasteless white Earth, which is called *Mercurius Dulcis*: Sometimes it looks like a red, opake, and volatile Earth, and then 'tis called *Cinnabar*: Sometimes 'tis in the form of a red, and sometimes of a white *Precipitate*, and sometimes of a fluid Salt: By Distillation it becomes a *Vapour*, and by *Agitation in Vacuo*, it shines like *Fire*. And yet after all these, and many other Changes, is capable of being brought back again into running *Mercury*. The Eggs of Insects, &c. as far as Sense can judge, are by little and little evolved, explicated, and encreased in Magnitude, and so turned into Animals: Tadpoles are turned into Frogs; little Worms, or Maggots, into Flies.

All Birds, Beasts, Fishes, Insects, Trees, and Plants, with all their so very different Parts, grow and encrease out of *Water*, and aqueous and saline Tinctures; and on Putrefaction, all of them revert into *Water*, or an aqueous Liquor again. Moreover, *Water* exposed a while to the open Air, puts on a Tincture, which (like the Tincture of Barley, macerated without boiling) in process of Time hath a Sediment and a Spirit, and before Putrefaction, yields Nourishment both for Animals and Plants. Now among all these many various and wonderful Transmutations, why should not Nature turn *Light* into *Bodies*, and *vice versa*?

The great Objection against the practical Transmuting of a baser Metal into a nobler, seems to be, that the specifick Gravities of Metals cannot be altered: But in Dr. Hook's Life, before his *Opera Posth.* I find, that Dr. Hook, in 1679, is said to have made some Experiments about the mixing of Metals; and particularly, that in a Mixture of Copper and Tin, the specifick Gravity of the Compositum was *really increased*; for that of the Copper was $8\frac{1}{2}$ to one, and that of the Tin but $7\frac{1}{10}$ to 1; and yet that of the Mixture was $8\frac{3}{4}$ to 1.

TRANSOM, in Architecture, is the piece of Timber which is framed a-cross in a Double-Light Window.

TRANSPARENT, the opakest Bodies that are, if their Parts be subtilly divided (as Metals when dissolved in Acids, &c.) become perfectly *Transparent*; from whence, and from some other Reasons, Sir *Is. Newton*, in his Opticks, concludes, That Water, Salt, Glass, some Stones, &c. and such like Substances, are Transparent, because tho' they may be as full of Pores or Interstices between their Parts, as other Bodies; yet their Parts and Interstices are too *small to cause Reflexions in their common Surfaces*. He shews also, that the least Parts of all natural Bodies are in some measure transparent; and that their Opacity arises from the multitude of Reflexions caused in their internal Parts. 'Tis plain also, as he shews, that opake Substances are rendered transparent, by filling their Pores with any Substance of equal, or almost equal Density with their Parts.

Thus Paper dipped in Water or Oil, the *Oculus Mundi* Stone steep'd in the former of those Liquors, Linnen-cloth oiled or varnished, and many other Substances soaked in such Liquors as will intimately pervade their little Pores, become more transparent by that means than they were before.

And the true Reason why all opake Bodies, when reduced into very small Parts, become transparent, is because the thickness of the Particles being *much less* than the Intervals of the Fits of easy Reflexion and Transmission of the Rays of Light, the Body loseth its reflecting Power; for if the Rays, which at their entring into the Body, are put into Fits of easy Transmission, arrive at the furthest Surface of the Body before they be out of those Fits, they must be transmitted.

TRANSVERSALIS *Pedis*. Dr. Douglas, in his comparative Description of the Muscles, saith that *this* is only part of the *Musculus accelerator Urinae*, arising from the Knob of the *Ischium*; for it is not inserted into the *Cavum Ovale*, or Bulb of the *Urethra*, but joins in with the *Accelerator*, of which it makes a second beginning.

TRAVERSE, in Fortification, is a Trench with a small Parapet, and sometimes with two, one on each side; it serves as a Cover from the Enemy, when they come on their Flank. Sometimes 'tis covered over with Planks on the top, and is also loaded with Earth; they are of good use to stop an Enemy's way, and to prevent being enfiladed. It is also a good Defence in a dry Ditch, when the Parapet is made on that side next the opposite Flank. There is also a *Traverse* in a wet Ditch, which is made by throwing into the Foss or Ditch over against the Place where the Miner is to be put to the Foot of the Wall, Saucissons,

Joints, and other pieces of Wood, with Fascines, Stones, Earth, &c. in order to fill up the Ditch, and to carry a Gallery over it. Also a Wall of Stone or Earth, built a-cross a Work which is commanded, in order to cover the Men, is called a *Traverse*.

TREASURER, is an Officer of great Trust. The Treasurer of *England* is a Lord by his Office, and under his Charge and Government is all the Queen's Money in the *Exchequer*, and also the Clerks of all Officers any way employed in collecting the Imposts, Taxes, Tributes, or other Revenues belonging to the Crown. He hath also, by virtue of his Office, the Nomination of all Escheators yearly throughout *England*; and giveth the Place of all Customers and Searchers in all the Ports of the Kingdom, with divers other Matters,

TREASURER of the *Queen's Household*, is an Officer in the Court, who is of the Privy-Council, and in the Absence of the *Steward of the Queen's Household*, hath Power, with the *Controller and Steward of the Marshalsea*, without Commission, to hear and determine Treasons, Misprisions of Treason, Murder, Homicide, and Bloodshed, committed within the Queen's Palace.

TRENTALS, see *Tricennalia*, were thirty Masses, said in so many Days for the Souls of Persons deceased; and the Offerings which were made, and the Priests for this Service, were also called *Trentals*.

TRICENNALIA

TRIGINTALIA

were *Trentals*, or, as they were called in *English*, a *Months Mind*, because the Service lasted a Month, or thirty Days; in which they said so many Masses.

TRIDENT is a Name given by Sir *Is. Newton* to that kind of *Parabola*, by which *Des Cartes* constructed Equations of six Dimensions. This Figure hath four infinite Legs, of which, two are Hyperbolical, tending contrary ways, but placed about an Asymptote; and the other two are Parabolic and Converging, and which, with the other two, form the Figure of the *Trident*. See *Curves*.

TRIMMERS, in Architecture, are those Pieces of Timber framed at right Angles to the Joists against the ways for Chimneys, and Well-holes for Stairs. *Build. Diction.*

TRINODA *Necessitas*, was a three-fold necessary Tax, or Imposition, to which all Lands were Subject in the *Saxons* Time, *i.e.* towards the Repairing of Bridges, the maintaining of Castles and Garisons, and Expeditions to repel invading Enemies.

TRINODA *Terre*, was a Quantity of Land, containing three *Rods* or *Perches*.

TRISTIS, *Trista*, and *Tristis*, was formerly an Immunity, whereby a Man was freed from his Attendance on the Lord of a Forest, and should not be compelled to hold a Dog, follow the Chace, nor to stand at a Place appointed; which, otherwise, he might be under pain of Amerciaments.

TRONAGE, is a Toll or Custom taken for weighing of Wool, especially in open Market or Staple, by a common Beam (*Trona*) or legal Standard.

TROY-WEIGHT: the Original of all Weights here in *England*, was a Corn of Wheat gathered from the middle of the Ear, and well dried. Of these

these, 32 were to make one Penny-weight, 20 Penny-weight an Ounce, and 12 Ounces a Pound; but afterwards, they came to divide the Penny-weight into 24 equal Parts, which have ever since been called Grains. See *Tables of Weight* under *Weights*, in Vol. I. Formerly the *Moneys* did, and perhaps do still, subdivide the Grain thus: 24 Blanks make a Periot, 20 Periot a Droite, 24 Droites a Mite, and 20 Mites one Grain. See *Ward's Introduction to Mathemat.* p. 32.

TUBA-Eustachiana, is the Canal of Communication between the Mouth and the Barrel of the Ear; 'tis so called by *Antonius Valsalva* from its Figure, and its first Discoverer, *Barthol. Eustachius*.

TUMBREL, *Tumbrellum*, *Turbicketum*, is an Engine of Punishment, which ought to be in every Liberty that hath view of Frank-Pledge, for the Correction of Scolds and unquiet Women; and was what we now call a *Cucking-stool*.

TUNICA Vaginalis, is the first of the proper Integuments of the Testes; 'tis formed by the Dilation of the Productions of the external Membrane of the Peritoneum. Its internal Superficies is smooth, its external rough: It contains the *Vasa Deferentia* and *Preparantia*; it embraces loosely the whole Body of the Testicle, adhering to one end of the *Epydidimis*; and on the out-side of it runs the Muscle called *Cremaster*, which see.

TYCHONIAN System or Hypothesis, is so called from having been advanced to solve the Phenomena of Astronomy, by the Noble *Tycho Brahe*. He supposes the Earth fixed and immoveable in the Centre of the Universe, or of the Sphere of the fixed Stars; so that all the Stars and Planets, are supposed to revolve round the Earth in

the space of 24 Hours. The Moon also he supposes to move round the Earth, as the Centre of her menstrual Motion: But the five other Planets, *Saturn*, *Jupiter*, *Mars*, *Venus*, and *Mercury*, he supposes to revolve round the Sun in their several Periods; as the Sun doth round the Earth in a Year's time. But this Hypothesis is so embarrass'd and perplex'd, that it hath had few Espousers: And, instead of it, *Longomontanus*, and some few others, have advanced another Hypothesis, that may be called *Semi-Tychonian*; in which, holding all things according to *Tycho*, they allow a *Diurnal Motion* to the Earth, tho' they deny an *Annual* one. But tho' this be a good deal more probable than the *Tychonian System*, yet it is still so intricate and confused, and so inconsistent with Observation, and the simple Uniform Laws of Nature, which establish the *Pythagorean* or *Copernican Hypothesis*; that I shall say no more of it, but that 'tis not worth while for any one to enquire into it, nor to invent Laws to solve it; since all the Phenomena of the Heavenly Bodies, are much better accounted for in the other System last mentioned. See *Greg. Astron. Book I. Sect. II.*

TYTHES, are of three Sorts. (1.) *Predial Tythes*, which arise wholly or chiefly from the Earth; as of Corn, Hay, Underwood, Fruits, &c. (2.) *Mixt Tythes*, are such as arise from Beasts, and other Animals pastured or fed with the Fruits of the Earth; as Colts, Calves, Lambs, Wool, Milk, Fowls, &c. (3.) *Personal Tythes*, which are the Profits arising from the Labour, Art, Trade, Negotiation, and Industry of Men. *Great Tythes*, are of the Tenths of Corn, Hay, and Wood only. All others being called *Small Tythes*.

VACUUM: To what hath been said on this Subject, under this Head in Vol. I. may be added by way of Illustration; That since all Bodies do (by what *Sir Isa. Newton* aptly calls the *Vis Inertiae*) resist as far as they can, any Change or Alteration of their present State, whether of Motion or Rest; and since this Resistance is always the same in the same Body, and in different Bodies is still Proportionable to the Quantity of Matter they contain: And since also of consequence, if two Bodies contain equal Quantities of Matter, and move towards one another with contrary Directions, and equal Velocities; they will necessarily both stop at the Point of Concourse: And *Conversely*, since 'tis certain also that two Bodies moving thus, with contrary Directions and equal Celerities, if at the Point of Concourse they do both rest, must be equally heavy: It plainly follows, that two Bodies, containing each an equal Quantity of Matter, must be equally heavy; wherefore, were there no such thing as Porosity or Vacuity, two Spheres of equal Diameters, must contain equal Quantities of Matter, and be equally heavy; that is, two Spheres

of different Matter, suppose one of Wood, and the other of Gold, if they had equal Diameters, must have equal or the same Specifick Gravities. But this being directly contrary to all experience, there is an unavoidable necessity of supposing Vacuities in the Sphere of Wood, to render it lighter bulk for bulk, than that of Gold.

The Planetary Regions in which the Heavenly Bodies move, must needs be almost devoid of all Body or Matter; for otherwise a Resistance must accrue to the Planets Motions, which tho' never so small, would in time be sensible, and have an effect in retarding the Motion of the Heavenly Bodies; but no such thing hath ever yet been observed or discovered, but the contrary is certain. And besides, such a thin Vapour as the Tail of a Comet, can move thro' the *Aether*, as some will call it, with incredible swiftness, without being dissipated or drawn from its natural Course; which is in it self a demonstration, that there must be a kind of Vacuum in those Celestial Regions. And *Dr. Hook*, who was a *Plenist*, saith, That the vast *Expansum* of the World, must be a Body so exceedingly fluid, (that is, *no Body at all*) as hardly

to hinder the Motion of any Body thro' it. And Sir Isa. Newton shows, p. 213. of his *Latin Opticks*, That if the Planetary Regions were, as the *Plenists* assert, entirely full of Matter, and without any interspersed Vacuities at all; let their Matter be never so subtile and fluid, they would have a greater Resistance to any Bodies moving in them, than Mercury or Quick-silver hath. And in such a Medium as That, even a perfectly solid Globe must lose half its Motion, before it can move thrice the length of its own Diameter. And Globes or Spheres, such as the Planets are, would be stopt much sooner; wherefore 'tis absolutely necessary for continuing the Motions of the Planets and Comets, that the Places they move in, be almost entirely devoid of all Matter.

The feigned Romantick Subtile Matter, with which the *Cartesians* have filled the Celestial Regions, and all other Parts of the Universe, is by no means useful to explain the Phænomena of Nature: since the Motions of the Planets and Comets, is much better explained by *Gravitation* without it, and the Cause and Nature of Gravity hath not yet been explained by that *Materia Subtilis*, nor I believe ever can be. And if there were any such thing as that Matter, it would only serve to do mischief, to disturb and retard the Motions of the Heavenly Bodies, and the Order and Course of Nature. And if there were any such thing within the hidden Pores and *Meatus* of Bodies, it would serve for no good purpose; it would only hinder and stop the vibrating Motion of their Parts, in which their Heat and all their active Force consists.

That Whim therefore of the *Materia Subtilis*, must be entirely banished out of our Philosophical Faith; and then, along with it, will sink all those imaginary Schemes and Hypotheses, for the explaining the Nature of the Phænomena of Light, by the means of Pressure or the Motion of the Medium. See Pressure.

VADIARE Duellum, was formerly to wage a Combat; that is, when any Person challenged another to decide a Controversy by Camp-fight, or Duel, and threw down a Gauntlet, or made some such like sign of Defiance, then if the other took it up, or accepted of the Challenge, he was said *Vadiare Duellum*; to give and take a mutual Pledge of Fighting.

VAGINALIS Tunica. See Tunica Vaginalis.

VALE of a Pump, at Sea, is the Term for the Trough by which the Water runs from the Pump along the Ship sides, to the Scupper-holes.

VAPOURS: In order to explain the Circulation of Vapour experimentally, Mr. Edm. Halley (See *Philos. Trans.* N^o 212.) caused an Experiment of the Quantity of Water, arising simply from the warmth of the Weather, without being exposed to either Sun or Wind, to be made in *Gresham-College*: Which was performed with great Care and Accuracy, by the Operator to the Royal Society. And having added up into one Sum, the Evaporations of the whole Year, he found, that from a Surface, as near as could be measured, of eight Inches square, there did evaporate during the Year, 16292 Grains of Water, which is 64 Cubick Inches; and that divided by eight Inches, the Area of the Water's Surface, shews that the Depth of Water evaporated in one Year amounts to eight Inches. But this is much too little to answer the Experiments of the French, who

found that it rained 19 Inches of Water in a Year at Paris: Or those of Mr. Townly, which, by a long continued Series of Observations, hath sufficiently proved, that in *Lancashire*, at the Foot of the Hills, there falls above 40 Inches of Water in a Year; from whence it is very obvious, that the Sun and Wind are much more the Causes of Evaporation, than any internal Heat or Agitation of the Water.

The same Observations do likewise shew an odd Quality in the Vapours of Water, which is that of adhering to the Surface that exhales them, which they clothe, as it were, with a Fleece of vaporous Air; which once investing it, the Vapour rises afterwards in much less quantity. And this was shewn by the small Quantity of Water that was lost in 24 Hours time, when the Air was very still from Wind, in proportion to what went away, when there blew a strong Gale; altho' the Experiment was made in a Place as close from the Wind as could be well contrived. For which reason I do not at all doubt (saith he) that had the Experiment been made where the Wind had come freely, it would have carried away at least three times as much more, without the Assistance of the Sun, which might perhaps have doubled it. By the same Experiment it likewise appears, that the Evaporations in May, June, July, and August, (which in each Month are nearly equal) are about three times as much as what evaporated in the four Months of November, December, January, February, which are likewise nearly equal; March and April answering nearly also to September and October.

This Fleece of Vapour, in still Weather, hanging on the Surface of the Water, is the occasion of very strange Appearances, by the Refraction of the said Vapours differing from that of the common Air, whereby every thing appears raised; Houses like Steeples, Ships as on Land above the Water, and the Land raised and lifted up, as it were, from the Sea, and many times seeming to over-hang. And this may give a tolerable account of what I have heard of seeing the Cattel at High-water-time, in the Isle of Dogs, from *Greenwich*, when none are to be seen at Low-water, (which some have endeavoured to explain, by supposing the Isle of Dogs to have been lifted up, by the Tide coming under it.) But the vaporous Effluvia of Water having a greater degree of Refraction than the common Air, may suffice to bring those Beams down to the Eye; with which, when the Water is refined, and the Vapours subsided with it, pass over, and consequently the Objects seen at the one time, may be conceived to disappear at the other.

Sir Isa. Newton in his *Opticks*, Book 2. p. 60. thinks that the Azure Colour of the Sky, which he takes to be a Blue, of what he calls the first Order, is caused by the Vapours, when they first begin to condense and coalesce into small Parcels; for then they become first of such a bigness, whereby such an Azure may be reflected, before they can constitute Clouds of other Colours: So that this Azure being the first Colour which Vapours begin to reflect, it ought to be the Colour of the finest and most transparent Skies, in which Vapours are not arrived to that Grossness requisite to reflect other Colours, as we find it by experience.

VARIABLE QUANTITIES, in Fluxions, are such as are supposed to be continually increasing or decreasing; and so do, by the motion of their said increase or decrease, generate Lines, Area's or Solidities.

VARIATION, or Permutation of Quantities; is the changing any Number of given Quantities, with respect to their Places. See *Combination*.

VASSAL, signifies him that holds Land in Fee of his Lord, (now he is called usually a *Tenant in Fee*) whereof some owe Fidelity and Service, and such are *Vassalli Furati*.

VAVASOR, alias **VALVASOR**, is one that in Dignities is next to a Baron: *vid. Bracton*, l. 1. c. 8. and *Camden*, p. 188. and *Spelman's Glossary*.

VECTIS; when the Weight lies beyond the *Fulcrum* or *Hypomochlion* with regard to the Power, then the *Vectis* is called *Heterodromus*; but when the Weight lies between the *Fulcrum* and the Power, so that 'tis not moved a contrary way with the Power, as in the former Case, but ascends or descends as the Power doth; then 'tis called *Vectis Homodromus*.

VENA PNEUMONICA; is a small Vein which creeps along upon the *Bronchia* of the *Aspera Arteria*, or *Trachea* in the Lungs; 'tis described and so called by *Sommichellius*.

VENTRICULUS: the Stomach or *Ventriculus* is placed immediately under the Midriff; the Liver covers part of its Right-side, and the Spleen touches it on its Left, and the Colon at its bottom; to which also the Cawl is tied. Its figure is like that of a *Scotch Bag-pipe*, being long, large, wide, and pretty round at the bottom, but shorter and less convex on its upper Part, where its two Orifices are. The left Orifice is called *Cardia*; to it the *Oesophagus* is joined, and by it the Aliments enter the Stomach, where being digested, they ascend obliquely to the *Pylorus* or right Orifice, which is united to the first of the Intestines. At this Orifice the Tunicks of the Stomach are much thicker than they are any where else, and the inmost hath a thick and strong Duplication in form of a Ring, which serves as a Valve to the *Pylorus*, when it contracts and shuts.

The Stomach is made of four Membranes or Coats. The first and inmost is made of short Fibres, which stand perpendicularly upon the Fibres of the next Coat; they are to be seen plainly towards the *Pylorus*. When the Stomach is distended with Meat, these Fibres become thick and short: whilst they endeavour to restore themselves by their natural Elasticity, they contract the Cavity of the Stomach, for the attrition and expulsion of the Aliments. This Coat is much larger than the rest, being full of Plaits and Wrinkles, and chiefly about the *Pylorus*. These Plaits retards the Chyle, that it runs not out of the Stomach before it be sufficiently digested. In this Coat there are also a great Number of small Glands, which separate a Liquor which besmeares all the Cavity of the Stomach; therefore this Coat is called *Tunica Glandulosa*.

The Second is much finer and thinner; it is altogether Nervous; it is of an exquisite Sense, and is called *Nervosa*.

The third is Muscular, being made of straight and circular Fibres; the straight run upon the upper part of the Stomach, between its superiour and inferiour Orifices; and the circular run obliquely from the upper part of the Stomach to the

bottom. These Fibres, by their Contraction and continual Motion, help the Attrition and Digestion of the Aliments.

The Fourth Tunicle is common; it comes from the *Peritonæum*.

The Stomach receives Veins from the *Porta*, viz. the *Gastrica*, *Pylorica*, and *Vas Breve*, and Branches from the *Gastroepiplois dextra & sinistra*, which are accompanied with Branches of the *Arteria Cœliaca*, all which lie immediately under the fourth Coat of the Stomach.

The Eighth Pair of Nerves, or *Par Vagum*, gives two considerable Branches to the Stomach, which descending by the sides of the Gullet, divide each into two Branches, the external and internal. The two external Branches unite in one, and the internal do so likewise; both which piercing the Midriff, form, by a great Number of small Twigs, upon the upper Orifice of the Stomach, a *Plexus*: and then the internal Branch spreads it self down to the bottom of the Stomach; and the external Branch spreads it self upon the inside, about the upper Orifice of the Stomach. This great Number of Nerves which is about the upper Orifice, renders it very sensible, and from them also proceeds the great Sympathy betwixt the Stomach, Head and Heart; upon which account *Van Helmont* thought, that the Soul had its seat in the upper Orifice of the Stomach.

The *Plexus Nervosus* of the *Hypochondria* and *Mesenterium*, give several Branches to the bottom of the Stomach; therefore in Hyfterick and Hypochondriack Passions, the Stomach is also affected.

The Use of the Stomach is Digestion, which is the dissolution or separation of the Aliments into such minute Parts, as are fit to enter our Lacteal Vessels, and circulate with the Mass of Blood: Or it is the simple breaking of the Cohæsion of all the little *Molecule*, which compose the Substances we feed upon. Now the principal Agents employed in this Action, are, first, the *Saliva*, the *Succus* of the Glands in the Stomach, and the Liquors we drink, whose chief Property is to soften the Aliments, as they are Fluids, which easily enter the Pores of most Bodies, and swelling them, break their most intimate Cohæsions. When the Aliments are thus prepared, their Parts are soon separated from one another, and dissolved into a Fluid, with the Liquors in the Stomach, by the continual Motion of its Side, whose Power in this Action, is, by that great Improver of the true Theory of *Physick*, the learned *Pitcairne*, demonstrated to be equal to the Pressure of 12951 Pound weight: To which if we add the force of the *Diaphragma*, and Muscles of the *Abdomen*, which likewise conduce to Digestion, the Sum will amount to 261086 Pound weight. These two Actions we see more clearly in Birds, because they are performed in two Stomachs. In the first the Corn is only swelled and softened by the Liquor of its Glands, but broken and dissolved in the second, which is composed of very strong Muscles, because those of the *Abdomen* and *Diaphragma* are weak, neither do they act upon the Stomach, as in Men. *Keil's Anatomy*.

VERDITER, is made thus: Into an hundred Pound weight of Whiting put into a Tub, the Refiners pour their *Copper Water*, (see *Refining*) and stir them together every Day for some Hours together, till the Water grows pale: Then they

H h h h h

pour

pour that away, and set it by for further use, and pour on more of the green Water, and so continue till the *Verditer* be made; which being taken out, is laid on large Pieces of *Chalk* in the Sun, till it be *dry* for the Market. The Water mentioned to be drawn or poured off from the *Verditer*, (which remains at the Bottom of the Tub) is put into a Copper and boiled, till it come to the thickness of Water-Gruel, now consisting principally of Salt-Peter reduced, most of the Spirit of Vitriol being gone with the *Copper* into the *Verditer*; and a Dish full of this being put into the other Materials for *Aqua-Fortis*, is re-distilled, and makes what they call a *Double Water*, which is near twice as good as that made without it. *Phil. Trans.* N^o 142.

VERSED-SINE; what it is, see in Vol. I. under *Trigonometry* and *Scale*, as well as under *Versed-Sine*.

From the Radius or Sine of any Ark, to find the Versed-Sine.

If the Ark be less than 90°. the Co-Sine taken out of the Radius leaves the Versed-Sine: But if the Ark be greater than a Quadrant, the Radius added to the Co-Sine, makes the Versed-Sine. By the Sector, the Distance from 90 to 80 on the Line of Sines taken laterally, is the Versed-Sine of 10°. The Distance between 90 and 70, the Versed-Sine of 20°. &c. But if the right Sine were 50°. and you would have the Versed-Sine of 50°. make a parallel entrance of the Sine given between 50 and 50 in the Lines of Sines; and by that means, the Distance between 90 and 90, will give the Length of the Radius: Then out of that Radius take parallelly found the Sine of 40°. (the Co-Sine of 50°.) the Remainder will be the Versed-Sine 50°.

In Sir *Jonas Moor's New System of Math.* Vol. II. in the New Book of *Logarithms*, (and in some other Books) you have *Tables of Versed-Sines*, both natural and artificial, whose Uses are very many; and especially in solving some of the most useful Cases of Spherick Triangles: As in calculating the Distances of Places on the Earth's Surface, according to the Arch of a great Circle, by having their Longitudes and Latitudes; The Distances of two Stars, by having their right Ascensions and Declinations, or their Longitudes and Latitudes; by which means, the Altitudes of two Stars not on the Meridian, or of the Sun, with the Difference of Time or Azimuth being observed, the Latitudes of Places may be found.

As in the Spherick Triangle B P L, let the Legs B P, and P L be given, and the contained Angle B P L. To find the side B L:

I say, as the Cube of Radius, to the Rectangle of the Sines of the Legs; so is the Square of

half the Sine of the contained Angle, to $\frac{1}{2}$ Difference of the Versed-Sines of the third Side, and of the Ark of Difference between the two containing sides.

Therefore, in Practice, double the Logarithmick Sine of half the Angle given, and to it add the Log. Sines of the Legs; and from the Left-hand of the Sum, strike out 3 for the Cube of the Radius, there will remain the Logarithm of half the Difference of those two Versed-Sines.

Which half Difference doubled, and added to the Versed-Sine of the Difference of the Legs, gives the Versed-Sine of the Side sought.

EXAMPLE.

The Log. Sine of 40°.	-	9.8080675
The Log. Sine of 77°.	-	9.9887239
The Log. Sine of 26°.	2-	19.2914116
15 when doubled	5-	
The natural Sine against 39.0882030	is	1227355

Whose double is	—	—	2454710
The natural Versed Sine of 57°.	the	}	2013645
Difference of the Legs, is	—		
Their Sum is	—	—	4468355

Which is the Versed-Sine of 57 deg. 53 min. the Side required or sought.

VERTICAL-PLANE, in *Conicks*, is a Plane passing thro' the Vertex of the Cone, and parallel to any Conick Section.

VERTICAL-LINE, in *Conicks*, is a right Line drawn on the Vertical-Plane, and passing thro' the Vertex of the Cone.

VERTICAL-LINE, in *Dialling*, is a Line on any Plane perpendicular to the Horizon; this is best found and drawn on an erect or reclining Plane, by holding up a String and heavy Plumbet steadily, and then marking two Points of the Shadow of the Thread on the Plane, a good distance from one another, and then drawing a Line thro' those Marks.

VIBRATING-MOTION, is a very quick and short Motion of the solid Parts of Bodies, caused by the Pulse or Stroke of some Body upon them. Thus the Rays of Light or Fire striking upon the small Particles of Bodies, do excite in them such Vibrations, and cause them to grow hot and shine. For all fixed solid Bodies when heated to a due degree, will emit Light, and shine; and Bodies which abound with earthy Particles, (as the Chymists speak) and especially sulphureous ones, do emit Light; which way soever their Parts come to be agitated into these vibrating Motions, whether by Heat, by Rubbing, by Striking, or by Putrefaction, or some animal or vital Motion. Thus the Sea-Water shines or burns, as they call it, in a Storm; Quick-silver emits a Light when shook in *Vacuo*; an Horse's Neck, or Cat's Back, when rubb'd with one's Hand in the dark; Wood, Flesh and Fish, when 'tis rotten and putrefied: so shine Vapours arising from putrid Waters, as the *Ignes Fatui*, &c. thus kindles wet Hay, &c. thus Diamonds rubb'd in the dark, emit a Light, like the *Phosphorus*; and thus Iron will grow hot, and burn with quick and forcible hammering on an Anvil.

Of the vibrating Motion of the Parts of solid Bodies, a good Instance also you have in Bells, or the Brims of Drinking-Glasses half full of Liquor, and then rubbed strongly with one's Finger a little worted.

Dr. Hooke saith, he hath observed the Direction of this vibrating Motion, to be from the Center outwards, & *vice versa*.

VICAR; the Priest of every Parish is called *Rector*, unless the *Predial* Tythes be impropriated; and then he is called *Vicar*, *quasi vicem fungens Rectoris*. The *Vicar* is called perpetual, because every Vicarage hath a constant Succession (like a Corporation) and never dies.

VICE-CHAMBERLAIN; is a great Officer in the Queen's Court, next under the Lord Chamberlain; and in his absence hath the Controul and Command of all Officers whatsoever, appertaining to that part of her Majesty's Household, which is called the *Chamber*, or above Stairs.

VIE *prime*, so the Physicians call the Stomach and Guts, accounting the whole length of the Canal which reaches from the Mouth to the *Sphincter Ani*.

VIGIL; tho' the Civil Day begins from Midnight, yet the Ecclesiastical or Scriptural Day begins at six in the Evening, and holds till six in the Evening of the ensuing Day. Hence the *Collect* for every Sunday and Holiday (by Order of our Church) is to be read at the preceding Evening Service, or at the Vespers or Even-song at six a'clock the Day before; from which Time the Religious Day was supposed to begin: and this first part of the Holiday, from six a'clock of the Day before, was by the Primitive Christians spent in Hymns, and other Devotions; and these being often continued till late in the Night, were thence called *Vigils*. Tho', by degrees, these *Vigils* became so enlarged, that at last all the Day preceding the Holiday, came to be called by this Name, as it is now.

VILLANIS *Regis subactis reducendis*, was a Writ that lay for bringing back the King's Bondmen, that had been carried away out of his Manors to which they belonged.

VINCULUM, is a Term in Fluxions, implying that some compound surd Quantity is multiplied into a Fluxion, &c. Thus, in this Expression, $a x \sqrt{a x} - o a$ the *Vinculum* is the compound

Surd $\sqrt{o x} - a a$. which is $x a$ into $a x$.

VIRGATE, or *Yard-Land*, was originally no more than a certain extent or compass of Ground, surrounded with such Bounds and Limits; and therefore the quantity was uncertain, according to the difference of Places and Customs.

VIRTUE; is a free elective and acquired Habit of the Mind, whereby we are constantly inclined to do, and do in Fact act or not act, pursue or avoid, according to the Rules of true Prudence.

VISCOUNT, *Vicecomes*, *Vicount*, signifies as much as Sheriff; betwixt which two Words there is no other Difference, but that the one comes from the *Normans*, and the other from the *Saxons*. See *Sheriff*. With us now, a *Viscount* or *Vicount*, is a Person having the next degree of Nobility below an Earl; and tho' it be an old Name of Office, 'tis a new one in Dignity, being not in use with us till the time of *Hen. 6*. But 'tis of

greater Antiquity in other Countries. See *Selden's Titles of Hon.* fol. 761.

VISION: the Physical Cause of Vision seems to be, That the Rays of Light striking on the Bottom of the Eye, do there excite certain Vibrations in the *Tunica Retina*; which Vibrations being propagated as far as the Brain, by the *solid Fibres of the Optick Nerves*, do there cause the Sense of *Seeing*. For as *Dense* Bodies do retain their Heat longest, and that in proportion to their density, they retain it longer, as they are more dense; so the Vibrations of their Particles are of a more durable nature, than those of rarer Bodies, and therefore can be propagated to greater Distances: Wherefore the solid and dense Fibres of the Nerves, whose Matter is of an homogeneous and uniform Nature, are very proper to transmit to the Brain such Motions as are impressed on the external Organs of all our Senses. For that Motion which can preserve it self a good while, in one and the same Part of any Body, can also be propagated a great way from one Part of it to another; provided the Body be of an homogeneous Nature, and that the Motion be not reflected, refracted, interrupted, or disturbed by any Inequality in that Body.

Rays of Light therefore of divers kinds, will excite Vibrations in the *Retina* of different *Magnitudes*; and these Vibrations, according to such their different Magnitudes, will produce the Sensations of different kinds of Colours; just almost as in the Air, Vibrations of different Magnitudes produce the Sensation of different Sounds. *v. gr.* (as you will find under *Colour*) Such Rays of Light as are most Refrangible, excite the most short Vibrations, and cause the Sensation of a deep Violet Colour: While such Rays as are least Refrangible, do excite the *longest* Vibrations; and cause the Sensation of a deep Red Colour. And Rays of Light of all intermediate kinds, do excite accordingly intermediate Vibrations, and so cause the Sensations of the other intermediate Colours, between the two Extremes of Violet and Red.

VIS INERTIÆ *Materiae*: This *Vis Inertiae* is no where more conspicuous, than in the sudden Motion of a Vessel full of Liquor upon a horizontal Plane; at first the Liquor seems to move with a Direction contrary to that of the Vessel, not that there is any such Motion really impress'd upon the Liquor, but that the *Vis Inertiae* endeavouring to continue it in its state of Rest, the Vessel cannot immediately communicate its Motion to the Liquor: But the Liquor perseveres in its state of Rest, whilst the Vessel moves forward, and so seems to move a contrary way. But when once the Liquor has the Motion of the Vessel communicated to it, and begins to move with a Velocity equal to that of the Vessel; if the Vessel be suddenly stop'd, the Liquor continues its Motion, and dashes over the sides of the Vessel.

The Resistance of all fluid Mediums against Bodies moving thro' them, is chiefly owing to this *Vis Inertiae*; as you will find under *Resistance* in this Vol.

VIS STIMULANS; a Term used by Dr. Cheyne in his Book of Fevers, and by some other Physicians, and they understand by it such a Quality in any Fluid, whereby the Particles of it are disposed to make a real Division, or a violent Inflection of the nervous and membranous Fibres of

the Body; which occasions frequent and forcible Reciprocations, Succussions, and Derivations of the *Liquidum Nervorum* into the Muscles and Contractile Fibres of the Canals of the Body, whereby all the involuntary Muscles are brought into violent Contractions, and the *Emissaries* of the Glands are squeezed. See *Bellini de Urinis & Pulsibus, & de Motu Cordis*.

VISUAL-ANGLE, is the same with the Optick-Angle; which you will find under Optick Pyramid and Optick Triangle.

VITRIOL or *Copperas*, is made at *Bricklesey* in *Essex*, according to Mr. *Ray's* Account thus: They lay the Copperas Stones (which *Wormius* in his *Met. c. 13. Sect. 2.* saith, are chiefly found in the Isle of *Shepey*; but are indeed gather'd upon the Coasts of *Kent* and *Sussex* in many Places) on a large Bed or Floor prepared in the open Air, underneath which there are Gutters or Troughs, disposed to receive and carry away the Liquor impregnated with the Mineral to a Cistern, where it is reserved. For the Air and Weather dissolving the Stones, the falling Rain carries away along with it, the Vitriolick Juice or Salt which is dissolved thereby. This Liquor they boil in large Leaden-Pans, putting in a good quantity of old Iron: When it is sufficiently evaporated, they pour it out into large Troughs wherein it cools; and the Vitriol chrySTALLIZES to the Sides, and to Cross-Bars of Wood, which are placed in the Troughs. The Liquor remaining after this ChrySTALLIZATION, they call the *Mother*, which is reserved to be boiled and evaporated again.

Wormius saith, the Liquor is six or seven Days boiling to a due consistence; and that it can be boiled in nothing but a Leaden Vessel.

Matthioli describes the way of making Vitriol in *Italy*, to be something different from ours; for, he saith, they burn the Copperas Stones in small heaps, till the greatest Part is reduced to a Calx or Ashes, which being powdered, is mingled and agitated with Water, in large Vessels, to get out the Vitriolick Matter; then they draw off the clear Water after the grosser Matter hath subsided, and boil it to a due consistence, throwing in pieces of old Iron or Brasses (according to the design of the Operator) and then put it to chrySTALLIZE in wooden Vessels.

VIVO, is the Shaft of a Column in any of the Orders of Pillars in Architecture.

UNCUTH, in *Saxon* is unknown, and, in the old *Saxon* Laws, is used for a Person that comes to an Inn, and lies but one Night: In which Case his Host was not answerable for any Offence he should commit, whereof he was guiltless himself. But if he lay there a second Night, then he was called a *Gust*, *Hesper*; and then the Host was to answer for him, as for one of his Family. If he tarried any longer, he was then called *Agenhine*, (or, as some write it, *Hogenbine*) and the third Night, *Awnbine*, that is, *Familiaris*: and then if he offended against the King's Peace, his Host was to see him forth-coming; and if he could not produce him in a Month and a Day, he was obliged to satisfy for his Offences.

UNDER-Chamberlain of the *Exchequer*, is an Officer there that cleaves the Tallies, and reads the same; so that the Clerk of the Pell, and the Controllers thereof, may see that the Entries be true; he also makes searches for all Records in the Treasury, and hath the Custody of the

Doomsday-Book. There are two Officers there of this Name.

UNGULA, in Geometry, is the Section of a Cylinder cut off by a Plane, which passes obliquely thro' the Plane of the Base, and part of the Cylindrick Surface.

Uniform Motion.

UNIFORM or equable Motion, and all its Properties, may be very well explained by the equiangular Parallelograms in this Figure. Where the Dirigent *a* represents the Time, and the Lines *ab*, *1c*, *2d*, &c. the uniform or equable Velocities with which any Body is moved, in any Parts or Moments of Time. And the Parallelograms *ac*, *c2*, *2e*, *e4*, *4g*, do truly represent the Spaces described or run thro' with the Velocity *ab*, in the Times *a1*; *1,2*; *2,3*; *3,4*; *4,5*.

From the bare Consideration of which only, it will follow;

1. That the Spaces described by any Moveable, with an equable or uniform Velocity, are always as the Times.

For the Parallelograms *ac*, *ad*, &c. having all the same Altitude, must be as their Bases, *bc*, *cd*, &c.

2. Or if the Times be equal, the Spaces must be as the Velocities; that is, the Parallelograms *an* to *am*, will be as *ab* to *ak*, &c.

3. And from hence it will follow, that if the Spaces are as the Velocities, the Times will be equal; if as the Times, the Velocities will be equal.

4. Where the Spaces are equal, the Times must be reciprocally as Velocities: for the similar and parallel Rectangles have their Sides reciprocally proportionable; and *vice versa*, where the Times and Velocities are reciprocally proportionable, the Spaces must be equal.

5. Wherefore the Ratio's of the Spaces are always compounded of the Ratio's of the Times and Velocities: And consequently, deducting the Ratio of the Time out of that of the Velocity; or, which is all one, dividing the Space by the Time, there will result the Velocity; dividing by the Velocity, the Quotient will be the Time.

After much the same manner also may the uniform or equable Acceleration or Retardation of any Motion, be expressed very easily and clearly by Lines.

As suppose the right-lined Triangle ABC, the Side AB denotes the *Time* in which a Body may move from a Point of Rest, as in A; and having its Velocity continually encreasing in the uniform *Ratio* of the Lines DL, EL, FL, and BC; or decreasing equally back again in the same *Ratio*, from any determinate degree of it in BC, to none at all in A.

In this Figure then, the Triangles ALD, ALE, ALF, and ABC, will very appositely represent the *Spaces* described in the several *Times* AD, AE, AF, and AB; and consequently the *Trapezia* DL, DC, &c. will represent the *still aggregated Velocity*, and the *Spaces* corresponding thereunto. And from hence all the Laws and Affections of *equable accelerated Motions* will be easily accounted for; which are such as these, viz.

1. That the *Space* described at the end of the accelerated Motion, will be equal to that which would have been described by an uniform equal Motion in the same time, and with half the degree of Velocity which the accelerated Body did at last acquire: For the Triangle ACB is equal to the Square MB; each being the half of the Square GB.

2. That the *Spaces* described by the Motion of a Body, beginning from Rest, and *uniformly accelerated*, are as the *Squares* of the *Times*. For the Area's of the similar Triangles ADL, AEL, &c. are as the *Squares* of AD, AE, &c.

3. And comparing divers Motions, thus *uniformly accelerated* one with another, it will be plain that the *Spaces* run thro', will be to one another in a *Compound Ratio* of the *Times*, and of the greatest Velocities at any time acquired, (because similar Squares are in a *Ratio* compounded of that of their Sides.)

4. And from hence 'tis plain, that the Case of Bodies accelerating their Motion uniformly, so as that the *Spaces* described, shall be as the *Squares* of the *Times*, (which is the known Case of the Descent of heavy Bodies towards the Cen-

tre of the Earth) may be very well expressed by the Complement of the *Semi-parabola* AEH;

where the vertical Tangent AE, represents the determinate *Time* divided into equal Parts; and the Lines BO, CP, Dq, and EH, the several Velocities required in the several Descents. Now the *Spaces* described, ABO, ACP, &c. are as the *Squares* of the *Times* AB, AC, &c. that is, as the *Squares* of the *Ordinates* do, *fp*, *gq*, &c. which *Squares* are (by the *Parabola*) as the *Ab-scissa* Ad, Af, Ag, &c.

Wherefore the *Velocities* acquired at the end of any Descents, will be as the *Squares* of the *Times* in which these Descents are made.

That is, the *Velocity* at the end of the second Moment, or Part of Time, to the *Velocity* at the end of the first Moment, will be as the Square of the second to the Square of the first, or as the fourth to the first, &c.

UNION of two Churches, is a consolidating or combining them into one, which may be done by the Consent of the Bishop, Patron, and Incumbent. See *Linwood's Provincials*, and 37 H. 8. c. 21 as also 17 Car. 2. c. 3.

UNISONS. It hath been long since observed, that if a Viol-String, &c. be struck with the Bow or Hand, another String on the same; or another Instrument not far from it, will (if an Unison to it) tremble at the same time of its own accord. But Dr. Wallis, in *Philos. Transf.* N^o. 134 tells us, that 'tis not the whole of the unstruck String that trembles, but the several Parts severally, according as they are Unisons to the whole, or the Parts of that String which is so struck: v. gr. If one String be an upper Octave to another, and therefore an Unison to each half of it when 'tis stopt in the middle; then I say, if the former be struck while the latter is open, the two halves only of the latter will tremble, and not the middle Point: as you may easily try, by laying a bit of Paper lightly wrapt about the middle of the second String. See a Solution of this in *Plot's Hist. of Oxfordshire*, by Dr. Narcissus Marsh, and of other such Phenomena.

UNMOOR, a Term used at Sea for a Ship that before *rid*, or was held by two Anchors, to begin to get them up, and prepare to weigh. See *Moor*.

VOLVA, the great *Kepler*, considering how our Earth will appear to the Inhabitants of the Moon, if there be any such, viz. that it will seem a large Moon to them 15 times greater than their Planet doth to us at the full, in 24 Hours time revolving round its Axis (as will be easily discovered by the Spots that must appear in it) but yet also fix'd like a fix'd Star in one determinate Place in the Heavens, and moving only as they appear to do; this being the Phenomenon of the Earth to a Lunar Spectator, (*i. e.* to such as live on that side of the Moon, which is always turn'd towards the Earth; for those in the other Hemisphere can never see the Earth at all) he fancies that they would give it a Name something like that of *Volva*; and while they would consider their own Earth as a *Vesta*, an immoveable Seat or Habitation. In pursuance of this imaginary State of Things, *Kepler* calls the Inhabitants that live in that half of the Moon's Sphere, which is turned towards the *Volva*, *Subvolvæ*; and the others that never see the Earth, *Privolvæ*.

VOMITIVE Medicines, see *Emeticks*; where there is an Account of their Operation, in Vol. I. and II.

URBICARIÆ Regiones. See *Suburbicariæ*.

USE in the *Civil Law*, is one of the *Personal Services*, and signifies a Right that a Man hath of using a corporeal thing belonging to another, without prejudice to the Proprietor of it: This Right is not so great as an *Usufruct*; for he that hath this Right, cannot take the Profits generally, but only for his daily Use and necessary Subsistence.

USHER, *Ostiarus*, from the *French Huissier*, a Door-keeper of a Court, is an Officer in the

Exchequer, of which sort three or four attend the chief Officers and Barons at the Court at *Westminster*; and Juries, Sheriffs, and all other Accountants, at the pleasure of the Court. There are also *Ushers* in the Queen's House, as of the Privy-Chamber, &c.

USUFRUCT, is a Personal Service, whereby a Man hath a Right of using and taking all manner of Profits, of a corporeal thing belonging to another Person, so it be without diminution or prejudice to the Propriety of it; and he that hath this Right, is called an *Usufructuary*.

UTAS Octava in the Law is used for the eighth Day following any Term or Feast; as the *Utas* of St. Michael, of St. Hillary, of St. John Baptist, &c. and any Day between the Feast and the Octave, is said to be within the *Utas*. The Use of this is in Return of Writs, as appears by 51 H. 3. and Preamble to 43 E. 3.

UTFANGTHEF, *Fur extra captus*, is an ancient Privilege or Royalty granted to a Lord of a Mannor by the Sovereign, giving him a Power to punish a Thief dwelling out of his Liberty, and committing the Theft also without the same, if so be that he be taken within the Fee of that Lord.

UVEA, this is reckoned the fifth Coat of the Eye, and seems to be only the Circumference of the *Pupilla*; it is composed of circular and strait Fibres, to contract and dilate according to the Strength or Weakness of the Light: for when the Light is too strong, the circular Fibres contract the *Pupilla*, that the Force of the Rays may not hurt the Eye; and when the Light is too weak, the strait Fibres dilate the *Pupilla*, to let in more Rays, in order to form the Vision of Objects more distinctly.

WAGA, or **VAGA**, the same with *Weigh*, which see in this Vol.

WAGE, *Vadiare*, from the *French Gager*, *dare Pignus*, signifies in our Law the giving Security for the Performance of any thing: As, to *wage Law*, is to put in Security, that you will *make Law* at a Day assigned; and to *make Law*, is to take an Oath that a Man owes not a Debt which is claimed of him, and also to bring with him so many Men as the Court should assign, to avow on their Oaths, that they believe he swears truly.

WAGER of Law. See *Law*.

WARDAGE, the same with *Ward-peny*.

WARDECORN, is the Duty of keeping Watch and Ward, with a Horn to blow, on any occasion of Surprise, &c.

WARD-PENY, *Warpen*, *Wartbpenny*, *Warscot*, *Warth*, was formerly a customary Due paid to the Sheriff, and other Officers, for maintaining Watch and Ward; it was payable at the Feast of St. Martin. This customary Acknowledgment is still paid within the Mannor of *Sutton Colfield*, in

Warwickshire; and with some Ceremonies that are as singular as surprizing. *Cowel's Interp.*

WARDMOTE, in *London*, is a Court so called, and which is kept in every Ward.

WARDEN of the Mint. See *Master*.

WARDS and *Liveries*, was a Court first erected by King H. 8. and afterwards augmented by him with the Office of *Liveries*: But 'tis now absolutely taken away and abolished, by a Statute made 12 Car. 2. cap. 24.

WARD-STAFF, was formerly the Term for a Constable's Watchman's Staff: And the Mannor of *Lamborn* in *Essex*, is held by *Service of the Ward-Staff*, viz. to carry a Load of Straw in a Cart, with six Horses, two Ropes, and two Men in Harness, to watch the *Ward-Staff*, when it is brought to the Town of *Aibridge*.

WARRANTIA Custodie, is a Writ judicial; and formerly, before the Court of Wards was abolished, lay for him who was challenged, when a Ward to another, in respect of Land said to be holden in Knight-Service; which when it was bought by the Ancestors of the *Ward*, was

warranted, to be free from such Thralldom; and it lay against the *Warranter* and his Heirs.

WARRECTUM and *Warrecta Terra*, is Land long neglected and uncultivated; for in old Records you will find, that *Tempus Warrecti* signifies the Time that Land lies fallow. *Warrectare* also signifies to fallow Land.

WARREN, is a Franchise, or Place privileged, either by Prescription or Grant from the Crown, to keep *Beasts and Fowl of Warren*; which are Hares and Conies, Partridges and Pheasants: And if any Person be found an Offender in any such *Fee-Warren*, he is punishable for the same at Common-Law; and by the Statute 21 *Ed.* 3. a *Fee-Warren* may lie open, and there is no necessity of closing that in, as there is of a Park; for that ought to be seized into the Queen's hands, if it be not enclosed.

WASSEL-BOWL, was a large Cup or Bowl of Silver or Wood, wherein the Saxons at their publick Entertainments drank a Health to one another, in the Phrase *Was-beal* (i. e.) *Health be to you*. This *Wassel-Bowl* seems plainly to be meant by the word *Vastellum*, in the Lives of the Abbots of *St. Albans*, by M. Paris, p. 144. where he saith, *Abbas solus prandeat supremis in Refectorio habens Vastellum*; that is, the Abbot had set by him at the upper-end of the Table, the *Wastell*, or *Wassel-Bowl*, to drink a Health to the Fraternity, or the *Poculum Charitatis*. So Cakes and White-Bread (which were commonly sopped in this Bowl) are called *Wastell-Bread*. And hence the Custom of going a *Wassailing*, as 'tis still called and used in *Suffex*, and some other Places, seems to have taken its Name.

WATER. Sir *Is. Newton* defines Water (when pure) to be a very fluid Salt, volatile, and void of all Sapor or Taste, and it seems to consist of small smooth hard porous spherical Particles, of equal Diameters, and of equal specifick Gravities, as Dr. *Cheyne* observes; and also that there are between them Spaces so large, and ranged in such a manner, as to be pervious on all sides. Their *Smoothness* accounts for their sliding easily over one another's Surfaces; their *Sphericity* keeps them also from touching one another in more Points than one; and by both these, their *Frictions* in sliding over one another, are rendered the least possible. Their *Hardness* accounts for the *Incompressibility* of Water, when 'tis free from the Intermixture of Air.

The *Porosity* of Water is so very great, that there is at least 40 times as much Space as Matter in it; for Water is 19 times specifically lighter than Gold, and consequently *rarer* in the same Proportion: but Gold will, by Pressure, let Water pass through its Pores, and therefore may be supposed to have (at least) more Pores than solid Parts. Now 'tis this great *Porosity* of Water that accounts for its different specifick Gravity, in comparison of *Mercury* or other Fluids; and also why 'tis more easily concreted into a solid Form, by adventitious Matter in freezing, than other Fluids are.

Dr. *Cheyne* observes rightly, that the Quantity of Water on this side our Globe, doth daily decrease, some part thereof being every day turn'd into *Animal*, *Vegetable*, *Metalline*, or *Mineral* Substances; which are not easily dissolved again into their component Parts; for separate a few Particles of any Fluid, and fasten them to a solid Body, or keep them asunder one from ano-

ther, and they are no more fluid: for to produce *Fluidity*, a considerable number of such Particles is required. (See *Fluidity* in this Vol.) Most of the Liquors we know are formed by the Cohesion of Particles of different Figures, Magnitudes, Gravities, and *attractive Powers*, (See *Attraction* and *Particles*) swimming in pure Water, or an aqueous Fluid; which seems to be the common Basis of all. And the only Reason why there are so many sorts of Water differing from one another by different Properties, certainly is, here the Corpuscles of *Salts* and *Minerals*, with which that Element is impregnated, are equally various. *Wine* is only Water impregnated with Particles of Grapes, and Beer with Particles of Barley. All *Spirits* seem to be nothing but *Water*, saturated with *saline* or *sulphureous* Particles. And all Liquors are more or less fluid, according to the greater or smaller Cohesion of the Particles which swim in the aqueous Fluid; and there is hardly any Fluid without this Cohesion of Particles, not even *pure Water* itself; as is apparent from the Bubbles which sometimes will stand on its Surface, as well as on that of *Spirits*, and other Liquors.

WATER-Bayliff, was an Officer in Port-Towns, appointed for the searching of Ships, as seems from 28 *H. 6. c. 5*. Now there is such an Officer in the City of *London*, who supervises and searches all Fish brought thither; and he gathers the Toll arising from the River *Thames*. He also attends on the Lord-Mayor, and hath the principal Care of marshalling the Guests at the Table. And he arrests Men for Debt, or other personal or criminal Matters, on the River of *Thames*, by Warrant of his Superiors, &c.

WATER-Measure, is a Measure mention'd in the 22 *Stat. of Car. 2.* and exceeds the *Winchester* Measure by about 3 Gallons in a Bushel. 'Tis now used for selling of Coals in the Pool, &c.

WATER-Ordeal, was one of the old *Saxon* Ways of *Purgation*, or Tryal of a Person's Innocence, when suspected of a Crime; 'twas called *Judicium Dei*, as the *Fire-Ordeal* was. This by Water, was, for the Person accused either to put his Hands into scalding Water, or to be thrown into some River, Pond, &c. if he escaped being burnt or scalded, or of being drowned, he was concluded innocent. This Water-Ordeal was for Churls, Bondmen, and other Rusticks: But the *Fire-Ordeal* was for Freemen, and Persons of better Condition.

WATER-Table, in Architecture, is a sort of Ledge left in Stone or Brick-Walls, about 18 or 20 Inches from the Ground, and there the Thickness of the Wall begins to abate.

WATLING-Street, is the Name of one of the four *Roman* Ways, by that Nation made here in *England*, and by them were called *Consulares*, *Prætorias*, *Militares*, & *Publicas*. In the Laws of *Edw.* the Confessor, it appears that these Publick Ways, had the Privilege of the King's Peace. This of *Watling-street*, or otherwise *Werlam-street*, (see *Hoveden, Part. prior. Annal. Fol. 248.*) was made from *Dover* to *London*, thence to *St. Albans*, *Dunstable*, *Towcester*, *Atherston*, and the *Severn*; near the *Wrekin* in *Shropshire*, extending itself to *Anglesey* in *Wales*. Anno 39 *Eliz. c. 2.*

The second of these Ways is called *Ikemild-street*, (*ab Icenis*) and reached from *Southampton* over the River *Issis*, at *Newbridge*; thence by *Cambden* and *Litchfield*, and so over the *Derwent* by *Derby*, thence to *Bolseover-Castle*, and ends at *Tinmouth*.

The third was called the *Fosse*, because in some Places it was never finished, but lies as a large Ditch, leading from *Cornwall* thro' *Devonshire*, by *Tetbury*, near *Stow* in the *Wold*, and besides *Coventry* to *Leicester*, *Newark*, and so to *Lincoln*.

The fourth was called *Ermine*, or *Erminage-street*, beginning at *St. David's* in *Wales*, and going to *Southampton*. See *Hollingshed's Chron.* Vol. 1. c. 19. and *Henry of Huntington*, Book 1. at the beginning.

WAVESON, is the Term for such Goods as, after Shipwreck, do appear swimming on the Waves.

WEALD, or *Weld*, is a *Saxon* Word, signifying the woody part of a Country: As the *Weald* of *Suffex* and of *Kent*, in the Collect. of Statutes, 14 Car. 2. c. 6. 'Tis mis-printed, as 'tis vulgarly pronounced, *The Wild* of *Suffex*, &c.

WEAR, a Term used by the Seamen for bringing a Ship to, on a different Tack.

WEED, in the Miners Language, is the Degeneracy of a *Load* or *Vein* of fine Metal, into an useless *Marchasite*.

WEDGE. See *Cuneus* in this Vol.

WEIGH, a Term used by the Seamen, for taking up a Ship's Anchor, and getting ready to sail; which they call *Weighing Anchor*.

WEIGH of Cheese, Wool, &c. *Waga*, alias *Vaga*, is 256 Pound Weight *Averdupois*; for by 9 H. 6. c. 8. a Weigh of Cheese ought to contain 32 Cloves, and each Clove 8 Pound; tho' some say but 7.

WEDBEDRIP, was formerly a customary Service that inferior Tenants paid to their Lords, in cutting down their Corn, or doing other Harvest Duties, &c.

WEIGHTS, in use in *England*, are chiefly of two sorts: One called *Troy-Weight*, having 12 Ounces in the Pound; and by this, Jewels, Silver, Gold, Corn, Bread, and all Liquors are usually weighed; and the other is called *Averdupois*, containing 16 Ounces in the Pound; by this all coarse drossy wafable Wares, such as Grocery, Pitch, Tar, Rosin, Wax, Tallow, Copper, Tin, Lead, Iron, &c. are weighed.

Georg. Agricola, in his Book *de Ponderibus & Mensuris*, calls the Pound of twelve Ounces, or the Pound *Troy*, *Libram Medicam*, which we retain in our Apothecaries Weight, (see the Table of it under *Weights*, in Vol. 1.) and the other Pound of 16 Ounces, he calls *Libram Civilem*: and he saith also, that *Medica & Civilis Libra Numero non Gravitate Unciarum differunt*.

The Original of all our *English* Weights was a Corn of Wheat, gathered out of the middle of the Ear; and being well dried, 32 of these made one Penny-Weight, or were the Weight of the *Penny-Sterling*; twenty of these Pence or Penny-Weights, were to make an Ounce, and twelve such Ounces made the Pound *Troy*. See 51 H. 3. 31 Edw. 1. and 12 H. 7.

But in latter Times, it was thought sufficient to divide the aforesaid Penny-Weight into 24 equal Parts, which came to be called *Grains*, being the smallest Weight now in com-

mon Use; tho' the Moneyers subdivide the Grain thus:

24 Blanks	} make	{	1 Periot.
20 Periot			1 Droite.
24 Droits			1 Mite.
20 Mites			1 Grain.

WELDING-HEAT, is a Degree of Heat which Smiths give their Iron in the Forge, when there is occasion to double up the Iron, and to weld or work in the Doublings, so that the Iron shall grow a Lump thick enough for your purpose: 'Tis used also when two Bars of Iron are to be joined together at the ends, to make a Length.

WEREGILD, *Wergeld*, *Wergildus*, also *Werre* (Werre) alone without *Gild*, was formerly the Price that was paid partly to the King, and partly to the Relations of the Deceased, for killing a Man; when such Crimes were not punished with Death, but with pecuniary Mulcts.

WHEEL, in the Art Military, is the Word of Command, when a Battalion is to alter its Front, either one way or other. If the Battalion is to wheel to the Right, the Man in the right Angle turns very slowly, and every one else moves and wheels from the Left to the Right, regarding him as the Centre; and vice versa, when they are to wheel to the Left. When a Division of Men are on a March, if the Word be, *Wheel to the Right*, or to the Left, then the Right or Left-hand Man keeps his ground, turning only on his Heel, and the rest of the Rank move about quick, till they make an even Line with the said Right or Left-hand Man. Squadrons of Horse wheel much after the same manner.

WHERLICOTS, were the open Chariots used here in *England* by Persons of Quality, before the Use of Coaches. See *Stow's Survey of London*, p. 70. Perhaps hence comes our Word *Whirligig*.

WHITE or *Flame* Heat, is a Degree of Heat given by Smiths to their Iron in the Forge, when it hath not yet its Form and Size, but must be forged into both; this is a less Heat than a *Welding Heat*: Iron in this Heat is batter'd or drawn out usually with the Pen or Edge of the Hammer; and afterwards hath the Dents of the Pen smoothed out with the Face of the Hand-Hammer.

WHITENESS. The excellent Sir *Is. Newton*, in his late Book of Opticks, demonstrates, that Whiteness is a dissimilar Mixture of all Colours, and that the common Light of the Sun is a Mixture of Rays, endued with all those Colours; for by the multitude of those Rings of Colours, which appear in the Compression of the two Prisms, or Object-Glasses of Telescopes together, (see *Observ.* 3, 12, 24. Book 2. Part 1.) it is manifest, that these do so interfere and mingle with one another at last, as after 8 or 9 Revolutions, to dilate one another wholly, and constitute an even and sensibly uniform Whiteness. Wherefore it appears from hence, as well as from other Experiments, mention'd elsewhere, that Whiteness is certainly a Mixture of all Colours, and that the Light which conveys it to the Eye, is a Mixture of Rays indued with all those Colours. And he shews that Whiteness, if it be most strong and luminous, is to be reckoned of the first Order of Colours, but if less, to be a Mixture of the Colours of several Orders: Of the former sort, he reckons

reckons White Metals; and of the latter, the Whiteness of Froth, Paper, Linen, and most other white Substances. And as the White of the first order is the strongest that can be made by Plates of transparent Substances, so it ought to be stronger in the denser Substances of Metals, than in the rarer ones of Air, Water, and Glass. Gold or Copper, mixed either by Fusion or Amalgamation, with a very little *Mercury*, with Silver, Tin, or Regulus of Antimony, becomes *White*; which shews both that the Particles of *White Metals* have much more Surface, and therefore are smaller, than those of Gold or Copper; and also that they are so Opaque, as not to suffer the Particles of Gold or Copper to shine through them: And as he doubts not but that the Colours of Gold and Copper are of the second or third Order, therefore the Particles of White Metals can't be much bigger than is requisite to make them reflect the White of the first Order: And this he concludes also from other Observations and Experiments.

WHITE-Hart Silver, is a Mulet paid into the *Exchequer* out of certain Lands, in or near the Forest of *White-Hart*; and it hath continued ever since *Henry the Third's* time, who imposed it upon *Thomas de Lynde*, for killing a most beautiful *White Hart*, which the King had before purposely spared in Hunting. *Camd. Brit.*

WHITSON Farthings. See *Pentecostals*.

WIDOW of the King, was she who after her Husband's Death, being the King's Tenant in *Capite*, was forced to recover her Dower by the Writ *de Dote assignanda*, and could not marry again without the King's Consent.

WILL. See *Testament*.

WINDAGE of a Gun, is the Difference between the Diameter of the Bore, and the Diameter of the Balls.

WIND. The Reverend Mr. *Derham*, of *Upminster* in *Essex*, and F. R. S. in a curious and accurate Discourse about the Motion of Sound, in *Phil. Trans.* N^o 313. takes occasion to say something of the Velocity of the Motion of Wind: And by many Trials he found, that the Wind in the greatest Storm doth not move above 50 or 60 *English* Miles in an hour: That a common brisk Wind moves about 15 Miles in an hour: But that the Course of many is so gentle, as not to exceed, if they come up to, one Mile in an hour.

WINDING-STAIRS, are such as wind round

a Newel, either Circular or Square, Close, *i. e.* Solid, or Open.

WOLD, *Walda*, is a Down, or Champagne-Ground, Hilly, and void of Wood; as *Stow* in the *Wold*, and *Cotswold* in *Gloucestershire*.

WORD, in an Army or a Garison, is some peculiar Word or Sentence, by which the Soldiers know and distinguish one another in the Night, &c. and by which Spies and treacherous Persons are discovered: 'Tis used also to prevent Surprizes. It is given out in an Army every Night by the General to the Lieutenant or Major-General of the Day, who gives it to the Majors of the Brigades, and they to the Adjutants, who give it first to the Field-Officers, and afterwards to a Serjeant of each Company, who carry it to the *Subalterns*. In Garisons 'tis given after the Gate is shut, to the Town-Major, who gives it to the Adjutants, and they to the Serjeants.

WRIT Breve, is the Queen's Precept, whereby any thing is commanded to be done touching a Suit or Action: As the Defendant or Tenant to be summoned, a Distress to be taken, a Disseisin to be redressed, &c. And these *Writs* are diversly divided in divers respects; some in respect of their Order or Manner of granting, are called

WRITS Original, which are sent out for the summoning of the Defendant in a personal, or the Tenant in a real Action, before the Suit begins; or indeed rather to begin the Suit.

WRITS Judicial, are such as are sent out by Order of that Court where the Cause depends, on Occasion after the Suit is begun. And these are distinguished from the *Original Writs* thus: The *Teste* of the *Judicial Writ* bears the Name of the Chief Justice of that Court whence it issues; whereas in the *Teste* of the *Original Writ*, the Queen's Name is inserted. Again also, there are

WRITS Personal and Real, *Writs of Entry*, *Writs of Right*, *Writs of Privilege*, &c. of which, see the *New Book of Entries*.

WRIT of Rebellion. See *Commission of Rebellion*.

WRIT of Assistance, issues out of the *Exchequer* to authorize any Person, to take a Constable or other Publick Officer, to seize Goods or Merchandise uncustomed or prohibited. There is also a *Writ of Assistance* which issues out of the Chancery, to give a Possession.

YARD-LAND, *Virgata Terre*, is a Quantity of Land, various according to the Place: At *Wimbleton* in *Surrey* 'tis accounted fifteen Acres; in other Counties 'tis twenty; in some twenty-four, in some thirty, and in others even four Acres. In a MS. of the Abbacy of *Maimesbury*, a *Virgate of Land* is said to contain twenty-four Acres. This uncertain Quantity in 28 E. 1. is called a *Verge of Land*.

YATCHES, are Vessels with one Deck, carrying from 4 to 12 Guns, with from 20 to 40 Men; and are of Burden from 30 to 160 Tun. They draw little Water, and are used for running, and making short Trips, &c. They are of several Makes and Forms.

YEARS-DAY, } See *Annualia*, this Vol.
YEARS-MIND, }

YEOMAN, a Derivative from the *Saxon* *Geman*, i. e. *Communis*, a Commoner; is our *English* Word for a Rank next in order below a Gentleman. *Camden* calls them *Ingenuous*; and his Notion of them the Statute confirms 6 Rich. 2. cap. 4. and 20 Rich. 2. cap. 2. Sir *Tho. Smith*, (in his *Republ. Anglor. lib. 1. cap. 23.*) saith, that Yeoman is the same with what our Law calls *Legalis Homo*, an *English* Free-born Man; and who can dispend of his own Free-Land, in yearly Revenue, the Sum of Forty Shillings *Sterling*.

Z A C

ZACCO, is the Term sometimes used for the lower part of the Pedestal of a Column; and is in the form of a square Brick or Tile.

Z O P

ZOPERUS, a Term in Architecture, signifying the same with *Frieze*.

Sines, Tangents, and Secants.

Zzzz 2

THE Description and Use OF THE TABLES OF

Natural and Artificial Sines, Tangents, and Secants.

THESE are continued to every Degree and Minute of the Quadrant.

1. And the first thing to be done is to know how to take out the Sine, Tangent or Secant, whether *Natural* or *Logarithmical*, of any Degrees, or Minutes.

In order to which you will find, that the *Natural* Numbers are always in the Left-hand Page, and the *Artificial* or *Logarithmical* on the Right-hand Pages: So that for every Degree and Minute of the Quadrant, you have before you, one right against the other, the *Natural* and *Logarithmic* Sines, Tangents and Secants, with their Complements placed by them.

2. If therefore the Number of the Degrees of any Ark or Angle given be under 45° , you must look for it at the Head of the Table; but if it exceed 45° , you will find it at the Bottom or Foot; and as in the former Case you find the Minutes under M increasing downwards on the Left-hand of the Page; so in the latter, they begin at the Bottom of the Page on the Right-hand of it and increase upward.

Thus, if you look for 23 Degrees 13 Minutes, you will find in Page 48 of the Tables, and its *Natural Sine* will be 3942093, its *Natural Tangent* 4289449, &c. and in the Right-hand Page its *Artificial Sine* will be 9.5957268, and its *Logarithmical Tangent* 9.6324015, &c.

But if the Degrees given had been more than 45° , as suppose $61^\circ. 25'$. then you turn till you come to those Degrees at the Foot of the Table; which you will find in Page 58. 59 and there you will find (reckoning the 23 upwards in the Right-hand Column of Minutes over M) that the *Natural Sine* will be 8781222, and the *Natural Tangent* will be 18353999; the *Logarithmick Sine* will be 9.9435549, and the *Logarithmick Tangent* will be 10.2637307; and so for the *Secants*, &c.

3. If you want the *Natural* or *Artificial Sine*, Tangent or Secant of any Ark greater than 90° . as suppose of $123^\circ. 11'$ you must first subtract it from 180 if it be less than it, or from 360 when

it is greater than 180; and then seek in the Tables for the Sine, Tangent or Secant of the Remainder. Thus $123^\circ. 11'$ subtracted from 180° leaves $56^\circ. 49'$. whose Sine, or Tangent must be sought in the Tables, as is shewn above.

4. And when this is understood, the *Inverse Practice* of finding the Degrees and Minutes answering to any Sine, Tangent or Secant given, will be easie.

Thus suppose you would have the Degrees and Minutes answering to 7027782, a *Natural Sine*: you must look amongst the *Natural Sines*, either downward or upward, till you find the Number given, and then on the Top or Bottom you will have the Degrees; and the Minutes on the Right or Left-hand in the Column marked M accordingly; and so you will find the Degrees and Minutes answering to the *Natural Sine* 7027782, to be $44^\circ. 39'$. For tho' it be not to be found there exactly, yet the nearest to it is 7027741; whose Deg. and Min. are $44^\circ. 39'$. and so you must always do when you cant find the Numbers exactly; which will most times be the case.

Thus the Arch to the Log. Sine 8.8647376, will be found to be $4^\circ. 12'$, &c.

How these Tables are useful in all kinds of *Trigonometrical Calculations*; as in Navigation, Dalling, Astronomy, &c. all Treatises on those Subjects do acquaint us.

N.B. There hath very great Care been taken in the Correction of these Tables and those of the *Logarithms*, and I believe very few Faults have been committed; but whenever the *Calculator* finds Reason to suspect the Tables, it will be very easie for him, by considering the Course and Proportion of the Increase or Decrease of the Numbers in the Tables, as they stand near that which he judges faulty, either above or below it, to find out nearly what Figure is wrong, and how much or how little; as Experience will soon teach him.

Deg. 0, 1, 2, 3.

The End of the TABLE of Versed Sines, &c.

The

The Use of the Table of Versed SINES.

THE Uses of the Table of *Versed Sines* are too numerous to be here all treated of: I shall now only shew how by them more easily to solve some of the most useful Cases of *Spherical Triangles*, which alone is enough to merit their Publication. It has been a long time the Votes and Desires of many able Men in the *Mathematicks*, that such a Table might be collected and published, but especially of that ingenious and ancient Student Mr. *John Collins*, who has expressed his desire thereof more than once in his elaborate *pieces*, and from whom I had the Loan of some Foreign Tables, which did assist much towards the composing of these.

Prop. 1. Two sides of an *Oblique Spherical Triangle*, with the Angle comprehended, being given, to find the 3d side.

As the Cube of the Radius: Is to the Rectangle of the Sines of the comprehended sides, :: So is the Square of the Sine of half the contained Angle, : To half the Difference of the Versed Sines of the 3d side, And of the Arch of Difference between the two including sides.

Which is thus, double the Log Sine of half the Angle given, and thereto add the Log. Sines of the contained sides, and from the left hand of the Sum, dash out 3 for the Cube of the Radius, so rests the Log. of half the difference of those two Versed Sines.

Which half difference doubled, and added to the Versed Sine of the difference of the Legs or containing sides, gives the Versed Sine of the side sought.

Exam. 1. In the Triangle *BPL*, let Figure 5. there be given the side *BP* $77^{\circ} 00'$, the side *PL* $40^{\circ} 00'$, and the contained Angle *BPL* $52^{\circ} 30'$, to find the side *B, L*.

The Log. Sine $40^{\circ} 00'$ ————— 9.8080675
The Log. Sine of $77^{\circ} 00'$ ————— 9.9887239
The Log. Sine of $26^{\circ} 15'$ ————— 19.2914116
doubled.

The Natural Sine against :: ————— 39.0882030

Is 1227355, whose double is: ————— 2454710

The Natural Ver. Sine of $37^{\circ} 00'$ ————— 2013645
the dif. of the two sides is

The Versed Sine of $57^{\circ} 53'$ ————— 4468355
the side sought.

If you make the third Term the Square of the Sine of half the Complement of the contained Angle to 180 Degrees, you will find the half difference of the Versed Sines of the third side, and of the Sum of the two including sides to be doubled, and subtracted from the Versed Sine of the said Sum.

But instead of the second Term be taken into the Proportion, the double of the Rectangle of the Sines of the containing sides, that is, if the Log. of the Number 2 be added to the Log. of the other middle Terms, you will have the Log. of the whole difference in the last place; having found it, take the Natural Sine that stands against it, and add it to the Natural Versed Sine of the difference of the Legs, and the Sum is the Natural Versed Sine of the side sought.

Exam. 2. Let the two containing sides be $38^{\circ} 30'$ and $66^{\circ} 30'$, and the containing Angle be $20^{\circ} 00'$.

The log. Sine of $38^{\circ} 30'$ ————— 9.7941496
The log. Sine of $66^{\circ} 30'$ ————— 9.9623978
The log. of the Number 2 ————— 0.3010300
The log. Sine of $15^{\circ} 00'$ doubled is ————— 18.8259924

The nearest Nat. Sine against ————— 38.8835698
 $66^{\circ} 30'$ Is ————— 770091

$38^{\circ} 30'$ Which taken from the Nat. ————— 1170524

———— Versed Sine of $28^{\circ} 00'$ —————

$28^{\circ} 00'$ There remains ————— 500433

The Nat. Versed Sine of $53^{\circ} 10'$.

This *Prop.* is of great Use to Calculate the Distances of Places on the Earth, according to the Arch of a great Circle by their *Long.* and *Latit.* given; the Distances of Stars, by having their Declinations and Right Ascensions, or Longitudes and Latitudes given, by means whereof the Altitudes of two Stars, or of the Sun with the Difference of Time or *Azimuth* being observed at any time off the Meridian, the Latitude may be found.

A TABLE of Difference of Latitude and Departure to every Degree and Quarter-Point of the Compass, for the exact working of a Traverse, when the Distance Run exceeds not (the Radius) 10000.

exceeds not (the Remarks)

The Nature, Construction, and Use of the TABLE of Difference of Latitude and Departure.

THE Table of Difference of Latitude and Departure, is designed principally for the more exact and expeditious working of Traverses, but may be applied to the Solution of the several Cases of *Plane Sailing*.

It shews by Inspection the Alteration of the Latitude and Departure to every Degree, Point, and Quarter point of the Compass, for any Distance not exceeding 10000, and may be made to serve for any greater Distance, provided it be first divided into Parts, not exceeding the Limits of the Table.

In the uppermost Rank are placed the Courses and their Complements from one Degree to 45, including the Points, Half-points, and Quarter-points, which are plac'd in their proper Columns between their next greatest and least Degree, and in the right and Left hand Columns are the Miles of Distance, and in the common Area the corresponding Difference of Latitude and Departure, and which are found from the Course and Distance by the Subsequent Proportion.

For the Difference of Latitude.

As the Radius, to the Sine of the Course 1. 2. 3. &c. Deg. so is the Distance run 1. 2. 3. &c. Miles the Difference of Latitude.

For the Departure.

As the Radius to the Co-sine of the Course 1. 2. 3. &c. Degrees, so is the Distance run 1. 2. 3. &c. Miles to the Departure.

By the Tables thus formed, no more is requisite to find the Alteration of Latitude and Departure; but to seek for the Course in the Head, and the Distance in the Side, and the Requisites in the Common Area.

A few Examples will render it very plain.

Suppose a Ship sails N.N.E. $\frac{3}{4}$ Easterly 7 Miles, and the Difference of Latitude and Departure be required.

In the Column under Latitude and Departure, I seek for 2 p. $\frac{3}{4}$ (because the distance of the Rumb N.N.E. $\frac{3}{4}$ E. is 2 p. from the Meridian) and in the Right hand Column for the Distance 7 Miles, and in the common Area I find 6.0041 for the Difference of Latitude, and 3.5987 for the Departure.

If the Course had been the same, and the Distance 70, it is but removing the Prick one place backward in the former Answers, and the thing is done. So that in this Case the Difference of Latitude would be 60.041, that is 60 Miles and $\frac{41}{1000}$ of a Mile, and the Departure 35.987, that is 35 Miles and $\frac{987}{1000}$ of a Mile. In like manner, If the Distance had been 700 Miles, and the Course the same, then the Difference of Latitude would be 600.41, and the Departure 359.87.

If the Distance proposed does not consist of any Number of 10's, as suppose 753, then the proper Requisites may be thus found.

From the dif. of Lat. answering to 800 686.18
Take the dif. of Lat. answering to 700 600.41

85.77

And, say, as 100 to 53, so is 85.77 the Difference 45.46, which therefore added to the Difference of Latitude 600.41, answering to the Distance 700, gives 645.87, the Difference of Latitude to the Distance 753, and Course as before, N. N. E. $\frac{3}{4}$ E. after the same manner, and it will be as 100 to 53. So is 51.41 to 272.17, which added to 359.87, gives 387.117, the Departure required.

But the Difference of Lat. and Departure in the former Case, may be more readily found by dividing the Distance into such Parts as may be found in the Table, and adding up the several Differences of Latitude and Departure in one Sum to find the Total: Thus,

Suppose the Course as before NNE. $\frac{3}{4}$ E. and Distance 753.

The dif. of Lat. answering to 700 is 600.41
to 50 is 45.886
to 3 is 2.573

The Dif. of Lat. answering to 753 645.869

After the same manner may be found.

The Departure belonging to 700 359.87
to 50 25.705
to 3 1.542

387.117

The same Difference of Latitude and Departure answering to 75. $\frac{3}{4}$, by placing the Prick one place forwarder, that is, instead of 645.869, for the Difference of Latitude take 64.5869, and for the Departure, instead of 387.117: 38.7117, also by placing it two places forwarder, they serve for the $\frac{1}{10}$, by placing of it three places forwarder for $\frac{1}{100}$.

In like manner, If the Distance had been any Number greater than 1000, as suppose 86753, by dividing it as in the former Example, into its component Parts 80000. 6000. 700. 50. 3, and summing up each particular difference of Latitude and Departure into one Sum, the proper Difference of Latitude and Departure will be had.

Keeping the Distance 753, as before the same difference of Latitude 645.87, and the Departure 387.117 will serve for any Course that makes an Angle with the Meridian of $2\frac{3}{4}$, as the NNW. $\frac{3}{4}$ W. the SSE. $\frac{3}{4}$ E. or the SSW. $\frac{3}{4}$ W. and the Difference of Latitude in this Case would be the Departure also, the Departure would become the difference of Latitude for any Course that makes an Angle of 5 p. $\frac{1}{4}$ with the Meridian.

As suppose a Ship Sails 753 Miles either NE. by E. $\frac{1}{4}$ E. or N. W. by W. $\frac{1}{4}$ W. or S. E. by E. $\frac{1}{4}$ E. or S. W. by W. $\frac{1}{4}$ W. or E. N

E N E N. &c. the proper difference of Latitude to each, or any of these will be the same with the Departure in the former Example 387.117, and the Departure in this 645.869, the same with the Alteration of the Latitude in the former.

If the Course cannot be found exactly in the Table, then the difference between the differences Latitude and Departure, proper to the whole Degrees next above and below the Course must be found, and the Proportional Increment investigated, as in the following Example.

Suppose a Ship sails North $38^{\circ} 20'$ westerly 600
Then against 6 and under 38° , the dif. Lat is 472.81
Against 6, and under 39, the differ Lat. is 466.29

The difference to the Alteration of 1 deg. is 6.52

Therefore as 60 to 30, so is 652 to 3.26, which therefore subtracted from 472.81, leaves 469.55 the difference of Latitude.

In like manner for the Departure.

Against 6, and under 38° the departure is 369.40
Against 6, and under 39 the Departure is 377.59

8.19

Therefore as 60' to 30', so is 819 to 4.095, which therefore added to 369.40, gives 373.495, for the departure required.

A Traverse

Admit a Ship from the Latitude of $48^{\circ} 30' N$. Sails NNW half W. 79 miles, then N W half W. 86, then N by E $\frac{3}{4} E$. 108, then N 48° East, 112, then E. 5° southerly 70, then East 50° Northerly 84, then North 48; And it be required to find the Latitude the Ship is in, her direct Course and Distance, and how much she has departed from her first Meridian.

Having set down the Courses and Distances, as in the following Table, proceed to find out the difference of Latitude and Departure for each (according to the directions already given) in the Table placing each in its proper Column, viz. If the Course be Northerly the difference of Latitude must be placed in the North Column, if Southerly, in the South Column, if Easterly, the departure must be put in the East Column, if Westerly, in

the West Column; which done, add up the Columns of difference of Latitude and departure, and subtract the lesser difference of Latitude from the greater, as also the lesser departure from the greater, and the Remainders will be the difference of that Latitude and departure the Ship has made.

The TABLE.

Courses	Dist	Diff. of Lat		Departure	
		N	S	E	W
NNW, $\frac{1}{2}$ W	79	69.67			37.24
NW $\frac{1}{2}$ W	86	54.56			66.47
N by E $\frac{3}{4}$ E	108	101.68		36.39	
N 48° E	112	74.94		83.23	
E 5°	70		6.10	69.73	
E 50° N	84	64.35		53.99	
North	48	48.00			
		413.20	6.10	243.34	103.71
		6.10		103.71	
Northings	407.10			139.63	E. ing

Hence it appears, that the Ship has departed from her first Meridian, 139.63 miles Easterly, and altered her Latitude 407.1 miles, which reduced into degrees and minutes, makes $6^{\circ} 47'$, which therefore added to the Latitude she came from $48^{\circ} 30'$, because she sail'd from a North Latitude Northerly makes $55^{\circ} 17'$, the Latitude the Ship is come into.

Entering the Table with the Difference of Latitude, thus deduced, viz. 407.01, and the Departure 139.63, I find the Course is greater than 15° , and less than 19 , and the Distance greater than 400.00, and less than 500.00 and after working the necessary Proportion (by the reverse of the Method made use of in the former Examples) the Course out North $18^{\circ} 56' E$. or E. by N. $70^{\circ} 41' E$, and the direct Distance 430.305 Miles.

The chief Use of this Table being for the Solution of Traverses, it would be needless to give an Example of each particular Case in Plane-Sailing, especially since he that is but moderately apprehensive of what has been said, will find it not difficult to do it himself, by the Directions given in Vol. I. under the words *Plain Sailing*.

AN Alphabetical INDEX To Both VOLUMES.

Navigation and Sea-Terms.

A Baft.
Abafe.
Affretamentum.
After-Sails.

Aloofe.
Amain.
Anchor.
Anchoring.
Ancient.
Animated Needle.
